18.11.2.156 EMC_AUTO_CAL_CONFIG3_0

Auto-Calibration Master Compute Control Register

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x45c | Read/Write: R/W | Reset: 0x00770000 (0bxxxxxxxxx111x111xx000000xx000000)

Bit	Reset	Description
22:20	0x7	AUTO_CAL_CLK_PD_SLOPE: [PMC] slope for CK pull-down value - range is 0.125 to 1.000 in steps of 0.125
18:16	0x7	AUTO_CAL_CLK_PU_SLOPE: [PMC] slope for CK pull-up value - range is 0.125 to 1.000 in steps of 0.125
13:8	0x0	AUTO_CAL_CLK_PD_OFFSET: [PMC] 2's complement offset for CK pull-down value
5:0	0x0	AUTO_CAL_CLK_PU_OFFSET: [PMC] 2's complement offset for CK pull-up value

18.11.2.157 EMC_TR_DVFS_0

Offset: 0x460 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	TRAINING_DVFS: Set for a DVFS that enables training 0 = DISABLED 1 = ENABLED

18.11.2.158 EMC_AUTO_CAL_CHANNEL_0

Autocal slave control register

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x464 | Read/Write: R/W | Reset: 0xc280030a (0b110x001010000000xxxx0011xx001010)

Bit	R/W	Reset	Description
31	RW	ENABLE	AUTO_CAL_UPDATE_IDLE: [PMC] Allow Autocal update outside of refresh if dramc is idle 0 = DISABLE 1 = ENABLE
30	RW	ENABLE	AUTO_CAL_STALL_ALL_TRAFFIC: [PMC] Stall all traffic for an Autocal update. When set to 0, will only stall RW traffic 0 = DISABLE 1 = ENABLE
29	RO	DISABLE	AUTO_CAL_COMPUTE_START_DVFS: [PMC] Writing a one to this bit triggers the Autocal compute FSM after DVFS shadow update 0 = DISABLE 1 = ENABLE
27:21	RW	0x14	CAL_WAIT_AFTER_DVFS: [PMC] Number of EMC clocks to wait after DVFS shadow update before resuming traffic to DRAM Note that this delay is applied serially after Autocal compute + transfer + update delay during DVFS (if enabled via AUTO_CAL_COMPUTE_START_DVFS trigger). For Autocal, this delay is meant to cover E_CAL_UPDATE pulse generation in pad macros for CK pads. This delay counter is used by DDLLCAL compute update also, and may need to be set to a higher value if AUTO_CAL_COMPUTE_START_DVFS is not triggered
20:16	RW	0x0	AUTO_CAL_UPDATE_TIMEOUT: [PMC] Timeout before forcing dramc idle to issue an Autocal update. A value of 0 disables the timeout This is a power of two value so a setting of TIMEOUT=8 will wait (1<<8) emcclk's
11:8	RW	0x3	AUTO_CAL_WAIT_BEFORE_UPDATE: [PMC] Number of EMC clocks to wait before issuing the Autocal update after the refresh/idle event. Minimum valid value is 0x3
5:0	RW	0xa	AUTO_CAL_NUM_STALL_CYCLES: [PMC] Number of EMC clocks to stall the DRAM bus for whenever Autocal codes are being updated

18.11.2.159 EMC_IBDLY_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x468 | Read/Write: R/W | Reset: 0x00000001 (0bxx00xxxxxxxxxxxxxxxxxxxx0000001)

Bit	Reset	Description
29:28	0x0	IBDLY_MODE: [PMC] OBDLY is enforced before write command is issued 0 = DISABLED 1 = AFTER_CMD 2 = RESERVED 3 = B4_CMD
6:0	0x1	IBDLY: [PMC] tells the chip when to change IBDLY for DQ/DQS.

18.11.2.160 EMC_OBDLY_0

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x46c | Read/Write: R/W | Reset: 0x00000003 (0bxx00xxxxxxxxxxxxxxxxxxxx000011)

Bit	Reset	Description
29:28	0x0	OBDLY_MODE: [PMC] OBDLY is enforced before write command is issued 0 = DISABLED 1 = AFTER_CMD 2 = RESERVED 3 = B4_CMD
5:0	0x3	OBDLY: [PMC] tells the chip when to update OB trim values with respect to WDV

18.11.2.161 EMC_TXDSRVTTGEN_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x480 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	TXDSRVTTGEN: [PMC] Cycles to wait from DSR exit (VTTGEN drive normal), to when a DRAM transaction is allow to start.

18.11.2.162 EMC_WE_DURATION_0

DRAM timing parameter

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x48c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4:0	0x0	WE_DURATION: [PMC] the number of cycles to assert write enable

18.11.2.163 EMC_WS_DURATION_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x490 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4:0	0x0	WS_DURATION: [PMC] the number of cycles to assert write strobe

18.11.2.164 EMC_WEV_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x494 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:0	0x0	WEV: [PMC] the number of cycles to post (delay) write enable from being asserted to the RAMs. 40 = maximum

18.11.2.165 EMC_WSV_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x498 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:0	0x0	WSV: [PMC] the number of cycles to post (delay) write strobe from being asserted to the RAMs. \ 40 = maximum

18.11.2.166 EMC_CFG_3_0

EMC Configuration

Boot requirements:

- This register (except for fields DRAMC_PRE_B4_ACT, MRR_BYTESEL_X16, MRR_BYTESEL) should be saved in the scratch registers and restored by the Boot ROM during warm boot.
- If the OS needs the MRR_BYTESEL* fields set to non-default values to perform a mode-register read, it needs to correctly program these values before performing the MRR.

Offset: 0x49c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx000x000)

Bit	Reset	Description
6:4	0x0	MRR_BYTESEL_X16: [PMC] If using 2 x16 DRAM on a single CS to form 32-bit wide data, indicates to which byte lane the second DRAM's byte 0 is connected.
2:0	0x0	MRR_BYTESEL: [PMC] Indicates which AP byte lane is connected to DRAM byte 0 (over which MRR data is returned).

18.11.2.167 EMC_MRW5_0

Command trigger: MRW5

Mode Register Write: LPDDRx-only version of MRS/EMRS

Offset: 0x4a0 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xx00000000xxxxxxxx00000000)

Bit	Reset	Description
31:30	0x0	MRW5_DEV_SELECTN: active-low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for dev1.
27	0x0	USE_MRW5_EXT_CNT: {USE_MRS_EXT_CNT, USE_MRS_LONG_CNT}: 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_MRW5_LONG_CNT: Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
23:16	0x0	MRW5_MA: register address
7:0	0x0	MRW5_OP: data to be written

18.11.2.168 EMC_MRW6_0

Command trigger: MRW6

The following Mode Registers (MRW6-MRW15) are added for LPDDR4 support; however, they can be used for LPDDRx. They add sub-partition support. They always use short MRS wait count to satisfy tMRW.

Boot requirements:

- This register triggers a mode register write command. Multiple mode-register writes may be required by the cold boot sequence. Such commands should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x4a4 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00000000000000000000000000)

Bit	Reset	Description
31:30	0x0	MRW6_DEV_SELECTN: [PMC] active-low chip-select, 0x0 applies command to both devices 0x1 for dev1 0x2 to for only dev0,
27	0x0	USE_MRW6_EXT_CNT: [PMC] {USE_MRS_EXT_CNT, USE_MRS_LONG_CNT}: 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_MRW6_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
25:24	0x0	MRW6_SP_SELECTN: [PMC] active-low subp chip-select, both subp can be written at the same 0x2 writes OP_SP0 to subp0, 0x1 writes OP_SP1 to subp1 0x0 writes OP_SP0 to subp0 and OP_SP1 to subp1
23:16	0x0	MRW6_MA: [PMC] register address
15:8	0x0	MRW6_OP_SP1: [PMC] data to be written to sub-partition 1 (subp1)
7:0	0x0	MRW6_OP_SP0: [PMC] data to be written to sub-partition 0 (subp0)

18.11.2.169 EMC_MRW7_0

Command trigger: MRW7

Offset: 0x4a8 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00000000000000000000000000)

Bit	Reset	Description
31:30	0x0	MRW7_DEV_SELECTN: active-low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for dev1.
27	0x0	USE_MRW7_EXT_CNT: {USE_MRS_EXT_CNT, USE_MRS_LONG_CNT}: 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2

18.11.2.185 EMC_QPOP_0

DRAM timing parameter

This register is shadowed

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the
- Boot ROM during warm boot.

Offset: 0x564 | Read/Write: R/W | Reset: 0x00000006 (0bxxxxxxxxx0000000xxxxxxxxx0000110)

Bit	Reset	Description
22:16	0x0	QPOP_PREAMBLE: [PMC] time from read command to pop preamble from the pad macro FIFO. EMC ignores this field if FBIO_CFG7.QPOP_RD_PREAMBLE_TOGGLE=0. 60 = MAX_1TO1 120 = MAX_2TO1
6:0	0x6	QPOP: [PMC] time from read command to pop data from the pad macro FIFO. 60 = MAX_1TO1 120 = MAX_2TO1

18.11.2.186 EMC_QUSE_WIDTH_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x568 | Read/Write: R/W | Reset: 0x00000003 (0bxx00xxxxxxxxxxxxxxxxxxxxxxxx0011)

Bit	Reset	Description
29	0x0	QUSE_SHORTEN_2UI: [PMC] Shorten QUSE 2 UI (1 DRAM clock)
28	0x0	QUSE_EXTEND_UI: [PMC] Extend QUSE 1 UI (1/2 clock)
3:0	0x3	QUSE_DURATION: [PMC] QUSE_DURATION. minimum value = 1 (ddr3/lp3), 2 (LP4), results 8/16 tCLK quse window

18.11.2.187 EMC_PUTERM_WIDTH_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Set both RXTERM_DURATION and CFG_STATIC_TERM to disable terminations.

RXTERM defines start of term window. RX_TERM_MODE controls termination type

Offset: 0x56c | Read/Write: R/W | Reset: 0x00000005 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxx0101)

Bit	Reset	Description
31	0x0	CFG_STATIC_TERM: [PMC] IOBRICK internally disables termination based on DOE. Core sends static '1' on term_enable
3:0	0x5	RXTERM_DURATION: [PMC] Additional PUTERM duration apart from default BL/2 -- set to 0 to disable termination

18.11.2.188 EMC_BGBIAS_CTL0_0

BGBIAS Pad controls

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x570 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3	0x0	BIAS0_DSC_E_PWRD_IBIAS_RX: [PMC] Bias current going out to brick receiver
2	0x0	BIAS0_DSC_E_PWRD_IBIAS_VTTGEN: [PMC] Active High. Disables biasing current going out to VTTGEN cells
1	0x0	BIAS0_DSC_E_PWRD: [PMC] Active High. Disables all DC current paths within entire cell.
0	0x0	BIAS0_DSC_BG_SEL_N: [PMC] Active low; 0= select BandGap reference current;

18.11.2.189 EMC_AUTO_CAL_CONFIG7_0

Autocal master compute control register

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x574 | Read/Write: R/W | Reset: 0x00770000 (0bxxxxxxxxx111x111xx000000xx000000)

Bit	Reset	Description
22:20	0x7	AUTO_CAL_DQS_PD_SLOPE: [PMC] slope for DQS pull-down value - range is 0.125 to 1.000 in steps of 0.125
18:16	0x7	AUTO_CAL_DQS_PU_SLOPE: [PMC] slope for DQS pull-up value - range is 0.125 to 1.000 in steps of 0.125
13:8	0x0	AUTO_CAL_DQS_PD_OFFSET: [PMC] 2's complement offset for DQS pull-down value
5:0	0x0	AUTO_CAL_DQS_PU_OFFSET: [PMC] 2's complement offset for DQS pull-up value

18.11.2.190 EMC_XM2COMPPADCTRL2_0

Autocal COMP pad control register

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x578 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxx00000000000000000)

Bit	Reset	Description
17	DISABLE	EMC2TMC_CFG_XM2COMP_PU_E_WKPD: [PMC] Enable weak pull-down 0 = DISABLE 1 = ENABLE

15:10	0x0	AUTO_CAL_SW_CTRL_DRVUP: Software control for TX_DRVUP pin of COMP pad slices used for pull-up and pull-down calibration
8:2	0x3c	AUTO_CAL_SW_CTRL_IVREF_LVL: Software control for IVREF_LVL, shared between COMP pad slices used for pull-up and pull-down calibration
1	DISABLE	AUTO_CAL_SW_CTRL_BG_E_PWRD: Software control for BG_E_PWRD 0 = DISABLE 1 = ENABLE
0	DISABLE	AUTO_CAL_SW_CTRL: Enable Software control of COMP pad inputs. Make sure AUTO_CAL_ENABLE is set to DISABLED first 0 = DISABLE 1 = ENABLE

18.11.2.192 EMC_REFCTRL2_0

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x580 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxx000xxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
31	DISABLED	REFPB_VALID: [PMC] Specifies if REFpb operation is enabled. Not valid unless REFCTRL_0_REF_VALID is ENABLED 0 = DISABLED 1 = ENABLED
26:24	0x0	REFPB_PD_THRESHOLD: [PMC] When in PD, issue REFpb if pending REFpb % num_banks is less than threshold. otherwise switch to REFab in PD A value of 0x0 will always issue REFab in PD
0	DISABLED	REFRESH_PER_DEVICE: [PMC] Controls whether refresh commands are sent independantly for each device, or are shared. 0 = DISABLED 1 = ENABLED

18.11.2.193 EMC_FBIO_CFG7_0

FBIO configuration Register

Offset: 0x584 | Read/Write: R/W | Reset: 0x0000002a (0b00000000000000000000000000101010)

Bit	Reset	Description
31:17	0x0	TEMP_REG: Reserved.
16	0x0	FORCE_CMD_PHASE_EQ0: [PMC] Setting this bit forces DRAM cmds to always be launched on phase 1. Bit is ignored if (DRAM_EMCCLK_2TO1 == ONEX).
15	0x0	DISABLE_CCDP1_WR_SPACING: [PMC] Setting this bit prevents write command spacing of tCCD+1. Allowed write spacing will then be tCCD or tCCD > 1.
14	0x0	DISABLE_CCDP1_RD_SPACING: [PMC] Setting this bit prevents read command spacing of tCCD+1. Allowed read spacing will then be tCCD or tCCD > 1. Set if using QPOP_RD_PREAMBLE_TOGGLE
13	X32	SUBP_ADDR_MODE: [PMC] Selects dram subp addr width. This affects mc column to dram column translation. Expected usage is X16 for LPDDR4 and X32 otherwise. 0 = X32 1 = X16
12	DISABLED	ZQCAL_LATCH_ENABLE: [PMC] Enables EMC to send an LPDDR4 MPC ZQCal Latch command as part of ZQ Calibration process. 0 = DISABLED 1 = ENABLED
11	DISABLED	ZQCAL_MPC_ENABLE: [PMC] Enables EMC to send ZQCal command as LPDDR4 MPC ZQCal Start command 0 = DISABLED 1 = ENABLED
10	DISABLED	QPOP_RD_PREAMBLE_TOGGLE: [PMC] enable qpop filter for LPDDR4 read preamble toggle 0 = DISABLED 1 = ENABLED
9	ACTIVE_LOW	CS_POLARITY: [PMC] Determines polarity of DRAM chip select (CS). LPDDR4 implements an active high CS. 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
8	DISABLED	MRR_DBI: [PMC] If RD_DBI=ENABLED, enables EMC to apply data bus inversion protocol to in-coming mode register read data (LPDDR4). EMC ignores this bit otherwise. This allows EMC to support DRAM which does not apply dbi to MRR data. 0 = DISABLED 1 = ENABLED
7	DISABLED	RD_DBI: [PMC] Enables EMC to apply data bus inversion protocol to in-coming read data (LPDDR4). If read dbi is enabled in DRAM, this bit must also be enabled. 0 = DISABLED 1 = ENABLED
6	DISABLED	WR_DBI: [PMC] Enables EMC to use write data bus inversion protocol (LPDDR4). If enabled, EMC will apply data bus inversion to any valid bytes which have more than 4 bits set. If this bit is enabled, write dbi must also be enabled in DRAM. 0 = DISABLED 1 = ENABLED
5	ENABLED	MASKED_WR: [PMC] Enables EMC to issue LPDDR4 masked write command. 0 = DISABLED 1 = ENABLED
4	DISABLED	LPDDR4_CMD_MAP: [PMC] Enables EMC to use LPDDR4 command mapping for DRAM commands. 0 = DISABLED 1 = ENABLED
3	ENABLED	QUSE_CCDP1_EXTEND: [PMC] Enables extension of QUSE through tCCD+1 spacing. Required for direct QUSE. Must be disabled for RPRE toggle 0 = DISABLED 1 = ENABLED
2	DISABLE	CH1_ENABLE: [PMC] 0 = DISABLE 1 = ENABLE
1	ENABLE	CH0_ENABLE: [PMC] 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
0	ONEX	DRAM_EMCCLK_2TO1: [PMC] Set to enabled if dramclk is 2x faster than emcclk 0 = ONEX 1 = TWOX

18.11.2.194 EMC_DATA_BRLSHFT_0_0

FBIO configuration Register

DQ/DQS BRLSHFTS

Rank 0 Per byte OB barrleshift setting

Offset: 0x588 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000000000000000000000)

Bit	Reset	Description
23:21	0x0	RANK0_BYTE7_DATA_BRLSHFT: [PMC] Per byte barrelshift setting
20:18	0x0	RANK0_BYTE6_DATA_BRLSHFT: [PMC] Per byte barrelshift setting

18.11.2.199 EMC_CMD_BRLSHFT_0_0

CMD/ADR BRLSHFTS

In LP4 mode SUBP0 address bits will be on one brick and SUBP1 address on another; so different 1T settings will be needed for different long trimmers.

In legacy (LP3) modes, the same 1T setting will need to be programmed for SUBP0 and SUBP1 because addresses belonging to the same subpartition can end up on different bricks with different long trimmer settings.

In summary, in LP4 - Training will set SUBP0 1T and SUBP1 1T; only software will set 2T for CKE/RST.

In Legacy modes - Software can only set both SUBP0 1T and SUBP1 1T to the same value. Also, software can set SUBP0 2T and SUBP1 2T to the same value.

1T LP4 ADR barrelshift setting on Ch0

These will be set by the training engine in LP4 mode. In Legacy modes, these will be set by software (if needed)

Offset: 0x59c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:3	0x0	CH0_SUBP1_1T_BRLSHFT: [PMC] Per Subp CMD/ADR barrelshift setting

2:0	0x0	CH0_SUBP0_1T_BRLSHFT: [PMC] Per Subp CMD/ADR barrelshift setting

18.11.2.200 EMC_CMD_BRLSHFT_1_0

1T LP4 ADR barrelshift setting on Ch1

These will be set by the training engine in LP4 mode. In Legacy modes, these will be set by software (if needed)

Offset: 0x5a0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:3	0x0	CH1_SUBP1_1T_BRLSHFT: [PMC] Per Subp CMD/ADR barrelshift setting
2:0	0x0	CH1_SUBP0_1T_BRLSHFT: [PMC] Per Subp CMD/ADR barrelshift setting

18.11.2.201 EMC_CMD_BRLSHFT_2_0

2T signal barrelshift setting on Ch1

These will not be set by the training engine in LP4 mode and will be applied only to CKE and RST. In legacy modes, these will be applied to non-ADR signals like RAS, CAS, WE

Offset: 0x5a4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:3	0x0	CH0_SUBP1_2T_BRLSHFT: [PMC] Per Subp CMD/ADR barrelshift setting
2:0	0x0	CH0_SUBP0_2T_BRLSHFT: [PMC] Per Subp CMD/ADR barrelshift setting

18.11.2.202 EMC_CMD_BRLSHFT_3_0

2T signal barrleshift setting on Ch1

These will not be set by the training engine in LP4 mode and will be applied only to CKE and RST. In legacy modes these will be applied to non-ADR signals like RAS, CAS, WE.

Offset: 0x5a8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:3	0x0	CH1_SUBP1_2T_BRLSHFT: [PMC] Per Subp CMD/ADR barrelshift setting
2:0	0x0	CH1_SUBP0_2T_BRLSHFT: [PMC] Per Subp CMD/ADR barrelshift setting

18.11.2.203 EMC_QUSE_BRLSHFT_0_0

QUSE BRLSHFTS

Per byte OB barrelshift setting

Offset: 0x5ac | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxx00000000000000000000)

Bit	Reset	Description

18.11.2.208 EMC_CCDMW_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x5c0 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	CCDMW: [PMC] This field supports LPDDR4 DRAMs. It specifies the DRAM CAS to CAS delay timing when the current command is any type of write and the next command is a masked write to the same bank. The EMC ignores this field if FBIO_CFG7.MASKED_WR is disabled.

18.11.2.209 EMC_QUSE_BRLSHFT_3_0

Per byte OB barrelshift setting

Offset: 0x5c4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000000000000000000)

Bit	Reset	Description
19:15	0x0	RANK1_BYTE7_QUSE_BRLSHFT: [PMC] Per byte quse barrelshift setting
14:10	0x0	RANK1_BYTE6_QUSE_BRLSHFT: [PMC] Per byte quse barrelshift setting
9:5	0x0	RANK1_BYTE5_QUSE_BRLSHFT: [PMC] Per byte quse barrelshift setting
4:0	0x0	RANK1_BYTE4_QUSE_BRLSHFT: [PMC] Per byte quse barrelshift setting

18.11.2.210 EMC_FBIO_CFG8_0

FBIO configuration Register

The QRST,QUSE,RDV fields specify the delays from read to internal timing signals. These fields should be set as follows:

QUSE = CAS_LATENCY - 1 non-mobile SDRAM

Offset: 0x5c8 | Read/Write: R/W | Reset: 0x0fff0000 (0bxxxx1111111111110xxxxxxxxxxxxxxx)

Bit	Reset	Description
27	0x1	EMC2PMACRO_CFG_PIPE_DATA_MODE_BRICK11: [PMC] 1= enables the clock to data control signals in pipestages of brick11. set to =0 in cmd bricks
26	0x1	EMC2PMACRO_CFG_PIPE_DATA_MODE_BRICK10: [PMC] 1= enables the clock to data control signals in pipestages of brick10. set to =0 in cmd bricks
25	0x1	EMC2PMACRO_CFG_PIPE_DATA_MODE_BRICK9: [PMC] 1= enables the clock to data control signals in pipestages of brick9. set to =0 in cmd bricks
24	0x1	EMC2PMACRO_CFG_PIPE_DATA_MODE_BRICK8: [PMC] 1= enables the clock to data control signals in pipestages of brick8. set to =0 in cmd bricks

15	0x0	Reserved. Write zero.

18.11.2.211 EMC_AUTO_CAL_CONFIG6_0

Autocal master compute control register

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x5cc | Read/Write: R/W | Reset: 0x00770000 (0bxxxxxxxxxx111x111xx000000xx000000)

Bit	Reset	Description
22:20	0x7	AUTO_CAL_DQ_PD_SLOPE: [PMC] slope for DQ pull-down value - range is 0.125 to 1.000 in steps of 0.125
18:16	0x7	AUTO_CAL_DQ_PU_SLOPE: [PMC] slope for DQ pull-up value - range is 0.125 to 1.000 in steps of 0.125
13:8	0x0	AUTO_CAL_DQ_PD_OFFSET: [PMC] 2's complement offset for DQ pull-down value
5:0	0x0	AUTO_CAL_DQ_PU_OFFSET: [PMC] 2's complement offset for DQ pull-up value

18.11.2.212 EMC_PROTOBIST_CONFIG_ADR_1_0

Protocol BIST register

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x5d0 | Read/Write: WO | Reset: 0x30000000 (0bxx11000000000000000000000000000)

Bit	Reset	Description
29	0x1	PROTOBIST_APC: Controls the auto-precharge function of transaction.
28	0x1	PROTOBIST_A_RDY: Indicates Activate interface is ready.
27:12	0x0	PROTOBIST_A_ROW: ROW control during protobist mode.
11	0x0	PROTOBIST_A_REF: REFRESH control during Activate request in protobist
10:9	0x0	PROTOBIST_A_DEV: DEVSEL control during Activate request in protobist
8:6	0x0	PROTOBIST_BANK: BANK control during transfer request in protobist
5:3	0x0	PROTOBIST_A_BANK: BANK control during Activate request in protobist
2:0	0x0	PROTOBIST_A_BANK1: BANK1 control during Activate request in protobist

18.11.2.213 EMC_PROTOBIST_CONFIG_ADR_2_0

Protocol BIST register

Offset: 0x5d4 | Read/Write: WO | Reset: 0x08000101 (0bxxx01000000000000000000100000001)

Bit	Reset	Description
28	0x0	PROTOBIST_SWAP: Swap control during protobist mode
27:26	0x2	PROTOBIST_SIZE: Size control during protobist mode
25	0x0	PROTOBIST_MASKED_WRITE: Mask write control during protobist mode
24	0x0	PROTOBIST_T_DEV: DEV control during Xfre request of protobist mode

Bit	Reset	Description
23:21	0x0	PROTOBIST_T_COL1: Column1 control during transfer request during protobist
20:9	0x0	PROTOBIST_T_COL: COlumn control during protobist
8	0x1	PROTOBIST_T_RDY: Indicates transfer interface is ready.
7:0	0x1	PROTOBIST_CGID: Controls the request ID of transaction.

18.11.2.214 EMC_PROTOBIST_MISC_0

Protocol BIST register

Offset: 0x5d8 | Read/Write: R/W | Reset: 0x0000X000 (0bxxxxxxxxxxxxx000x000000000000000)

Bit	R/W	Reset	Description
18:16	WO	0x0	PROTOBIST_REQ
15	RO	X	PROTOBIST_READ_ACK
14	RW	0x0	PROTOBIST_START
13	WO	0x0	PROTOBIST_W_BE: Protobist mode control for byte enable.
12	WO	0x0	PROTOBIST_MODE: Protobist mode control, indicates bist mode.
11:8	WO	0x0	PROTOBIST_RDI_SEL: RDI select is MUX control for read data.
7:0	WO	0x0	PROTOBIST_TAG: Tag control during protobist mode

18.11.2.215 EMC_PROTOBIST_WDATA_LOWER_0

Protocol BIST register

Offset: 0x5dc | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	PROTOBIST_DATA_LOWER: 1st 32 bit Data for protobist mode

18.11.2.216 EMC_PROTOBIST_WDATA_UPPER_0

Protocol BIST register

Offset: 0x5e0 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	PROTOBIST_DATA_UPPER: 2nd 32 bit Data for protobist mode

18.11.2.217 EMC_PROTOBIST_RDATA_0

Protocol BIST register

Offset: 0x5ec | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	PROTOBIST_RDATA: read data after read Xaction during PBIST mode

18.11.2.218 EMC_DLL_CFG_0_0

DLL calibration configuration register 0

Offset: 0x5e4 | Read/Write: R/W | Reset: 0x01a340ff (0bxx000001101000110100000011111111)

Bit	Reset	Description
29	0x0	DDLLCAL_CTRL_IGNORE_START: [PMC] Ignore DLLCAL start trim priv value
28	0x0	DDLLCAL_CTRL_DUAL_PASS_LOCK: [PMC] 2 Pass Lock

Bit	Reset	Description
27:24	0x1	DDLLCAL_CTRL_STEP_SIZE: [PMC] Calibration step size
23:20	0xa	DDLLCAL_CTRL_END_COUNT: [PMC] End count
19:16	0x3	DDLLCAL_CTRL_FILTER_BITS: [PMC] Filter
15:12	0x4	DDLLCAL_CTRL_SAMPLE_COUNT: [PMC] No. of samples to take (power of 2)
11:4	0xf	DDLLCAL_CTRL_SAMPLE_DELAY: [PMC] delay to allow DLL value to settle
3:0	0xf	DDLLCAL_UPDATE_CNT_LIMIT: [PMC] Wait cycles for priv update

18.11.2.219 EMC_DLL_CFG_1_0

DLL calibration configuration register 1

Offset: 0x5e8 | Read/Write: R/W | Reset: 0x00000020 (0bxxxxxxxxxxxxxxxx00000000000100000)

Bit	Reset	Description
16	0x0	DDLL_BYPASS: [PMC] Bypass
15:12	0x0	DDLL_RFU: [PMC] RFU
11	0x0	E_DDLL_PWRD: [PMC] Master dLL powerdown
10:0	0x20	DDLLCAL_CTRL_START_TRIM: [PMC] Calibration start value

18.11.2.220 EMC_CONFIG_SAMPLE_DELAY_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Some fields in this register are shadowed: see usage note in *Section 18.11.2: EMC Registers*.

Offset: 0x5f0 | Read/Write: R/W | Reset: 0x00000020 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx0100000)

Bit	Reset	Description
6:0	0x20	PMACRO_SAMPLE_DELAY: [PMC] Number of emcclk's from sending pad macro configuration read, to sampling of the read return data.

18.11.2.221 EMC_CFG_UPDATE_0

CFG_UPDATE is used to control special features of the timing updates.

Offset: 0x5f4 | Read/Write: R/W | Reset: 0x70000301 (0b0111xxxxxxxxxxxxxxxx011xxxxx001)

Bit	Reset	Description
31	DISABLED	STALL_READS_DURING_TIMING_UPDATE: [PMC] Disallow configuration reads during a timing update 0 = DISABLED 1 = ENABLED
30	ENABLED	STALL_WRITES_DURING_TIMING_UPDATE: [PMC] Disallow configuration writes during a timing update 0 = DISABLED 1 = ENABLED
29	ENABLED	LINKED_TIMING_UPDATE_TIMEOUT: [PMC] Set to ENABLED to have the linked timing update timeout after 16k emcclk's. When DISABLED the linked update can cause the EMC to hang if the timing update is not sent to both channels in dual channel operation 0 = DISABLED 1 = ENABLED
28	ENABLED	LINKED_TIMING_UPDATE: [PMC] Set to DISABLED to allow per-channel TIMING_UPDATE requests. Setting this DISABLED can cause ordering issue across the channels for the pad macro registers 0 = DISABLED 1 = ENABLED

Bit	Reset	Description
10:9	WRITTEN	UPDATE_DLL_IN_UPDATE: [PMC] When to allow a pad macro autocal update to be triggered from a manual timing update. NEVER means it is never allowed. WRITTEN means allow the update if a pad macro autocal was written since the previous update. ALWAYS means to always issue the autocal update. 0 = NEVER 1 = WRITTEN 2 = ALWAYS
8	ENABLED	UPDATE_DLL_IN_CLKCHANGE: [PMC] Allow a pad macro DLL update to be triggered during a clock change timing update 0 = DISABLED 1 = ENABLED
2:1	NEVER	UPDATE_AUTO_CAL_IN_UPDATE: [PMC] When to allow a pad macro autocal update to be triggered from a manual timing update. NEVER means it is never allowed. WRITTEN means allow the update if a pad macro autocal was written since the previous update. ALWAYS means to always issue the autocal update. 0 = NEVER 1 = WRITTEN 2 = ALWAYS
0	ENABLED	UPDATE_AUTO_CAL_IN_CLKCHANGE: [PMC] Allow a pad macro autocal update to be triggered during a clock change timing update 0 = DISABLED 1 = ENABLED

18.11.2.222 EMC_PMACRO_QUSE_DDLL_RANK0_0_0

Rank0 QUSE DDLL value for Byte0 and Byte1

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x600 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK0_BYTE1: [PMC] This should be programmed to QUSE trimmer value for rank0 byte1
10:0	0x0	QUSE_DDLL_RANK0_BYTE0: [PMC] This should be programmed to QUSE trimmer value for rank0 byte0

18.11.2.223 EMC_PMACRO_QUSE_DDLL_RANK0_1_0

Rank0 QUSE DDLL value for Byte2 and Byte3

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x604 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK0_BYTE3: [PMC] This should be programmed to QUSE trimmer value for rank0 byte3
10:0	0x0	QUSE_DDLL_RANK0_BYTE2: [PMC] This should be programmed to QUSE trimmer value for rank0 byte2

18.11.2.224 EMC_PMACRO_QUSE_DDLL_RANK0_2_0

Rank0 QUSE DDLL value for Byte4 and Byte5

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x608 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK0_BYTE5: [PMC] This should be programmed to QUSE trimmer value for rank0 byte5
10:0	0x0	QUSE_DDLL_RANK0_BYTE4: [PMC] This should be programmed to QUSE trimmer value for rank0 byte4

18.11.2.225 EMC_PMACRO_QUSE_DDLL_RANK0_3_0

Rank0 QUSE DDLL value for Byte6 and Byte7

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x60c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK0_BYTE7: [PMC] This should be programmed to QUSE trimmer value for rank0 byte7
10:0	0x0	QUSE_DDLL_RANK0_BYTE6: [PMC] This should be programmed to QUSE trimmer value for rank0 byte6

18.11.2.226 EMC_PMACRO_QUSE_DDLL_RANK0_4_0

Rank0 CMD DDLL value for cmd1 and cmd0

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x610 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK0_CMD1: [PMC] This should be programmed to QUSE trimmer value for rank0 cmd1
10:0	0x0	QUSE_DDLL_RANK0_CMD0: [PMC] This should be programmed to QUSE trimmer value for rank0 cmd0

18.11.2.227 EMC_PMACRO_QUSE_DDLL_RANK0_5_0

Rank0 CMD DDLL value for cmd2 and cmd3

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x614 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK0_CMD3: [PMC] This should be programmed to QUSE trimmer value for rank0 cmd3
10:0	0x0	QUSE_DDLL_RANK0_CMD2: [PMC] This should be programmed to QUSE trimmer value for rank0 cmd2

18.11.2.228 EMC_PMACRO_QUSE_DDLL_RANK1_0_0

Rank1 QUSE DDLL value for Byte0 and Byte1

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x620 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK1_BYTE1: [PMC] This should be programmed to QUSE trimmer value for rank1 byte1
10:0	0x0	QUSE_DDLL_RANK1_BYTE0: [PMC] This should be programmed to QUSE trimmer value for rank1 byte0

18.11.2.229 EMC_PMACRO_QUSE_DDLL_RANK1_1_0

Rank1 QUSE DDLL value for Byte2 and Byte3

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x624 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK1_BYTE3: [PMC] This should be programmed to QUSE trimmer value for RANK1 byte3
10:0	0x0	QUSE_DDLL_RANK1_BYTE2: [PMC] This should be programmed to QUSE trimmer value for RANK1 byte2

18.11.2.230 EMC_PMACRO_QUSE_DDLL_RANK1_2_0

Rank1 QUSE DDLL value for Byte4 and Byte5

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x628 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK1_BYTE5: [PMC] This should be programmed to QUSE trimmer value for RANK1 byte5
10:0	0x0	QUSE_DDLL_RANK1_BYTE4: [PMC] This should be programmed to QUSE trimmer value for RANK1 byte4

18.11.2.231 EMC_PMACRO_QUSE_DDLL_RANK1_3_0

Rank1 QUSE DDLL value for Byte6 and Byte7

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x62c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK1_BYTE7: [PMC] This should be programmed to QUSE trimmer value for RANK1 byte7
10:0	0x0	QUSE_DDLL_RANK1_BYTE6: [PMC] This should be programmed to QUSE trimmer value for RANK1 byte6

18.11.2.232 EMC_PMACRO_QUSE_DDLL_RANK1_4_0

Rank1 CMD DDLL value for cmd0 and cmd1

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x630 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK1_CMD1: [PMC] This should be programmed to QUSE trimmer value for RANK1 cmd1
10:0	0x0	QUSE_DDLL_RANK1_CMD0: [PMC] This should be programmed to QUSE trimmer value for RANK1 cmd0

18.11.2.233 EMC_PMACRO_QUSE_DDLL_RANK1_5_0

Rank1 CMD DDLL value for cmd2 and cmd3

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x634 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	QUSE_DDLL_RANK1_CMD3: [PMC] This should be programmed to QUSE trimmer value for RANK1 cmd3

Bit	Reset	Description
10:0	0x0	QUSE_DDLL_RANK1_CMD2: [PMC] This should be programmed to QUSE trimmer value for RANK1 cmd2

18.11.2.234 EMC_PMACRO_OB_DDLL_LONG_DQ_RANK0_0_0

Rank0 OB Long DQ DDLL value for Byte0 and Byte1

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x640 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description
26:16	0x0	OB_DDLL_LONG_DQ_RANK0_BYTE1: [PMC] This should be programmed to OB trimmer value for rank0 byte1
10:0	0x0	OB_DDLL_LONG_DQ_RANK0_BYTE0: [PMC] This should be programmed to OB trimmer value for rank0 byte0

18.11.2.235 EMC_PMACRO_OB_DDLL_LONG_DQ_RANK0_1_0

Rank0 OB Long DQ DDLL value for Byte2 and Byte3

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x644 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxx00000000000xxxxx00000000000)

Bit	Reset	Description

18.11.2.278 EMC_PMACRO_TX_PWRD_5_0

Clock gate register for unused TX bits in cmd2 and cmd3 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x734 | Read/Write: R/W | Reset: 0x00000000 (0bxx00000000000000xx00000000000000)

Bit	Reset	Description
29	0x0	CMD_TX_E_WKPD_CMD3: [PMC] Active high to enable weak pull down for CMD pin of CMD3 brick
28	0x0	CMD_TX_E_WKPU_CMD3: [PMC] Active high to enable weak pull up for CMD pin of CMD3 brick
27	0x0	CMD_TX_PWRD_CMD3: [PMC] This should be programmed to TX PWRD value for CMD pin of CMD3 brick
26	0x0	DQSN_TX_PWRD_CMD3: [PMC] This should be programmed to TX PWRD value for DQSN of CMD3

18.11.2.291 EMC_PMACRO_CMD_CTRL_2_0

DLL bypass and power down mode enables for CMD I/O

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x788 | Read/Write: R/W | Reset: 0x0a0a0a0a (0bxx001010xx001010xx001010xx001010)

18.11.2.374 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD0_2_0

Rank1 OB SHORT DQ DDLL value for pin8 of cmd0 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x988 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN8_CMD0: This should be programmed to TX fine trimmer value for pin8 of CMD0

18.11.2.375 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD0_3_0

Rank1 OB SHORT DQ DDLL value for pin9 to pin10 of cmd0 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x98c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxx0000000x0000000)

Bit	Reset	Description
14:8	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN10_CMD0: This should be programmed to TX fine trimmer value for pin10 of CMD0
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN9_CMD0: This should be programmed to TX fine trimmer value for pin9 of CMD0

18.11.2.376 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD1_0_0

Rank1 OB SHORT DQ DDLL value for pin0 to pin1 of cmd1 brick.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x990 | Read/Write: R/W | Reset: 0x00000000 (0bx0000000x0000000x0000000x0000000)

Bit	Reset	Description
30:24	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN3_CMD1: This should be programmed to TX fine trimmer value for pin3 of CMD1
22:16	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN2_CMD1: This should be programmed to TX fine trimmer value for pin2 of CMD1
14:8	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN1_CMD1: This should be programmed to TX fine trimmer value for pin1 of CMD1
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN0_CMD1: This should be programmed to TX fine trimmer value for pin0 of CMD1

18.11.2.377 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD1_1_0

Rank1 OB SHORT DQ DDLL value for pin4 to pin7 of cmd1 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x994 | Read/Write: R/W | Reset: 0x00000000 (0bx0000000x0000000x0000000x0000000)

Bit	Reset	Description
30:24	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN7_CMD1: This should be programmed to TX fine trimmer value for pin7 of CMD1
22:16	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN6_CMD1: This should be programmed to TX fine trimmer value for pin6 of CMD1
14:8	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN5_CMD1: This should be programmed to TX fine trimmer value for pin5 of CMD1
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN4_CMD1: This should be programmed to TX fine trimmer value for pin4 of CMD1

18.11.2.378 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD1_2_0

Rank1 OB SHORT DQ DDLL value for pin8 of cmd1 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x998 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN8_CMD1: This should be programmed to TX fine trimmer value for pin8 of CMD1

18.11.2.379 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD1_3_0

Rank1 OB SHORT DQ DDLL value for pin9 to pin10 of cmd1 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x99c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxx0000000x0000000)

Bit	Reset	Description
14:8	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN10_CMD1: This should be programmed to TX fine trimmer value for pin10 of CMD1
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN9_CMD1: This should be programmed to TX fine trimmer value for pin9 of CMD1

18.11.2.380 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD2_0_0

Rank1 OB SHORT DQ DDLL value for pin0 to pin1 of cmd2 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x9a0 | Read/Write: R/W | Reset: 0x00000000 (0bx0000000x0000000x0000000x0000000)

Bit	Reset	Description
30:24	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN3_CMD2: This should be programmed to TX fine trimmer value for pin3 of CMD2
22:16	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN2_CMD2: This should be programmed to TX fine trimmer value for pin2 of CMD2
14:8	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN1_CMD2: This should be programmed to TX fine trimmer value for pin1 of CMD2
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN0_CMD2: This should be programmed to TX fine trimmer value for pin0 of CMD2

18.11.2.381 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD2_1_0

Rank1 OB SHORT DQ DDLL value for pin4 to pin7 of cmd2 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x9a4 | Read/Write: R/W | Reset: 0x00000000 (0bx0000000x0000000x0000000x0000000)

Bit	Reset	Description
30:24	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN7_CMD2: This should be programmed to TX fine trimmer value for pin7 of CMD2
22:16	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN6_CMD2: This should be programmed to TX fine trimmer value for pin6 of CMD2
14:8	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN5_CMD2: This should be programmed to TX fine trimmer value for pin5 of CMD2
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN4_CMD2: This should be programmed to TX fine trimmer value for pin4 of CMD2

18.11.2.382 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD2_2_0

Rank1 OB SHORT DQ DDLL value for pin8 of cmd2 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x9a8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN8_CMD2: This should be programmed to TX fine trimmer value for pin8 of CMD2

18.11.2.383 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD2_3_0

Rank1 OB SHORT DQ DDLL value for pin9 to pin10 of cmd2 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x9ac | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxx0000000x0000000)

Bit	Reset	Description
14:8	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN10_CMD2: This should be programmed to TX fine trimmer value for pin10 of CMD2
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN9_CMD2: This should be programmed to TX fine trimmer value for pin9 of CMD2

18.11.2.384 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD3_0_0

Rank1 OB SHORT DQ DDLL value for pin0 to pin1 of cmd3 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x9b0 | Read/Write: R/W | Reset: 0x00000000 (0bx0000000x0000000x0000000x0000000)

Bit	Reset	Description
30:24	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN3_CMD3: This should be programmed to TX fine trimmer value for pin3 of CMD3
22:16	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN2_CMD3: This should be programmed to TX fine trimmer value for pin2 of CMD3
14:8	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN1_CMD3: This should be programmed to TX fine trimmer value for pin1 of CMD3
6:0	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN0_CMD3: This should be programmed to TX fine trimmer value for pin0 of CMD3

18.11.2.385 EMC_PMACRO_OB_DDLL_SHORT_DQ_RANK1_CMD3_1_0

Rank1 OB SHORT DQ DDLL value for pin4 to pin7 of cmd3 brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x9b4 | Read/Write: R/W | Reset: 0x00000000 (0bx0000000x0000000x0000000x0000000)

Bit	Reset	Description
30:24	0x0	OB_DDLL_SHORT_DQ_RANK1_PIN7_CMD3: This should be programmed to TX fine trimmer value for pin7 of CMD3

5:0	0x1f	DQ_RX_DRVUP_TERM: [PMC] RX pull-up termination strength code for DQ.

18.11.2.482 EMC_PMACRO_CMD_TX_DRV_0

Transmit drive strength control reg for CMD pad in DQ/CA brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xc4c | Read/Write: R/W | Reset: 0x00001f1f (0bxxxxxxxxxxxxxxxxxxxx011111xx011111)

Bit	Reset	Description
13:8	0x1f	CMD_TX_DRVDN: [PMC] TX pull-down drive strength code for CMD.
5:0	0x1f	CMD_TX_DRVUP: [PMC] TX pull-up drive strength code for CMD.

18.11.2.483 EMC_PMACRO_CMD_PAD_RX_CTRL_0

Receiver mode control for cmd pad

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xc50 | Read/Write: R/W | Reset: 0x00008000 (0bxxx00000x00000001000x000xx00x000)

Bit	Reset	Description
28:24	0x0	CMD_DQ_RX_CTRL: [PMC] Active high for differential amplifier to adjust bias current
22	0x0	CMD_RX_E_DIRECT_ZI: [PMC]
21	0x0	CMD_RX_E_IBIAS_PWRD: [PMC]
20:16	0x0	CMD_DQS_RX_CTRL: [PMC] Active high for differential amplifier to adjust bias current
15	0x1	CMD_EINPUT_FORCE_ON: [PMC] Active high for enabling the static einput -- enable at reset to clear QUSE serializer flops in BRICK
14	0x0	CMD_DQ_RX_E_RDIV: [PMC] Active high for differential amplifier to enable resistor divider
13	0x0	CMD_DQ_RX_E_DAMP_DFE: [PMC] Active high to enable RX differential amplify DFE Circuit
12	0x0	CMD_DQS_RX_E_DIFF_MODE: [PMC] Enable strobe RX in differential mode; 10ns latency for mode switch. 1 = IOP-ION, 0 = IOP-VREF
10:8	0x0	CMD_DQ_RX_DAMP_DFE_CTRL: [PMC] Selection for different DFE modes.
5:4	0x0	CMD_DQS_RX_MODE: [PMC] Set front-end RX type. 00: Schmitt common mode @ 50% of VDDP, 10: DAMP common mode @ 50% of VDDP, 11: DAMP (Differential Amplifier) common mode @ 16.67% 0 = DQS_SCHMITT 1 = RESERVED 2 = DQS_DIFF_MODE_50 3 = DQS_DIFF_MODE_15

18.11.2.485 EMC_PMACRO_CMD_RX_TERM_MODE_0

Receiver termination mode control for cmd pad

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xc58 | Read/Write: R/W | Reset: 0x00002000 (0bxxxxxxxxxxxxxxxxxx10xx00xx00xx00)

Bit	Reset	Description
13	0x1	CMD_E_PWRD_RX: [PMC] Active High to disable RX DC current paths within entire brick cell (for outbound only IOBRICKs).
12	0x0	CMD_DDLL_QU_SEL_M2CLK: [PMC] Select clock for QUSE DDLL. 0 = QUSE_IN for DQBRICK, 1 = M2CLKP/N for ADBRICK
9:8	0x0	CMD_DQSN_RX_TERM_MODE: [PMC] 10 = Enable pull up termination for RX, 11= Enable Center Tap Termination for RX
5:4	0x0	CMD_DQSP_RX_TERM_MODE: [PMC] 00 = HIZ, 01 = Enable pull down termination for RX
1:0	0x0	CMD_DQ_RX_TERM_MODE: [PMC] Enable Driver as receiver ODT or CTT termination.

18.11.2.486 EMC_PMACRO_DATA_RX_TERM_MODE_0

Receiver termination mode control for data pad

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xc5c | Read/Write: R/W | Reset: 0x00002000 (0bxxxxxxxxxxxxxxxxxx10xx00xx00xx00)

Bit	Reset	Description
13	0x1	DATA_E_PWRD_RX: [PMC] Active High to disable RX DC current paths within entire brick cell (for outbound only IOBRICKs).
12	0x0	DATA_DDLL_QU_SEL_M2CLK: [PMC] Select clock for QUSE DDLL. 0 = QUSE_IN for DQBRICK, 1 = M2CLKP/N for ADBRICK

18.11.2.489 EMC_PMACRO_COMMON_PAD_TX_CTRL_0

OB control for Bricks

Offset: 0xc68 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1111)

Bit	Reset	Description
3	0x1	CMD_DQS_TX_BPSDYNEN: [PMC]
2	0x1	CMD_DQ_TX_BPSDYNEN: [PMC]
1	0x1	DATA_DQS_TX_BPSDYNEN: [PMC]
0	0x1	DATA_DQ_TX_BPSDYNEN: [PMC]

18.11.2.490 EMC_PMACRO_DQ_TX_DRV_0

Transmit drive strength control register for DQ brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xc70 | Read/Write: R/W | Reset: 0x1f1f1f1f (0bxx011111xx011111xx011111xx011111)

Bit	Reset	Description
29:24	0x1f	DATA_DQS_TX_DRVDN: [PMC] TX pull-down drive strength code for DQS.
21:16	0x1f	DATA_DQS_TX_DRVUP: [PMC] TX pull-up drive strength code for DQS.
13:8	0x1f	DATA_DQ_TX_DRVDN: [PMC] TX pull-down drive strength code for DQ.
5:0	0x1f	DATA_DQ_TX_DRVUP: [PMC] TX pull-up drive strength code for DQ.

18.11.2.491 EMC_PMACRO_CA_TX_DRV_0

Transmit drive strength control register for CA brick

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xc74 | Read/Write: R/W | Reset: 0x1f1f1f1f (0bxx011111xx011111xx011111xx011111)

Bit	Reset	Description
29:24	0x1f	CMD_DQS_TX_DRVDN: [PMC] TX pull-down drive strength code for CK.
21:16	0x1f	CMD_DQS_TX_DRVUP: [PMC] TX pull-up drive strength code for CK.
13:8	0x1f	CMD_DQ_TX_DRVDN: [PMC] TX pull-down drive strength code for CA.
5:0	0x1f	CMD_DQ_TX_DRVUP: [PMC] TX pull-up drive strength code for CA.

18.11.2.492 EMC_PMACRO_AUTOCAL_CFG_COMMON_0

Autocal padmacro register for controls that are shared across all IOBRICKs

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xc78 | Read/Write: R/W | Reset: 0x00000810 (0bxxxxxxxxxxxxxxxx0xx001000xx010000)

Bit	Reset	Description
16	DISABLE	E_CAL_BYPASS_DVFS: [PMC] If enabled, asserts E_CAL_BYPASS for all pad macros. To be used during DVFS only 0 = DISABLE 1 = ENABLE
13:8	0x8	E_CAL_UPDATE_HIGH: [PMC] Number of EMC clocks for which E_CAL_UPDATE pulse is asserted for CK pad
5:0	0x10	E_CAL_UPDATE_DELAY: [PMC] Wait time in EMC clock cycles between CK pad cal code change and E_CAL_UPDATE assertion

18.11.2.493 EMC_PMACRO_DDLLCAL_CAL_0

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

DDLLCAL_CAL is used by the DDLL master to communicate the calibration value to the DDLL slaves

Offset: 0xce0 | Read/Write: R/W | Reset: 0x00000040 (0bxxxxxxxxxxxxxxxxxxxxxx00001000000)

Bit	Reset	Description
10:0	0x40	DDLLCAL_CAL: DDLL Calibration value (how many trimmer taps == 1ui)

18.11.2.494 EMC_PMACRO_DDLL_OFFSET_0

DDLL_OFFSET is used to verify margins of the trained DDLL values.

Offset: 0xce4 | Read/Write: R/W | Reset: 0x00000000 (0bxxx000000000xxx000000000xx000000)

Bit	Reset	Description
28	0x0	CMD_DDLL_OFFSET_BYTE_QU_EN: Enable DDLL offset
27	0x0	CMD_DDLL_OFFSET_BYTE_RXDQS_EN: Enable DDLL offset
26	0x0	CMD_DDLL_OFFSET_BYTE_TXCMD_EN: Enable DDLL offset
25	0x0	CMD_DDLL_OFFSET_BYTE_TXDQS_EN: Enable DDLL offset
24	0x0	CMD_DDLL_OFFSET_BYTE_TXDQ_EN: Enable DDLL offset
23	0x0	CMD_DDLL_OFFSET_BIT_RXDQ_EN: Enable DDLL offset

8	0x0	DATA_DDLL_PERIODIC_OFFSET_BIT_TXDQ_EN: Enable DDLL offset
5:0	0x0	DDLL_PERIODIC_OFFSET: Signed Offset to apply to each DDLL

18.11.2.496 EMC_PMACRO_VTTGEN_CTRL_2_0

VTTGEN control register

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xcf0 | Read/Write: R/W | Reset: 0x00100404 (0bxxxxxxxx00010000000010000000100)

Bit	Reset	Description
23:16	0x10	VTT_VDDA_LOAD: [PMC]
15:8	0x4	VTT_VAUXP_LOAD: [PMC]
7:0	0x4	VTT_VCLAMP_LOAD: [PMC]

18.11.2.497 EMC_PMACRO_IB_RXRT_0

IB DQ Receive path retiming for Byte0 to Byte3

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xcf4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxx00000000000)

Bit	Reset	Description
10:0	0x0	IB_RXRT: [PMC] This should be programmed to IB DQ Receive path retiming

18.11.2.498 EMC_PMACRO_TRAINING_CTRL_0_0

Used by training engine to configuration pad macros for Channel 0

Offset: 0xcf8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	CH0_TRAINING_DRV_DQS: When training is enabled, force the DQS_t and DQS_c drivers on
3	0x0	CH0_TRAINING_E_WRPTR: Enables direct return of the ififo wrptr as read data if training is enabled
2	0x0	CH0_TRAINING_RX_E_DIRECT_ZI: Training override for the RX_E_DIRECT_ZI pin of the pad
1	0x0	CH0_TRAINING_TRAIN_QPOP: Set to 1 when training QPOP
0	0x0	CH0_TRAINING_ENABLED: Indicates training is enabled for this channel

18.11.2.499 EMC_PMACRO_TRAINING_CTRL_1_0

Used by training engine to configuration pad macros for Channel 1

Offset: 0xcfc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	CH1_TRAINING_DRV_DQS: When training is enabled, force the DQS_t and DQS_c drivers on
3	0x0	CH1_TRAINING_E_WRPTR: Enables direct return of the ififo wrptr as read data if training is enabled
2	0x0	CH1_TRAINING_RX_E_DIRECT_ZI: Training override for the RX_E_DIRECT_ZI pin of the pad
1	0x0	CH1_TRAINING_TRAIN_QPOP: Set to 1 when training QPOP
0	0x0	CH1_TRAINING_ENABLED: Indicates training is enabled for this channel

18.11.2.500 EMC_TRAINING_CMD_0

Main register for launching training

Offset: 0xe00 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxxxxxxxxx000000000)

Bit	Reset	Description
31	DISABLED	GO: Start the Training. Training will automatically stop. This bit is cleared by hardware when Training is done. Refer to the Training status register definition. 0 = DISABLED 1 = ENABLED
30	DISABLED	PERIODIC: Start the periodic Training 0 = DISABLED 1 = ENABLED
8	DISABLED	QUSE_VREF:Initiates DQS_VREF Training 0 = DISABLED 1 = ENABLED
7	DISABLED	RD_VREF:Initiates IB_DQ_VREF Training 0 = DISABLED 1 = ENABLED
6	DISABLED	WR_VREF:Initiates OB (wrire) DRAM_VREF Training 0 = DISABLED 1 = ENABLED

Bit	Reset	Description
5	DISABLED	CA_VREF:Initiates CA_VREF Training 0 = DISABLED 1 = ENABLED
4	DISABLED	QUSE:Initiates QUSE Training 0 = DISABLED 1 = ENABLED
3	DISABLED	WR:Initiates WR Training 0 = DISABLED 1 = ENABLED
2	DISABLED	RD:Initiates RD Training 0 = DISABLED 1 = ENABLED
1	DISABLED	CA:Initiates CA Training 0 = DISABLED 1 = ENABLED
0	DISABLED	PRIME:Writes the custom pattern into MPC register 0 = DISABLED 1 = ENABLED

18.11.2.501 EMC_TRAINING_CTRL_0

MISC controls for training configuration

Offset: 0xe04 | Read/Write: R/W | Reset: 0x00009080 (0bxxxxxxxxxxxxxxxx01001000010000000)

Bit	Reset	Description
16	DISABLED	FORCE_DR_TO_SR:When config is dual rank - only RANK0 will be swept and Training engine will stop and not do RANK1 sweep. 0 = DISABLED 1 = ENABLED
15	ENABLED	TR_IN_SELF_REFRESH:Selects if Training is done in self refresh 0 = DISABLED 1 = ENABLED

14	RANK0	SWAP_RANK:FORCE_DR_TO_SR is set - denotes - which rank should be trained. If FORCE_DR_TO_SR = 0 for dual rank - Denotes the order in which ranks will be trained //if RANK0 : RANK0_followed_by_RANK1. if RANK1 - RANK1_Followed_by_RANK0.
		0 = RANK0
		1 = RANK1

13	DISABLED	UPDATE_QUSE_RD_TR:Selects if QUSE PRIV needs to be updated during read training. 0 = DISABLED 1 = ENABLED
12	IFIFO_WRPTR	QUSE_MODE: Selects between expect Actual read data or IFIFO WRPTR for QUSE Training read returns 0 = READ_DATA 1 = IFIFO_WRPTR
11:4	0x8	IFIFO_WRPTR: Expected WRPTR value for expected read_data in QUSE Training when RPT mode is unavailable in DRAM
3	DISABLED	RPT_MODE: Indicates read preamble training mode is available in DRAM. 0 = DISABLED 1 = ENABLED
2	DISABLED	REFRESH_CA:allows refreshes in CA Training 0 = DISABLED 1 = ENABLED
1	DISABLED	REFRESH:allows refreshes in all Training but CA Training. 0 = DISABLED 1 = ENABLED
0	DISABLED	ASYNC_UPDATES: This bit must be disabled. 0 = DISABLED 1 = ENABLED

18.11.2.502 EMC_TRAINING_STATUS_0

Read back for Training status

Offset: 0xe08 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
1:0	X	STATUS:Writes 0 = DONE 1 = RUNNING 2 = ERROR

18.11.2.503 EMC_TRAINING_QUSE_CORS_CTRL_0

Controls for QUSE TRainings cors sweep

Offset: 0xe0c | Read/Write: R/W | Reset: 0x0111e000 (0bxxx000010001x001111000x000000000)

Bit	Reset	Description
28	ZERO	STEP_LN_SIZE: 0 = ZERO 1 = ONE
27:24	ONE	STEP_LN: 0 = ZERO 1 = ONE
23:20	ONE	STEP: 0 = ZERO 1 = ONE
18:10	PROD	MAXIMUM: 120 = PROD
8:0	ZERO	MIMIMUM: 0 = ZERO

18.11.2.504 EMC_TRAINING_QUSE_FINE_CTRL_0

Controls for QUSE Trainings fine sweep

Offset: 0xe10 | Read/Write: R/W | Reset: 0x1110ffc1 (0bxxx10001000100001111111111000001)

Bit	Reset	Description
28	ONE	STEP_LN_SIZE: 0 = ZERO 1 = ONE
27:24	ONE	STEP_LN: 0 = ZERO 1 = ONE
23:20	ONE	STEP: 0 = ZERO 1 = ONE
19:10	PLUS_63	MAXIMIM: 2's complement 63 = PLUS_63
9:0	MINUS_63	MIMIMUM:2's complement 961 = MINUS_63

18.11.2.505 EMC_TRAINING_QUSE_CTRL_MISC_0

MISC Controls for QUSE Training

Offset: 0xe14 | Read/Write: R/W | Reset: 0x15081000 (0b00010101000010000001000000000000)

Bit	Reset	Description
31:24	0x15	PATRAM_MAX:End index in patram. Program as PATRAM_MIN + (2* BURST_COUNT)-1

Bit	Reset	Description
23:16	0x8	PATRAM_MIN:Starting index in patram
15:14	BYTE	LEVEL:Selects between byte vs bit level training style 0 = BYTE 1 = BIT
13:12	MPC	PATTERN:Selects between MPC register or training FIFO 0 = FIFO 1 = MPC
11:8	ONE	BURST_COUNT:Number of reads in each STEP_LN. Number of reads each step_ln = BURST_COUNT + 1 0 = ONE 1 = TWO 2 = THREE 3 = FOUR

18.11.2.519 EMC_TRAINING_MPC_0

16-bit data for MPC-RD registers. DRAM stores this information in MR32 and MR40. 16-bit invert pattern for DQ. DRAM stores this information in MR12 and MR15. When using Default MPC pattern for read/Quse - Write this register with default pattern. when using custom pattern for readquse - Write this register along with MR32, MR40, M15, M20. Writing to this register triggers an automated patram initialization of some pf the patram location. Pointed by QUSE_MISC_PATRAM_MIN/MAX

Offset: 0xe5c | Read/Write: R/W | Reset: 0x05053c5a (0b00000101000001010011110001011010)

Bit	Reset	Description
31:16	0x505	INVERT_PATTERN
15:0	0x3c5a	DATA

18.11.2.520 EMC_TRAINING_PATRAM_CTRL_0

Register to write pattern RAM

Offset: 0xe60 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxx0000xxxxxxxx00000000)

Bit	Reset	Description
31	0x0	WRITE:when write=1 - trigger a write into pattern RAM with data supplied by PATRAM_DATA_* registers
19:16	0x0	FORMAT
7:0	0x0	SELECT_OFFSET: locationt to write in pattern RAM

18.11.2.521 EMC_TRAINING_PATRAM_DQ_0

DQ data to write into pattern RAM

Offset: 0xe64 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	DATA: locationt to write in pattern RAM

18.11.2.522 EMC_TRAINING_PATRAM_DMI_0

DMI data to write into pattern RAM

Offset: 0xe68 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	DATA: locationt to write in pattern RAM

18.11.2.523 EMC_TRAINING_VREF_SETTLE_0

Controls for settle time for vref in MCCLK

Offset: 0xe6c | Read/Write: R/W | Reset: 0x000007d0 (0b00000000000000000000011111010000)

Bit	Reset	Description
31:16	0x0	OB: Settle time for WRITE/CA vrefs. From DRAM specification. CA/OB receiver settle time is 200ns with VRCG mode(MR13-bit3) enabled. With VRCG disabled 1us. Training engine does not implement this delay.
15:0	0x7d0	IB: Settle time for READ/QUSE vrefs. For circuit folks - AP's receiver vref settle time is 1us. Do not program PRIV_DELAY + VREF_SETTLE to be more than a 16b number. 16b number gives far more than required range.

18.11.2.524 EMC_TRAINING_OPT_CA_VREF_0

Read back for CA VREF optimal Vref results

Offset: 0xec0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:24	X	RANK1_SUB_PARTITION1:CA_VREF optimal for RANK1 SUB_PARTITION1 (16b) for each channel. For single rank readback is zero.
23:16	X	RANK1_SUB_PARTITION0:CA_VREF optimal for RANK1 SUB_PARTITION0 (16b) for each Channel. For single rank readback is zero.
15:8	X	RANK0_SUB_PARTITION1:CA_VREF optimal for RANK0 SUB_PARTITION1(16b) for each Channel
7:0	X	RANK0_SUB_PARTITION0:CA_VREF optimal for RANK0 SUB_PARTITION0(16b) for each Channel

18.11.2.525 EMC_TRAINING_OPT_DQ_OB_VREF_0

Read back for OB-DQ VREF optimal Vref results

Offset: 0xec4 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:24	X	RANK1_SUB_PARTITION1:DQ_OB_VREF optimal for RANK1 SUB_PARTITION1(16b) for each Channel. For single rank readback is zero.
23:16	X	RANK1_SUB_PARTITION0:DQ_OB_VREF optimal for RANK1 SUB_PARTITION0(16b) for each Channel. For single rank readback is zero.
15:8	X	RANK0_SUB_PARTITION1:DQ_OB_VREF optimal for RANK0 SUB_PARTITION1(16b) for each Channel
7:0	X	RANK0_SUB_PARTITION0:DQ_OB_VREF optimal for RANK0 SUB_PARTITION0(16b) for each Channel

18.11.2.526 EMC_TRAINING_QUSE_VREF_CTRL_0

Controls for Read-DQS-Vref trainings sweep.

CHAPTER 19: AHB

19.1 AHB Bus

The AHB Bus conforms to the *AMBA® Specification (Rev 2.0) Advanced High-performance Bus (AHB)* architecture as published by ARM.

AHB is a 32-bit multi-master bus. Despite what its name implies, it is a second tier bus in the Tegra® X1 processor, slower and less flexible than the AXI bus used by the CPU, or the memory client interface used by the high-speed devices.

The Master clients on the AHB are:

- The AHB memory controller slave, which is the interface between the AHB bus and the Memory Controller
- The BPMP-Lite crossbar, both as a master and as a slave. This is the path to IRAM from AHB devices, and also the BPMP-Lite and CPU path to AHB devices. Neither the CPU complex nor the BPMP-Lite can access DRAM through this path.
- The APB DMA controller, used to provide data transfer between APB devices and memory
- The USB-OTG controller
- ARC controller
- The security engine (SE), both as a master and as a slave
- The deprecated AHB DMA controller master
- USB2 controllers

The Slave clients on the AHB are:

- XBAR
- DRAM
- USB-OTG, USB2
- TZRAM

AHB in the Tegra X1 processor supports secure access to memory, using the same secure bit mechanism used by the CPU TrustZone® security mechanism. This is supported by the SE, which can make secure accesses to memory.

19.2 AHB Bus Arbiter

The AHB Arbiter controls AHB bus master arbitration. This effectively forms a second level of arbitration for access to the memory controller through the AHB Slave Memory device, although AHB masters in some circumstances can use other AHB slaves, in particular they can access IRAM.

The controls presented here are largely for diagnostic purposes only. For suspect AHB performance problems, try disabling the other masters for the device with performance issues. In normal operation bus parking is usually enabled, and all the masters are enabled.

Also see the AHB slave interface registers, where the AHB pre-fetch logic can be configured to enhance performance for devices doing sequential read access from DRAM.

Each AHB master is assigned to either the high or low priority bin.

19.2.1 Arbitration Scheme

In every AHB Arbitration cycle, it is first decided whether a request from the high or low priority bin will be served. If there are only requests active for one of the bins, then that bin is served. When there are active requests from both bins, then the value from the AHB_PRIORITY_WEIGHT field is considered. There is a counter that is loaded with the AHB_PRIORITY_WEIGHT whenever the current count is 0 and someone wins an AHB arbitration. This counter is decremented anytime the count is nonzero and the winner of AHB arbitration was from the high-priority bin. Whenever this counter is nonzero, then a high-priority bin request will win over any low-priority bin request. In a system where both high- and low- priority bin requests are constantly active, the AHB_PRIORITY_WEIGHT says how many high-priority requests will be served for every one low-priority request.

Within each bin, the arbitration algorithm is round robin. For example, after AHB Master 2 wins an arbitration, then Master 3 has precedence for winning the next (followed by Master 4, etc. while Master 2 is last). The AHB Master ID can be seen in the enumeration of AHB_MEM_PREFETCH_CFG* registers' AHB_MST_ID field.

19.2.2 AHB Arbiter Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

In prior generation Tegra processors, this location used to hold a configuration register for COP_CACHE, but COP_CACHE has been replaced with AVP_CACHE, which has a region in a different section. For software compatibility, this location is reserved.

19.2.2.1 AHB_ARBITRATION_DISABLE_0

The AHB arbitration control register allows user to tweak arbitration behavior of the AHB arbiter.

- Enable bus parking. This keeps the last serviced AHB master on the bus granted so that it can start another transaction faster. If bus parking is disabled, no AHB master will be able to start a new transaction until the arbitration is done and the master is granted the bus.
- Allows the user to specifically disable an AHB master from arbitrating on the AHB bus.

AHB Arbitration Controller

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxx0x000xxxxx00000x00)

Bit	Reset	Description
31	0x0	DIS_BUS_PARK: 1 = Disable bus parking. 0 = ENABLE 1 = DISABLE
30	0x0	DIS_PENULTIMATE_ARB: 1 = Disable arbitration on the second to last transfer.
18	0x0	USB2: 1 = Disable USB2 from arbitration. 0 = ENABLE 1 = DISABLE
14	0x0	SE: 1 = Disable SE from arbitration. 0 = ENABLE 1 = DISABLE
7	0x0	APBDMA: 1 = Disable APB-DMA from arbitration. 0 = ENABLE 1 = DISABLE
6	0x0	USB: 1 = Disable USB from arbitration. 0 = ENABLE 1 = DISABLE
4	0x0	ARC: 1 = Disable ARC from arbitration. 0 = ENABLE 1 = DISABLE
1	0x0	COP: 1 = Disable COP from arbitration. 0 = ENABLE 1 = DISABLE

Bit	Reset	Description
0	0x0	CPU: 1 = Disable CPU from arbitration. 0 = ENABLE 1 = DISABLE

19.2.2.2 AHB_ARBITRATION_PRIORITY_CTRL_0

The AHB arbiter implements a 2-level priority scheme. In the first level, arbitration is determined between the high and low priority group according to the priority weight; the higher the weight, the higher the winning rate of the high priority group.

In the second level, within each of the high/low priority group, arbitration is determined in a round-robin fashion.

AHB Arbitration Priority Control Register

Offset: 0x8 | Read/Write: R/W | Reset: 0xe0000000 (0b11100000000000000000000000000000)

Bit	Reset	Description
31:29	0x7	AHB_PRIORITY_WEIGHT: AHB priority weight count. This 3-bit field is used to control the amount of attention (weight) given to the high priority group before switching to the low priority group.
28:0	0x0	AHB_PRIORITY_SELECT: 0 = low priority group.

19.2.2.3 AHB_ARBITRATION_USR_PROTECT_0

USR Protection Register

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000x0000)

Bit	Reset	Description
8	0x0	CACHE: Abort on USR mode access to Cache memory space 0 = ABT_DIS 1 = ABT_EN
7	0x0	ROM: Abort on USR mode access to internal ROM memory space 0 = ABT_DIS 1 = ABT_EN
6	0x0	APB: Abort on USR mode access to APB memory space 0 = ABT_DIS 1 = ABT_EN
5	0x0	AHB: Abort on USR mode access to AHB memory space 0 = ABT_DIS 1 = ABT_EN
3	0x0	IRAMD: Abort on USR mode access to iRAMd memory space 0 = ABT_DIS 1 = ABT_EN
2	0x0	IRAMC: Abort on USR mode access to iRAMc memory space 0 = ABT_DIS 1 = ABT_EN
1	0x0	IRAMB: Abort on USR mode access to iRAMb memory space 0 = ABT_DIS 1 = ABT_EN
0	0x0	IRAMA: Abort on USR mode access to iRAMa memory space 0 = ABT_DIS 1 = ABT_EN

19.3 AHB “Gizmo”

AHB master/slave gizmos are essentially hardware layers used by many of the master/slave logic which need to connect to the AHB bus.

These hardware layers handle all the AHB bus protocols and convert the more complex AHB protocol into a much simpler IP interface/handshake.

Because the AHB master/slave gizmos interface with many IP logic with different characteristics varying in speed, latency, etc., the gizmos accept a number of static configuration bits. Depending on system speed, latency requirement, transfer direction, burst characteristic, etc., these static configuration bits can be pre-configured to give extra performance or improve bus efficiency.

19.3.1 AHB Gizmo Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

19.3.1.1 AHB_GIZMO_AHB_MEM_0

AHB Master/Slave Gizmo Register

Given below is a description of each configuration field, what they are used for and the pros and cons of using them.

> ***Note:*** *These configuration bits are meant to be changed only when the particular gizmo you want to change is idle (not being used). Changing the configuration bits on-the-fly while that gizmo is active can hang the system.*

AHB gizmo configuration bit definition:

(1) AHB Master Gizmo

1. MAX_AHB_BURSTSIZE: Controls the maximum burst size that this gizmo can generate on the AHB bus. For the current system, this field should be set to burst-of-8.
2. IMMEDIATE: Controls how quickly an AHB write request on the bus can start.
   - If 1, the gizmo will start an AHB write request once the IP side provides one beat of data of a burst. For IP that can provide quick continuous burst data, this setting provides parallelism between AHB request and IP data transfer. However, for IP that cannot provide quick burst data, this setting will force this gizmo to hold the AHB bus longer, reducing bus efficiency.
   - If 0, gizmo will wait until all beats of data of a burst are provided before starting an AHB write request. With this setting, AHB bus efficiency is realized but IP latency and efficiency may be reduced.
3. RD_DATA: Controls how read data will be returned from the gizmo to the IP side.
   - If 1, all beats of data of a burst have to be available before it indicates to the IP logic that read data is ready. This setting ensures there is no wait-state (bubble) between read data burst, but it will increase latency.
   - If 0, each beat of data of a burst will be sent from gizmo to the IP logic immediately. This setting will reduce latency, but can create non-consecutive data burst or bubble between data.
4. REQ_NEG_CNT: Provides a way to limit (in terms of number of AHB bus clock) how fast/often this master can request the AHB bus. The bigger the number, the slower the rate of AHB request.

(2) AHB Slave Gizmo

1. ENABLE_SPLIT: Controls enabling the split feature of the AHB bus.
   - If 1, the gizmo will always generate split response for a read. If 'DONT_SPLIT_AHB_WR' is set to 0, gizmo also generates split response if it can no longer accept a write request from the AHB master. This setting can increase AHB bus utilization since it allows other AHB masters to talk to other AHB slaves while this original AHB slave is fetching read data. However, the flip side is that it takes longer time for the original AHB master to get the read data, because the original AHB master has to re-arbitrate for the AHB bus again to get to the data it asked for.
   - If 0, the gizmo will not generate split response. Instead, it will hold on to the AHB bus until all the requested read data is returned back to the AHB master. This setting will reduce read latency to the master, but decrease AHB bus utilization.
2. FORCE_TO_AHB_SINGLE: Controls how the gizmo treats the AHB master's burst request.
   - If 1, the gizmo will break up the burst request internally into individual single word requests.

- If 0, the gizmo will burst request internally as burst request.

3. ENB_FAST_REARBITRATE: Controls when the gizmo can allow the original read requested AHB master to re-arbitrate for the AHB bus again so the AHB master can retrieve the originally requested read data.
   - If 1, once first read data of a burst is in the slave gizmo's FIFO, it will allow the original AHB master to re-arbitrate, thus, allowing arbitration to happen in parallel with subsequent read data of a burst. However, if the data burst has wait-states or bubbles, then this setting will decrease AHB bus utilization because the slave gizmo will hold on to the AHB bus longer.
   - If 0, all read data of a burst must be in the slave gizmo's FIFO before it allows the original AHB master to re-arbitrate to retrieve the read data. This increases read data latency, and also increase AHB bus utilization.
4. IP_WR_REQ_IMMEDIATE: Controls when the gizmo will start write data request to the IP logic.
   - If 1, the gizmo will start write request to the IP logic once it gets one write data of a burst from the AHB side. This setting will create non-consecutive/bubbles in a write data burst.
   - If 0, the gizmo will start write request to the IP logic only when it gets all write data of a burst from the AHB side. This setting will create consecutive data burst (no bubbles or wait-states).
5. MAX_IP_BURSTSIZE: Controls the maximum burst size that this gizmo can generate to the IP logic.
6. ACCEPT_AHB_WR_ALWAYS: Controls how the slave gizmo will treat AHB write request.
   - If 1, the gizmo will always accept a write request without checking whether it's FIFOs can accept the write or not. This setting can reduce bus utilization, but can reduce the rate of AHB retry.
   - If 0, the gizmo will check its FIFOs to make sure they have room before accepting the AHB write request. This setting increase bus utilization, but can create a lot of AHB retry.
7. DONT_SPLIT_AHB_WR: Controls whether to split AHB write request when the slave gizmo determines it cannot accept the write request.
   - If 1 and when ENABLE_SPLIT=1, the gizmo will generate split for write if its FIFOs are not ready to accept the AHB write request or data. This setting can improve AHB bus utilization as there are no continuous AHB master retries on the bus.
   - If 0, the gizmo will generate retry response for write if its FIFOs are not ready to accept the AHB write request. Software should leave this bit at 0 since this feature has not been proven.

AHB Gizmo AHB-DMA/Memory Control Register

Offset: 0x10 | Read/Write: R/W | Reset: 0x00020385 (0b00000000xxxxx010xxxxxx1110xxx101)

Bit	Reset	SW Default	Description
31:24	0x0	NONE	REQ_NEG_CNT: AHB master request negate count. This is an 8-bit counter used to indicate the minimum number of clock counts between requests from this AHB master.
18	0x0	NONE	IMMEDIATE: AHB master gizmo (AHB-DMA) – Start AHB write request immediately 1 = Start the AHB write request immediately as soon as the device has put one write data in the AHB gizmos queue. 0 = Start the AHB write request only when all the write data has transferred from the device to the AHB gizmos queue. 0 = DISABLE 1 = ENABLE
17:16	0x2	NONE	MAX_AHB_BURSTSIZE: AHB master gizmo (AHB-DMA) – Maximum allowed AHB burst size. 00 = Single transfer 01 = Burst-of-4 10 = Burst-of-8 11 = Burst-of-16 0 = DMA_BURST_1WORDS 1 = DMA_BURST_4WORDS 2 = DMA_BURST_8WORDS 3 = DMA_BURST_16WORDS

Bit	Reset	SW Default	Description
9	0x1	ENABLE	EN_USB_WAIT_COMMIT_ON_XK_STALL: Enabling this register and enabling WR_WAIT_COMMIT_ON_XK causes MC requests to be stalled when the current request from the USB is in a different XKB block with respect to the previous USB request. Note that XK = 4K for Tegra X1 devices. 0 = DISABLE 1 = ENABLE
8	0x1	ENABLE	WR_WAIT_COMMIT_ON_XK: Writes to ahbslv will only be issued to the MC when all prior writes in different XKB pages have reached the point of coherency. This is needed because the MC allows re-ordering of transactions. If this is not set, an entity which polls memory for a descriptor or flag to indicate some other memory has been written, may think something is available in memory when it is not. Note that XK = 4K for Tegra X1 devices. 0 = DISABLE 1 = ENABLE
7	0x1	NONE	DONT_SPLIT_AHB_WR: AHB slave gizmo (memory controller) – Do not split AHB write transaction 1 = Do not split AHB write transaction ever. 0 (and enable_split=1) = Allow AHB write transaction to be split. 0 = ENABLE 1 = DISABLE
6	0x0	NONE	ACCEPT_AHB_WR_ALWAYS: AHB slave gizmo (memory controller) - Accept AHB write request always. 1= Always accept AHB write request without checking whether there is room in the queue to store the write data. Bypass Memory Controller AHB slave gizmo write queue. 0 = Accept AHB write request only when there is enough room in the queue to store all the write data. Memory controller AHB slave gizmos write queue is used in this case. 0 = ACCEPT_ON_CHECK 1 = ACCEPT_ON_NOCHECK
2	0x1	ENABLE	ENB_FAST_REARBITRATE: AHB slave gizmo - Enable fast re-arbitration. 1 = Allow AHB master re-arbitration as soon as the device returns one read data into the gizmos queue. 0 = Allow AHB master re-arbitration only when the device returns all read data into the gizmos queue. 0 = DISABLE 1 = ENABLE
1	0x0	NONE	FORCE_TO_AHB_SINGLE: AHB slave gizmo (memory controller) - Force all AHB transaction to single data request transaction 1 = Force to single data transaction always. 0 = Do not force to single data transaction. 0 = NOT_SINGLE_DATA 1 = SINGLE_DATA
0	0x1	NONE	ENABLE_SPLIT: AHB slave gizmo (memory controller) - Enable splitting AHB transaction. 0 = DISABLE 1 = ENABLE

19.3.1.2 AHB_GIZMO_APB_DMA_0

AHB Gizmo APB-DMA Control Register

Offset: 0x14 │ Read/Write: R/W │ Reset: 0x00020000 (0b00000000xxxxx010xxxxxxxxxxxxxxxx)

Bit	Reset	Description

19.4 AHB Memory Controller Slave

The AHB memory controller slave is the path used by AHB bus masters to access the Memory Controller. It provides access to DRAM from the AHB bus and can pre-fetch data.

19.4.1 AHB Memory Pre-Fetcher

The AHB memory controller slave contains a pre-fetcher block. This is intended to improve performance for AHB masters performing sequential reads from DRAM. Performance can be a problem because the AHB bus protocol only allows a single outstanding read request from a master, so the round trip latency limits bandwidth. As there are two level of arbitration, firstly on AHB and secondly within the memory controller, this latency can become large on a busy system.

There are eight such pre-fetchers, allowing this function to be active for up to eight AHB masters.

When the pre-fetcher is enabled, the first read request initiates a speculative read of up to 128 bytes, and subsequent linear reads will return the data directly to the AHB master without going through the memory controller to DRAM.

19.4.1.1 Pre-Fetch Invalidate

The pre-fetch buffer's contents are invalidated under any of the following conditions, in all cases a read refers to a DRAM read by the assigned AHB master:

- The programmed time-out value is reached since the last read
- A read occurs which is not sequential with the previous read
- A read occurs which is not the same size as the previous read, unless the corresponding DISABLE_CHECK_SIZE_MASTERx bit is set.

- A read occurs which is past the end of the pre-fetch buffer (this will trigger a new fill of the buffer).
- The pre-fetcher is disabled. A momentary disable and then re-enable can be used to invalidate the buffer.

19.4.1.2 Pre-Fetch Buffer Coherency

As the pre-fetch buffer contains a copy of data in DRAM, there is an inherent coherency risk if the DRAM data is updated. The hardware invalidation mechanisms provide some protection here, but there remains risk of subtle problems arising from this hardware. If an AHB master shows errors that appear to arise from stale data then a reasonable experiment is to disable the pre-fetcher to see if that cures the problem. If so, the following guidelines may help.

Problems have been seen for control structures such as USB Transfer Descriptors.

Two approaches can resolve this problem:

1. Pad the data

   As the pre-fetcher invalidates the buffer for any non-sequential read, placing some padding will prevent pre-fetch issues. A problem can be triggered by using something like this:

   ```
   struct dtd { unsigned HW_descriptor[K] ; } ; struct dtd dtd_array[N] ;
   ```

   This makes the hardware descriptors structures as read by the USB DMA sequential, and so pre-fetchable.
   If the definition is modified as:

   ```
   struct dtd { unsigned HW_descriptor[K] ; unsigned Padding ; } ; struct dtd dtd_array[N] ;
   ```

   Then reads by USB DMA of consecutive hardware descriptors become **not** sequential and so there is no coherency issue as the pre-fetch buffer will be invalidated.

2. Invalidate the pre-fetch buffer

   After updating a memory structure, the pre-fetch buffer can be invalidated by disabling the pre-fetcher and then immediately re-enabling it.

19.4.2 AHB Memory Controller Slave Registers

19.4.2.5 AHB_AHB_MEM_PREFETCH_CFG_X_0

If DISABLE_CHECK_SIZE is 0, then only read requests that have the exact same size as the original read request that kick-started the prefetch process will cause a "hit". In addition, the address must be the exact next one in the sequence.

For instance, if the first request on a prefetch-enabled AHB Master arrives with SIZE=ONE_BYTE and ADDR[31:0]=0x3, then the next access must have SIZE=ONE_BYTE and ADDR[31:0]=0x4 in order to be considered a hit.

If DISABLE_CHECK_SIZE is 1, then a read request will hit as long as the incoming ADDR[31:4]matches the expected_ADDR[31:4]. expected_ADDR[31:4] is always either "last ADDR[31:4]" or "last ADDR[31:4] + 1", where last ADDR is the prior read request actually issued by the AHB Master(as opposed to the last request to the CIF, which could have been a speculative read).

expected_ADDR[31:4] is always "last ADDR[31:4]" unless "SIZE" field in the last request uses the last byte in the 16-byte CIF word.

19.4.2.10 AHB_AHB_MEM_PREFETCH_CFG1_0

NV_ahbslvmem prefetch

The NV_ahbslvmem prefetch feature reduces latency and improves overall bandwidth for AHB Masters doing reads to SDRAM. AHB only allows one outstanding read transaction at a time. When enabled, and kick-started by a first read request (which will "miss" since there would be nothing in the prefetch FIFO) the prefetcher makes speculative read requests to the memory controller in consecutive progression of linear address. Without this feature, an AHB Master will suffer roundtrip latency through the gizmo, PPCS, CIF, MC arbitration, and all the read data passing for every AHB transaction.

Address Boundaries for prefetching will stop the sequential prefetch process from making additional speculations. This is useful to help prevent coherency issues -- software needs ways to stop the prefetcher from prefetching data before the data has been written in memory. If an AHB master can be known to make 256 byte transfers that are aligned accesses, ADDR_BNDRY should be set to a value of 4.

INACTIVITY_TIMEOUT is intended to prevent coherency problems. If no read request from the prefetch-enabled master is observed after the number of cycles specified in the inactivity timeout counter, then any speculatively prefetched read data is invalidated.

There are eight AHB masters that can be enabled for prefetching. Each prefetch buffer can hold up to 8 entries (of 128 bits each entry) of prefetched data.

0x6000_C0F0: ahbslv prefetch cfg1 --> reset value = 0x1483.0800.

19.4.2.20 AHB_AVPC_MCCIF_FIFOCTRL_0

Note: *The FIFO timing aspects of this register are no longer supported, but are retained for software compatibility.*

The clock override/ovr_mode fields of this register control the second-level clock gating for the client and MC sides of the MCCIF. All clock gating is enabled by default.

A '1' written to the rclk/wclk override field will result in one of the following:

- With wclk/rclk override mode = LEGACY, the clock reverts to legacy mode of operation where the clock is on whenever the client clock is enabled.
- With wclk/rclk override mode = ON, the clock is always on inside the MCCIF and PC

A '1' written to the CCLK override field keeps the client's clock always on inside the MCCIF.

CHAPTER 20: PIXEL MEMORY FORMAT

This document outlines the memory tiling formats that may be produced and consumed by interacting engines in Tegra® X1. This document also provides a description of the pixel formats that may be produced and consumed by interacting engines in Tegra X1.

20.1 Tiling Formats

Tegra X1 supports the memory tiling formats described below. Clients can support block linear formats and/or pitch linear formats. Refer to the description of each device for more details on the modes supported. Pitch linear client support is useful for clients that interact directly or indirectly with the CPU or that make horizontal (or linear) accesses to memory. Block linear is optimized for clients that access regions of pixels across more than one line.

Table 83: Client Shared Tiling Formats

Format	Status	Used for	Description
Pitch Linear	Supported by some clients	Software-compatibility, clients that linearly access memory	Simple array ordering
Block linear 16Bx2 with Tegra sector ordering	Supported by most clients	GPU color surfaces, clients that access memory in blocks or vertically	Square DRAM page arrangement (blocks) with folded atoms

The tiling format describes the organization of bytes within a surface. The tiling formats convert an (x, y) offset of a sample in a surface to a linear address. To do the translation, they need additional information about the surface.

Table 84: Surface Descriptor Parameters

Parameter	Used by	Description	Values	Minimum Alignment[a]
Layout	All	Surface layout	PITCH, BLOCKLINEAR	N/A
Base Address	Pitch	Starting address of surface, in bytes	32-bit virtual address (40-bit virtual address within the GPU) -or- 34-bit physical address	64 B (general) 128 B (GPU) 256 B (NVENC, VIC, Display)
Pitch	Pitch	Line-to-line stride in bytes	Large enough for at least 4,096 pixels in bytes (some clients may support larger values)	64 B (general) 128 B (GPU) 256 B (NVENC) up to 256 B (VIC)[b]
Base Address	Block Linear	Starting address of surface, in bytes	32-bit virtual address (40-bit virtual address within the GPU)-or- 34-bit physical address	512 B (one gob)
Block Width	Block Linear	Width of block in gobs	ONE_GOB (this is the only setting supported on Tegra X1)	N/A
Block Height	Block Linear	Height of block in gobs	[ONE_GOB, THIRTYTWO_GOBS] (SIXTEEN_GOBS is the normal setting, but TWO_GOBS may be needed for some display surfaces with rotation disabled.	N/A
Block Depth	Block Linear	Depth of block in gobs	[ONE_GOB, THIRTYTWO_GOBS] (values greater than ONE_GOB are currently only supported by the GPU)	N/A
Width	Block Linear	Width of surface in samples	[1, 4096] samples (some clients may support larger values)	1 sample

a. These are minimum alignments. Larger alignments are sometimes needed for performance

b. The pitch alignment restrictions for VIC depend on its cache line shape: 256Bx1: 256B, 128Bx2: 128B, otherwise: 64B

The Maxwell 3d class supported by the GPU has a full list of surface parameter ranges that, in many cases, exceed those in this table. For GPU surfaces that are larger than a Tegra client can support, all manipulation of the surface must be done on the GPU. Displayable surfaces are limited to the max 8K image width supported by display.

20.1.1 DRAM Organization

Although the tiling equations produce byte addresses, the memory controller interfaces operate in terms of *atoms*, which are the smallest possible unit of addressable memory. Legacy chips have used a 16-byte atom. Tegra X1 uses a 64-byte atom.[1]

Tegra X1 works with an effective 1 KB or 2 KB page, *i.e.* bank bits change on 1 KB or 2 KB boundaries. DRAM accesses are most efficient if adjacent accesses remain in the same page. Accesses can cross a page boundary into another bank as long as there are sufficient accesses in the current page to allow the DRAM controller to overlap the opening of the new bank while the current one is accessed. The *row cycle time* is the minimum amount of time that it takes the DRAM to open and close a page; in order to efficiently access the DRAM the client must arrange to issue enough requests within each bank to cover the row cycle time across all available banks.

If a client accesses different pages in the same bank, this produces a *bank conflict*. Bank conflicts are very inefficient, since they cause the DRAM to close and re-open the page. Unless the controller can find enough work in other banks to cover this cost, the bank conflict will turn into lost efficiency. The purpose of most of the tiling formats is to maximize the number of requests in one page and remove or reduce the potential for bank conflicts.

In physically allocated memory (carveout), bank swizzling equations ensure that banks are evenly interleaved, so bank conflicts are rare. In dynamically allocated virtual memory, a given 4 KB page only contains data from 4 banks. To prevent unnecessary bank conflicts, memory allocation should use page coloring. In page coloring, each 4 KB physical page is assigned a “color” based on the banks it contains. For example, a “red” page might have banks 0-3 and a “green” page might have banks 4-7. The page table mapping should map physical pages of the appropriate color to virtual pages so as to optimally interleave the banks. If page coloring is not feasible, clients should take advantage of the fact that there are no bank conflicts within a single 4 KB virtual memory page, but need to be aware that bank conflicts can occur at the boundary of this page with other virtual memory pages.

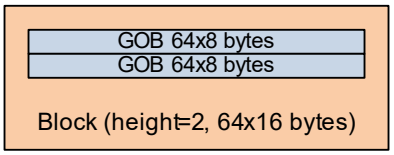
20.1.2 Block Linear

The block linear formats map batches of contiguous addresses into rectangular *blocks*, and tile these blocks linearly. Blocking serves two purposes:

1. It maps a DRAM page into a rectangular region, rather than into a one-pixel-tall strip, to capture locality in a graphics geometry stream or other 2d-oriented client, such as an MPEG encoder or decoder
2. It makes it possible to predictably interleave banks in x and y, minimizing bank conflicts over a large region.

Blocks themselves are arranged from *GOB*s, which are *Groups of Bytes*. A Maxwell GOB, as used in Tegra X1, is 512 bytes arranged as 64x8 bytes. GOBs are stacked vertically to form a block. The number of GOBs stacked vertically in a block is controlled by an additional surface parameter called the *block height*. The recommended block height for most buffers on Tegra X1 is 16 GOBs (128 lines). This supports 8x8 bank interleaving. For buffers for which linear display access is more important than access by GPU, VIC, or other block-oriented engine, block height may be set to 1 GOB, providing more locality for the display client.

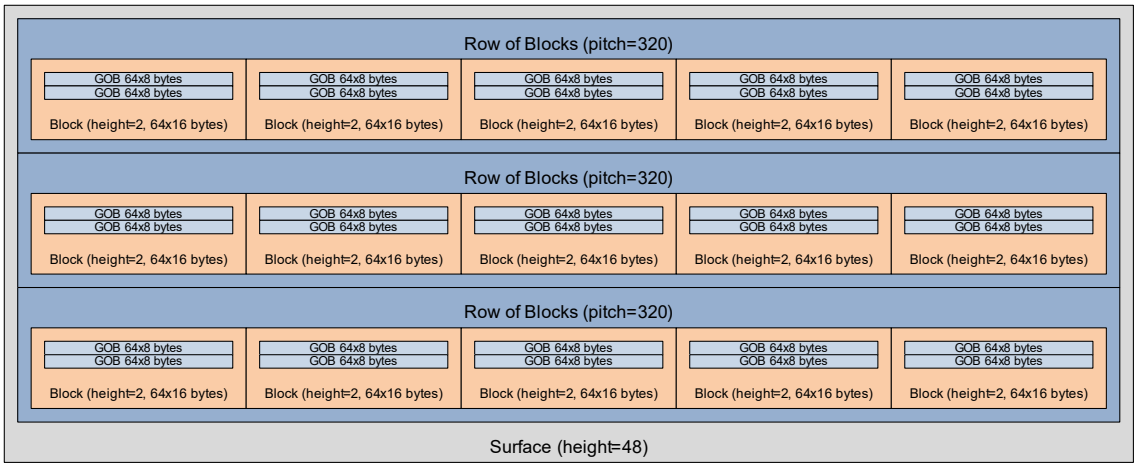
Figure 45: Example block with block_height = 2



1. Certain clients can take advantage of the memory system’s sub-partition feature to read or write non-contiguous pairs of 32B subpackets, rather than being restricted to a 64B DRAM atom. See the following section for details.

Blocks are arranged horizontally into a *Row of Blocks (ROBs)* to fill out the surface to the width value (or slightly beyond, if the width is not a multiple of the 64 B block width). Upper address bit swizzling in the bank swizzling algorithm generally makes it unnecessary to pad the surface width further.

Figure 46: Block Linear Surfaces



The tiling equations for block linear start out by computing the *GOB address* as follows:

```
GOB_address = base_address +
(y / (8 * block_height)) * 512 * block_height * image_width_in_gobs +
(x * bytes_per_pixel / 64) * 512 * block_height +
(y % (8 * block_height) / 8) * 512
where
image_width_in_gobs = ceiling(image_width * bytes_per_pixel / 64)
```

The individual pixel byte address is then determined from the GOB address based on the sector packing and sector ordering.

Note: *Image_width_in_gobs is directly determined by the image width itself. There is no additional 'pitch' parameter, as in legacy Tegra tiling. Tegra X1 units must not make data fetches wider than 64B (the block width) to block linear surfaces.*

20.1.2.1 Sector Packing and Sector Ordering

Sector packing is the arrangement of bytes within a 32 B sector. Sector ordering is the arrangement of sectors within a GOB. All buffers that are shared between Tegra clients use 16 B x 2 sector packing: the 32 B within a sector are arranged as two 16 B lines on top of each other.

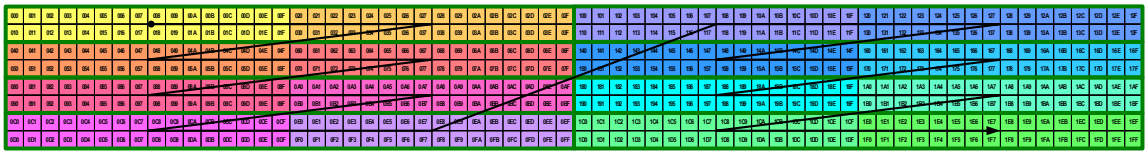
Note: *The GPU supports KINDs with other packing, but these are private to the GPU.*

The sectors are arranged in the GOB as shown below. This format will be the lingua franca between Tegra all engines, including the Maxwell GPU.

The diagram below represents a view of a GOB in pixel space. Each numbered box represents a byte, and each number represents the address offset of that byte from the base address of the GOB. The green outline denotes the set of sectors that make up a 64 B memory atom.

As an example of how to interpret the diagram below, assuming 4 bytes per pixel, the first 8 pixels in row 0 within the GOB are stored in bytes 00-0F and 20-2F (i.e., first, second, third, fourth pixels are stored in bytes 00-03, 04-07, 08-0B, 0C-0F respectively, and fifth, sixth, seventh, eighth pixels are stored in bytes 20-23, 24-27, 28-2B, 2C-2F respectively) in one 64 byte atom. The ninth pixel in row 0 within the GOB is stored in bytes 100-103 in a separate 64 byte atom.

Figure 47: Block Linear (GPU 16Bx2 kind with Tegra X1 Sector Ordering)



The address of a byte is computed as follows:

Address = GOB_addr + ((x%64)/32)*256 + ((y%8)/2)*64 + ((x%32)/16)*32 + (y%2)*16 + (x%16)

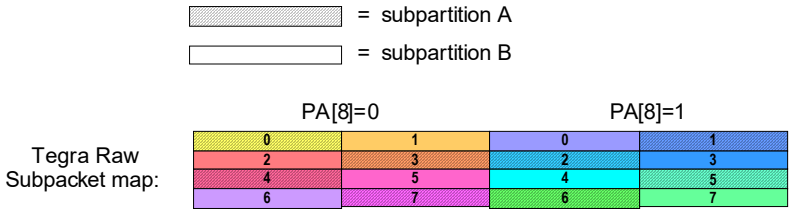
The sector ordering in this format reduces the amount of buffering required by clients that use line stores, such as Display and ISP. It also reduces the amount of instantaneous bandwidth required by Display because the number of lines that must be fetched before scanning out is reduced. Clients that do more vertically oriented accesses can take advantage of the sub-partition feature described below.

20.1.3 Sub-Partitions

The 64 b DRAM channel can be divided into two sub-partitions with DQ[31:0] forming sub-partition A and DQ[63:32] forming sub-partition B.

Each 64 B atom is divided into 2 sectors of 32 B. One sector contains bytes 0 – 31 while the other contains bytes 32 – 63. The sectors are mapped to sub-partitions by the MCCIF using PA[8]^PA[6]^PA[5]. This produces a checkerboard mapping of the physical address space to sub-partitions which allows both sub-partitions to be used whether the primitive is oriented horizontally or vertically. The checkerboard is mirrored between tiles in a GOB which is important when the surface is compressed.

Figure 48: Address to Sub-Partition Mapping



Clients that use the sub-partition feature can access two non-contiguous sectors targeting the same GOB in a single request provided they do not target the same sub-partition. A common use for this feature is to change the shape of a 64 B request from 32 B x 2 (without sub-partitions) to 16 B x 4 (using sub-partitions), which is the preferred fetch footprint for the GPU texture cache and is used by display when scanning out vertically.

20.2 Hardware Support

Clients implement registers in their module to control the four parameters (base address, kind, width or pitch, and block height) required for tiling control of each surface supported by the client.

For planar and semi-planar surfaces, in which a single image is composed of multiple buffers or *planes*, independent parameters should be provided for each buffer or *plane*.[1]

The kind and block height fields are enumerations defined below. All Tegra X1 clients use the same enumeration values. The most common block height for Tegra X1 is expected to be SIXTEEN_GOBS, but the others are supported.

Table 85: Block Height Enumeration

Block height enumeration	Value	Encoding (four bits log2 encoding)
ONE_GOB	1	0

1. Multiple YUV surface producers and consumers violate this rule and use one kind and block_height parameter for all planes in a YUV image, which is problematic since the planes have different numbers of pixels.

Table 85: Block Height Enumeration

Block height enumeration	Value	Encoding (four bits log2 encoding)
TWO_GOBS	2	1
FOUR_GOBS	4	2
EIGHT_GOBS	8	3
SIXTEEN_GOBS	16	4
THIRTYTWO_GOBS	32	5

Surface kinds shared by Tegra X1 clients are listed below. Tegra X1 clients expecting to share surfaces must support the NV_MMU_PTE_KIND_GENERIC_16Bx2 surface kind listed below, and optionally support the NV_MMU_PTE_KIND_PITCH surface kind. Note that the NV_MMU_PTE_KIND_GENERIC_16Bx2 enumeration is used by Tegra clients to represent the layout described in Tegra systems, and the same enumeration is used by the discrete GPU group to represent a different memory layout in non-Tegra systems.

Table 86: Surface Kind Enumeration

Surface kind enumeration	Encoding (eight bits)
NV_MMU_PTE_KIND_PITCH	0x00
NV_MMU_PTE_KIND_GENERIC_16Bx2	0xFE

Tegra X1 clients should make memory fetches that are integral multiples of DRAM atoms to avoid wasting bandwidth. If fetches can extend beyond the active buffer size (in width or height), the buffer must be padded to accommodate the maximum sized fetch. For pitch linear surfaces, this may mean padding the pitch and/or padding the number of lines in the buffer. For block linear surfaces (in rare instances), this may mean adding an additional row of blocks at the bottom of the buffer.

Note: *For block linear surfaces, there is no pitch parameter separate from surface width. To avoid making data fetches outside a buffer's allocated width, units should generally not make requests that are wider than 64B (the block width).*

20.3 Software Guidelines

Software should allocate surfaces respecting the minimum alignments. This section gives additional alignment restrictions for certain clients and advice on allocating surfaces for best performance.

Certain clients, such as NVENC, NVDEC, Display and VIC use 32-bit registers (left-shifted 8) to specify 40-bit base addresses of a buffer. Base addresses for these clients must be aligned to a minimum of 256 B.

Certain clients, such as NVENC and VIC have a fixed cache line size and read all data within a cacheline, even if it is beyond the nominal height and width of the surface. For such clients, surface width and height need to be padded to at least the next multiple of the cache line size so the unit does not read beyond the end of the buffer.

Surface type

- **Block linear** format generally provides best performance and should be chosen by default.
- **Pitch format** may be preferable if producer and consumer clients perform linear accesses and both clients support pitch.
- **Private formats** are used by a few units, such as NVENC and NVDEC. For private formats, the client-required allocation and padding rules must be followed.

Block Linear

- **Alignment**. Align surface start address as follows:

- 512 B is the minimum alignment for correct behavior. Performance will be poor (no zero-bandwidth clears, poor page locality).
- 1 KB alignment is better. Zero bandwidth clears will work. Bank interleave will be suboptimal.
- 8 KB alignment is best. All compression features work. Bank interleave assumes 8 KB alignment. Use this setting for large buffers.

- **Block height** should normally be programmed to SIXTEEN_GOBS (128 lines). For certain surfaces for which display is the primary client, block heights of ONE_GOB or TWO_GOBS are recommended. Surfaces to be accessed by the GPU texture unit may require a smaller block height under certain conditions.[1]
- **Width** is typically prescribed by the application. Hardware allocates a block linear surface to be an integral number of blocks wide, so its allocated width is width*Bpp rounded up to the next block boundary (64B), which is sufficient padding in almost all circumstances.[2]
- **Height padding**. Surfaces should be an integral number of blocks tall. If a client such as NVENC or VIC has a cache line that is taller than the block height, additional row(s) of blocks may be required for padding.

Pitch

- **Alignment**. Align surface start address to a minimum of:
  - 128 B if surface is to be accessed by GPU
  - 256 B if surface is to be accessed by NVENC, NVDEC, Display or VIC (due to the 8-bit left-shift issue)
  - 64 B otherwise
- **Pitch**. Surface pitch must be a multiple of:
  - 128 B bytes if surface is to accessed by GPU
  - 128 B if surface is to be read by VIC with 128x2 cache line shape
  - 256 B if surface is to be read by VIC with 256Bx1 cache line shape
  - 64 B otherwise
- **Height padding**. For clients, such as NVENC and VIC, additional lines of padding may be required beyond the nominal height of the surface. For example, when VIC is reading a source buffer with an internal cache line shape of 32x8, the source buffer must be a multiple of 8 lines tall.

20.3.1 Block Height Limitations

NVENC supports only a subset of the block heights. However, in general all hardware blocks support full range of block heights (i.e. 2/4/8/16/32). Below is a table of programmable block height support for Tegra X1.

Block	Surface	Block Height(s) Supported
ISP	Any	All (optimal performance BlockHeight=2)
NVDEC	Any	All except 1 (optimal performance based on Coding Tree Block size)
NVENC	Input/Reference	All (optimal performance based on Coding Tree Block size)
	Recon	BlockHeight = 2 only
VIC	Input	All (optimal performance BlockHeight=32)
	Output	All (optimal performance BH=32 normal/BH=2 rotated)
Display	Horizontal	All (optimal performance BlockHeight=2)
	Vertical	All (optimal performance BlockHeight=32)

1. For buffers that are to be accessed using the gp10b texture unit, the BlockHeight parameter must match that used by the texture unit. In particular, note that if a texture surface is smaller than the specified size in blocks, texture uses a shrunken BlockHeight instead of the nominal parameter specified in the Texture Header.
2. If VIC cacheline shapes of 128x2 or 256x1 are used (generally not recommended for blocklinear), width must be padded up to a multiple of the cache line width. If this is not possible, a narrower cache line shape must be used.

Beyond limitations of multimedia blocks performance with respect to block height, the SMMU has possibly a larger performance penalty for block heights that are outside of the “SMMU block height sweet spot”.

A summary of block height recommendations is given below:

- BlockHeight = 16 GOBs (128 lines) is the recommended setting for most clients that use block linear. It provides decent accesses per activate for clients that traverse a buffer horizontally, vertically, or in tiles. DRAM pages are 64B x 64 lines. TLB cache lines are roughly square in screen space. *This should be the default setting and is the only performant block height for rotated display.*
- BlockHeight = 1 GOB (8 lines) is optimal for clients that make horizontal accesses, doubling access per activate, but at the expense of clients that make vertical accesses. This is the optimal setting for non-rotated display, but other block heights are okay for non-rotated display.
- BlockHeight = 2 GOBs (16 lines) is the hard-coded value for NVENC video engines RECON surface. It does not provide the access per activate benefit of BlockHeight = 1 and TLB cache lines have a poor aspect ratio. Buffers used by this client must have block height = 2.

20.4 Pixel Formats

20.4.1 Pixel Format Naming

Tegra X1 Mobile pixel format naming conventions continues to use the naming style adopted in previous chips.

20.4.1.1 Naming Conventions

Tegra X1 pixel format names are based on the following set of rules:

3. All format names begin 'T_' (T followed by underscore) to distinguish them from Tegra 3 and other format name conventions.
4. If the number of bits per pixel is not a power of 2, use an Array of Words name.
   Example: T_R8_G8_B8.
   a. Write all the components in increasing address order from left to right with an underscore between each component.
   b. The name lists the bits in this order. Each component is described by a set of attributes:
      - Component letter (see Table 87)
      - a decimal number (the number of bits in the component – always a multiple of 8)
      - an optional Type Suffix (see Table 88)
5. Otherwise, if the number of bits per pixel is a power of 2, use a Single Word name.
   Example: T_A8B8G8R8, T_R5G6B5.
   a. Collect all the components in the pixel into a single word using little endian order.
   b. Arrange the components from left to right in msb to lsb order.
   c. The name lists the bits in this order. Each component is described by:
      - a Component letter (see Table 87).
      - a decimal number (the number of bits in the component)
      - an optional type suffix (see Table 88)
6. Identify the type:
   a. Identify the type of each component, ignoring any S and X components. Applicable types are listed in Table 88.
   b. If all the (non-ignored) types are Unsigned Normalized then do not use any type suffix.
   Example: T_A8B8G8R8.

c. Else if all the (non-ignored) types use the same type (not Unsigned Normalized) then add to the end of the format name an underscore and a type suffix. This suffix applies to all the components (except S and X components). Example: T_A8B8G8R8_I.

d. Else there are different types. Add a type suffix (without an underscore) to each component identifier (following the number of bits). Do not add a type identifier to any S or X or Unsigned Normalized components. Do not add an underscore or type identifier to the end of the format name.
Example: T_A2B10FG10FR10F.

7. Special cases:

a. T_E5B9G9R9_F - each RGB component is a mantissa and E is a shared exponent which is applied to each component. The result is 3 floating point components (RGB).

b. Packed YUV formats like T_V8_Y8__U8_Y8 and T_B8_G8__R8_G8 which have a repeated component: This format represents 2 pixels. The double underscore is the separator between the two pixels. The repeated component (Y/G) is unique to each pixel. The other components (U/V/R/B) are shared by both pixels. Use Array of Words naming for these (see Step 2 above).

c. Bayer formats (TBD).

d. Compressed formats (ETC, DXT, LATC, EAC).

e. Append the “N” delimitor to indicate chroma subsampling (i.e., N444, N422, N422R, N420). For example, T_U8V8_N420 indicates a U8V8 plane with 4:2:0 chroma subsampling).

8. Multi-Pixel Packing Formats:

If more than one pixel is described by a single word which is a power-of-two bits, then use a word-oriented name.

Example: T_X2Lc10Lb10La10.

a. Collect all the components in the pixel into a single word using little endian order.

b. Arrange the components from left to right in msb to lsb order

c. The name lists the bits in this order. Each component is described by:

- a Component letter (see Table 87)
- a lower case pixel ordering identifier “a”, “b”, “c”, etc, where “a” is the “first” logic pixel in the group, “b” is the second, “c” is the third, and so on. For components that are shared by all pixels in the group, or X components (that are not part of any pixel), the pixel ordering identifier is omitted. For components that are shared by more than one, but not all, pixels in the group, multiple pixel order identifying letters are to be used.
- a decimal number (the number of bits in the component)
- an optional Type Suffix (see Table 88)

9. Multiple Plane Formats:

Some units may use a different color format name for each plane. In that case, the color format names will be as described above (e.g., T_Y8, T_U8, T_V8, T_V8U8, etc). Other units may use a single color format name describing all planes in a single name. In this case, the name has one or more triple underscores. The triple underscore separates one plane from the next.

Example: T_Y8___V8U8_N420:

Indicates a semi-planar YUV with T_Y8 in the first plane, and T_V8U8 in the second plane, with 4:2:0 chroma subsampling.

Example: T_Y8___U8___V8_N420:

Indicates a fully planar YUV with T_Y8 in the first plane, T_U8 in the second plane, and T_V8 in the third plane, with 4:2:0 chroma subsampling.

Note: *Tegra X1 clients are required to support YCbCr Rec.601 formats (unsigned 8 bit values), but for brevity, we represent Cb and Cr components with U and V respectively (e.g., AYUV represents*

a format containing A, Y, Cb, Cr components). This does not imply that "YUV" formats use Y, U, V components (signed 8 bit values with a 128 offset).

Table 87: Pixel Naming Component Letters

Component Letter	Description
R	Red
G	Green
B	Blue
A	Alpha
L	Luma (copy to R, G, and B. Copy from R.)
Y	Luminance for YCbCr601 (YUV)
U	Cb for YCbCr601 (YUV)
V	Cr for YCbCr601 (YUV)
N	Delimiter for indicating chroma subsampling (i.e., _N444, N422, N422R, N420)
P	Palette index
C	Coverage (or other special usage)
S	Stencil (always Unsigned Integer)
Z	Depth value
E	Shared exponent. When this component is present, all the other components are mantissas to which this exponent is applied.
X	Unused (ignored on read)

Table 88: Pixel Naming Type Suffixes

Type Suffix	Description
<none>	Unsigned Normalized
SN	Signed Normalized
I	Signed Integer
UI	Unsigned Integer
NL	Nonlinear Z Format
F	Float
LN	Unsigned Normalized sRGB colorspace (L=log)
MSAA	Multisample (special case – only used with S8 (T_S8_MSAA))
N444	No subsampling of chroma (chroma and luma are full resolution)
N422	Subsampled chroma in 422 (half res horizontal, full res vertical)
N422R	Subsampled chroma in 420R (full res horizontal, half res vertical)
N420	Subsampled chroma in 420 (half res horizontal, half res vertical)
TRUE	Uses true YUV (not YCbCr)

20.4.1.2 Pixel Format Bit Patterns

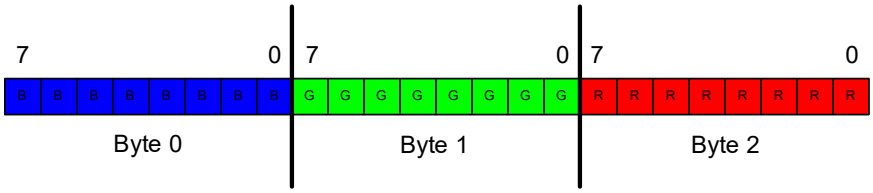
The tables below describe the bit patterns associated with the pixel formats supported in Tegra X1.

The maximum pixel size supported by Tegra X1 engines will be 128 bits.

Array of Words Pixel Formats

Array of Words type pixel formats will list each component in increasing address order from left to right.

e.g., T_B8_G8_R8



e.g., T_R16_G16_B16_I

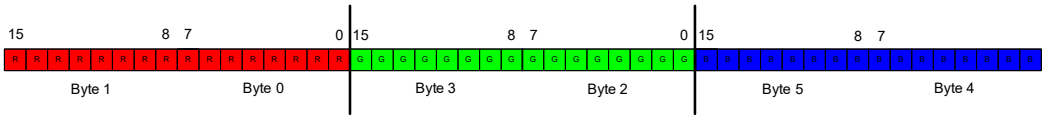


Table 89: Array of Words Pixel Formats

Hardware Name	Bit pattern (Left to Right: LS-Byte to MS-Byte□ms-bit to ls-bit per Byte)	Software Name

Single Word Pixel Formats

Single Word type pixel formats, which use a single word to list all components in a single pixel, will list components from left to right, starting from the component in the most significant bit position and ending with the component in the least significant bit position. Little endian byte order is assumed when storing words into memory bytes.

e.g., T_A8B8G8R8

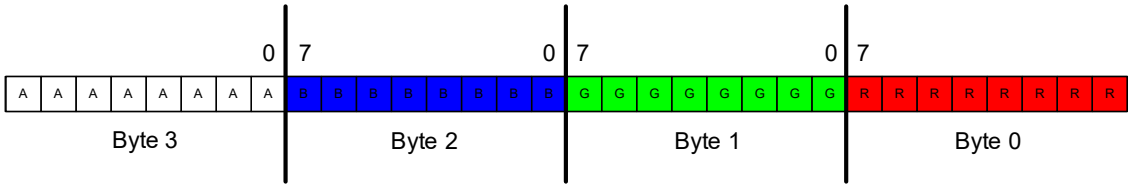

Table 90: Single Word Pixel Formats

Multi-Pixel Packing Pixel Formats

Pixel data can come in non-power of two bit sizes that are difficult to fetch and process when contained in certain memory formats (e.g., block linear). For example, raw camera data can come in 6-bit and 10-bit pixel sizes. It can simplify pixel data fetch and processing by packing multiple pixels into a single large word.

Table 92: Multiple Plane Pixel Formats

Hardware Name	Bit pattern (Left to Right: MS-Byte to LS-Byte ms-bit to ls-bit per Byte)	Software Name
T_X2Lc10Lb10La10	XX $L^2L^2L^2L^2L^2L^2L^2L^2L^2L^2$ $L^1L^1L^1L^1L^1L^1L^1L^1L^1L^1$ $L^0L^0L^0L^0L^0L^0L^0L^0L^0L^0$

Multiple Plane Pixel Formats

Some color formats, for example, describing the YUV color space, split pixel data across multiple planes. Fully planar YUV formats contain three planes, one each for Y, U, and V components. Semi-planar YUV formats contain two planes, one for Y, and one shared between U and V components.

Some units may use a different color format name for each plane. Other units may use a single color format name describing all planes in a single name as described below.

20.4.1.3 Bayer Pixel Formats

Bayer pixel data can come from camera sensor equipment in various sizes, e.g., 6bits, 10bits, 14bits, 16bits, etc. Most Bayer data is stored using existing pixel formats, such as T_L8, or T_L16. In some special cases, special formats are created to pack pixel data efficiently to work with existing memory formats, e.g., T_X2Lc10Lb10La10, T_X2Le6Ld6Lc6Lb6La6.

20.4.1.4 Maxwell Caveats

Pixel formats that are not a power of 2 bits cannot be used together with block linear memory tiling formats because they cannot fit into a block linear GOB (256 or 512 bytes) without additional padding. These formats can only be used with pitch linear surfaces.

The list of pixel formats that will not work with block linear memory tiling is listed below:

- 24 bit packed RGB
  - T_R8_G8_B8, T_B8_G8_R8, T_R8_G8_B8_SN, T_R8_G8_B8_UI, T_R8_G8_B8_I)
- 24bit packed YUV
  - i.e., T_Y8_U8_V8, T_Y8_V8_U8, T_U8_Y8_V8, T_V8_Y8_U8, T_U8_V8_Y8, T_V8_U8_Y8
- T_R16_G16_B16_I, T_R16_G16_B16_UI
- T_R32_G32_B32_I, T_R32_G32_B32_UI

20.5 Compression Overview

Tegra employs lossless surface compression without compaction on 4BPP ARGB surface data. Tegra uses GPU compression techniques whereby surfaces are compressed in tiled regions. This allows for bandwidth reduction but the surface footprint remains uncompressed.

Techniques for compression vary based on the surface type. Compression techniques these surface types are:

- Arithmetic
  - 2:1 surface compression
  - Improved algorithm for Maxwell utilizing Variable Difference Compression (VDC)
- Reduction
  - 4:1 or 8:1 surface compression
  - Efficient for pixel replication within a tiled region
- Zero Bandwidth Clear (ZBC)
  - Surface tile made up of single color
  - Only 1 ZBC color per surface
  - No memory access required

Tegra X1 supports two forms of sRGB surface compression:

- 1xAA support using 2CRA surface compression
  - ZBC
  - 8:1 or 4:1 reduction
  - 2:1 VDC
  - Uncompressed
- 4xAA support using BRA surface compression
  - 8:1 compression
  - 4:1 reduction followed by 2:1 VDC
  - 4:1 reduction
  - 2:1 VDC
  - Uncompressed

The surface tile follows the GPU ROP tile dimension of 32Bx8 or 256B or half of a GOB. The compressed data is stored in this tile as:

- 32 B (8:1 compression ratio)
- 64 B (4:1 compression ratio)
- 128 B (2:1 compression ratio)
- 256 B (1:1 compression ratio)

20.5.1 Compression Format Kinds

Tegra X1 compression formats are taken from GPU and therefore follow GPU compression format naming conventions. Tegra X1 will support the following compression kind for RGB:

- RGB
  - NV_MMU_PTE_KIND_C32_2CRA (2CRA)
  - NV_MMU_PTE_KIND_C32_MS4_2BRA (2BRA)

The compression kind for GPU 1xAA surfaces is 2CRA and will be used for the following pixel formats:

- 32-bit ARGB

The compression kind for GPU 4xAA surfaces is 2BRA and will be used for the following pixel formats:

- 32-bit ARGB

20.5.2 Compression Format Mappings

Compression tags

Description of 2CRA compression mapping:

- Uncompressed enum CROP_CS_2CRA_U0
- Zero Bandwidth Clear enum CROP_CS_2CRA_C 1
- Reduction Compressed enum CROP_CS_2CRA_R 2
- Arithmetic Compressed enum CROP_CS_2CRA_A 3

Description of 2BRA compression mapping:

- Uncompressed enum CROP_CS_2BRA_U0
- Both Compressed enum CROP_CS_2BRA_B 1

- Reduction Compressed enum CROP_CS_2BRA_R 2
- Arithmetic Compressed enum CROP_CS_2BRA_A 3

20.6 End-to-End Support

20.6.1 Overview

To determine if Tegra X1 can support a given multimedia use case, it is important to understand the full path from a system point of view. Limits on important parameters associated with the use case must be documented to determine if the use case is possible. For example, the maximum resolution associated with H.264 video stream. The intent of this section is to associate those parameters with pixel memory formats to determine if Tegra X1 can support a given use case. Important parameters associated with these formats are:

- Codec
- Color space/component depth
- Resolution
- Frame rate

The pixel processing paths described in this section are:

- Video input path
- Video encode path
- Camera input path
- Display output path

Analysis of the end to end path is broken down into three relatively orthogonal sections:

- Input
- Internal
- Output

Each section is meant to capture the extents of support provided on the input path, internally or out to a display panel. Ideally this information would be incorporated into the use case model (UCM) so that along with bandwidth limitations, those limitations captured in the following sections would also be checked to determine IMP (is-mode-possible) for a given set of use cases.

20.6.2 Input Support

Tegra X1 has two major pixel capture paths: video and camera input. The video input path is processed by NVDEC which supports a variety of CODECs. The camera input path is supported by VI and ISP blocks.

The table below shows the extent of support on the video input path. Each CODEC has a list of parameters describing the limit of support for that CODEC. The color space and maximum component depth describe the extents that YUV data is captured for that CODEC.

Notes:

- *Color space is not manipulated in NVDEC so only the component depth determines color space support for the input video path.*
- *ULV refers to Ultra Low Voltage or minimum voltage level allowed for Tegra X1.*
- *SV refers to Standard Voltage which is actually the maximum voltage used for Tegra X1 performance targets.*

Table 96: Video Decode Input Path (NVDEC)

CODEC	FORMAT	COLOR SPACE	MAX DEPTH	MAX RES	ULV Frame Rate	SV Frame Rate
H.264, MPEG2 VP8	YUV420	Rec.601 Rec.709	8 bpc	4096x4096	4K at 30fps	4K at 60fps
VC1 MPEG4	YUV420	Rec.601 Rec.709	8 bpc	2048x1024	1080p at 120fps	1080p at 120fps
H.265	YUV420, YUV444	Rec.601 Rec.709 Rec.2020	8/10/12 bpc (yuv444 don't support 12bpc)	4096x4096	4K at 30fps	4K at 60fps
VP9	YUV420	Rec.601 Rec.709 Rec.2020	8/10/12 bpc	4096x4096	4K at 30fps	4K at 60fps

The camera input path has major points that can impose limits on pixel throughput:

- CSI
  - 1 or 2 sensors (x4) – tablet platform
    - 12 bpp
    - 30 MPix/frame @ 30fps
    - 900 MPix/s (single sensor)
    - 1.8 GPix/s (dual sensor)
  - 12 sensors – automotive platform
    - 16 bpp
    - 12 * 4 MPix/frame @ 30fps
    - 1.44 GPix/s
  - Maximum sensor resolution of 50MPel
  - Maximum pixel depth of 16 bpp RAW format
- ISP
  - 2 pixel per clock
  - 700 MHz clock at SV
  - 1.4 GPix/s
  - Independent of pixel depth
  - Maximum component depth of 12 bpc
  - Output format of YUV420, YUV444

Using this information, the table below describes the camera capture rate of various sensor resolutions as well as for a 12-sensor automotive platform.

Note: *ISP supports a maximum of 1.4 GPix/s throughput regardless of YUV format or component depth. Therefore ignoring memory bandwidth, camera input path can output 12 bpc Rec.2020 output at the same rate as 8 bpc Rec.601.*

Table 97: Camera Input Path (Maximum Performance)

Sensor Configuration			CSI Capture Rate (fps)	ISP Capture Rate (fps)	Camera Path Capture Rate (fps)
Number Sensors	Sensor Resolution	Sensor Connection			
1	8 MPEL	X4 12bpp	112	175	112
1	13 MPEL	X4 12bpp	69	112	69
1	20 MPEL	X4 12bpp	45	70	45
1	50 MPEL	X4 12bpp	18	28	18
2	8 MPEL	X4 12bpp	224	175	175
2	13 MPEL	X4 12bpp	138	112	112
2	20 MPEL	X4 12bpp	90	70	70
2	50 MPEL	X4 12bpp	36	28	28
12	4 MPEL	All lanes 16bpp	30	29	29

20.6.3 Internal Support

Internal support refers to those blocks downstream from the input path but prior to prior to panel or video encode blocks. Internal path processing blocks include:

- GPU
- VIC
- Display pipeline
- ISP (image improvement stages)

The pixel processing functions provided in these blocks are necessary for areas such as:

- Camera image quality
- Video post processing
- Color space conversion
- Scaling
- Compositing

This section focuses on the parameter that must be carried through the internal blocks and the effects on the parameter due to processing limitations of the internal blocks, namely color space. The good news is Tegra X1 provides full support for Rec.601 and Rec.709 color spaces as well as 10bpc Rec.2020 color space. The bad news is 12bpc Rec.2020 color space images may suffer precision loss when images are processed by VIC or display.

VIC and display have internal pipeline precision of S1.14 which provides an acceptable level of precision for blending 8-bit and 10-bit surfaces. For scaling and blending 12-bit surfaces, an internal pipeline color format of S1.16 is required. Therefore 12-bit content that requires scaling or blending will suffer precision loss. This issue could be noticed in systems with a 12-bit output panel. Systems with lower component depth panels should not be able to perceive the drop in precision. The precision of 12-bit video content that do not require gamma operations, scaling or blending will be maintained. Note that GPU can avoid precision loss by compositing using 32-bpc floating point processing. GPU outputs can then be converted to 16 bpc UNORM ARGB outputs.

Bandwidth limitations affecting refresh rates are beyond the scope of this document.

Note: *Internal blocks all support resolutions of 16K x 16K. VIC and display support 8K x 8K for reading compressed images.*

20.6.4 Output Support

There are two outputs covered in this section:

- Video encode path (NVENC)
- Display panel support

The video encode path limitations are described below.

Table 98: Video Encode Path (NVENC)

CODEC	FORMAT	COLOR SPACE	MAX DEPTH	MAX RES	SV Frame Rate
VC1, MPEG2, MPEG4, VP8, VP9	YUV420	Rec.601, Rec.709	8 bpc	4096x4096	4K at 30fps
H.264	YUV420, YUV444	Rec.601, Rec.709	8 bpc		YUV420: 4K at 60fps YUV444: 4K at 30fps
H.265	YUV420, YUV444	Rec.601, Rec.709	8 bpc		

The following tables show the component depth supported for a given output panel resolution. Limitations are based on the available bandwidth for a given panel's link speed as well as link format support. It should be noted that display has the flexibility to support color space conversion to and from any of the supported color spaces for Tegra X1.

Namely:

- sRGB
- Rec.601
- Rec.709
- Rec.2020

Therefore display can support any color space for a given resolution within the display pipeline. However Rec.2020 minimum component depth is 10 bits. Therefore, any output unable to generate 10-bpc or greater cannot claim Rec.2020 support.

Table 99: eDP Maximum Output Color Depth

Resolution	Maximum Component Depth Supported			
	RGB Format	YUV420 Format[1]	YUV422 Format	YUV444 Format
Up to 2560x1440@120Hz	10 bpc	See note 1	8 bpc	10 bpc
Up to 3840x2160@30Hz	12 bpc	See note 1	8 bpc	12 bpc
Up to 3840x2160@60Hz	10 bpc	See note 1	8 bpc	10 bpc
Up to 5120x3200@60Hz	Unsupported	See note 1	8 bpc	Unsupported

Table 100: HDMI Output Color Depth

Resolution	Component Depth Supported			
	RGB Format	YUV420 Format[1]	YUV422 Format	YUV444 Format
Up to 2560x1440@120Hz	8 and 12 bpc	See note	8, 10 and 12 bpc	8 and 12 bpc
Up to 3840x2160@30Hz	8 and 12 bpc bpc	See note	8, 10 and 12 bpc	8 and 12 bpc
Up to 3840x2160@60Hz	8 bpc	See note	8 bpc	8 bpc
Up to 5120x3200@60Hz	Unsupported	See note	Unsupported	Unsupported

Table 101: DSI Maximum Output Color Depth

Resolution	Maximum Component Depth Supported			
	RGB Format	YUV420 Format	YUV422 Format	YUV444 Format
Up to 3840x2160@30Hz	8 bpc	Unsupported	Unsupported	Unsupported
Up to 3840x2160@60Hz	8 bpc	Unsupported	Unsupported	Unsupported
Up to 5120x3200@60Hz	8 [2] bpc	Unsupported	Unsupported	Unsupported

Notes:

- *YUV420 is not a supported output of display. WAR is to use a single-surface pass-through mode where an HDMI 8bpc YUV420 surface generated via a GPU shader can be sent directly to the panel through the display pipeline. Note that display can convert YUV420 to YUV422 or YUV444 on the fly and send YUV422 or YUV444 to the monitor.*
- *Support for RGB and YUV444 formats require DSI output compression to achieve the refresh rates for the resolutions shown.*
- *Unlike eDP and DSI color depth support tables, HDMI only color depths listed in the table are supported (i.e., 10 bpc depths are not supported for RGB and YUV444).*

CHAPTER 21: APB

21.1 APB Miscellaneous Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

This chapter describes a number of system control registers that are grouped together in the aptly named miscellaneous registers section. These registers are all present on the APB bus.

21.1.1 APB Control Registers

21.1.1.1 APB_MISC_PP_STRAPPING_OPT_A_0

Strapping Options Register

Offset: 0x8 | Read/Write: R/W | Reset: 0xXX00XXX0 (0bxxxxxxxxxxxxxxxxxxxxxxxx00xxxxxxx0)

Bit	Reset	Description
28:26	X	BOOT_SELECT: read at power-on reset, main reset, tsensor reset, and watchdog timer reset time from uart3_txd_IB, uart4_txd_IB, uart4_rts_IB
13	X	NVPROD_UART
12:10	X	RCM_STRAPS: read at power-on reset, main reset, tsensor reset, and watchdog timer reset time from button_home_IB, button_vol_down_IB, button_vol_up_IB
9	0x0	BOOT_FAST_UART: UART Boot speed from TMC JTAG configuration bit 0=57600 baud, 1=Osc Frequency (1 bit per OSC clock) 0 = SLOW 1 = FAST
8	RSVD1	MIO_WIDTH: 0 = RSVD1 1 = RSVD2
5:4	X	RAM_CODE: read at power-on reset, main reset, tsensor reset, and watchdog timer reset time from uart1_tx_IB, uart1_rts_IB
0	RSVD1	NOR_WIDTH: 0 = RSVD1 1 = RSVD2

21.1.1.2 APB_MISC_PP_CONFIG_CTL_0

Configuration Control Register

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxx00)

Bit	Reset	Description
7	DISABLE	TBE: 0 = Disable; 1 = Enable RTCK Daisy chaining 0 = DISABLE 1 = ENABLE
1	DISABLE	XBAR_SO_DEFAULT: Deprecated -- keep disabled 0 = DISABLE 1 = ENABLE
0	DISABLE	CPU_XBAR_SO_ENABLE: Deprecated -- keep disabled 0 = DISABLE 1 = ENABLE

21.1.1.3 APB_MISC_PP_PINMUX_GLOBAL_0_0

Global Pinmux Control Register

When both CLAMP_INPUTS_WHEN_TRISTATED is set to ENABLE and the TRISTATE field is set to TRISTATE (1b1), the inputs to the core are clamped to zero. Software must set this bit before taking any controller using a pinmuxed pin out of reset.

Offset: 0x40 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	DISABLE	CLAMP_INPUTS_WHEN_TRISTATED: 0 = Do not clamp inputs when tristated; 1 = Clamp inputs when tristated 0 = DISABLE 1 = ENABLE

21.1.1.4 APB_MISC_SC1X_PADS_VIP_VCLKCTRL_0

VCLK Control Register

Enable VCLK pad to get external clock for VI.

Offset: 0x428 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	INVERSION: VCLK invert enable 0 = DISABLE 1 = ENABLE
0	0x0	IE: VCLK input enable 0 = DISABLE 1 = ENABLE

21.1.1.5 APB_MISC_GP_HIDREV_0

Chip ID Revision Register

Offset: 0x804 | Read/Write: RO | Reset: 0x000XXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
19:16	X	MINORREV: Chip ID minor revision. Minor revisions from 2 to 10 are reserved.
15:8	X	CHIPID: Chip ID
7:4	X	MAJORREV: Chip ID major revision (0: Emulation, 1-15: Silicon) 0 = EMULATION 1 = A01
3:0	X	HIDFAM: Chip ID family register. 0 = GPU 1 = HANDHELD 2 = BR_CHIPS 3 = CRUSH 4 = MCP 5 = CK 6 = VAIO 7 = HANDHELD_SOC

21.1.2 Pad Control Registers

The registers below control pad behavior. For each digital pad, the following controls can be used to tune pad performance, functionality, and power consumption. The pads controlled by each pad group register can be found in Chapter 9: Multi-Purpose I/O Pins and Pin Multiplexing (Pinmuxing) of this document.

- **HSM_EN** - High speed mode - active high, enables high speed mode for driver and receiver for better matching of the rise/fall delay in outbound and inbound paths. Use it for clocks and the high speed signaling where the matching timings are of importance.

- SCHMT_EN - Schmitt enable - active high, enables the Schmitt Trigger Type of I/P receiver. Default is Inverter Type of receiver.
- CAL_DRVDN - drive down (falling edge) - Driver Output Pull-Down drive strength code.
- CAL_DRVUP - drive up (rising edge) - Driver Output Pull-Up drive strength code.
- DRVDN_SLWR - Driver Output Rising Edge Slew 2-bit control code.

  Code 11 is least slewing of signal, code 00 is highest slewing of the signal.
- DRVUP_SLWF -Driver Output Falling Edge Slew 2-bit control code.

  Code 11 is least slewing of signal, code 00 is highest slewing of the signal.

21.1.3 APB_MISC_GP_ASDBGREG_0

Debug registers. Has controls for debug enable, and performance enable.

Offset: 0x810 I Read/Write: R/W I Reset: 0x00000000 (0bxx0000000000xxxxxxxxxxxx00xxx00x)

Bit	Reset	Description
29:28	0x0	CFG2TMC_RAM_SVOP_SP: control write timing characteristics for the compiled RAMSP, add reset to RAM_SVOP_SP
27:26	0x0	CFG2TMC_RAM_SVOP_REG: control write timing characteristics for the compiled RAMREG
25:24	0x0	CFG2TMC_RAM_SVOP_PDP: control write timing characteristics for the compiled RAMPDP[a]
23:22	0x0	CFG2TMC_RAM_SVOP_DP: control write timing characteristics for the compiled RAMDP
21:20	0x0	CFG2TMC_RAM_EMAA: control timing characteristics for the compiled rams 0 = DISABLE 1 = ENABLE
7:6	0x0	CFG2TMC_CLKBYP_FUNC:8 rw CFG2TMC_SW_BP_T1CLK i=0x0 enum (DISABLE, ENABLE) 9 rw CFG2TMC_SW_BP_T2CLK i=0x0 enum (DISABLE, ENABLE)10 rw CFG2TMC_SW_BP_T3CLK i=0x0 enum (DISABLE, ENABLE)11 rw CFG2TMC_SW_BP_T4CLK i=0x0 enum (DISABLE, ENABLE)12 rw CFG2TMC_SW_BP_T5CLK i=0x0 enum (DISABLE, ENABLE)13 rw CFG2TMC_SW_BP_T6CLK i=0x0 enum (DISABLE, ENABLE)14 rw CFG2TMC_SW_BP_T7CLK i=0x0 enum (DISABLE, ENABLE)15 rw CFG2TMC_SW_BP_CLK_DIV i=0x0 enum (DISABLE, ENABLE) 0 = DISABLE 1 = ENABLE
2	0x0	CFG2TMC_PULLDOWN_EN: Enables pulldown 0 = DISABLE 1 = ENABLE
1	0x0	CFG2TMC_PULLUP_EN: Enables pullup 0 = DISABLE 1 = ENABLE
0	0x0	CFG2TMC_IDDQ_EN: Enables iddq WARNING: Will functionally kill chip) enum 0 = DISABLE 1 = ENABLE

a. Software needs to program CFG2TMC_RAM_SVOP_PDP to 0x2 as part of cold and warm boot initialization.

21.1.4 APB_MISC_GP_SDMMC1_CLK_LPBK_CONTROL_0

This bit is set when pads are used for SDMMC/eMMC, otherwise it is reset.

Offset: 0x8d4 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	0x1	SDMMC1_CLK_PAD_E_LPBK: when set, enables deep loopback in SDMMC1 CLK pad

21.1.4.1 APB_MISC_GP_SDMMC3_CLK_LPBK_CONTROL_0

Offset: 0x8d8 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	0x1	SDMMC3_CLK_PAD_E_LPBK: When set, enables deep loopback in SDMMC3 CLK pad

21.1.4.2 APB_MISC_GP_EMMC2_PAD_CFG_CONTROL_0

Offset: 0x8dc | Read/Write: R/W | Reset: 0x0000ff37 (0bxxxxxxxxxxxxxxxx11111111xx11x111)

Bit	Reset	Description
15:8	0xff	EMMC2_PAD_E_INPUT: Enable input path for D0-D7; enable=1, disable=0
5	0x1	EMMC2_PAD_E_INPUT_CLK: Enable input for CLk pad. Always on by default.
4	0x1	EMMC2_PAD_E_INPUT_CLKB: Enable input for CLkB pad. Always on by default.
2	0x1	EMMC2_PAD_E_INPUT_DQS: Enable Differential receiver for the DQS
1	0x1	EMMC2_PAD_E_INPUT_DQSB: Enable Differential receiver for the DQSB
0	0x1	EMMC2_PAD_E_DEEP_LPBK_CLK: When set, enables deep loopback in SDMMC2 CLK pad; Should be set to 1 to get loopback clock for capturing read data from device

21.1.4.3 APB_MISC_GP_EMMC4_PAD_CFG_CONTROL_0

Offset: 0x8e0 | Read/Write: R/W | Reset: 0x0000ff37 (0bxxxxxxxxxxxxxxxx11111111xx11x111)

Bit	Reset	Description
15:8	0xff	EMMC4_PAD_E_INPUT: Enable input path for D0-D7; enable=1, disable=0
5	0x1	EMMC4_PAD_E_INPUT_CLK: Enable input for CLK pad. Always on by default.
4	0x1	EMMC4_PAD_E_INPUT_CLKB: Enable input for CLKB pad. Always on by default.
2	0x1	EMMC4_PAD_E_INPUT_DQS: Enable Differential receiver for the DQS
1	0x1	EMMC4_PAD_E_INPUT_DQSB: Enable Differential receiver for the DQSB
0	0x1	EMMC4_PAD_E_DEEP_LPBK_CLK: When set, enables deep loopback in SDMMC4 CLK pad; Should be set to 1 to get loopback clock for capturing read data from device.

21.1.4.4 APB_MISC_GP_ALS_PROX_INT_CFGPADCTRL_0

ALS_PROX_INT_CFG Pad Control Register

Offset: 0x8e4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_ALS_PROX_INT_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_ALS_PROX_INT_CFG_CAL_DRVDN

21.1.4.5 APB_MISC_GP_AP_READY_CFGPADCTRL_0

AP_READY_CFG Pad Control Register

Offset: 0x8e8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_AP_READY_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_AP_READY_CFG_CAL_DRVDN

21.1.4.6 APB_MISC_GP_AP_WAKE_BT_CFGPADCTRL_0

AP_WAKE_BT_CFG Pad Control Register

Offset: 0x8ec | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_AP_WAKE_BT_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_AP_WAKE_BT_CFG_CAL_DRVDN

21.1.4.7 APB_MISC_GP_AP_WAKE_NFC_CFGPADCTRL_0

AP_WAKE_NFC_CFG Pad Control Register

Offset: 0x8f0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_AP_WAKE_NFC_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_AP_WAKE_NFC_CFG_CAL_DRVDN

21.1.4.8 APB_MISC_GP_AUD_MCLK_CFGPADCTRL_0

AUD_MCLK_CFG Pad Control Register

Offset: 0x8f4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_AUD_MCLK_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_AUD_MCLK_CFG_CAL_DRVDN

21.1.4.9 APB_MISC_GP_BATT_BCL_CFGPADCTRL_0

BATT_BCL_CFG Pad control register

Offset: 0x8f8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_BATT_BCL_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_BATT_BCL_CFG_CAL_DRVDN

21.1.4.10 APB_MISC_GP_BT_RST_CFGPADCTRL_0

BT_RST_CFG Pad control register

Offset: 0x8fc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_BT_RST_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_BT_RST_CFG_CAL_DRVDN

21.1.4.11 APB_MISC_GP_BT_WAKE_AP_CFGPADCTRL_0

BT_WAKE_AP_CFG Pad control register

Offset: 0x900 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_BT_WAKE_AP_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_BT_WAKE_AP_CFG_CAL_DRVDN

21.1.4.12 APB_MISC_GP_BUTTON_HOME_CFGPADCTRL_0

BUTTON_HOME_CFG Pad control register

Offset: 0x904 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_BUTTON_HOME_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_BUTTON_HOME_CFG_CAL_DRVDN

21.1.4.13 APB_MISC_GP_BUTTON_POWER_ON_CFGPADCTRL_0

BUTTON_POWER_ON_CFG Pad control register

Offset: 0x908 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_BUTTON_POWER_ON_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_BUTTON_POWER_ON_CFG_CAL_DRVDN

21.1.4.14 APB_MISC_GP_BUTTON_SLIDE_SW_CFGPADCTRL_0

BUTTON_SLIDE_SW_CFG Pad control register

Offset: 0x90c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_BUTTON_SLIDE_SW_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_BUTTON_SLIDE_SW_CFG_CAL_DRVDN

21.1.4.15 APB_MISC_GP_BUTTON_VOL_DOWN_CFGPADCTRL_0

BUTTON_VOL_DOWN_CFG Pad control register

Offset: 0x910 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_BUTTON_VOL_DOWN_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_BUTTON_VOL_DOWN_CFG_CAL_DRVDN

21.1.4.16 APB_MISC_GP_BUTTON_VOL_UP_CFGPADCTRL_0

BUTTON_VOL_UP_CFG Pad control register

Offset: 0x914 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_BUTTON_VOL_UP_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_BUTTON_VOL_UP_CFG_CAL_DRVDN

21.1.4.17 APB_MISC_GP_CAM1_MCLK_CFGPADCTRL_0

CAM1_MCLK_CFG Pad control register

Offset: 0x918 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000xxx00000xxxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_CAM1_MCLK_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_CAM1_MCLK_CFG_CAL_DRVDN

21.1.4.18 APB_MISC_GP_CAM1_PWDN_CFGPADCTRL_0

CAM1_PWDN_CFG Pad control register

Offset: 0x91c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxx00000xxx00000xxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_CAM1_PWDN_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_CAM1_PWDN_CFG_CAL_DRVDN

21.1.4.19 APB_MISC_GP_CAM1_STROBE_CFGPADCTRL_0

CAM1_STROBE_CFG Pad control register

Offset: 0x920 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxx00000xxx00000xxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_CAM1_STROBE_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_CAM1_STROBE_CFG_CAL_DRVDN

21.1.4.20 APB_MISC_GP_CAM2_MCLK_CFGPADCTRL_0

CAM2_MCLK_CFG Pad control register

Offset: 0x924 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxx00000xxx00000xxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_CAM2_MCLK_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_CAM2_MCLK_CFG_CAL_DRVDN

21.1.4.21 APB_MISC_GP_CAM2_PWDN_CFGPADCTRL_0

CAM2_PWDN_CFG Pad control register

Offset: 0x928 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxx00000xxx00000xxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_CAM2_PWDN_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_CAM2_PWDN_CFG_CAL_DRVDN

21.1.4.22 APB_MISC_GP_CAM_AF_EN_CFGPADCTRL_0

CAM_AF_EN_CFG Pad control register

Offset: 0x92c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxx00000xxx00000xxxxxxxxxxx)

Bit	Reset	Description
24:20	0x0	CFG2TMC_CAM_AF_EN_CFG_CAL_DRVUP
16:12	0x0	CFG2TMC_CAM_AF_EN_CFG_CAL_DRVDN

21.1.4.23 APB_MISC_GP_CAM_FLASH_EN_CFGPADCTRL_0

CAM_FLASH_EN_CFG Pad control register

Offset: 0x930 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxx00000xxx00000xxxxxxxxxxx)

Bit	Reset	Description

21.1.4.108 APB_MISC_GP_SDMMC1_PAD_CFGPADCTRL_0

SDMMC1_PAD_CFG Pad control register

Controls for BDSDMEM pads of SDMMC1

The following calibration codes need to be used for the pad under default conditions. In General, the calibration pad will provide the code for the pad.

To bypass calibration and provide default code for the required impedance, these values (in decimal) should be used.

On power ON, Vio is 3.3 V only. Software runs calibration, when Vio is switched to 1.8 V. So, 3.3 V DRV codes should be used as default values.

Table 102: DRV Codes

Supply	33 ohms		50 ohms	
	Up	DN	Up	DN
3.3V			8	8
1.8V			3	4

Offset: 0xa98 | Read/Write: R/W | Reset: 0x00808000 (0b0000x0001000x0001000xxxxxxxxxxxx)

Bit	Reset	Description
31:30	0x0	CFG2TMC_SDMMC1_CLK_CFG_CAL_DRVUP_SLWF:SlewF code override for CLK pad only. If autocal is disabled in the SDMMC1 controller, this register field value will be applied to SLWF input of sdmmc1 CLK pad only.
29:28	0x0	CFG2TMC_SDMMC1_CLK_CFG_CAL_DRVDN_SLWR:SlewR code override for CLK pad only. If autocal is disabled in the SDMMC1 controller, this register field value will be applied to SLWR input of sdmmc1 CLK pad only.
26:20	0x8	CFG2TMC_SDMMC1_PAD_CAL_DRVUP:3.3V 50ohm driver. If autocal is disabled in the SDMMC1 controller, this register field value will be applied to DRVUP input of CLK/DAT/CMD pads in sdmmc1 pin group

21.1.4.112 APB_MISC_GP_SDMMC3_PAD_CFGPADCTRL_0

SDMMC3_PAD_CFG Pad control register

Controls for BDSDMEM pads of SDMMC3.

The following calibration codes need to be used for the pad under default conditions. In general, the calibration pad provides the code for the pad.

To bypass calibration and provide default code for the required impedance, these values (in decimal) should be used.

On power ON, Vio is 3.3 V only. Software runs calibration, when Vio is switched to 1.8 V. So, we should use 3.3 V DRV codes as default values

Table 103: DRV Codes

Supply	33 ohms		50 ohms	
	Up	DN	Up	DN
3.3V			8	8
1.8V			3	4

Offset: 0xab0 | Read/Write: R/W | Reset: 0x00808000 (0b0000x0001000x0001000xxxxxxxxxxxx)

Bit	Reset	Description
31:30	0x0	CFG2TMC_SDMMC3_CLK_CFG_CAL_DRVUP_SLWF: SlewF code override for CLK pad only. If autocal is disabled in the SDMMC3 controller, this register field value will be applied to SLWF input of sdmmc3 CLK pad only.

Bit	Reset	Description
29:28	0x0	CFG2TMC_SDMMC3_CLK_CFG_CAL_DRVDN_SLWR: SlewR code override for CLK pad only. If autocal is disabled in the SDMMC3 controller, this register field value will be applied to SLWR input of sdmmc3 CLK pad only.
26:20	0x8	CFG2TMC_SDMMC3_PAD_CAL_DRVUP:3.3V 50ohm driver. If autocal is disabled in the SDMMC3 controller, this register field value will be applied to DRVUP input of CLK/DAT/CMD pads in sdmmc3 pin group
18:12	0x8	CFG2TMC_SDMMC3_PAD_CAL_DRVDN:3.3V 50ohm driver If autocal is disabled in the SDMMC3 controller, this register field value will be applied to DRVDN input of CLK/DAT/CMD pads in sdmmc3 pin group

21.1.4.113 APB_MISC_GP_EMMC4_PAD_CFGPADCTRL_0

EMMC4_PAD_E_CFG Pad control register

Offset: 0xab4 | Read/Write: R/W | Reset: 0x07ffc310 (0b0000x11111111111100001100010000)

Bit	Reset	Description
31:30	0x0	CFG2TMC_EMMC4_PAD_DRVUP_SLWF: SLWF code for CLK pad of emmc4 iobrick. If autocal is disabled in the SDMMC4 controller, this register field value will be applied to DRVUP_SLWF input of emmc4 iobrick which will be sent to CLK pad only.
29:28	0x0	CFG2TMC_EMMC4_PAD_DRVDN_SLWR: SLWR code for CLK pad of emmc4 iobrick. If autocal is disabled in the SDMMC4 controller, this register field value will be applied to DRVDN_SLWR input of emmc4 iobrick which will be sent to CLK pad only.
26	0x1	MISC2PMC_EMMC4_DAT7_PARK:0: Normal - 1: PARKED: default value should be 1 so that during LP0 exit the pads stay in DPD mode until pinmux recovery is done and I/O controllers are activated, etc.

21.1.4.160 APB_MISC_GP_QSPI_SCK_LPBK_CONTROL_0

Offset: 0xb78 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	0x1	QSPI_SCK_PAD_E_LPBK: When set, enables deep loopback in the QSPI pad

21.1.5 SATA Aux Registers

21.1.5.1 SATA_AUX_MISC_CNTL_1_0

MISC_CNTL_1 Register

Offset: 0x1108 | Read/Write: R/W | Reset: 0x00016XX0 (0bxxxxxxxxxxxxxx0010110xxx00xx00000)

Bit	R/W	Reset	Description
18	RW	0x0	AUX_RX_IDLE_STATUS_MASK: Set this bit to mask the aux_rx_idle_status input to the SATA core to 0. 0 = Do not mask the rx_stat_idle input to the SATA core 1 = Mask the rx_stat_idle input to the SATA core to 0. 0 = DISABLE 1 = ENABLE
17	RW	0x0	DEVSLP_OVERRIDE: Set this bit to override the DEVSLP output from the SATA core. 0 = Assertion of DEVSLP is controlled by the SATA core 1 = DEVSLP is asserted irrespective of the state of DEVSLP from the SATA core. 0 = DISABLE 1 = ENABLE
16	RW	0x1	DSP_SUPPORT: Set this bit to set the AHCI's PxDEVSLP.DSP register bit. 0 = Indicates the SATA port does not support device sleep 1 = Indicates the SATA port supports device sleep. 0 = CLEAR 1 = SET
15	RW	0x0	DESO_SUPPORT: Set this bit to set the AHCI's CAP2.DESO register bit. 0 = Indicates the SATA core has the capability to enter DevSleep from any link state 1 = Indicates the SATA core only has the capability to enter DevSleep from the slumber link state. 0 = CLEAR 1 = SET
14	RW	0x1	SADM_SUPPORT: Set this bit to set the AHCI's CAP2.SADM register bit. 0 = Indicates the SATA core does not have the capability to support hardware assertion of the DEVSLP 1 = Indicates the SATA core has the capability to support hardware assertion of the DEVSLP. 0 = CLEAR 1 = SET
13	RW	0x1	SDS_SUPPORT: Set this bit to set the AHCI's CAP2.SAS register bit. 0 = Indicates the SATA core does not support device sleep 1 = Indicates the SATA core supports device sleep. 0 = CLEAR 1 = SET
12	RW	0x0	RX_STAT_IDLE_MASK: Set this bit to mask the rx_stat_idle input to the SATA core to 0. 0 = Do not mask the rx_stat_idle input to the SATA core 1 = Mask the rx_stat_idle input to the SATA core to 0. 0 = DISABLE 1 = ENABLE
11	RO	X	SATA2IPSM_DEVSLP: Indicates if the SATA link is in DEVSLP. Used for debug purposes.
10:9	RO	X	SATA2IPSM_ST: Indicates whether the SATA link is in partial/slumber modes. Used for debug purposes.
8	RW	0x0	NVA2SATA_OOB_ON_SCONTROL_SPD_WR: If this bit is set to 1, the SATA controller will do an OOB and go through speed negotiation with the drive whenever its SCONTROL_SPD register is written. 0 = NO 1 = YES
7	RW	0x0	NVA2SATA_OOB_ON_POR: Controls whether or not SATA controllers do an OOB sequence automatically when they come out of reset. 0 = NO 1 = YES
6:5	RO	X	L0_RX_IDLE_T_SAX: l0_rx_idle_t value from the SATA controller When the SAX partition is power-gated, this field shows a clamped value. 0 = NORMAL

Bit	R/W	Reset	Description
4:3	RW	0x0	L0_RX_IDLE_T_NPG: Sets the l0_rx_idle_t value for the SATA PHY from apb_misc (non-power-gated logic). Before the SAX partition is power-gated, SATA_l0_rx_idle_t_npg needs to have the same value as SATA_l0_rx_idle_t_sax, then set SATA_l0_rx_idle_t_mux to '1'. This ensures that the SATA PHY is still receiving the correct threshold setting for OOB detection when the SAX is power-gated. After SAX power is restored, the same value is restored to the l0_rx_idle_t register in the SATA controller, then SATA_l0_rx_idle_t_mux can be set back to '0'. 0 = NORMAL
2	RW	0x0	L0_RX_IDLE_T_MUX: Select l0_rx_idle_t driving source for SATA PHY 0: From the SATA controller 1: From apb_misc 0 = FROM_SATA 1 = FROM_APB_MISC
1	RW	0x0	PMU2SATA_ACCLMTR_TRIG: This config bit is used inside SATA to select between the two accelerometer triggers, between the external trigger and the PMU's trigger. 0: External trigger disable 1: External trigger enable 0 = DISABLE 1 = ENABLE
0	RW	0x0	DEVICE_DIS_SATA0: Serial ATA Interface 0 Disable 1 = Internal Serial ATA Interface 0 disabled (Not seen as part of PCI space) 0 = Internal Serial ATA Interface 0 enabled. 0 = ENABLE 1 = DISABLE

21.1.5.2 SATA_AUX_RX_STAT_INT_0

RX_STAT_INT Register

Offset: 0x110c | Read/Write: R/W | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxx0xx0xx0xx)

Bit	R/W	Reset	Description
8	RW	0x0	SATA_DEVSLP_INT_DISABLE: SATA devslp interrupt disable 1 = Disables interrupt assertion when devslp interrupt status is set 0 = Enables interrupt assertion when devslp interrupt status is set 0 = ENABLE 1 = DISABLE
7	RO	X	SATA_DEVSLP: SATA devslp state interrupt status 1 = SATA link is in the devslp state 0 = SATA link is not in the devslp state 0 = NO 1 = YES

21.1.7 AP Control Registers

Secure Registers

21.1.7.1 APB_MISC_SECURE_REGS_APB_SLAVE_SECURITY_ENABLE_REG0_0

This block of registers is only accessible from a TrustZone® enabled master operating in secure mode.

APB Slave Security Enable Register 0

These registers are used to enable and disable secure access of corresponding APB slaves. If set, the corresponding APB slave is accessed only via secure transactions.

This register may only be accessed in TrustZone secure mode.

21.1.8 Pin Mux Selects

Refer to Chapter 9: Multi-Purpose I/O Pins and Pin Multiplexing (Pinmuxing) in this document for details on the Pinmux_aux registers.

21.2 APB DMA Controller

The APB DMA Controller is placed between the AHB Bus and the APB Bus and is a master on both buses.

The APB DMA Controller is used for block data transfers from a source location to the destination location. The source may be DRAM or IRAM, and the destination location could be devices placed on APB Bus; or vice versa. DMA transfers are done without any processor intervention other than register writes needed to program the parameters for a particular transfer, and accesses needed to handle any interrupts.

The APB DMA Controller has 32 fully programmable channels, which can all transfer data concurrently.

21.2.1 Features

- DMA master for transfers between external/internal memory and peripheral devices on the APB Bus
- Two modes of operation: single transfer (once) or continuous
- Programmable burst sizes of 1, 4, or 8 words
- Maximum transfer size is 1 GB per channel, with the minimum size being one word
- Programmable APB bus widths of 8, 16, and 32 bits
- Separate AHB and APB start addresses
- Per channel trigger and flow control mechanism support
- Channel to channel trigger support, i.e., ability to link up channels to start at the end of another channel's transfer, allowing scattering/gathering of physical memory.
- Interrupt generation at the completion of channel transfer
- Interrupts per channel can be routed to the CPU or BPMP-Lite
- Ability to hold processor until transfer is done
- Wrap mode supported for all channels in Once mode
- Ping-Pong feature supported in continuous mode
- Weighted round robin arbitration among channels at burst granularity. The weights for each channel can be set.
- Runs on APB clock. The APB clock generally runs at 1:2:2 or 1:2:3 clock ratios (sclk : hclk : pclk).
- APB DMA secure access feature allows configuration of secure and non-secure areas
- Address wraparound
- Global or individual channel pausing

21.2.2 Functionality

There are 32 channels in APB DMA. An APB DMA channel can transfer specified portions of data from an AHB address space (can be iRAMs or DRAMs on the MC) to an APB address space. APB DMA follows a simple round robin arbitration scheme, starting with channel 0.

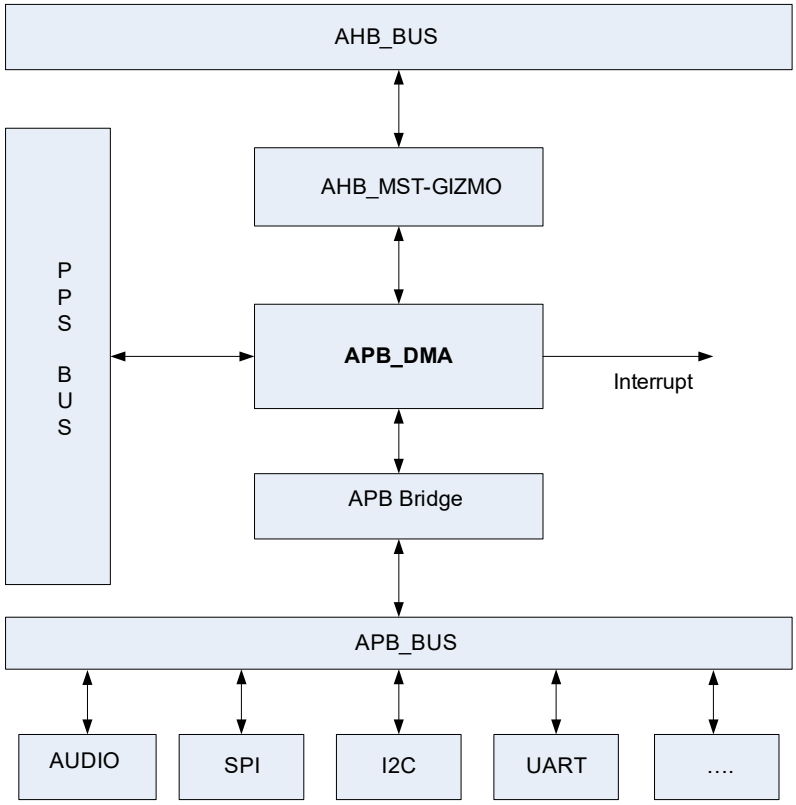
Each channel can have independent burst transfer sizes programmed to one word, four words, or eight words.

Each DMA channel supports:

- Enable bit: one for each channel and one global enable bit.
- Interrupt Enable at the end of transfer with ability to mask or route to desired processor.
- Ability to hold off a processor. The Processor that writes into this bit will be held until transfer is completed.

- Direction bit to determine the direction of transfer--AHB to APB or APB to AHB.
- Trigger and Flow selects. These are addition controls apart from channel enable, on which the transfer depends. Trigger is used to start a channel on some event to start the transfer and flow is used to proceed with every new burst transfer. These events are under either Software or Hardware control.
- Wrap feature wraps the LS nibble of the address back to ‘b0000 instead of incrementing to the next address if the required number of words has been transmitted.
- APB bus width is configurable whereas the AHB bus width is fixed to 32 bits. The APB bus can be 8, 16, or 32 bits wide. For an AHB burst of 8 (burst is always with regard to words) and an APB bus size of 16, there are: 8 words transferred to the APB side, or 16 halfwords transferred.
- Double Buffering Mode makes the APB DMA Burst Address reset to AHB Base Address after every even (2nd, 4th, 6th, etc.) APB DMA Transfer. This mode is used only along with continuous mode (once bit 0).
- Separate AHB start address and APB start address.
- Ability to delay the burst rate with the help of a global counter which can be programmed to desired value, which equals number of clocks delay required between each burst.

Figure 49: APB-DMA Block Diagram



21.2.3 APB DMA Secure Access

APB DMA secure access is determined by the channel security enable bits in the APB DMA Security register. A particular channel is secured by enabling the respective bit field section. Whether through the CPU or APB DMA, accesses are blocked if the SECURITY_EN bit of that region is enabled and the incoming access is non-secured.

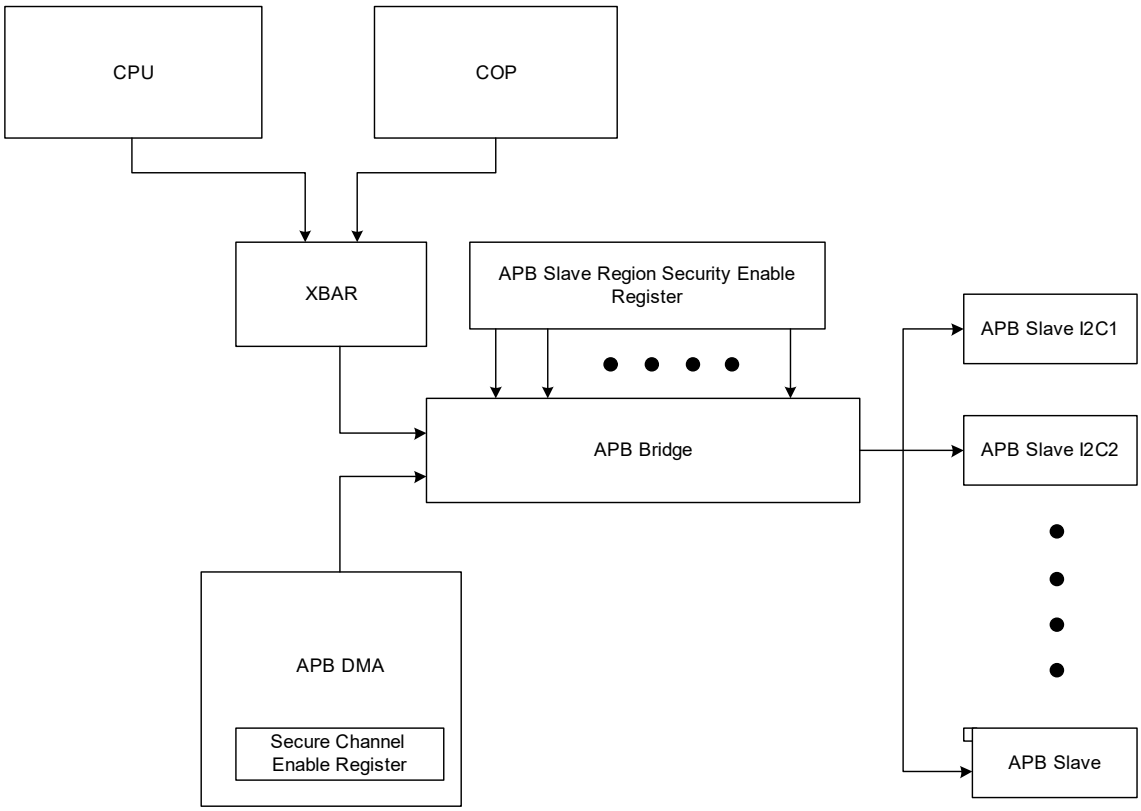
The APBDMA_SECURITY_REG register contains the fields CH_<0-31>_SECURITY_EN, which indicate which channel is secure. Write and read transactions to this register must always be secure.

If a channel is designated as secure, its registers must be written and read out in a secure manner. A non-secure write attempt will not affect any of the secure channel’s registers and a non-secure read attempt will not generate any read data.

If a channel is non-secure, its registers can be written or read either in a secure or a non-secure manner.

The following figure shows the security flow.

Figure 50: Security Flow Diagram



21.2.4 Programming Guidelines

Follow these guidelines when programming the APB DMA Controller:

The DMA transfer size should be in multiples of 4 bytes only.

The APB burst size and the FIFO trigger levels (in the modules) need to be programmed such that they do not lead to an overflow/underflow of the FIFO in the APB client.

All registers of a channel should be programmed before the Channel Enable bit in the channel's control register is set as follows:

1. Program the AHB Starting Address and APB Starting address in the *AHB_PTR and *APB_PTR registers.
2. Program the required AHB BURST size, WRAP word window size, and AHB_DATA_SWAP (byte swapping) option in the *AHB_SWQ register. The AHB BUS WIDTH is fixed to a 32-bit bus.
3. Program the required APB_BUS_WIDTH (as the peripheral), APB_DATA_SWAP (byte swapping) option, and WRAP word window size in the *APB_SEQ register.
4. Program the number of words to be transferred in the *WCOUNT register.
5. Program the trigger in the CHANNEL_*_CSRE register.
6. Program the Interrupt option, Hold Processor option, DMA transfer direction, Transfer Mode, and Flow Enable in the CHANNEL_*_CSR register.
7. Program the Global Enable (GEN) bit in the APB_DMA Command Register. The GEN bit can also be programmed before programming the channel registers.
8. Whenever the channel's ENB bit is enabled, the DMA starts the data transfer.

9. Each channel's status is observed by polling the APB_DMA Status Register. The number of words remaining to be transferred will be in the WORD_TRANSFER register.
10. The Tx/Rx Flow/Trigger requesters are programmed in the APB-DMA Requester Assignments Registers.
11. The busy (BSY) bit is set as soon as a DMA channel is enabled and is cleared after the transfer is completed.

Pausing and Ending of Data Transfers

- Clearing the Global Enable (GEN) bit causes the transfers that are in progress to be paused. Setting the GEN bit resumes the transfers. A channel should never be disabled when the DMA is in global pause.
- Setting the CHANNEL_PAUSE bit in the CSRE register pauses data transfers on that channel. If the CHANNEL_PAUSE bit of a particular channel is enabled during a data transfer, the data transfer is paused only on this channel after the completion of the current burst. It can be resumed by setting this bit to 0.
- If a channel's ENB is disabled independently while a transfer is in progress, the transfer ends after completing any burst sequence that is in progress.

Interrupts

- Interrupts are write-1-to-clear, i.e., an interrupt bit is cleared when the value of write data corresponding to the bit position of the interrupt bit is 1.
- An interrupt is generated when the last data is accepted by the AHB slave while writing on the AHB bus and once the last data is placed on APB bus while reading from AHB bus. Note that completion of an AHB write does not guarantee the data is written to DRAM. Refer to Chapter 19: AHB of this document for how data is flushed from AHB to the MC for this master.

Wraparound

Wraparound does not occur in between bursts; it is only after completing a burst that the address wraps around. Wraparound is possible for both AHB and APB addresses.

The programming of the AHB wraparound needs to account for the address that is programmed in the AHB start address and the burst size.

Usually, APB clients have a buffer of a fixed size. If the APB addresses are incremented after each word transfer, it is likely that the address would cross the address limit of that client and go into the address range of another client. To avoid this, the wrap feature is used. The default wraparound on the APB side is wrapping on 1 word. It prevents unnecessary address switching on the APB.

With the address wrap feature enabled, the LS nibble of the address wraps back to 0 after completion of the programmed number of words instead of incrementing the address.

Example: AHB burst size = 4 words, AHB start address = 0x4000_0000, AHB wrap on 32 words

In this case, the AHB addresses would be:

0x4000_0000, 0x4000_0004, 0x4000_0008, 0x4000_000C

…….

0x4000_0070, 0x4000_0074, 0x4000_0078, 0x4000_007C

When the address wrap feature is disabled, the addresses are incremented after each word transfer. This helps transfer data from/to contiguous locations.

Flow Control

When flow control is enabled, the number of words to be transferred must always be a multiple of the burst size/APB trigger level. Without flow control the following are possible:

- If a burst of 8 is requested with an address that is not aligned to an 8-word boundary, the DMA will do a single burst until it aligns itself to the 8-word boundary and then starts issuing burst requests.

- If a burst of 8 is requested and at any point of time the transfer size goes below 8, the DMA completes the remaining transfers with a burst of 4 or 1, whichever is possible.
- If a burst of 4 is requested with an address that is not aligned to a 4-word boundary, the DMA transfers a single burst until it aligns itself to the 4-word boundary.
- If a burst of 4 is requested and at any point of time the transfer size goes below 4, the DMA completes the remaining transfers with a burst of 1.

Continuous Mode

In continuous mode, when a transfer is in progress, the APB and AHB addresses and the WCOUNT fields can be reprogrammed in the middle of a data transfer. When the current transfer completes and a new transfer starts, it picks up the newly programmed values. All new programming must complete before the channel completes the data transfer. To be sure about this, CHANNEL_PAUSE can be used.

2x Mode

In 2x mode, the reprogramming can be done only on the second half of the data transfer.

21.2.5 APB DMA Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

21.2.5.1 APBDMA_COMMAND_0

APB-DMA Command Register

The Global Enable (GEN) bit in the command register enables the APB DMA. Clearing this bit causes active DMA transfers to be paused. Pending bus transactions (ongoing burst) will be completed, and no new transactions will be initiated. Setting this bit again resumes the transfers. Disabling this bit will disable the channel register access.

Note that the power on reset value for the APB DMA Global Enable is 0. This bit must be written to 1 before any APB DMA transactions can begin.

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	GEN: Enables Global APB-DMA 0 = DISABLE 1 = ENABLE

21.2.5.2 APBDMA_STATUS_0

APB-DMA Status Register

The Busy bits in the Status Register indicate which (if any) of the APB DMA channels have active pending APB DMA transfers. Note that Busy bits remain active in APB DMA transfers that are started in continuous (repetitive) mode until the enable bit for the APB DMA channel is cleared to 0 (by the software). Read-only flags are set/cleared by hardware.

21.2.5.3 APBDMA_CNTRL_REG_0

APB-DMA Counter Register

The APB DMA Counter is used to slow down the request rates on some APB DMA channels. The APB DMA Channel Counter Enable register stores bits that configure which (if any) channel(s) should be throttled (bits [31:0] of channel counter enable register correspond to the 32 APB DMA channels).

The APB DMA Counter initial/reload count value is programmed in the APB DMA Counter Register (bits[15:0]).The APB DMA Counter is loaded with this initial/reload count value whenever the APB DMA Counter Register is written, and is re-loaded to this saved initial count value on a burst complete (programmable). The APB DMA Counter value will decrement whenever an APB DMA burst complete, and the current count value is non-zero, and any of the bits [31:16] are set.

Offset: 0x10 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description

21.2.6 APB DMA Channel Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

Each of the 32 APB DMA channels has its own set of 10 APB DMA registers. Each channel has 64 bytes of address space. This subsection defines one complete set of APB DMA channel registers. The register spaces per APB DMA channel are listed in the table below.

Table 104: APB DMA Channel Register Mapping

Register Space	Channel Registers
0x0 – 0x3f	Channel 0 APB DMA Channel Registers
0x40 – 0x7f	Channel 1 APB DMA Channel Registers

Table 104: APB DMA Channel Register Mapping

Register Space	Channel Registers
0x80 – 0xbf	Channel 2 APB DMA Channel Registers
0xc0 – 0xff	Channel 3 APB DMA Channel Registers
0x100 – 0x13f	Channel 4 APB DMA Channel Registers
0x140 – 0x17f	Channel 5 APB DMA Channel Registers
0x180 – 0x1bf	Channel 6 APB DMA Channel Registers
0x1c0 – 0x1ff	Channel 7 APB DMA Channel Registers
0x200 – 0x23f	Channel 8 APB DMA Channel Registers
0x240 – 0x27f	Channel 9 APB DMA Channel Registers
0x280 – 0x2bf	Channel 10 APB DMA Channel Registers
0x2c0 – 0x2ff	Channel 11 APB DMA Channel Registers
0x300 – 0x33f	Channel 12 APB DMA Channel Registers
0x340 – 0x37f	Channel 13 APB DMA Channel Registers
0x380 – 0x3bf	Channel 14 APB DMA Channel Registers
0x3c0 – 0x3ff	Channel 15 APB DMA Channel Registers
0x400 – 0x43f	Channel 16 APB DMA Channel Registers
0x440 – 0x47f	Channel 17 APB DMA Channel Registers
0x480 – 0x4bf	Channel 18 APB DMA Channel Registers
0x4c0 – 0x4ff	Channel 19 APB DMA Channel Registers
0x500 – 0x53f	Channel 20 APB DMA Channel Registers
0x540 – 0x57f	Channel 21 APB DMA Channel Registers
0x580 – 0x5bf	Channel 22 APB DMA Channel Registers
0x5c0 – 0x5ff	Channel 23 APB DMA Channel Registers
0x600 – 0x63f	Channel 24 APB DMA Channel Registers
0x640 – 0x67f	Channel 25 APB DMA Channel Registers
0x680 – 0x6bf	Channel 26 APB DMA Channel Registers
0x6c0 – 0x6ff	Channel 27 APB DMA Channel Registers
0x700 – 0x73f	Channel 28 APB DMA Channel Registers
0x740 – 0x77f	Channel 29 APB DMA Channel Registers
0x780 – 0x7bf	Channel 30 APB DMA Channel Registers
0x7c0 – 0x7ff	Channel 31 APB DMA Channel Registers

21.2.6.1 APBDMACHAN_CHANNEL_n_CSR_0

APB-DMA-n Control Register

There are 32 APB DMA Channel Control Registers, one per channel (n = 0 through 31).

Writing a 1 to bit [31] of an APB DMA Channel Control Register will initiate the APB DMA transfer. Because this action will depend on some values programmed in the other registers, it is recommended that the registers in the address space in the required APB DMA channel be programmed before writing into control register.

In "Once" mode, the channel is disabled after the APB DMA transfer has completed. When the channel's transfer completes, an interrupt will be sent if the IE.EOC bit is set. If the transfer requires a trigger or flow, then the corresponding trigger selected by the "TRIG_SEL" or "REQ_SEL" field must become active respectively before the channel can starts its transfer. If both Trigger and Flow bits are set, both conditions must be met before the channel starts each DMA burst.

Offset: 0x0+ (n * 0x40) | Read/Write: R/W | Reset: 0x00000000 (0b00000xxxxx000000xxxxxxxxxxxxxxxx)

26:24	0x6	AHB_BURST: AHB Burst Size DMA Burst Length (encoded). 4 = 1 Word (1x32bits). 5 = 4 Words (4x32 bits). 6 = 8 Words (8x32bits), default 4 = DMA_BURST_1WORDS 5 = DMA_BURST_4WORDS 6 = DMA_BURST_8WORDS
19	0x0	DBL_BUF: 2X Double Buffering Mode (for Run-Multiple Mode with No Wrap Operations). 1 = Reload Base Address for 2X blocks (reload every other time). 0 = Reload Base Address for 1X blocks (default) (reload each time) 0 = RELOAD_FOR_1X_BLOCKS 1 = RELOAD_FOR_2X_BLOCKS
18:16	0x0	WRAP: AHB Address Wrap: AHB Address wrap-around window. 0=No Wrap (default). 5=Wrap on 512 word window. 1=Wrap on 32 word window. 6=Wrap on 1024 word window. 2=Wrap on 64 word window. 7=Wrap on 2048 word window. 3=Wrap on 128 word window. 4=Wrap on 256 word window 0 = NO_WRAP 1 = WRAP_0N_32WORDS 2 = WRAP_ON_64WORDS 3 = WRAP_ON_128WORDS 4 = WRAP_ON_256WORDS 5 = WRAP_ON_512WORDS 6 = WRAP_ON_1024WORDS 7 = WRAP_ON_2048WORDS

21.2.6.7 APBDMACHAN_CHANNEL_n_APB_PTR_0

APB-DMA-n APB Starting Address Pointer Register

There are 32 APB DMA APB Starting Address Pointer Registers, one per channel (n = 0 through 31).

Offset: 0x18 + (n * 0x40) │ Read/Write: R/W │ Reset: 0x00000000 (0b00000000000000000000000000000xx)

Bit	Reset	Description
31:2	0x0	APB_BASE: APB-DMA Starting address for APB Bus

21.2.6.8 APBDMACHAN_CHANNEL_n_APB_SEQ_0

APB-DMA-n APB Address Sequencer Assignments

There are 32 APB DMA APB Address Sequencer Registers, one per channel (n = 0 through 31).

Offset: 0x1c + (n * 0x40) | Read/Write: R/W | Reset: 0x20010000 (0bx0100xxxxxxxx001xxxxxxxxxxxxxxx)

Bit	Reset	Description
30:28	0x2	APB_BUS_WIDTH: 0 = 8-bit bus. 1 = 16-bit bus. 2 = 32-bit bus (default) 3 = 64-bit bus. (RSVD). 4 = 128-bit bus (RSVD) 0 = BUS_WIDTH_8 1 = BUS_WIDTH_16 2 = BUS_WIDTH_32 3 = BUS_WIDTH_64 4 = BUS_WIDTH_128
27	0x0	APB_DATA_SWAP: When enabled, the data going to the APB gets swapped as [31:0] --> {[7:0], [15:8], [23:16], [31:24] }. 0 = DISABLE 1 = ENABLE
18:16	0x1	APB_ADDR_WRAP: APB Address Wrap-around Window. 0 = No Wrap. 1 = Wrap on 1 Word Window (default). 2 = Wrap on 2 Word Window. 3 = Wrap on 4 Word Window. 4 = Wrap on 8 Word Window. 5 = Wrap on 16 Word Window. 6 = Wrap on 32 Word Window. 7 = Wrap on 64 Word Windows (rsvd). 0 = NO_WRAP 1 = WRAP_0N_1WORDS 2 = WRAP_ON_2WORDS 3 = WRAP_ON_4WORDS 4 = WRAP_ON_8WORDS 5 = WRAP_ON_16WORDS 6 = WRAP_ON_32WORDS 7 = WRAP_ON_64WORDS

21.2.6.9 APBDMACHAN_CHANNEL_n_WCOUNT_0

APB-DMA-n Word Count Register

There are 32 APB DMA Word Count Registers, one per channel (n = 0 through 31).

Offset: 0x20 + (n * 0x40) | Read/Write: R/W | Reset: 0x00000000 (0bxx00000000000000000000000000xx)

Bit	Reset	Description
29:2	0x0	WCOUNT: Number of 32-bit word cycles.

21.2.6.10 APBDMACHAN_CHANNEL_n_WORD_TRANSFER_0

APB-DMA-n Word Transfer Register

There are 32 APB DMA Word Transfer Registers, one per channel (n = 0 through 31).

Offset: 0x24 + (n * 0x40) | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
29:2	X	COUNT: APB-Current 32-bit Word Cycles. Flags set/cleared by hardware.

CHAPTER 22: USB COMPLEX

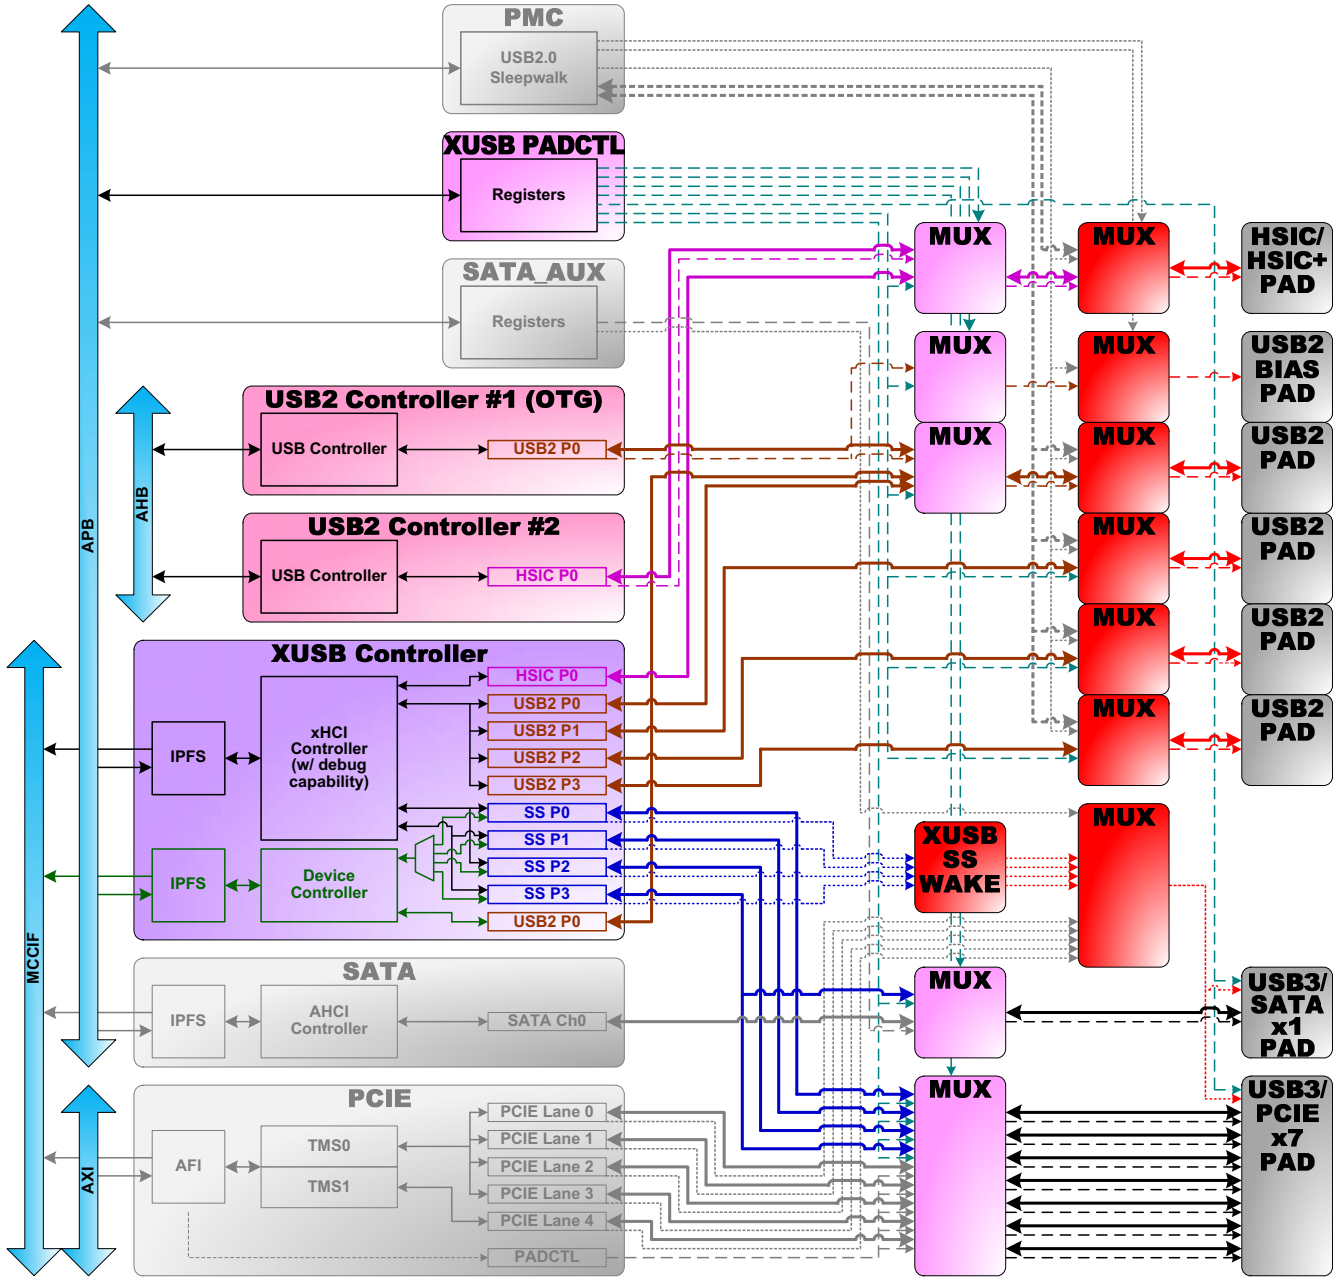
Note: *The ULPI functionality described in this section has been deprecated from Tegra® X1 devices, and is not supported by NVIDIA.*

22.1 USB Overview

The Tegra X1 device has two USB 2.0 controllers (named USB_OTG and USB2) and one XUSB 3.0 (xHCI/Device) controller (named XUSB), controlling a total of eight exposed ports and one internal only port shared among them. There are a total of 4 USB2 ports and 4 USB3 ports, and 1 HSIC port. Of the eight ports, one can be USB3.0 OTG or USB2.0 OTG while the rest are Host Mode only ports.

The following diagram shows the relationship between the different USB controllers and interfaces. Note that some USB ports are shared between the USB 2.0 and XUSB controllers. The HSIC pad supports one port. The APB slave provides the programmability of the owner of the pad to be a USB2 or XUSB controller.

Figure 51: Tegra X1 USB Controllers and Interfaces



The XUSB Pad Control logic and the USB2 controllers are allocated under the ungated partition of Vaux_soc power domain, where the XUSB Host Mode and Device Mode, PCIe, and SATA are allocated under power-gate-able partitions that are separately power gated.

The XUSB Pad Control logic is a stand-alone APB slave that accepts downstream requests for programming the Pad MUX and Pad specific parameters. The XUSB Pad Control logic also provides the programmability of the capabilities of the individual ports of XUSB, where PCIe and SATA each have their own per-port controls for the UPHY, and USB2 controllers each have their own per-port controls for the USB2.0 pads.

Below is a summary of the key components in the USB complex:

- USB_OTG and UTMIP: This is the primary USB port that supports OTG. USB recovery is also supported on this interface.
- USB2 and UHSIC: This interface allows connection of an HSIC peripheral/host on the PCB board.
- XUSB and UTMIP3. XUSB can support multiple interfaces at the same time.

- XUSB and UTMIP2. XUSB can support multiple interfaces at the same time.
- XUSB and UTMIP1. XUSB can support multiple interfaces at the same time.
- XUSB and UTMIP. XUSB can support multiple interfaces at the same time.
- XUSB and UHSIC. XUSB can support multiple interfaces at the same time.
- XUSB and SS. XUSB can support multiple interfaces at the same time, up to 4 Host Modes or 3 Host Modes and one OTG mode.

USB_OTG supports 16 bidirectional endpoints in Device Mode, where USB2 should never be advised or programmed to support Device Mode. Endpoint 0 of USB_OTG is always a bidirectional control endpoint. All other endpoints can be programmed as one of Bulk, Interrupt, Isochronous, or Control type in either direction. Control endpoints are always bidirectional and hence to program an endpoint as control type, both IN and OUT directions need to be programmed to control type. Conversely, if an endpoint has either IN or OUT direction programmed to be non-control type, the other direction also needs to be programmed to be non-control type. The maximum packet size supported on any endpoint is 1024 bytes in high-speed mode, for both Device and Host Modes.

VBus and ID detection are supported via an external PMIC. The input for VBUS detection status connects via dedicated sideband signals from the VGPIO. In addition, the APB slave should implement local software override bits to allow software to directly program the VBUS status to the APB Slave that bypasses the VGPIO.

22.2 USB 2.0 Controllers and Interfaces

The USB 2.0 controllers in the Tegra X1 mobile processors provide mechanisms for the processor to communicate with a PC as a peripheral or to communicate with USB 2.0 peripherals, such as keyboards, mouse devices, cameras, or storage devices, as a host using regular USB 2.0 ports. The USB 2.0 controllers also provide mechanisms for Tegra X1 devices to communicate with an on-board baseband controller with HSIC or regular UTMIP interfaces. Each Tegra X1 device provides two USB 2.0 controllers with five USB interfaces: four regular USB ports and one HSIC (see Figure 51).

The Tegra X1 device supports peripheral functionalities with USB 2.0 controller #1, which implements interrupt mechanisms to support device and host OTG operations with the regular USB 2.0 port. Tegra X1 devices support battery charging charger detection capabilities and associated interrupt mechanisms that are compliant with USB Battery Charging specification version 1.2 with USB 2.0 controller #1. For battery charging, software programming sequences are required to support the operations in response to hardware notifications from USB 2.0 controller #1.

Both USB 2.0 controllers support the EHCI programming model for scheduling transactions and interface managements as hosts. Each USB 2.0 controller contains an integrated transaction translator hub to support USB 1.1 transactions when connected to a USB 1.0 peripheral. USB 2.0 controller #1 supports EHCI-like programming models for scheduling responses to host requests.

Tegra X1 USB 2.0 controllers support L1 and L2 (suspend) link power managements. Tegra X1 USB 2.0 controllers support remote wakeup, wake on connect, wake on disconnect, and wake on overcurrent in all Tegra X1 power states, including deep sleep mode.

22.2.1 USB 2.0 Controller #1 (USB_OTG)

USB 2.0 Controller #1 only connects to USB2 port 0 (USB2 P0), which is the primary USB 2.0 port on Tegra X1 devices. USB 2.0 Controller #1 shares the same USB2 P0 pins with the USB 3.0 xHCI controller. The pinmux must be programmed prior to USB 2.0 Controller #1 using USB2 P0.

USB 2.0 Controller #1 supports both USB 2.0 device and USB 2.0 host operations. USB recovery is supported only with USB 2.0 Controller #1 and USB2 P0.

Wake-up from deep sleep mode is also supported on VBUS and accessory detect (ACCx_DETECT) pins.

22.2.2 USB 2.0 Controller #2

USB 2.0 Controller #2 must always be configured to Host mode, and it can be configured to connect to HSIC Port #1.

HSIC

USB 2.0 Controller #2 can be configured to use HSIC interface #1 to allow connection of an on-board peripheral supporting an HSIC interface to the Tegra X1 device. HSIC can support baseband controllers that support an HSIC interface.

22.2.3 Interface Restrictions

USB controller #2 is exclusively used for HSIC.

22.2.4 AHB Interface

Both USB 2.0 controllers adapt the AHB interface as masters and slaves for communicating with the other Tegra X1 devices. The following table lists the AHB interface numbers for each controller.

Table 105: AHB Master and Slave Numbers

Controller	AHB Master Number	AHB Slave Number
USB 2.0 Controller #1	6	6
USB 2.0 Controller #2	18	9

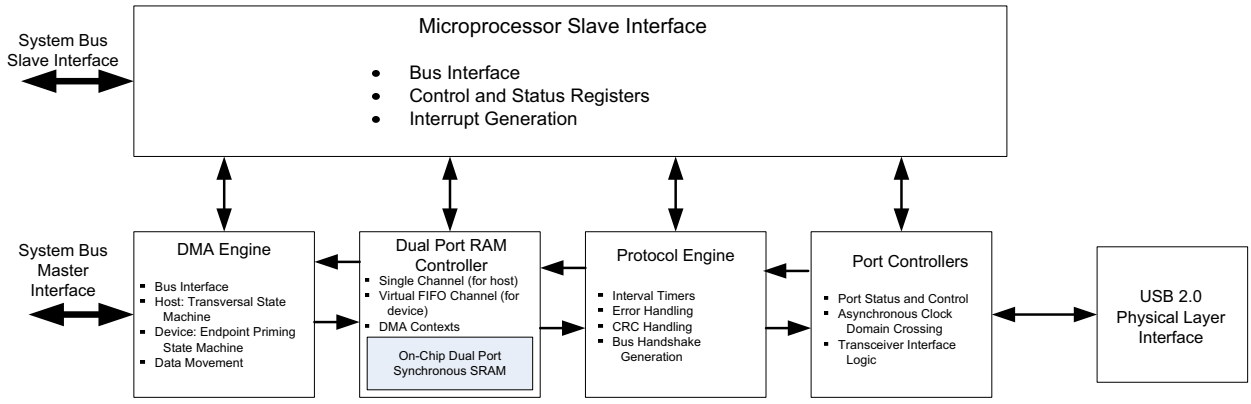
22.3 USB 2.0 Programming Interfaces

Both USB 2.0 controllers offer the same functionalities and may be configured to either host or device. However, due to interface restrictions, only USB 2.0 controller #1 should be configured to Device Mode, while USB 2.0 controller #2 must always be configured to Host Mode.

- Host controller registers and data structures are implemented as standard EHCI programming interface.
- Host controller supports USB 1.1 Full and Low speed devices via integrated transaction translator hub through EHCI standard data structures, instead of utilizing companion USB 1.1 host controller.
- Device controller registers and data structures are implemented as extensions to the EHCI programmers interface.

Figure 52 illustrates the control and datapaths block diagram of USB 2.0 controllers.

Figure 52: USB 2.0 Controller Block Diagram



22.3.1 Endpoint Capabilities

USB 2.0 controller #1 supports 16 IN and 16 OUT endpoints in Device Mode. Endpoint 0 is always a bidirectional control endpoint. All other endpoints can be configured as Bulk, Interrupt, Isochronous or Control endpoints in either direction. Control endpoints are always bidirectional. Hence for a control endpoint, the endpoints in both directions must be configured to be control endpoint. Conversely, if a particular endpoint number has either IN or OUT direction programmed to be a non-control endpoint, the other direction must also be configured as a non-control endpoint.

The maximum packet size supported on any endpoint is 1024 bytes in high-speed mode.

22.4 XUSB Controller

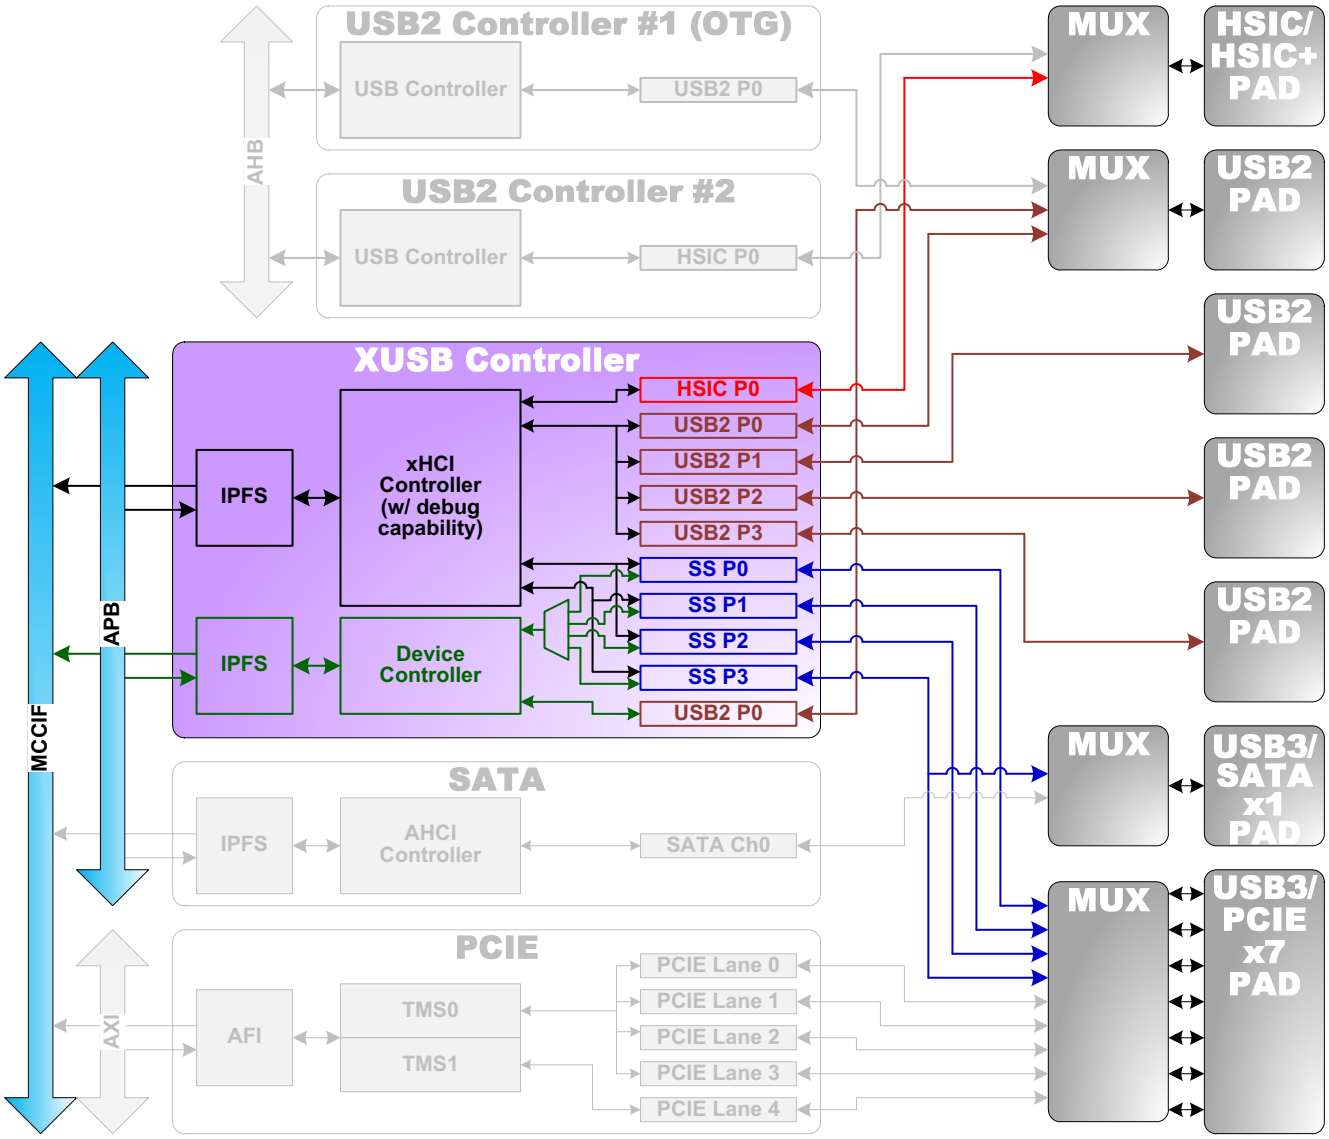
The Tegra X1 device provides 1 XUSB controller that can support up to 4 regular USB 3.0 ports and their companion regular USB 2.0 ports, or up to 4 standalone USB 2.0 ports (one of the four could be OTG). The XUSB controller provides mechanisms to communicate with USB 2.0 peripherals, such as keyboards, mouse devices, and card readers. The USB 3.0 controller also provides mechanisms to communicate with USB 3.0 peripherals, such as cameras and storage devices, as a host using regular USB 3.0 ports.

The XUSB controller supports xHCI Debug Capability. The xHCI Debug Capability supports only super speed link with one control, one bulk IN and one bulk OUT endpoints.

The XUSB controller supports Device Mode allowing the mobile platform to be accessed from a host device. The Device Mode supports both high/full speed and super speed with up to 15 IN and 15 OUT endpoints, where a control endpoint consists of one bidirectional endpoint. The endpoints can be configured by the driver to support transfer types of different device classes such as modem, storage, or input devices.

The following figure illustrates the connection between the XUSB controller and USB interfaces in Tegra X1 devices, where each USB 3.0 receptacle must encompass 1 USB 3.0 port and 1 USB 2.0 port from the XUSB controller. The XUSB Controller shares the same USB 2.0 Port #0 pins with USB 2.0 controller #1. The pinmux must be programmed prior to XUSB Controller using USB 2.0 Port #0.

Figure 53: Tegra X1 XUSB Controller and Interfaces



The XUSB controllers support the xHCI programming model for scheduling transactions and interface managements as a host that natively supports USB 3.0, USB 2.0, and USB 1.1 transactions with its USB 3.0 and USB 2.0 interfaces.

The Tegra X1 XUSB controller supports USB 2.0 L1 and L2 (suspend) link power management and USB 3.0 U1, U2, and U3 (suspend) link power managements. The XUSB controller supports remote wakeup, wake on connect, wake on disconnect, and wake on overcurrent in all Tegra X1 power states, including deep sleep mode.

USB 2.0 Ports

Each USB 2.0 port operates in USB 2.0 High Speed mode when connecting directly to a USB 2.0 peripheral. Each USB 2.0 port operates in USB 1.1 Full and Low Speed modes when connecting directly to a USB 1.1 peripheral.

All USB 2.0 ports operating in High Speed mode share one High Speed Bus Instance, which means 480 Mb/s theoretical bandwidth is distributed across these ports. All USB 2.0 ports operating in Full or Low Speed modes share one Full/Low Speed Bus Instance, which means 12 Mb/s theoretical bandwidth is distributed across these ports.

USB 2.0 ports of the XUSB controller support software initiated L1 and L2 (suspend) link power management. USB 2.0 ports of the XUSB controller do not support hardware initiated L1 link power management.

USB 3.0 Ports

USB 3.0 ports only operate in USB 3.0 Super Speed mode. All USB 3.0 ports share one Super Speed Bus Instance, which means 5 Gb/s theoretical bandwidth is distributed across these ports.

USB 3.0 ports of the XUSB controller support hardware initiated U1 and U2 link power management as well as software initiate U3 (suspend) link power management.

Note: *For details on USB2.0 and USB3.0 wake host capability, refer to the document entitled eXtensible Host Controller Interface for Universal Serial Bus (xHCI) on the Intel website:* http://www.intel.com/content/dam/www/public/us/en/documents/technical-specifications/extensible-host-controler-interface-usb-xhci.pdf

---

Falcon Microcontroller

The Tegra X1 XUSB controller integrated an NVIDIA Falcon microcontroller to perform the following tasks:

- Command ring processing
- Event ring management
- Endpoint scheduling
- Context save and restore

22.4.1 Interface Restrictions

A USB3.0 connector includes both USB2.0 and USB3.0 interface signals. The USB2.0 interface signals of a USB3.0 connector must be assigned to the USB3.0 controller for xHCI specification compliance.

Similarly, if the USB3.0 interface signals are used to connect to a peripheral on the system board, such as a USB3.0 hub, the USB2.0 signals connecting to that peripheral must be assigned to the USB3.0 controller.

Only USB2.0 Port 0 can be configured as a device port or an OTG port. Any one of the USB3.0 port can be exclusively paired with USB 2.0 Port 0 and operates as the USB 3.0 interface of the device port or OTG port. Either USB 2.0 or USB 3.0 interface would be active when connected to a host port.

22.4.2 Host and Memory Access Interfaces

The XUSB controller adapts the APB interface as its host interface for configuration and memory-mapped I/O register accesses. The XUSB controller adapts direct memory as its memory interface for direct memory accesses.

22.5 XUSB Device Mode

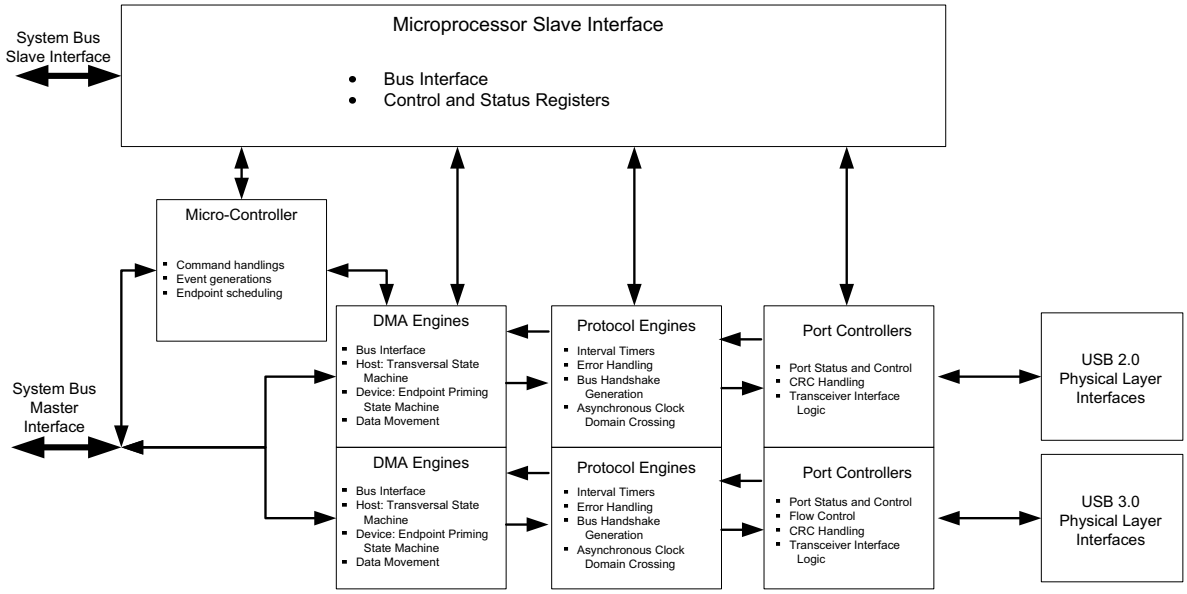
The xHCI host controller supports Debug Capability to satisfy the WHQL requirement of Microsoft. The xHCI Debug Capability supports only super speed link with one control, one bulk IN and on bulk OUT endpoints. It is expected that Microsoft will provide the drivers for both the host system and the system-under-debug to allow access to the system-under-debug via its xHCI Debug Capability.

The Device Mode allows the mobile platform to be accessed from a host device. The Device Mode supports both high/full speed and super speed with up to 15 IN and 15 OUT endpoints, where a control endpoint consists of one bidirectional endpoint. The driver of the Device Mode is expected to be developed in-house initially. The endpoints can be configured by the driver to support transfer types of different device classes such as modem, storage, or input devices.

22.6 XUSB Programming Interface

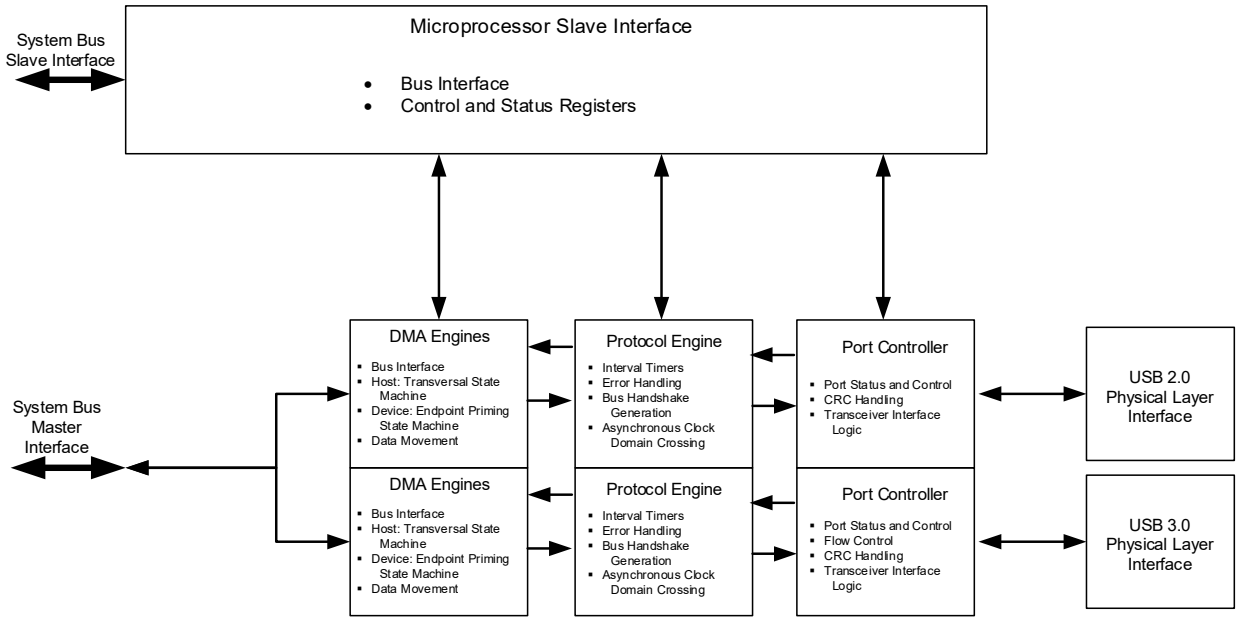
The XUSB Controller supports host functionality with host controller registers and data structures implemented as standard xHCI programming interface. The following figure illustrates the control and datapaths block diagram of the XUSB host controller.

Figure 54: XUSB Host Controller Block Diagram



The XUSB Controller supports device functionality with device controller registers and data structures developed to resemble xHCI programming interface. The following figure illustrates the control and datapaths block diagram of the XUSB device controller.

Figure 55: XUSB Device Controller Block Diagram

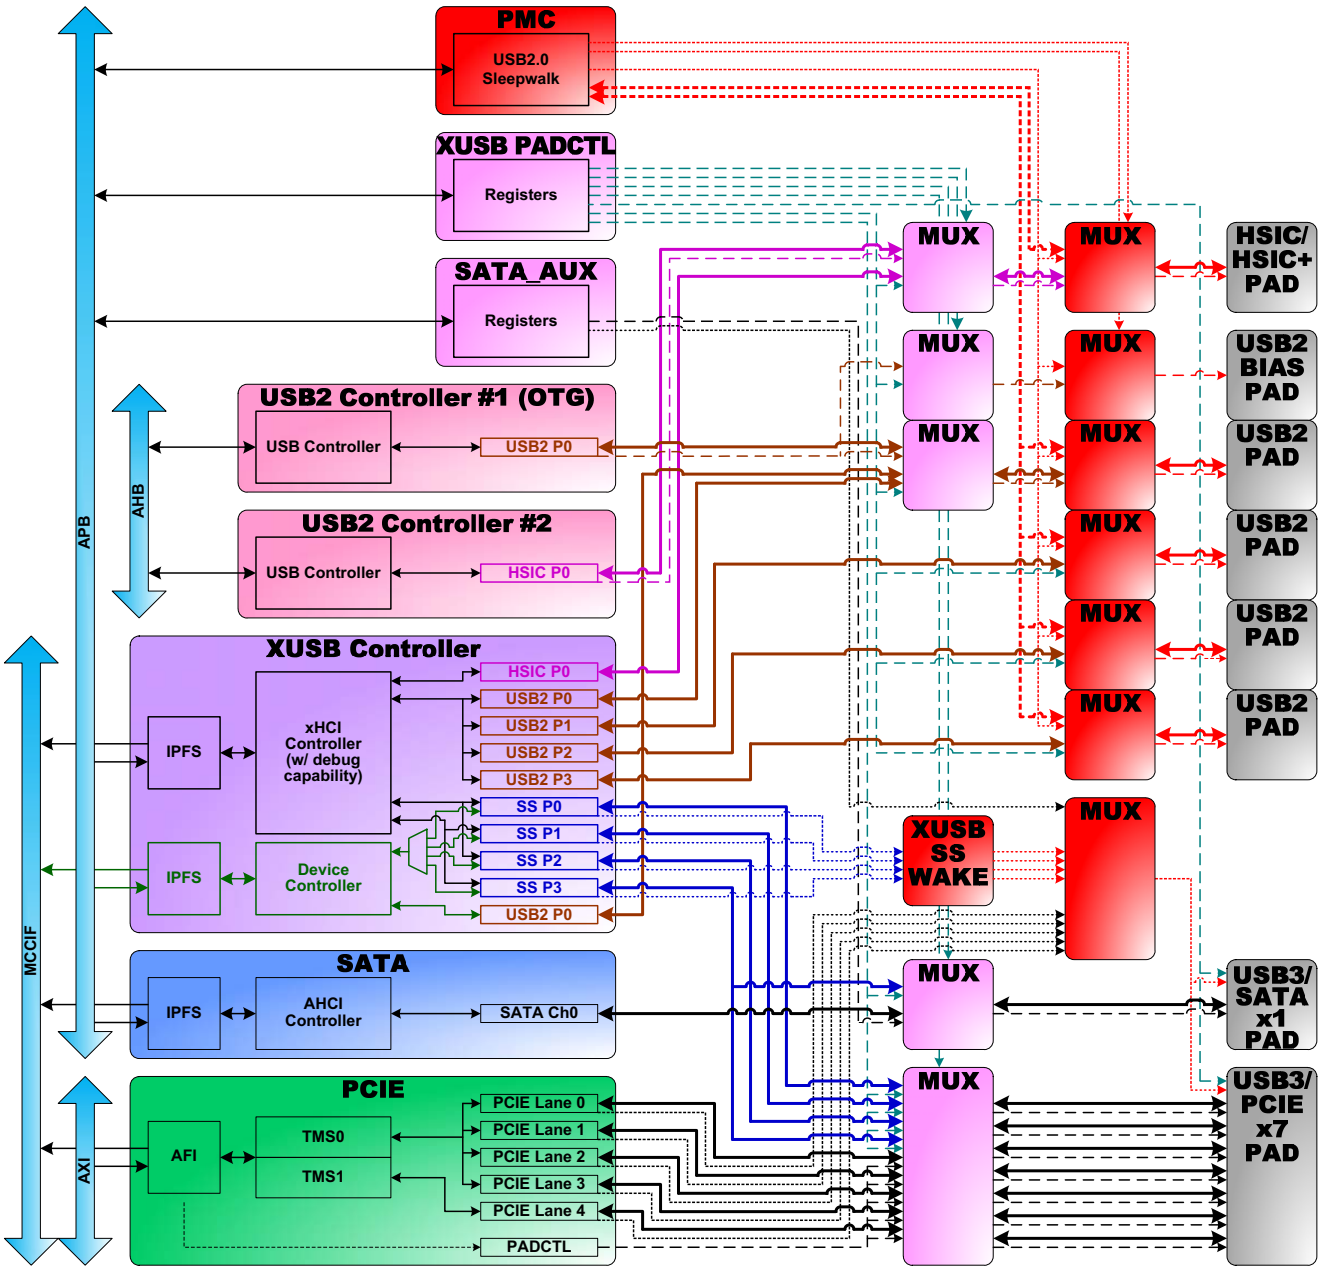


22.7 USB PADCTL

The XUSB Pad Control logic and the Synopsys USB2 controllers are allocated under the ungated partition of Vaux_soc power domain, where the XUSB Host Mode and Device Mode, PCIe, and SATA are allocated under power-gate-able partitions that are separately power gated.

The XUSB Pad Control logic is a stand-along APB slave that accepts downstream requests for programming the Pad MUX and Pad specific parameters. The XUSB Pad Control logic also provides the programmability of the capabilities of the individual ports of XUSB, where PCIe and SATA each have their own per-port controls for the UPHY, and USB2 controllers each have their own per-port controls for the USB2.0 pads.

Figure 56: Tegra X1 USB PADCTL and Interfaces



The following table lists the supported PCIe, XUSB, and SATA use cases in the Tegra X1 processor, where a 7-lane pad is shared between PCIe and XUSB's SuperSpeed ports and a 1-lane pad is shared with XUSB's SuperSpeed port and SATA.

Use Case	Lane P0	Lane P1	Lane P2	Lane P3	Lane P4	Lane P5	Lane P6	Lane S0
1A	PCIE x1 (Controller 1)	PCIE x2 (Controller 0)		USB SS (Port 2)	USB SS (Port 3)	USB SS (Port 1)	USB SS (Port 0)	SATA
1B	PCIE x1 (Controller 1)	PCIE x2 (Controller 0)		USB SS (Port 2)		USB SS (Port 1)	USB SS (Port 0)	USB SS (Port 3)
2A	PCIE x1 (Controller 1)	PCIE x4 (Controller 0)				USB SS (Port 1)	USB SS (Port 0)	SATA
2B	PCIE x1 (Controller 1)	PCIE x4 (Controller 0)				USB SS (Port 1)	USB SS (Port 0)	USB SS (Port 3)
3	USB SS (Port 2)	PCIE x2 (Controller 0)			USB SS (Port 3)	USB SS (Port 1)	USB SS (Port 0)	SATA

Use Case	Lane P0	Lane P1	Lane P2	Lane P3	Lane P4	Lane P5	Lane P6	Lane S0
4A	USB SS (Port 2)	PCIE x4 (Controller 0)				USB SS (Port 1)	USB SS (Port 0)	SATA
4B	USB SS (Port 2)	PCIE x4 (Controller 0)				USB SS (Port 1)	USB SS (Port 0)	USB SS (Port 3)

When set as a x4 controller, PCIe Controller 0 can further support the following modes, with lane 0 of the device connecting to either Lane P1 or Lane P4.

Use Case	Lane P0	Lane P1	Lane P2	Lane P3	Lane P4	Lane P5	Lane P6	Lane S0
		PCIE x4 (Controller 0)						
		PCIE x2 (Controller 0)						
				PCIE x2 (Controller 0)				
		PCIE x1 (Controller 0)						
					PCIE x1 (Controller 0)			

When set as an x2 controller, PCIe Controller 0 can further support the following modes, with lane 0 of the device connecting to either Lane P1 or Lane P2.

Use Case	Lane P0	Lane P1	Lane P2	Lane P3	Lane P4	Lane P5	Lane P6	Lane S0
		PCIE x2 (Controller 0)						
		PCIE x1 (Controller 0)						
			PCIE x1 (Controller 0)					

22.7.1 USB PADCTL Features

- Stand-alone APB slave
  - MMIO registers implemented under a stand-alone APB slave
  - MMIO space outside of xHCI host controller and Device Mode
- XUSB Port Control
  - Global configuration for XUSB ports
- Pad Control and Pad MUX
  - Pad ownership assignments for the PCIe pad, the SATA pad, and all USB 2.0 interface pads
  - Global pad programming outside of transaction protocols for the PCIe pad and the SATA pad
- VGPIO
  - VBUS and ID assertion/detection status via dedicated sideband signals from VGPIO
  - Software overrides allow software to directly update status from accessing PMIC
- Battery Charging
  - Supports standard and charging downstream port identification control when programmed as host/downstream ports
  - Supports charging port detection reporting as when programmed device/upstream ports
- On-the-Go
  - SuperSpeed and HighSpeed/FullSpeed device only – LowSpeed not supported
  - Supports OTG role swapping with SuperSpeed warm reset (RSP) and HighSpeed host negotiation protocol (HNP)

- Supports Session request protocol (SRP)
- Does not support attach detection protocol (ADP)

22.7.2 APB Interface

USB PADCTL adapts the APB interface as its host interface for configuration and memory-mapped I/O register accesses.

22.8 Programming Guidelines

22.8.1 USB_OTG Programming Guidelines

22.8.1.1 USB_OTG Programming

Clock Initialization

After power-on-reset, the USB clocks are disabled. Software can enable the USB clocks by setting CLK_ENB_USBD in the CLK_OUT_ENB_L register to ENABLE. Also, the USB controller stays in reset. Software should bring it out of reset by first setting SWR_USBD_RST in the RST_DEVICES_L register to ENABLE and then setting it to DISABLE.

Some parameters in UTMIP need to be programmed before the UTMIP can be brought out of reset. These parameters need to be programmed every time the USB controller is reset: the SWR_USBD_RST in RST_DEVICES_L register and RST in the USB2D_USBCMD register.

After UTMIP is reset, the PHY clock takes some time to come up, so software must wait until the USB_PHY_CLK_VALID bit in the USB_SUSP_CTRL register becomes valid. This bit, when set to 1, also generates an interrupt if RSM_IE is set in the USB_SUSP_CTRL register.

PHY Clock Control

The PHY clock can be turned off using the SUSP_SET bit in the USB_SUSP_CTRL register. This bit must be pulsed by first writing a 1 and then writing a 0 to the bit.

To turn on the PHY clock, software should write to SUSP_CLR in the USB_SUSP_CTRL register. This bit must be pulsed by first writing a 1 and then writing a 0 to the bit.

The current suspend status of the PHY can be checked by the USB_PHY_CLK_VALID bit of the USB_SUSP_CTRL register. If this bit is 1, the PHY clock is turned on; otherwise it is off.

The PHY clock can be turned on automatically on the events mentioned below. Set only the required wakeup enable bits based on the state of the USB as mentioned below. Do not set unnecessary wakeup enable bits. When the PHY clock wakes up under any such event, make sure that the wakeup enable bits are turned off as soon as possible.

There is an interrupt generated whenever the PHY clock is turned on which can be checked by checking that the value of USB_PHY_CLK_VALID in the USB_SUSP_CTRL register is 1. The interrupt can be enabled/disabled by setting the RSM_IE bit in USB_SUSP_CTRL to 1/0.

Notes:

- *The PLLU_ENABLE bit in the PLLU_BASE register should be always set to ENABLE. All parameters for PLLU in the PLLU_BASE and PLLU_MISC registers should be set according to the oscillator frequency used. Not doing that will put the USB PHY PLL in a free-running mode, and can result in undesirable side effects.*
- *When the USB PHY is suspended, the PCLK should not be stopped. It can be reduced to 32 KHz, however. If the system clock is stopped, then it might not be possible to bring up the system on a wakeup event described below.*

There are two cases to consider for controlling the PHY clocks depending on whether the Tegra X1 device is in device or Host Mode.

Device Mode

The PHY clock can be turned off in two cases:

- When the USB cable is not connected, the VBUS signal is 0. In this case, software needs to turn on the PHY clock on cable insertion.
- When the USB cable is connected, the PHY clock can only be turned off when the SLI bit in the USB2D_USBSTS register is set to 1 when the USB Host puts the USB bus in suspend mode. This bit can be used to generate an interrupt if the SLE bit in the USB2D_USBINTR register is set to 1.

  In this case, software needs to set two bits in the USB_SUSP_CTRL register to turn on the PHY clock on a USB resume or a USB reset event from USB Host: WAKE_ON_DISCON_EN (Wake on Disconnect enable) and WK_RSM_EN (Wake on Resume enable).

  If WK_RSM_EN (bit 8) in the USB_SUSP_CTRL register is set to 1, the PHY clock can be turned on automatically on receiving a USB resume event from the USB Host. If WAKE_ON_DISCON_EN in the USB_SUSP_CTRL register is set to 1, the PHY clock can be turned on automatically on receiving a USB reset event from the USB Host or if the USB cable is disconnected. These bits should only be turned on after the PHY clock is turned off. The method described above can be used to interrupt the processor when the PHY clock is turned on. Also, turn off these bits when coming out of the suspend state.

Host Mode

When a device is not connected, software can set the WKCN bit in USB2D_PORTSC1 register. After this, it can stop the PHY clock by using the method described above. The PHY clock resumes automatically when a device is connected. The method described above can be used to interrupt the processor when the PHY clock is turned on.

With a device connected, software needs to put the USB system in the suspend state by setting the SUSP bit in the USB2D_PORTSC1 register. It needs to wait until this bit is set to 1 by the controller to make sure that the USB system actually went into the suspend state. It can enable the WK_RSM_EN bit in the USB_SUSP_CTRL register and the WK_DS bit in the USB2D_PORTSC1 register. Then it can stop the PHY clock as described above. The PHY clock is turned on automatically if the USB device disconnects or it does a remote wakeup signaling. There is an interrupt associated with this as described above.

If the software wants to wake up the USB system, then it needs to turn on the PHY clock as described above.

22.8.1.2 LPM Support

Software should program the following register to set the duration that the host keeps generating resume signaling when the host initiated an exit from L1 based on system and device specific requirements:

CONTROLLER_USB2D_USBCMD_0.HIRD

The following software walk-around is required to extend the resume signaling if required.

1. Move pad out of Suspend

   IF_USB_SUSP_CTRL_0.USB_SUSP_CLR = SET (1)
2. Fake resume signaling

   UTMIP_MISC_CFG0_0.UTMIP_DPDM_OBSERVE = 1

   UTMIP_MISC_CFG0_0.UTMIP_DPDM_OBSERVE_SEL = 0xE
3. Wait the required time following the encoding of the HIRD value
4. Enable hardware to drive the resume signaling

   CONTROLLER_USB2D_PORTSC1_0.FPR = Resume driven on port (1)
5. Disable fake resume signaling as hardware takes over

   UTMIP_MISC_CFG0_0.UTMIP_DPDM_OBSERVE = 0
6. Wait for hardware to finish driving resume signaling by checking the following bit:

   CONTROLLER_USB2D_PORTSC1_0.FPR = No resume driven on port (0)

7. Wait 50 µs
8. Enable hardware to start sending SOF and executing schedule

   CONTROLLER_USB2D_USBCMD_0.RS = RUN (1)

Software Initiated L1 Support

Software puts the bus into the L1 or Suspend (L2) state by setting the same SUSP bit in PORTSC1 register. The difference is to put the link to L1, software should first program the following registers:

CONTROLLER_USB2D_PORTSC1_0.DA = N, Device Address of the attached device

CONTROLLER_USB2D_HOSTPC1_DEVLC_0. EPLPM = 0

CONTROLLER_USB2D_PORTSC1_0.SLP = Suspend using L1 (1)

Software should then set the following register bit to initiate L1 entry:

CONTROLLER_USB2D_PORTSC1_0.SUSP = 1

Software can check the following registers to ensure the link has entered L1:

CONTROLLER_USB2D_PORTSC1_0.SUSP = Port in suspend state (1)

CONTROLLER_USB2D_PORTSC1_0.SSTS = L1STATE_ENTERED (0)

If L1 cannot be entered successfully, the bus stays in the L0 state. Hardware will generate a port change interrupt when L1 entry fails. So software can check the following registers for the reason of the failed entry. Software can retry the L1 entry later if the reason is NYET_PERIPH, where the peripheral indicates it is not ready to put the bus into L1.

CONTROLLER_USB2D_PORTSC1_0.SUSP = Port not in suspend state (0)

CONTROLLER_USB2D_PORTSC1_0.SSTS = NYET_PERIPH (1), or

= L1STATE_NOT_SUPPORTED (2),

= PERIPH_NORESP_ERR (3),

When the bus is in the L1, software can set the following register at any time to bring the link back to the L0 state.

CONTROLLER_USB2D_PORTSC1_0.FPR = Resume driven on port (1)

Hardware Initiated L1 Support

Software can enable hardware to put the bus to L1 automatically. Software should first program the following registers, where *X* is the system specific idle threshold measured in number of SOFs with no activities in between:

CONTROLLER_USB2D_PORTSC1_0.DA = N, device address of the attached device

CONTROLLER_USB2D_HOSTPC1_DEVLC_0. EPLPM = 0

CONTROLLER_USB2D_HOSTPC1_DEVLC_0. LPMFRM = X

Software should then set the following register bit to enabled hardware initiated L1 entry:

CONTROLLER_USB2D_HOSTPC1_DEVLC_0. LPMX = 1

22.8.1.3 Streaming Mode

The USB controller supports streaming, where it starts sending DATA packets for OUT transactions when the controller has not finished fetching the entire data packet from system memory to its TX buffer. For IN transactions, the streaming mode allows data to be written to system memory before the entire data packet is received in its RX buffer. Streaming mode can be disabled with the following bit:

CONTROLLER_USB2D_USBMODE_0.SDIS

Enabling streaming mode allows lower latency and higher bandwidth of USB transfers but requires lower system memory latency.

Long system memory latency might cause TX buffer underrun/RX buffer overrun when streaming mode is enabled. Streaming mode should be kept enabled when USB controller is initialized and streaming mode should only be disabled if it is determined the system latency does cause the buffer overrun/underrun issues.

22.8.2 USB2 Programming Guidelines

The USB2 controller supports a UHSIC interface. All of these interfaces are directly controlled through USB2 register space.

22.8.2.1 Clock Initialization

After power-on-reset, the USB clocks are disabled. Software can enable the USB clocks by setting CLK_ENB_USB2 in CLK_OUT_ENB_L register to ENABLE.

Also, USB stays in reset. So software should bring it out of reset by first setting the SWR_USB2_RST in RST_DEVICES_L register to ENABLE and then setting it to DISABLE.

After the clocks for USB2 are up, software can program any register for USB2 required for proper configuration.

PLLU outputs a 480 MHz clock (FO_UHSIC) for the UHSIC interface. If using any of these interfaces, PLLU should be programmed appropriately.

Any time after USB2 is reset, or the UHSIC PHY comes out of suspend, software needs to wait until ULPI/UHSIC PHY clock comes up. It can do that by checking for USB_PHY_CLK_VALID bit in USB2_IF_USB_SUSP_CTRL register. If this bit is 1, PHY clocks are up; otherwise, they are not. There are interrupts associated with this bit: if USB_PHY_CLK_VALID_INT_ENB is set to ENABLE, USB_PHY_CLK_VALID_INT_STS will be set to SET whenever the PHY clock becomes valid. Software can write a 1 to USB_PHY_CLK_VALID_INT_STS to clear the interrupt status.

Before doing anything useful on USB2, one of its interfaces needs to be selected and configured.

Selection of UHSIC Interface

1. The UHSIC I/O pad is in the power-down state at power-on. Bring it out of power-down mode by setting the PD_BG, PD_TX, PD_RX, PD_ZI and RPD_DATA, RPD_STROBE fields in the UHSIC_PADS_CFG1 register to 0.
2. Bring the tracking circuit out of power-down mode by clearing the PD_TRK bit.
3. Add 25 µs delay to allow calibration to complete.
4. Tracking circuit can be powered down now by setting PD_TRK=1.
5. Hold UHSIC in reset by writing 1 to the UHSIC_RESET field in the IF_USB_SUSP_CTRL register.
6. Program the PLLU parameters to enable the UHSIC PLLU clock.
7. Select the UHSIC interface by writing 1 to the UHSIC_PHY_ENB field in the IF_USB_SUSP_CTRL register.
8. Program the configuration parameters for UHSIC.
9. Release reset to the UHSIC by writing 0 to the UHSIC_RESET field in the IF_USB_SUSP_CTRL register.
10. Set the CM field in the USB2D_USBMODE register to HOST mode.
11. Program the USB2 controller to use the UHSIC PHY by writing 0 to the PTS field in the CONTROLLER_1_USB2D_HOSTPC1_DEVLC register.
12. Program the UHSIC_HS_POSTAMBLE_OUTPUT_ENABLE field in the UHSIC_TX_CFG0 register to “1”.
13. Wait until the PHY clock comes up by checking the USB_PHY_CLK_VALID bit in the IF_USB_SUSP_CTRL register. An interrupt can be generated as explained above.

22.8.2.2 PHY Clock Control

The PHY clock can be turned off using the PHCD bit in the USB_PORTSC1 register. Note: This bit does not need to be pulsed.

To turn on the PHY clock, software should write to USB_SUSP_CLR in USB2_IF_USB_SUSP_CTRL register. This bit must be pulsed by first writing a 1 and then writing a 0 to the bit.

Whenever the PHY is placed in the suspend mode, the PHY clock is turned off and USB_PHY_CLK_VALID in the USB2_IF_USB_SUSP_CTRL register is set to 0. Software should make sure that the PHY clock shuts down by polling this bit whenever it places the PHY into suspend mode.

The PHY clock can be turned on automatically on the events mentioned below. Set only the required wakeup enable bits based on the state of the USB as mentioned below. Do not set unnecessary wakeup enable bits. When the PHY clock wakes up under any such event, make sure that the wakeup enable bits are turned off as soon as possible.

To prevent the PHY clock from waking up on unnecessary glitches on the USB pins, software can set the USB_WAKEUP_DEBOUNCE_COUNT field in the USB_SUSP_CTRL register to a non-zero value (between 1-7). This will allow the wakeup event to be debounced by the equivalent number of HCLK cycles.

An interrupt is generated whenever the PHY clock is turned on, which can be checked by checking the value of USB_PHY_CLK_VALID in the USB_SUSP_CTRL register to be 1. The interrupt can be enabled/disabled by setting the USB_PHY_CLK_VALID_INT_ENB bit in the USB_SUSP_CTRL register to 1/0.

To clear the USB_WAKEUP_INT_STS and USB_PHY_CLK_VALID_INT_STS interrupts, software can write a 1 to corresponding bits.

Generally, whenever the PHY is woken up from the suspend mode, first a wakeup event is generated (USB_WAKEUP_INT_STS = 1) followed by a PHY clock valid interrupt (USB_PHY_CLK_VALID_INT_STS = 1) when PHY clock starts up.

22.8.2.3 Bus Signaling Procedure Changes for the UHSIC Interface

To support the UHSIC interface, some changes are required in the bus signaling procedure for USB2 controller (connect and bus reset sequences) as described in the subsections below:

Host Mode - Bus Connect Sequence

The normal connect sequence assumes that port power has been enabled on a downstream port and the device has signaled a “Connect” on the bus. This will generate a port change interrupt and the software takes action from here. Standard EHCI connect interrupt can be used to detect the device connect.

Host Mode: Bus Reset Sequence

This is a reconnect procedure without physically detaching the USB cable. This operation is demanded by software whenever necessary as it is the case when an unrecoverable anomaly takes place. It would then bring the bus, the port, and the device into a well-known state.

1. Check if PortReset (the PR bit in the USB2D_PORTSC1 register) is NOT active. If by any means a bus reset is already taking place, it must be stopped before proceeding. This is done by clearing the bit and polling until it goes LOW.
2. Enable the “PortReset” bit - Start the HSIC bus reset on a downstream port by activating the PR bit of the USB2D_PORTSC1 register.
3. Wait until the end of the reset. This wait time is defined by the USB 2.0 specification and has the effect of holding the reset signaling on the HSIC bus.
4. Clear the PR bit.Stop the reset signaling by clearing the respective port reset bit.
5. Poll until the reset bit goes LOW to guarantee that the reset bit is effectively cleared;
6. Poll until LineState is DPlus.This confirms that the reset signaling has really finished on the HSIC bus and that the USB2 controller is ready to connect again.
7. Proceed with the “HOST Bus Connect Sequence” as described above. From here on, the procedure is the same as with an initial connect, instructing the USB2 controller to enter HS directly, skipping speed negotiation.
8. Standard EHCI reset interrupt can be used in Tegra X1 HSIC because native HSIC support is built-in.

22.8.3 UTMIP Programming Guidelines

A Tegra X1 device has a total of 4 UTMIP interfaces and four cabled USB ports. These ports are not part of a multiport host configuration. They are completely independent ports and can be configured in any combination of device or host. Internally, these ports correspond to USB controller 2.0, and any three XUSB controllers. UTMIP Port 0 is controlled only by the USB 2.0 controller. Externally, these are USB ports 0, 1, 2, and 3. All UTMIP PHY interfaces are identical instances of the same design. All four controllers use latest edition of USB core controller.

22.8.3.1 Holding USB in Reset

It is important that most static configuration of the UTMIP (and USB) be done while the unit is held in reset. For example, holding reset ensures that PLL_U is disabled and can be reconfigured. It also ensures that transactions are not occurring on the USB interface. Holding reset in both a controller and its corresponding PHY can be achieved by using the RST bit of the USB2D_USBCMD register.

22.8.3.2 PLL_U Programming

The USB ports use a cascaded PLL scheme to guarantee a high clock quality. First there is a PLL_U, which is the source clock for both the USB PLLs that are dedicated to ports. PLL_U (of type CLKPLL960_USB) produces reference clocks for all forms of USB (UTMIP, UHSIC). The table below describes the parameter settings that are dependent on the crystal clock reference frequency. The parameters are specified in decimal notation.

Table 106: 480 MHz PLL_U Output Frequency Fo = (Fi·N)÷(M· 2) With VCO_FREQ=0

Fi (MHz)	12.0 MHz	13.0 MHz	16.8 MHz	19. 2MHz	26.0 MHz	38.4 MHz	48.0 MHz
N (PLLU_DIVN)	960	960	400	200	960	200	960
M (PLLU_DIVM)	12	13	7	4	26	4	12

These parameters can be found in the PLLU_BASE register. The PLLU_OVERRIDE bit should be set to 0. PLLU_VCO_FREQ parameter must also be set to 0.

> ***Note:*** *PLL_U must be properly configured in the Boot ROM. DO NOT change the parameters of PLL_U while the unit is running. The same applies to the USB_PHY_PLL.*

22.8.3.3 PLL_U and USB_PHY_PLL Automatic Startup Times

The PLL_U and USB_PHY_PLL automatic startup times are used in reset and suspend modes to kick start the PLLs. Software should not manually force the PLL up and down because it cannot do so rapidly enough to meet the protocol. The following table lists the start times, which must be set up in the Boot ROM.

Table 107: PLL Automated Start Times (Must be Set Up in the Boot ROM)

Crystal Frequency	12.0 MHz	38.4 MHz
PLLU_ENABLE_DELAY_COUNT	2	5
PLLU_STABLE_COUNT	47	150
PLL_ACTIVE_DLY_COUNT	8	24
XTAL_FREQ_COUNT	118	375

PLLU_ENABLE_DLY_COUNT should be set for at least 1 microsecond, PLLU_STABLE_COUNT should be set for at least 1 ms, the PLL_ACTIVE_DLY_COUNT should be at least 10 us, and the XTAL_FREQ_COUNT set for about 2.5 ms.

22.8.3.4 Fuse Programming

The Tegra X1 device incorporates fuses to account for process variation in high speed data eye swing. The high speed data eye is controlled through the SETUP[6:0] transceiver pad parameter of the USB control registers. To set this parameter via the fuses, set the UTMIP_SPARE_CFG0[3] bit on all USB ports. This must be done in the Boot ROM. The default is to maintain

backward compatibility, which implies no fuses are used by default. The objective is to get the data eye swing as close as possible to 400mV without falling below the mark under typical operating conditions.

22.8.3.5 Programming the Tracking Length Time

The PD_TRK signal is used to power down the bias cell. After 25 microseconds of bias cell operation, the PD_TRK signal can be turned high to save power. This can be automated by programming a timing interval as given in the following table.

Table 108: 25 µs Timer on Bias Cell Tracking (for Set Up in the Boot ROM)

Crystal Frequency	12.0 MHz	38.4 MHz
UTMIP_BIAS_PAD_TRK_COUNT (UTMIP_BIAS_CFG1[7:3])	5	15

All values in the table are decimal. This parameter must be set in the Boot ROM while the crystal clock is stopped. To stop the crystal clock, disable the UTMIP_PHY_XTAL_CLOCKEN bit of register UTMIP_MISC_CFG1 and then re-enable it when done.

Because there is more than one UTMIP sharing the same bias cell, power down is done through a daisy chain, requiring power down across all ports.

22.8.3.6 Powering Down a USB Port Outside of Deep Power Down (DPD)

When a port is known to be disabled, there needs to be a mechanism to stop its power consumption for situations outside of DPD. This section addresses disabling a port while powered up.

Powering down of USB at times other than deep power down should be done by setting all specialized PLL and pad power down pins instead of using the global E_DPD pins of the USB analog components. It is safer to power down the cells through the traditional power down pins when the 3.3V and 1.2V supplies might still be on. This is achieved by setting the following pad controls from UTMIP register space. Before setting the power down bits; save previous registers values so that they may be restored. This type of power down should not be done in the Boot ROM.

Table 109: UTMIP Pad Controls

Pad Control	Analog Cell	Register Bit Settings
PD	Transceiver	UTMIP_FORCE_PD_POWER_DOWN=1
PD2	Transceiver	UTMIP_FORCE_PD2_POWER_DOWN=1
PD_ZI	Transceiver	UTMIP_FORCE_PDZI_POWER_DOWN=1
PD_DR	Transceiver	UTMIP_FORCE_PDDR_POWER_DOWN=1
PD_CHRP	Transceiver	UTMIP_FORCE_PDCHRP_POWER_DOWN=1
PD_DISC	Transceiver	UTMIP_FORCE_PDDISC_POWER_DOWN=1
PD_CHG	Transceiver	UTMIP_PD_CHG=1
PD	Bias	UTMIP_BIASPD=1
PD_TRK	Bias	UTMIP_FORCE_PDTRK_POWER_DOWN=1
OTG_PD	Bias	UTMIP_OTGPD=1
ID_PD	Bias	UTMIP_IDPD_SEL=1, UTMIP_IDPD_VAL=1
ENABLE	PHY PLL	UTMIP_FORCE_PLL_ENABLE_POWERDOWN=1
ACTIVE	PHY PLL	UTMIP_FORCE_PLL_ACTIVE_POWERDOWN=1
PD_SAMP_A/C	PHY_PLL	UTMIP_FORCE_PD_SAMP_A/C_POWERDOWN=1
ENABLE	PLL U	UTMIP_FORCE_PLLU_POWERDOWN=1
UTMIP	PHY	UTMIP_PHY_XTAL_CLOCKEN=0

22.8.3.7 Extending Debouncer Period Length

USB debouncers provide a programmable debounce to alleviate the software burden. This is done with the UTMIP_DEBOUNCE_TIME_SCALE parameter located at UTMIP_BIAS_CFG1[13:8]. The default implies a timescale factor of

1. The timescale should not be programmed at Boot ROM time. The timescale register field incremented by 1 multiplies the debounce duration for all debouncers.

In the Boot ROM, the A debounce period should be set to 10 ms. This is dependent on the crystal frequency scale. The following table shows how it is programmed.

Table 110: 10 ms Timer on the A Debounce Period

Crystal Frequency	12.0 MHz	13.0 MHz	16.8 MHZ	19.2 MHz	26.0 MHz	38.4 MHz	48.0 MHz
UTMIP_BIAS_DEBOUNCE_A	30000	32500	42000	48000	65000	96000	120000

To program values of 96000 and 120000 for crystal clock frequencies of 38.4 and 48 MHz, respectively, these steps must be followed:

1. In the debounce register, program 48000 for a 38.4 MHz crystal clock or 60000 for a 48 MHz clock.
2. Set UTMIP_BIAS_DEBOUNCE_TIMESCALE to 1 by writing into the USB2_UTMIP_BIAS_CFG1[1] register field.

22.8.3.8 Deep Power Down Behavior

Tegra X1 devices' deep power down behavior for USB wake-up events is controlled in the PMC via registers USB_DEBOUNCE_DLY, USB_AO and the WAKE_MASK (USB_EVENT field) of the PMC unit. These control the wake-up events, their debounce duration, and their debounce length while powered down. USB port 0 has a possible event on ID or VBUS detection. These can be configured at startup time. These registers take over from the UTMIP registers when the chip is powered down. The programming depends on the context of the chip. For example, if USB port 0 is a dedicated host port then the VBUS wake-up event should be kept powered down. Conversely, a dedicated Device Mode port may not want to wake-up on the detection of an ID connector and can chose to power down ID.

22.8.3.9 Miscellaneous Boot ROM Fields

The UTMIP fields in the following table must be programmed at Boot ROM time. These should be set when the USB device is held in reset.

Field	Value
UTMIP_FS_PREAMBLE_J (UTMIP_TX_CFG0)	1
UTMIP_PD_CHG (UTMIP_BAT_CHRG_CFG0)	1
UTMIP_XCVR_LSBIAS_SEL (UTMIP_XCVR_CFG0)	0
UTMIP_SPARE_CFG0[3]	1
UTMIP_IDLE_WAIT (UTMIP_HSRX_CFG0)	17
UTMIP_ELASTIC_LIMIT (UTMIP_HSRX_CFG0)	16
UTMIP_HS_SYNC_START_DLY (UTMIP_HSRX_CFG1)	9

22.8.3.10 PHY Resets

Additional controls have been provided to stop the USB PHY (and its clocks) by issuing a reset to the PHY only (as opposed to a reset encompassing the controller and the PHY). This is akin to the Reset found in the UTMI+ standard. This is done in both controllers. See the UTMIP_RESET field of the USB_SUSP_CTRL register for more information.

22.8.3.11 Static Boot ROM Configuration for UTMIP

The boot ROM configuration for UTMIP should be done while the unit is held in Reset. For correct behavior, the following sequence MUST be followed:

1. Apply Reset to the USB controller (and UTMIP).
2. Run the crystal clock for approximately 5 microseconds while the UTMIP is in reset.
3. Stop the crystal clock by setting UTMIP_PHY_XTAL_CLOCKEN Low. This only stops the crystal clocks in the UTMIP units.

4. Program PLL_U as described in the “PLL_U Programming” section.
5. Program automatic PLL start times as described in the “PLL_U and USB_PHY_PLL Automatic Startup Times” section.
6. Remove power downs from USB_PHY_PLL ACTIVE/ENABLE/PD_SAMP_A/C and PLL_U.
7. Program the tracking duration as described in “Programming the Tracking Length Time.” Remove the power downs from PD (Bias) and disable PD_TRK. After 25 µs (tracking time), enable PD_TRK by writing 0 into UTMIP_FORCE_PDTRK_POWER_DOWN.
8. Once PD (Bias) is disabled, disable OTG_PD after 1 µs.
9. Remove powerdowns from ID_PD and VBUS_WAKEUP_PD. This can be removed earlier, as there is no timing or sequential relation with other signals.
10. Once the PLL_U, USB_PHY_PLL, and Bias pad are ready, remove PD (Transceiver). After 400 ns, the USB pad is ready for HS/FS/LS operation.
11. There are other powerdowns which can be removed if needed (as such not needed for Boot ROM). These are PD / PD_ZI / PD_DR / PD_CHRP / PD_DISC / PD_CHG.
12. Program the debouncer length time as described in “Extending Debouncer Period Length.”
13. Program various static parameters of the UTMIP as described in “Miscellaneous Boot ROM Fields.”
14. Restart the crystal clock by setting UTMIP_PHY_XTAL_CLOCKEN.
15. Resume any previous USB programming work that falls outside of UTMIP and release reset. From the UTMIP perspective it does not matter when reset is released, as long as it is after step 8. It will take about 3.5 ms before the 60 MHz clock appears once reset is released.

From a UTMIP perspective, ensure that all the cabled USB port PHYs are configured similarly in the Boot ROM.

22.8.3.12 EHCI Deviations

- Embedded Transaction Translator – Allows direct attachment of FS and LS devices in Host Mode without the need for a companion controller.
- Embedded design interface – This core does not have a PCI Interface and therefore the PCI configuration registers described in the EHCI specification are not applicable.

Programmable Physical Interface Behavior

This design supports multiple Physical interfaces which can operate in differing modes when the core is configured with software programmable Physical Interface Modes. Software programmability allows the selection of the Physical interface part during the board design phase instead of during the chip design phase. The control bits for selecting the Physical Interface operating mode have been added to the HOSTPCx register providing a capability that is not defined by EHCI.

Port Reset

The port connect methods specified by EHCI require setting the port reset bit in the PORTSCx register for a minimum duration of 10ms. Due to the complexity required to support the attachment of devices that are not high speed, there are counter already present in the design that can count the 10ms reset pulse to alleviate the requirement of the software to measure this duration. The basic connection is then summarized as the following:

- [Port Change Interrupt] Port connect change occurs to notify the host controller driver that a device has attached.
- Software shall write a ‘1’ to the reset the device.
- Software shall write a ‘0’ to the reset the device after 10 ms.
- Driver needs to wait until port change interrupt is asserted and port reset is cleared

---

Note: *Should the EHCI host controller driver attempt to write a ‘0’ to the reset bit while a reset is in progress the write will be ignored and the reset will continue until completion.*

- [Port Change Interrupt] Port enable change occurs to notify the host controller that the device is now operational and at this point the port speed has been determined.

Port Speed Detection

After the port change interrupt indicates that a port is enabled, the EHCI stack should determine the port speed. Unlike the EHCI implementation which will re-assign the port owner for any device that does not connect at High-Speed, this host controller supports direct attach of non high-speed devices. Therefore, the following differences are important regarding port speed detection:

- Port Owner is read-only and always reads 0.
- A 2-bit Port Speed indicator (PSPD) has been added to HOSTPCx to provide the current operating speed of the port to the host controller driver.

Port Reset duration is 55 ms instead of 50 ms.

Port Suspend (PORTSC.Suspend) bit is set immediately after setting the bit. As per EHCI a 4 ms delay is expected for this bit to be set.

Tegra X1 devices also have the following cases that are not directly compliant to EHCI:

- USB controller/PHY interface initialization
- PHY Clock shutdown/wakeup procedure during suspend/resume/connect/disconnect
- PMC logic use for special low power modes during suspend/LP0

Notes:

- *UTMIPLL can be sourced from the osc_clk (38.4 MHz) or PLLU output (480 MHz). Default source is osc_clk. In cases, where PLLU is being used as a source for UTMIPLL reference clock, ensure that PLLU is enabled and locked before enabling UTMIPLL.*
- *PLLE can be sourced from the osc_clk (38.4 MHz) or PLL_REFE output (624 MHz). Default source is osc_clk. In cases, where PLL_REFE is being used as a source for PLLE reference clock, ensure that PLL_REFE is enabled and locked before enabling PLLE.*
- *Both Brick PLLs are sourced from PLLE (100 MHz) output. So, PLLE should always be enabled and locked first before enabling Brick PLLs.*
- *For PLLE and pex_pad PLL/sata_pad PLL, PLLE needs to be running when software is enabling pex_pad PLL or sata_pad PLL. The hardware sequencer cannot be enabled for PLLE (as it might disable PLLE) until software has enabled brick PLLs and subsequently has enabled the Brick PLL hardware sequencers as well.*
- *Boot loaders should perform the minimum PLL programming for access boot media. For example, if boot from PCIe is desired, boot loader should initialize PLLE and pex_pad PLL. In this case sata_pad PLL should be left uninitialized.*
- *Boot loader should not enable hardware power sequencer. Boot loader should enable the required PLLs in software controlled state.*
- *In order to hand off UPHY PLLs and PLLE cleanly to the next stage of boot loader or the main OS, (after boot loader completes access to boot media), boot loader should disable PLLs and assert resets to UPHY.*

22.8.4 Cold Boot with no Recovery Mode or Boot from USB

Step 1

Boot ROM enables USB2.0 related PLLs with software override.

1. Access the following CAR registers to measure the frequency of osc_clk.
   - CLK_RST_CONTROLLER_OSC_FREQ_DET_0[REF_CLK_WIN_CFG]

- CLK_RST_CONTROLLER_OSC_FREQ_DET_0[OSC_FREQ_DET_TRIG]
- CLK_RST_CONTROLLER_OSC_FREQ_DET_STATUS_0[OSC_FREQ_DET_BUSY]
- CLK_RST_CONTROLLER_OSC_FREQ_DET_STATUS_0[OSC_FREQ_DET_CNT]
- CLK_RST_CONTROLLER_OSC_CTRL_0[OSC_FREQ]

Set up the PLLU (enable in software):

2. Program these registers:
   - CLK_RST_CONTROLLER_PLLU_BASE_0[PLLU_OVERRIDE] = 1 (Default)
   - CLK_RST_CONTROLLER_PLLU_MISC_0[PLLU_IDDQ]= 1
   - CLK_RST_CONTROLLER_PLLU_MISC_0[PLLU_IDDQ]= 0
   - CLK_RST_CONTROLLER_PLLU_OUTA_0[PLLU_OUT1_RSTN]=RESET_ENABLE (Default)
   - CLK_RST_CONTROLLER_PLLU_OUTA_0[PLLU_OUT2_RSTN]=RESET_ENABLE (Default)
3. Wait 5 µs.

   DIVM/DIVN should be programmed to generate 480 MHz VCOCLK and DIVP should be programmed to do divide-by-2
   - CLK_RST_CONTROLLER_PLLU_BASE_0[PLLU_DIVM]
   - CLK_RST_CONTROLLER_PLLU_BASE_0[PLLU_DIVN]
   - CLK_RST_CONTROLLER_PLLU_BASE_0[PLLU_DIVP]
   - CLK_RST_CONTROLLER_PLLU_MISC_0[PLLU_KCP]
   - CLK_RST_CONTROLLER_PLLU_MISC_0[PLLU_KVCO]
   - CLK_RST_CONTROLLER_PLLU_BASE_0[PLLU_ENABLE] = 1
4. Wait for LOCK:
   - CLK_RST_CONTROLLER_PLLU_BASE_0[PLLU_LOCK]
5. Enable the Clocks:
   - CLK_RST_CONTROLLER_PLLU_BASE_0[PLLU_CLKENABLE*] = 1
6. Enable Post dividers:
   - CLK_RST_CONTROLLER_PLLU_OUTA_0[PLLU_OUT1_RSTN]=RESET_DISABLE
   - CLK_RST_CONTROLLER_PLLU_OUTA_0[PLLU_OUT2_RSTN]=RESET_DISABLE
7. Wait 2 µs.

Set up the UTMIPLL (enable in software):

8. If (UTMIPLL Source == osc_clk) {
   - CLK_RST_CONTROLLER_UTMIP_PLL_CFG3_0[UTMIP_PLL_REF_SRC_SEL] = 0 (Default)
   - CLK_RST_CONTROLLER_UTMIP_PLL_CFG3_0[UTMIP_PLL_REF_DIS] = 0 (Default)
   - Skip to step 10.
9. Otherwise
   - CLK_RST_CONTROLLER_UTMIP_PLL_CFG3_0[UTMIP_PLL_REF_SRC_SEL] = 1
10. Program this register:
    - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_OVERRIDE_VALUE] = 0
11. Wait 10 µs.

12. Based on the reference clock source selected, MDIV/NDIV should be programmed to generate a 960 MHz VCOCLK. PLL has internal divide-by-2 (fixed) to generate a 480 MHz clock at the output.
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG0_0[UTMIP_PLL_MDIV]
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG0_0[UTMIP_PLL_NDIV]
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG0_0[UTMIP_PLL_KCP]
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG0_0[UTMIP_PLL_KVCO]
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG0_0[UTMIP_PLL_VREG_CTRL]
13. USB2.0 Controller IP FSM configuration
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG2_0[UTMIP_PHY_XTAL_CLOCKEN] = 1 (Default) [Gating for FSM input clock which is clk_m]
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG2_0[UTMIP_PLL_ACTIVE_DLY_COUNT] = Don’t Care [No PLL Active control in UTMIPLL anymore]
14. If (UTMIPLL Source == osc_clk)
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG2_0[UTMIP_PLLU_STABLE_COUNT] = 0x0.
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_PLLU_ENABLE_DLY_COUNT] = 0x0.
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_FORCE_PLLU_POWERDOWN] = 1
    - Skip to step 16.
15. Otherwise:
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG2_0[UTMIP_PLLU_STABLE_COUNT] = 0x3.

      [40 µs {8 µs} = (40*19.2/256)]
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_PLLU_ENABLE_DLY_COUNT] = 0x3.

      [1 µs = (1*19.2/8)]
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_FORCE_PLLU_POWERDOWN] = 0
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_FORCE_PLLU_POWERUP] = 0
16. Program this register:
    - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_XTAL_FREQ_COUNT] = 0x3.

      [40 µs {15 µs} = (40*19.2/256)] -> This should be total delay for the sequence, i.e., sum of both PLLs lock time + extra time for FSM states

Step 2

Boot ROM deasserts reset to XUSB PADCTL block.

1. Set the following CAR register bit to ‘0’ to deassert reset to XUSB Pad Control block.
    - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_PADCTL_RST]

Boot ROM deasserts reset to XUSB PADCTL block.

2. Set the following CAR register bit to ‘0’ to deassert reset to PCIE/XUSB PAD and SATA/XUSB PAD.

    -CLK_RST_CONTROLLER_RST_DEVICES_Y_0[SWR_PEX_USB_UPHY_RST]

    -CLK_RST_CONTROLLER_RST_DEVICES_Y

_0[SWR_SATA_USB_UPHY_RST]

Note: *All USB2.0 ports are assigned to USB2 controllers by default so no port assignment programming is required.*

Step 3

Boot ROM performs battery charging operations through USB2 Controller.

1. Set the following CAR register bits to '1' to enable the clocks to USB2 Controller, where only USB2 Controller #1 is required to be enabled for battery charging detection.
   - CLK_RST_CONTROLLER_CLK_ENB_L_SET_0[SET_CLK_ENB_USBD]
   - CLK_RST_CONTROLLER_CLK_ENB_H_SET_0[SET_CLK_ENB_USB2]
   - CLK_RST_CONTROLLER_CLK_ENB_H_SET_0[SET_CLK_ENB_USB3]
2. Set the following CAR register bits to '0' to deassert reset to USB2 Controller #1
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0[SWR_USBD_RST]
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0[SWR_USB2_RST]
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0[SWR_USB3_RST]
3. Set the following PMC register bits to '0' to deassert reset to USB2 Controller #1
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0[SWR_USBD_RST]
4. Set the following USBOTG register bits to follow the value programmed from FUSE to program the USB pad.
   - USB1_UTMIP_XCVR_CFG0_0[UTMIP_XCVR_SETUP_MSB,UTMIP_XCVR_SETUP] to {0, FUSE_USB_CALIB_0[5:0]}
   - USB1_UTMIP_XCVR_CFG1_0[UTMIP_XCVR_TERM_RANGE_ADJ] to FUSE_USB_CALIB_0[10:7]
   - USB1_UTMIP_XCVR_CFG1_0[UTMIP_XCVR_HS_IREF_CAP] to FUSE_USB_CALIB_0[14:13]
   - USB1_UTMIP_BIAS_CFG0_0[UTMIP_HSSQUELCH_LEVEL] to FUSE_USB_CALIB_0[12:11]
5. Set the following USBOTG register bits to '1' to switch the VBUS detection from hardware operation to software override.
   - USB1_IF_USB_PHY_VBUS_SENSORS_0[B_SESS_VLD_SW_VALUE]
   - USB1_IF_USB_PHY_VBUS_SENSORS_0[B_SESS_VLD_SW_EN]
6. Ensure the following USBOTG register bit is set to '1' during charger detection. This bit should be cleared to '0' after charger detection is completed.
   - USB1_UTMIP_XCVR_CFG0_0[UTMIP_FORCE_PD2_POWERUP]

Step 4

Pad driver switches USB 2.0 related PLLs to under hardware control after pad driver is loaded.

Set up UTMIPLL under Hardware control

1. Enable Hardware Power Sequencer:
   - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_FORCE_PLL_ENABLE_POWERUP] = 0
   - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_FORCE_PLL_ENABLE_POWERDOWN] = 0
2. If (USB2.0 Controller IP exists in platform), skip to step 4.
3. Program these registers:
   - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_SWCTL] = 0
   - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_PD_INCLUDE] = 1
4. Program these registers:
   - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_CLK_ENABLE_SWCTL] = 0
   - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_USE_LOCKDET] = 1
   - CLK_RST_CONTROLLER_XUSB_PLL_CFG0_0[UTMIPLL_LOCK_DLY] = 0

5. Wait 1 µs
   - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_SEQ_ENABLE] = 1

Set up PLLU under Hardware control

1. Enable Hardware Power Sequencer:
   - CLK_RST_CONTROLLER_PLLU_BASE_0[PLLU_OVERRIDE] = 0
   - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_IDDQ_PD_INCLUDE] = 1
   - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_USE_SWITCH_DETECT] = 1
   - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_CLK_ENABLE_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_CLK_SWITCH_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_USE_LOCKDET] = 1
   - CLK_RST_CONTROLLER_XUSB_PLL_CFG0_0[PLLU_LOCK_DLY] = 0
2. Wait 1 µs
   - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_SEQ_ENABLE] = 1
     Pad driver enables USB3.0 related PLLs.
3. Enable Hardware Power Sequencer:
   - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_IDDQ_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SS_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_ENABLE_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SS_SEQ_INCLUDE] = 1
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_USE_LOCKDET] = 1
4. Wait 1 µs.
5. CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SEQ_ENABLE] = 1
6. Enable Hardware Power Sequencer for PLLE:
   - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_IDDQ_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SS_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_ENABLE_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SS_SEQ_INCLUDE] = 1
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_USE_LOCKDET] = 1
7. Wait 1 µs.
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SEQ_ENABLE] = 1

The pad driver sets up USB3.0 related PLLE.

Set up PLL under Hardware control

PLLREFE

1. The pad driver sets up USB3.0 related PLLREFE in software
   - CLK_RST_CONTROLLER_PLLREFE_MISC_0[PLLREFE_IDDQ]= 0
2. Wait 5 µs
   - CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_DIVM]
   - CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_DIVN]
   - CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_DIVP]

- CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_KCP]
- CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_KVCO]
- CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_ENABLE] = 1

3. Wait for LOCK:
   - CLK_RST_CONTROLLER_PLLREFE_MISC_0[PLLREFE_LOCK]

Note: *There is no Hardware Power Sequencer for PLLREFE.*

PLLEs

The pad driver sets up USB3.0 related PLLE in software.

1. Select XTAL as the source:
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_REF_SEL_PLLREFE] = 0
   - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_IDDQ_OVERRIDE_VALUE] = 0
2. Wait 5 µs.
3. Program the following registers to generate a low jitter 100 MHz clock:
   - CLK_RST_CONTROLLER_PLLE_BASE_0[PLLE_MDIV]
   - CLK_RST_CONTROLLER_PLLE_BASE_0[PLLE_NDIV]
   - CLK_RST_CONTROLLER_PLLE_BASE_0[PLLE_PLDIV_CML]
   - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_KCP]
   - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_KVCO]
   - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_VREG_CTRL]
   - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_PTS] = 1
   - CLK_RST_CONTROLLER_PLLE_BASE_0[PLLE_ENABLE] = 1
4. Wait for LOCK:
   - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_LOCK]
5. Enable SSA:
   - CLK_RST_CONTROLLER_PLLE_SS_CNTL_0[PLLE_SSCINC]
   - CLK_RST_CONTROLLER_PLLE_SS_CNTL_0[PLLE_SSCINCINTRV]
   - CLK_RST_CONTROLLER_PLLE_SS_CNTL_0[PLLE_SSCMAX]
   - CLK_RST_CONTROLLER_PLLE_SS_CNTL_0[PLLE_SSCINVERT]
   - CLK_RST_CONTROLLER_PLLE_SS_CNTL_0[PLLE_SSCCENTER]
   - CLK_RST_CONTROLLER_PLLE_SS_CNTL_0[PLLE_BYPASS_SS] = 0
   - CLK_RST_CONTROLLER_PLLE_SS_CNTL_0[PLLE_SSCBYP] = 0
6. Wait 300 ns
   - CLK_RST_CONTROLLER_PLLE_SS_CNTL_0[PLLE_INTERP_RESET] = 0
7. Enable Hardware Power Sequencer for PLLE:
   - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_IDDQ_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SS_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_ENABLE_SWCTL] = 0
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SS_SEQ_INCLUDE] = 1

- CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_USE_LOCKDET] = 1

8. Wait 1 µs.
   - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SEQ_ENABLE] = 1

UPHY PLLs

Enable PEX_PAD PLL in software:

1. Deassert PLL/Lane resets.
   - CLK_RST_CONTROLLER_RST_DEVICES_Y_0[SWR_PEX_USB_UPHY_RST] = 0
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_2_0[PLL0_CAL_CTRL] = 0x136
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_5_0[PLL0_DCO_CTRL] = 0x2A
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_1_0[PLL0_PWR_OVRD] = 1 (Default)
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_2_0[PLL0_CAL_OVRD] = 1
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_8_0[PLL0_RCAL_OVRD] = 1
2. For the following registers, default values take care of the desired frequency.
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_4_0[REFCLK_SEL]
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_4_0[TXCLKREF_SEL]
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_4_0[TXCLKREF_EN]
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_1_0[FREQ_MDIV]
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_1_0[FREQ_NDIV]
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_1_0[FREQ_PSDIV]
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_1_0[PLL0_IDDQ] = 0
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_1_0[PLL0_SLEEP] = 0
3. Wait 100 ns.
4. Calibration:
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_2_0[PLL0_CAL_EN] = 1
   - Wait for XUSB_PADCTL_UPHY_PLL_P0_CTL_2_0[PLL0_CAL_DONE] == 1
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_2_0[PLL0_CAL_EN] = 0
   - Wait for XUSB_PADCTL_UPHY_PLL_P0_CTL_2_0[PLL0_CAL_DONE] == 0
5. Enable the PLL (20 µs Lock time)
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_1_0[PLL0_ENABLE] = 1
   - Wait for XUSB_PADCTL_UPHY_PLL_P0_CTL_1_0[PLL0_LOCKDET_STATUS] == 1
6. RCAL:
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_8_0[PLL0_RCAL_EN] = 1
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_8_0[PLL0_RCAL_CLK_EN] = 1
   - Wait for XUSB_PADCTL_UPHY_PLL_P0_CTL_8_0[PLL0_RCAL_DONE] == 1
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_8_0[PLL0_RCAL_EN] = 0
   - Wait for XUSB_PADCTL_UPHY_PLL_P0_CTL_8_0[PLL0_RCAL_DONE] == 0
   - XUSB_PADCTL_UPHY_PLL_P0_CTL_8_0[PLL0_RCAL_CLK_EN] = 0

Enable SATA_PAD PLL in Software:

1. For Reset deassertion:

- CLK_RST_CONTROLLER_RST_DEVICES_Y_0[SWR_SATA_USB_UPHY_RST] = 0

2. All steps are same as mentioned above for pex pad – Just change the register to: XUSB_PADCTL_UPHY_PLL_S0_CTL_*_0

Note: *FREQ_NDIV and TXCLKREF_SEL should be programmed differently in the above registers for SATA Brick if configured for XUSB.*

Enable Hardware Power Sequencer:

1. For the PEX_pad:
   a. Lift the SWCTLs from the CAR:
      - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_CLK_ENABLE_SWCTL] = 0
      - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_PADPLL_RESET_SWCTL] = 0

   b. Include IDDQ and LOCK-Detect in the hardware sequence.
      - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_PADPLL_SLEEP_IDDQ] = 1
      - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_PADPLL_USE_LOCKDET] = 1

   c. Lift PADCTL overrides
      - XUSB_PADCTL_UPHY_PLL_P0_CTL_1_0[PLL0_PWR_OVRD] = 0
      - XUSB_PADCTL_UPHY_PLL_P0_CTL_2_0[PLL0_CAL_OVRD] = 0
      - XUSB_PADCTL_UPHY_PLL_P0_CTL_8_0[PLL0_RCAL_OVRD] = 0

   d. Wait 1 µs.
      - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_SEQ_ENABLE] = 1

2. For the SATA_pad:
   a. Lift the SWCTLs from CAR
      - CLK_RST_CONTROLLER_SATA_PLL_CFG0_0[SATA_PADPLL_RESET_SWCTL] = 0

   b. Include IDDQ and LOCK-Detect in the hardware sequence.
      - CLK_RST_CONTROLLER_SATA_PLL_CFG0_0[SATA_PADPLL_SLEEP_IDDQ] = 1
      - CLK_RST_CONTROLLER_SATA_PLL_CFG0_0[SATA_PADPLL_USE_LOCKDET] = 1

   c. Lift PADCTL overrides
      - XUSB_PADCTL_UPHY_PLL_S0_CTL_1_0[PLL0_PWR_OVRD] = 0
      - XUSB_PADCTL_UPHY_PLL_S0_CTL_2_0[PLL0_CAL_OVRD] = 0
      - XUSB_PADCTL_UPHY_PLL_S0_CTL_8_0[PLL0_RCAL_OVRD] = 0

   d. Wait 1 µs.
      - CLK_RST_CONTROLLER_SATA_PLL_CFG0_0[SATA_SEQ_ENABLE] = 1

Step 5

Pad driver enables platform specific regulators enable power rails to the pads, VBUS, and pull-up voltage to the VBUS control PMIC's EN input.

Pad driver deasserts reset to XUSB pad.

1. Set the following CAR register bit to '0' to deassert reset to PCIe/XUSB pad and SATA/XUSB pad.
   - CLK_RST_CONTROLLER_RST_DEVICES_Y_0[SWR_PEX_USB_UPHY_RST]
   - CLK_RST_CONTROLLER_RST_DEVICES_Y_0[SWR_SATA_USB_UPHY_RST]

Pad driver sets up the I/O pins for the VBUS control and over current report.

2. Program the following PINMUX registers to set up the I/O pins for USB 2.0 ports owned by XUSB and USB2, according to the platform specific configuration:
   - PINMUX_AUX_USB_VBUS_EN0_0[E_OD]
   - PINMUX_AUX_USB_VBUS_EN0_0[E_IO_HV]
   - PINMUX_AUX_USB_VBUS_EN0_0[E_INPUT]
   - PINMUX_AUX_USB_VBUS_EN0_0[PARK]
   - PINMUX_AUX_USB_VBUS_EN0_0[TRISTATE]
   - PINMUX_AUX_USB_VBUS_EN0_0[PUPD]
   - PINMUX_AUX_USB_VBUS_EN1_0[E_OD]
   - PINMUX_AUX_USB_VBUS_EN1_0[E_IO_HV]
   - PINMUX_AUX_USB_VBUS_EN1_0[E_INPUT]
   - PINMUX_AUX_USB_VBUS_EN1_0[PARK]
   - PINMUX_AUX_USB_VBUS_EN1_0[TRISTATE]
   - PINMUX_AUX_USB_VBUS_EN1_0[PUPD]

   Pad driver sets up the VGPIO for VBUS and ID status reporting used by the device and OTG modes of XUSB and USB2.
3. Program the following XUSB PADCTL registers to use local override for VBUS and ID status reporting
   - XUSB_PADCTL_USB2_VBUS_ID_0[ID_SOURCE_SELECT] to ‘ID_OVERRIDE’
   - XUSB_PADCTL_USB2_VBUS_ID_0[VBUS_SOURCE_SELECT] to ‘VBUS_OVERRIDE’
4. Write ‘1’ to the following XUSB PADCTL registers to clear false reporting of VBUS and ID status changes
   - XUSB_PADCTL_USB2_VBUS_ID_0[IDDIG_ST_CHNG]
   - XUSB_PADCTL_USB2_VBUS_ID_0[VBUS_VALID_ST_CHNG]

   Pad driver assigns the USB ports to the controllers, then programs the port capabilities and pad parameters of ports assigned to XUSB after booted to OS.
5. Set the following CAR register bits to ‘1’ to assert reset to USB2
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0[SWR_USBD_RST]
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0[SWR_USB2_RST]
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0[SWR_USB3_RST]
6. Program the following XUSB PADCTL registers to assign the USB2.0 ports to XUSB or USB2, according to the platform specific configuration. (Note: Only OTG and HSIC Pad Port 0 could be assigned to USB2 controller.)
   - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_HSIC_PAD_PORT0]
   - XUSB_PADCTL_USB2_PAD_MUX_0[HSIC_PAD_TRK]
   - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_ULPI_PAD_PORT]
   - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT2]
   - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT1]
   - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT0]
   - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_BIAS_PAD]
7. Program the following XUSB PADCTL registers to assign the port capabilities for USB2.0 ports owned by XUSB, according to the platform specific configuration:
   - XUSB_PADCTL_USB2_PORT_CAP_0[PORT3_CAP] for host/disabled

- XUSB_PADCTL_USB2_PORT_CAP_0[PORT3_INTERNAL] for whether its internal port
- XUSB_PADCTL_USB2_PORT_CAP_0[PORT2_CAP] for host/disabled
- XUSB_PADCTL_USB2_PORT_CAP_0[PORT2_INTERNAL] for whether its internal port
- XUSB_PADCTL_USB2_PORT_CAP_0[PORT1_CAP] for host/disabled
- XUSB_PADCTL_USB2_PORT_CAP_0[PORT1_INTERNAL] for whether its internal port
- XUSB_PADCTL_USB2_PORT_CAP_0[PORT0_CAP] for host/device/OTG/disabled
- XUSB_PADCTL_USB2_PORT_CAP_0[PORT0_INTERNAL] for whether its internal port

8. Program the following XUSB PADCTL registers to 'OC_DETECTION_DISABLED' to disable the over current signal mapping for USB 2.0 ports owned by XUSB and USB2:
   - XUSB_PADCTL_SNPS_OC_MAP_0[CONTROLLER1_OC_PIN]
   - XUSB_PADCTL_USB2_OC_MAP_0[PORT3_OC_PIN]
   - XUSB_PADCTL_USB2_OC_MAP_0[PORT2_OC_PIN]
   - XUSB_PADCTL_USB2_OC_MAP_0[PORT1_OC_PIN]
   - XUSB_PADCTL_USB2_OC_MAP_0[PORT0_OC_PIN]
   - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE3_OC_MAP]
   - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE2_OC_MAP]
   - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE1_OC_MAP]
   - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE0_OC_MAP]
9. Program the following XUSB PADCTL registers to assign the SuperSpeed port mapping to USB2.0 ports owned by XUSB, where the SuperSpeed ports inherit their port capabilities from the USB2.0 ports they mapped to, according to the platform specific configuration:
   - XUSB_PADCTL_SS_PORT_MAP_0[PORT3_MAP] to USB2.0 Port 3/2/1/0 or Disabled
   - XUSB_PADCTL_SS_PORT_MAP_0[PORT3_INTERNAL] for whether its internal port
   - XUSB_PADCTL_SS_PORT_MAP_0[PORT2_MAP] to USB2.0 Port 3/2/1/0 or Disabled
   - XUSB_PADCTL_SS_PORT_MAP_0[PORT2_INTERNAL] for whether its internal port
   - XUSB_PADCTL_SS_PORT_MAP_0[PORT1_MAP] to USB2.0 Port 3/2/1/0 or Disabled
   - XUSB_PADCTL_SS_PORT_MAP_0[PORT1_INTERNAL] for whether its internal port
   - XUSB_PADCTL_SS_PORT_MAP_0[PORT0_MAP] to USB2.0 Port 3/2/1/0 or Disabled
   - XUSB_PADCTL_SS_PORT_MAP_0[PORT0_INTERNAL] for whether its internal port
10. Program the following XUSB PADCTL registers to keep the UPHY in IDDQ and under sleep state before changing the LANE assignments, where *$LN* = P0, P1, P2, P3, P4, P5, P6, S0:
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[TX_IDDQ_OVRD_RANGE] to '1'
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[TX_IDDQ_RANGE] to '1'
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[TX_SLEEP_RANGE] to '3'
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[TX_PWR_OVRD_RANGE] to '1'
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[RX_IDDQ_OVRD_RANGE] to '1'
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[RX_IDDQ_RANGE] to '1'
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[RX_SLEEP_RANGE] to '3'
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[RX_PWR_OVRD_RANGE] to '1'
11. Program the following XUSB PADCTL registers to assign the UPHY lanes to XUSB, PCIe, or SATA, according to the platform specific configuration

- XUSB_PADCTL_USB3_PAD_MUX_0[SATA_PAD_LANE0]
- XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE6]
- XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE5]
- XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE4]
- XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE3]
- XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE2]
- XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE1]
- XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE0]

12. Program the following XUSB PADCTL registers to bring the UPHY out of IDDQ after changing the LANE assignments, where *$LN* = P0, P1, P2, P3, P4, P5, P6, S0:
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[TX_IDDQ_OVRD_RANGE] to ‘0’
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[TX_IDDQ_RANGE] to ‘1’
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[TX_SLEEP_RANGE] to ‘3’
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[TX_PWR_OVRD_RANGE] to ‘0’
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[RX_IDDQ_OVRD_RANGE] to ‘0’
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[RX_IDDQ_RANGE] to ‘1’
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[RX_SLEEP_RANGE] to ‘3’
    - XUSB_PADCTL_UPHY_MISC_PAD_*$LN*_CTL_2_0[RX_PWR_OVRD_RANGE] to ‘0’
13. Program the following XUSB PADCTL registers to assign the static UPHY pad and PLL parameters according to the platform specific configuration, where *$LN* = P0, P1, P2, P3, P4, P5, P6, S0:
    - XUSB_PADCTL_UPHY_PLL_P0_CTL1_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL2_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL3_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL4_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL5_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL6_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL7_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL8_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL9_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL10_0
    - XUSB_PADCTL_UPHY_PLL_P0_CTL11_0
    - XUSB_PADCTL_UPHY_PLL_S0_CTL1_0
    - XUSB_PADCTL_UPHY_PLL_S0_CTL2_0
    - XUSB_PADCTL_UPHY_PLL_S0_CTL3_0
    - XUSB_PADCTL_UPHY_PLL_S0_CTL4_0
    - XUSB_PADCTL_UPHY_PLL_S0_CTL5_0
    - XUSB_PADCTL_UPHY_PLL_S0_CTL6_0
    - XUSB_PADCTL_UPHY_PLL_S0_CTL7_0
    - XUSB_PADCTL_UPHY_PLL_S0_CTL8_0
    - XUSB_PADCTL_UPHY_PLL_S0_CTL9_0

- XUSB_PADCTL_UPHY_PLL_S0_CTL10_0
- XUSB_PADCTL_UPHY_PLL_S0_CTL11_0
- XUSB_PADCTL_UPHY_MISC_PAD_$LN_CTL_1_0
- XUSB_PADCTL_UPHY_MISC_PAD_$LN_CTL_2_0
- XUSB_PADCTL_UPHY_MISC_PAD_$LN_CTL_3_0
- XUSB_PADCTL_UPHY_MISC_PAD_$LN_CTL_4_0
- XUSB_PADCTL_UPHY_MISC_PAD_$LN_CTL_5_0
- XUSB_PADCTL_UPHY_MISC_PAD_$LN_CTL_6_0
- XUSB_PADCTL_UPHY_MISC_PAD_$LN_CTL_7_0
- XUSB_PADCTL_UPHY_MISC_PAD_$LN_CTL_8_0
- XUSB_PADCTL_UPHY_MISC_PAD_$LN_CTL_9_0

14. Program the following XUSB PADCTL registers to assign the static UPHY pad parameters of ports owned by XUSB, according to the platform specific configuration:
    - XUSB_PADCTL_UPHY_USB3_PAD0_ECTL_1_0
    - XUSB_PADCTL_UPHY_USB3_PAD0_ECTL_2_0
    - XUSB_PADCTL_UPHY_USB3_PAD0_ECTL_3_0
    - XUSB_PADCTL_UPHY_USB3_PAD0_ECTL_4_0
    - XUSB_PADCTL_UPHY_USB3_PAD0_ECTL_5_0
    - XUSB_PADCTL_UPHY_USB3_PAD0_ECTL_6_0
    - XUSB_PADCTL_UPHY_USB3_PAD0_CTL_0_0
    - XUSB_PADCTL_UPHY_USB3_PAD1_ECTL_1_0
    - XUSB_PADCTL_UPHY_USB3_PAD1_ECTL_2_0
    - XUSB_PADCTL_UPHY_USB3_PAD1_ECTL_3_0
    - XUSB_PADCTL_UPHY_USB3_PAD1_ECTL_4_0
    - XUSB_PADCTL_UPHY_USB3_PAD1_ECTL_5_0
    - XUSB_PADCTL_UPHY_USB3_PAD1_ECTL_6_0
    - XUSB_PADCTL_UPHY_USB3_PAD1_CTL_0_0
    - XUSB_PADCTL_UPHY_USB3_PAD2_ECTL_1_0
    - XUSB_PADCTL_UPHY_USB3_PAD2_ECTL_2_0
    - XUSB_PADCTL_UPHY_USB3_PAD2_ECTL_3_0
    - XUSB_PADCTL_UPHY_USB3_PAD2_ECTL_4_0
    - XUSB_PADCTL_UPHY_USB3_PAD2_ECTL_5_0
    - XUSB_PADCTL_UPHY_USB3_PAD2_ECTL_6_0
    - XUSB_PADCTL_UPHY_USB3_PAD2_CTL_0_0
    - XUSB_PADCTL_UPHY_USB3_PAD3_ECTL_1_0
    - XUSB_PADCTL_UPHY_USB3_PAD3_ECTL_2_0
    - XUSB_PADCTL_UPHY_USB3_PAD3_ECTL_3_0
    - XUSB_PADCTL_UPHY_USB3_PAD3_ECTL_4_0
    - XUSB_PADCTL_UPHY_USB3_PAD3_ECTL_5_0

- XUSB_PADCTL_UPHY_USB3_PAD3_ECTL_6_0
- XUSB_PADCTL_UPHY_USB3_PAD3_CTL_0_0

15. Program the following XUSB PADCTL registers to assign the static USB2.0 pad parameters of ports owned by XUSB, according to the platform specific configuration:
    - XUSB_PADCTL_USB2_OTG_PAD0_CTL_0_0
    - XUSB_PADCTL_USB2_OTG_PAD0_CTL_1_0
    - XUSB_PADCTL_USB2_OTG_PAD1_CTL_0_0
    - XUSB_PADCTL_USB2_OTG_PAD1_CTL_1_0
    - XUSB_PADCTL_USB2_OTG_PAD2_CTL_0_0
    - XUSB_PADCTL_USB2_OTG_PAD2_CTL_1_0
    - XUSB_PADCTL_USB2_OTG_PAD3_CTL_0_0
    - XUSB_PADCTL_USB2_OTG_PAD3_CTL_1_0
    - XUSB_PADCTL_USB2_BIAS_PAD_CTL_0_0
    - XUSB_PADCTL_USB2_BIAS_PAD_CTL_1_0
    - XUSB_PADCTL_HSIC_PAD0_CTL_0_0
    - XUSB_PADCTL_HSIC_PAD0_CTL_1_0
    - XUSB_PADCTL_HSIC_PAD0_CTL_2_0
    - XUSB_PADCTL_HSIC_PAD_TRK_CTL_0_0
    - XUSB_PADCTL_HSIC_STRB_TRIM_CONTROL_0
16. Program the following XUSB PADCTL register bits to ‘0’ to disable power down of the USB2.0 of ports owned by XUSB, according to the platform specific configuration.
    - XUSB_PADCTL_USB2_OTG_PAD0_CTL_0_0[PD]
    - XUSB_PADCTL_USB2_OTG_PAD1_CTL_0_0[PD]
    - XUSB_PADCTL_USB2_OTG_PAD2_CTL_0_0[PD]
    - XUSB_PADCTL_USB2_OTG_PAD3_CTL_0_0[PD]
    - XUSB_PADCTL_USB2_OTG_PAD0_CTL_0_0[PD2]
    - XUSB_PADCTL_USB2_OTG_PAD1_CTL_0_0[PD2]
    - XUSB_PADCTL_USB2_OTG_PAD2_CTL_0_0[PD2]
    - XUSB_PADCTL_USB2_OTG_PAD3_CTL_0_0[PD2]
    - XUSB_PADCTL_USB2_OTG_PAD0_CTL_0_0[PD_ZI]
    - XUSB_PADCTL_USB2_OTG_PAD1_CTL_0_0[PD_ZI]
    - XUSB_PADCTL_USB2_OTG_PAD2_CTL_0_0[PD_ZI]
    - XUSB_PADCTL_USB2_OTG_PAD3_CTL_0_0[PD_ZI]
    - XUSB_PADCTL_USB2_OTG_PAD0_CTL_1_0[PD_DR]
    - XUSB_PADCTL_USB2_OTG_PAD1_CTL_1_0[PD_DR]
    - XUSB_PADCTL_USB2_OTG_PAD2_CTL_1_0[PD_DR]
    - XUSB_PADCTL_USB2_OTG_PAD3_CTL_1_0[PD_DR]
    - XUSB_PADCTL_USB2_BIAS_PAD_CTL_0_0[PD]
    - XUSB_PADCTL_HSIC_PAD0_CTL_0_0[PD_TX_DATA0]
    - XUSB_PADCTL_HSIC_PAD0_CTL_0_0[PD_TX_STROBE]

- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[PD_RX_DATA0]
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[PD_RX_STROBE]
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[PD_ZI_DATA0]
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[PD_ZI_STROBE]

17. Program the following XUSB PADCTL register bits to '0' to release the XUSB SS wake logic state latching
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_CLAMP_EN]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_CLAMP_EN_EARLY]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_VCORE_DOWN]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_CLAMP_EN]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_CLAMP_EN_EARLY]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_VCORE_DOWN]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_CLAMP_EN]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_CLAMP_EN_EARLY]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_VCORE_DOWN]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_CLAMP_EN]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_CLAMP_EN_EARLY]
    - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_VCORE_DOWN]
18. Perform USB2.0 and HSIC pad tracking. (Refer to Section 22.8.10: USB2 Pad Tracking Programming.)

Note: *To avoid confliction or ambiguity, the XUSB and USB2 controllers should be under reset when updating the port assignments.*

Step 6

Pad driver programs the clocks and deasserts the resets to the controllers

1. Set the following CAR register bits to '1' to enable the clocks to XUSB
    - CLK_RST_CONTROLLER_CLK_ENB_W_SET_0[SET_CLK_ENB_XUSB]
2. Set the following CAR register bits to '1' to enable the clocks to individual XUSB partitions
    - CLK_RST_CONTROLLER_CLK_ENB_U_SET_0[SET_CLK_ENB_XUSB_HOST]
    - CLK_RST_CONTROLLER_CLK_ENB_U_SET_0[SET_CLK_ENB_XUSB_DEV]
    - CLK_RST_CONTROLLER_CLK_ENB_W_SET_0[SET_CLK_ENB_XUSB_SS]
3. Program the following CAR register bits to set the source of XUSB clocks, where PLLP_OUT0 runs at 408 MHz.
    - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_CORE_HOST_0[XUSB_CORE_HOST_CLK_SRC] to 'PLLP_OUT0'
    - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_CORE_HOST_0[XUSB_CORE_HOST_CLK_DIVISOR] to '0x6'
    - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_CORE_DEV_0[XUSB_CORE_DEV_CLK_SRC] to 'PLLP_OUT0'
    - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_CORE_DEV_0[XUSB_CORE_DEV_CLK_DIVISOR] to '0x6'
    - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_FALCON_0[XUSB_FALCON_CLK_SRC] to 'PLLP_OUT0'
    - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_FALCON_0[XUSB_FALCON_CLK_DIVISOR] to '0x2'
    - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_FS_0[XUSB_FS_CLK_SRC] to 'FO_48M'

- CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_FS_0[XUSB_FS_CLK_DIVISOR] to ‘0x0’
- CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_SS_0[XUSB_SS_CLK_SRC] to ‘HSIC_480’
- CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_SS_0[XUSB_SS_CLK_DIVISOR] to ‘0x6’

4. Set the following CAR register bits to ‘0’ to deassert reset to XUSB
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST]
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_DEV_RST]
   - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST]
5. Set the following CAR register bits to ‘0’ to deassert reset to USB2
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0[SWR_USBD_RST]
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0[SWR_USB2_RST]

Step 7

Pad driver programs the capability and pad parameters of ports assigned to USB2 controllers.

1. Program the following USB2 registers of each controller to assign the port capabilities of ports owned by USB2, according to the platform specific configuration:
   - USB2_CONTROLLER_USB2D_HOSTPC1_DEVLC_0[PTS] for HSIC or UTMI
   - USB2_CONTROLLER_USB2D_USBMODE_0[CM] for Host Mode or Device Mode
2. Program the following USB2 registers of each controller to assign the pad parameters of ports owned by USB2 according to the platform specific configuration:
   - UHSIC_PLL_CFG0_0
   - UHSIC_HSRX_CFG0_0
   - UHSIC_HSRX_CFG1_0
   - UHSIC_TX_CFG0_0
   - UHSIC_MISC_CFG0_0
   - UHSIC_MISC_CFG1_0
   - UHSIC_PADS_CFG0_0
   - UHSIC_PADS_CFG1_0
   - UHSIC_CMD_CFG0_0
   - UHSIC_STAT_CFG0_0
   - UHSIC_SPARE_CFG0_0
   - UTMIP_PLL_CFG0_0
   - UTMIP_PLL_CFG1_0
   - UTMIP_XCVR_CFG0_0
   - UTMIP_XCVR_CFG1_0
   - UTMIP_BIAS_CFG0_0
   - UTMIP_BIAS_CFG1_0
   - UTMIP_HSRX_CFG0_0
   - UTMIP_HSRX_CFG1_0
   - UTMIP_FSLSRX_CFG0_0
   - UTMIP_FSLSRX_CFG1_0
   - UTMIP_TX_CFG0_0

- UTMIP_MISC_CFG0_0
- UTMIP_MISC_CFG1_0
- UTMIP_SPARE_CFG0_0

Notes:

- *In Tegra X1, USB2 Controller #1 always uses UTMI, USB2 Controller #2 always uses HSIC.*
- *Only USB2 Controller #1 may be set to Device Mode.*

Step 8

Pad driver brings the UPHY out of IDDQ.

1. Program the following XUSB PADCTL registers to '1' to bring specific lanes of UPHY out of IDDQ. Only lanes that are used in the platform are required to be bring out of IDDQ:
   - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_SATA_PAD_IDDQ_DISABLE_MASK0]
   - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK6]
   - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK5]
   - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK4]
   - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK3]
   - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK2]
   - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK1]
   - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK0]
2. Alternatively, program the following XUSB PADCTL register to '0' to bring all lanes of IOPHY out of IDDQ:
   - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE]

Pad driver releases the always on pad muxing logic state latching.

3. Program the following XUSB PADCTL register bits
4. Wait 1 µs
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[AUX_MUX_LP0_CLAMP_EN] to '0'
5. Wait 100 µs
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[AUX_MUX_LP0_CLAMP_EN_EARLY] to '0'
6. Wait 100 µs
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[AUX_MUX_LP0_VCORE_DOWN] to '0'

Pad driver enables the VBUS to the USB ports.

7. Program the following XUSB PADCTL registers to assign the over current signal mapping for USB 2.0 ports owned by XUSB and USB2, according to the platform specific configuration:
   - XUSB_PADCTL_SNPS_OC_MAP_0[CONTROLLER1_OC_PIN]
   - XUSB_PADCTL_USB2_OC_MAP_0[PORT3_OC_PIN]
   - XUSB_PADCTL_USB2_OC_MAP_0[PORT2_OC_PIN]
   - XUSB_PADCTL_USB2_OC_MAP_0[PORT1_OC_PIN]
   - XUSB_PADCTL_USB2_OC_MAP_0[PORT0_OC_PIN]
   - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE3_OC_MAP]
   - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE2_OC_MAP]

- XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE1_OC_MAP]
- XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE0_OC_MAP]

8. Write ‘1’ to the following XUSB PADCTL register bits to clear possible false reporting of over current events before the over current signal mappings are properly programmed:
   - XUSB_PADCTL_OC_DET_0[OC_DETECTED3]
   - XUSB_PADCTL_OC_DET_0[OC_DETECTED2]
   - XUSB_PADCTL_OC_DET_0[OC_DETECTED1]
   - XUSB_PADCTL_OC_DET_0[OC_DETECTED0]
   - XUSB_PADCTL_OC_DET_0[OC_DETECTED_VBUS_PAD3]
   - XUSB_PADCTL_OC_DET_0[OC_DETECTED_VBUS_PAD2]
   - XUSB_PADCTL_OC_DET_0[OC_DETECTED_VBUS_PAD1]
   - XUSB_PADCTL_OC_DET_0[OC_DETECTED_VBUS_PAD0]
9. Wait 1 µs
10. Set the following XUSB PADCTL register bits to ‘1’ to enable the VBUS of the host ports
    - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE3]
    - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE2]
    - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE1]
    - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE0]

Step 9

xHCI PEP driver initializes IPFS registers.

1. Program the following XUSB Host IPFS registers to allow software accesses to XUSB Host’s MMIO registers:
   - XUSB_HOST_AXI_BAR0_START_0[AXI_BAR0_START] to ‘0x70090’
   - XUSB_HOST_AXI_BAR0_SZ_0[AXI_BAR0_SIZE] to ‘0x00008’
   - XUSB_HOST_FPCI_BAR0_0[FPCI_BAR0_START] to ‘0x0010000’
   - XUSB_HOST_FPCI_BAR0_0[FPCI_BAR0_ACCESS_TYPE] to ‘0’
2. Program the following XUSB Host IPFS register to enable the XUSB host:
   - XUSB_HOST_CONFIGURATION_0[EN_FPCI] to ‘1’

xHCI Device driver initializes IPFS registers.

3. Program the following XUSB Device IPFS registers to allow software accesses to XUSB Device’s MMIO registers:
   - XUSB_DEV_AXI_BAR0_START_0[AXI_BAR0_START] to ‘0x700d0’
   - XUSB_DEV_AXI_BAR0_SZ_0[AXI_BAR0_SIZE] to ‘0x00008’
   - XUSB_DEV_FPCI_BAR0_0[FPCI_BAR0_START] to ‘0x0010000’
   - XUSB_DEV_FPCI_BAR0_0[FPCI_BAR0_ACCESS_TYPE] to ‘0’
4. Program the following XUSB Host IPFS register to enable the XUSB host:
   - XUSB_HOST_CONFIGURATION_0[EN_FPCI] to ‘1’

Note: *XUSB Host’s and Device’s configuration address mappings are hardcoded in IPFS starting from offset 0x8000.*

---

xHCI PEP driver initializes XUSB Host’s configuration registers.

5. Program the following XUSB configuration registers to initialize XUSB:
   - NV_PROJ__XUSB_CFG_1_BUS_MASTER to ‘1’
   - NV_PROJ__XUSB_CFG_1_MEMORY_SPACE to ‘1’
   - NV_PROJ__XUSB_CFG_4_BASE_ADDRESS to ‘0x02000’

xHCI Device driver initializes XUSB Host’s configuration registers.

6. Program the following XUSB configuration registers to initialize XUSB:
   - NV_PROJ__XUSB_DEV_CFG_1_BUS_MASTER to ‘1’
   - NV_PROJ__XUSB_DEV_CFG_1_MEMORY_SPACE to ‘1’
   - NV_PROJ__XUSB_DEV_CFG_4_BASE_ADDRESS to ‘0x02000’

Step 10

xHCI PEP driver loads XUSB Host firmware.

During system cold boot, the Boot Loader is responsible for triggering the hardware to load the firmware into Falcon. During exit from power gating either when the XUSB was power gated or when the system exits from LP, the xHCI driver for Linux OS and xHCI driver power management PEP for Windows will be responsible to trigger the hardware to load the firmware into Falcon.

The sequence of steps performed by the FW boot loader is as follows:

1. Copy the DFI image into system memory (physically contiguous). DFI contains the configuration table, FW code, and Falcon bootstrap code.
2. Cold Boot:
   a. The Boot Loader sets the CONTEXT_SAVED bit to “0”.

   Note: *This bit is reset to “0” so the Boot Loader can ignore this step.*

3. Exit from Power Gating:
   - Linux xHCI driver or Windows xHCI PEP sets the CONTEXT_SAVED bit to “0” or “1” according to the state it read from the CONTEXT_SAVED bit before power gating the XUSB.
   - Linux xHCI driver or Windows xHCI PEP sets the PORT_STATE_SAVED and FS_PORT_SPEED_SAVED fields according to the state it read from these same fields before power gating XUSB.
4. Program the system memory address at which the FW code starts to NV_PROJ__XUSB_CSB_MEMPOOL_ILOAD_BASE_LO, NV_PROJ__XUSB_CSB_MEMPOOL_ILOAD_BASE_HI, and NV_PROJ__XUSB_CSB_MEMPOOL_ILOAD_ATTR_SIZE.

   Notes:
   - *FW code address program in the above step is = Start address of DFI + 256.*
   - *The value to be programmed to ILOAD_ATTR_SIZE is stored in the DFIOFFSET field present with in the configuration table of DFI image.*

5. Invalidate all entries in the L2IMEM by writing ‘L2IMEM_INVALIDATE_ALL’ to ‘ACTION’ field in the NV_PROJ__XUSB_CSB_MEMPOOL_L2IMEMOP_TRIG register.
6. Program the L2IMEM register as follows to fetch the complete bootstrap into L2IMEM:
   - Program the 256 byte aligned offset of the FW bootstrap code (in DFI image) in the system memory to NV_PROJ__XUSB_CSB_MEMPOOL_L2IMEMOP_SIZE_OFFSET. The offset corresponds to bootstrap location from the start of the complete FW code.
   - Program the number of code pages (multiples of 256B) to copy from system memory from start of the FW bootstrap code to NV_PROJ__XUSB_CSB_MEMPOOL_L2IMEMOP_SIZE_SRC_COUNT

- Program the L2IMEM action to be performed as ‘L2IMEM_LOAD_LOCKED_RESULT’ into NV_PROJ__XUSB_CSB_MEMPOOL_L2IMEMOP_TRIG_ACTION (DEST_INDEX will be zero).

7. Reserve the required number of IMEM blocks by writing to ‘IMFILLCTL’ register.
8. Enable the auto-fill mode for the bootstrap code range by programming ‘IMFILLRNG1’ register. The low tag will be ‘Boot Tag’ present in the configuration table and high tag will be ‘Boot tag + FW bootstrap code size).
9. Program the BOOTVEC register with the location of IMEM at which Falcon boot code is copied. The value programmed will be the “Boot tag” value present in the DFI configuration table.
10. Start the Falcon by writing to the STARTCPU field in the CPUCTL register.

22.8.5 LP0

22.8.5.1 LP0 Entry

Step 1

The EHCI driver performs context save operations.

The xHCI driver performs a context save operation as described in Section 4.23.2 of the xHCI specification.

The xHCI PEP driver performs an XUSB specific context save operation.

The xHCI PEP driver performs an XUSB IPFS specific context save operation.

- Read and store the value of the following registers
  - XUSB_{HOST,DEV}_MSI_BAR_SZ_0
  - XUSB_{HOST,DEV}_MSI_AXI_BAR_ST_0
  - XUSB_{HOST,DEV}_MSI_FPCI_BAR_ST_0
  - XUSB_{HOST,DEV}_MSI_VEC0_0
  - XUSB_{HOST,DEV}_MSI_EN_VEC0_0
  - XUSB_{HOST,DEV}_FPCI_ERROR_MASKS_0
  - XUSB_{HOST,DEV}_INTR_MASK_0
  - XUSB_{HOST,DEV}_IPFS_INTR_ENABLE_0
  - XUSB_{HOST,DEV}_UFPCI_CONFIG_0
  - XUSB_{HOST,DEV}_CLKGATE_HYSTERESIS_0
  - XUSB_{HOST,DEV}_XUSB_HOST_MCCIF_FIFOCTRL_0

Step 2

The System Power Management driver programs the PMC USB2.0 sleepwalk logic as described in the “PMC Programming” section.

The System Power Management driver should enable the wake events according to the port states and Wake-on-Connect, Wake-on-Disconnect, and Wake-on-Over-Current settings of the USB2 and XUSB registers ports accordingly.

The System Power Management driver enables wake events from USB ports.

- Set the following PMC register bits to ‘1’ to set the wake signal active level to ‘HIGH’
  - APBDEV_PMC_WAKE2_LVL_0[7] for USB2.0 port 0 wakeup
  - APBDEV_PMC_WAKE2_LVL_0[8] for USB2.0 port 1 wakeup
  - APBDEV_PMC_WAKE2_LVL_0[9] for USB2.0 port 2 wakeup
  - APBDEV_PMC_WAKE2_LVL_0[10] for USB2.0 port 3 wakeup
  - APBDEV_PMC_WAKE2_LVL_0[11] for HSIC port 0 wakeup

- APBDEV_PMC_WAKE2_LVL_0[12] for USB3.0 ports wakeup

- Set the following PMC register bits to '1' to enable USB wake events
  - APBDEV_PMC_WAKE2_MASK_0[7] for USB2.0 port 0 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[8] for USB2.0 port 1 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[9] for USB2.0 port 2 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[10] for USB2.0 port 3 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[11] for HSIC port 10 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[12] for USB3.0 ports wakeup

Step 3

The System Power Management driver setup the VBUS_ENABLE I/O pins as GPIO with wake events enabled to enable wake on overcurrent.

- Set the following XUSB PADCTL registers to 'OC_DETECTION_DISABLED' to disable over current wake events reporting from XUSB PADCTL
  - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE3_OC_MAP]
  - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE2_OC_MAP]
  - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE1_OC_MAP]
  - XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE0_OC_MAP]
- Program the following GPIO registers to enable the I/O pins to generate events when over current events are reported with signals asserting to logical low
  - GPIO_CNF_1_3[BIT_5] to 'GPIO'
  - GPIO_CNF_1_3[BIT_4] to 'GPIO'
  - GPIO_OE_1_3[BIT_5] to 'TRI_STATE'
  - GPIO_OE_1_3[BIT_4] to 'TRI_STATE'
  - GPIO_INT_ENB_1_3[BIT_5] to 'ENABLE'
  - GPIO_INT_ENB_1_3[BIT_4] to 'ENABLE'
  - GPIO_INT_LVL_1_3[EDGE_5] to 'EDGE-Triggered'
  - GPIO_INT_LVL_1_3[EDGE_4] to 'EDGE-Triggered'
  - GPIO_INT_LVL_1_3[BIT_5] to 'LOW'
  - GPIO_INT_LVL_1_3[BIT_4] to 'LOW'
- Set the following PMC register bits to '1' to set the wake signal active level to 'HIGH' and enable the wake events
  - APBDEV_PMC_WAKE2_LVL_0[23] for VBUS_ENABLE1
  - APBDEV_PMC_WAKE2_LVL_0[22] for VBUS_ENABLE0
  - APBDEV_PMC_WAKE2_MASK_0[23] for VBUS_ENABLE1
  - APBDEV_PMC_WAKE2_MASK_0[22] for VBUS_ENABLE0

Step 4

The pad driver asserts reset to XUSB pad.

- Set the following CAR register bits to '1' to assert reset to PCIe/XUSB pad and SATA/XUSB pad.
  - CLK_RST_CONTROLLER_RST_DEVICES_Y_0[SWR_PEX_USB_UPHY_RST]
  - CLK_RST_CONTROLLER_RST_DEVICES_Y_0[SWR_SATA_USB_UPHY_RST]

The pad driver disables DVDD power of the XUSB pad by turning off regulators with platform specific means.

Step 5

The system software puts the system in LP0.

22.8.5.2 LP0 Exit

After exiting LP0, the PMC will restore the partition power gating to the state before LP0 entry. This means if a partition was power gated before entering LP0, that partition would stay power gated after exiting LP0, and only partitions that were powered before entering LP0 would have their power restored after exiting LP0.

Step 1

The Boot ROM enables USB related PLLs with software override.

Refer to Step 1 of “Cold Boot” for the programming sequence.

Step 2

The Boot ROM deasserts reset to XUSB PADCTL block.

Refer to Step 2 of “Cold Boot” for the programming sequence.

Step 3

The Boot ROM performs battery charging operations through USB2 Controller.

Refer to Step 3 of “Cold Boot” for the programming sequence.

Step 4

The LP0 exit sequence is described in Chapter 12: Power Management Controller of this TRM.

Step 5

The pad driver switches USB related PLLs to under hardware control.

Refer to Step 7 of “Cold Boot” for the programming sequence.

Step 6

The pad driver checks the VBUS_ENABLE I/O pins for over current events and disables wake event reporting.

- Read the following PMC register bits
  - APBDEV_PMC_WAKE2_STATUS_0[23] for VBUS_ENABLE1
  - APBDEV_PMC_WAKE2_STATUS_0[22] for VBUS_ENABLE0
- Program the following GPIO registers to enable the I/O pins to generate events when overcurrent events are reported with signals asserting to logical low:
  - GPIO_CNF_1_3[BIT_5] to ‘SPIO’
  - GPIO_CNF_1_3[BIT_4] to ‘SPIO’
  - GPIO_INT_ENB_1_3[BIT_5] to ‘DISABLE’
  - GPIO_INT_ENB_1_3[BIT_4] to ‘DISABLE’

The pad driver forwards the overcurrent events to XUSB or USB2 if they occurred during LP0.

- Program the following XUSB PADCTL registers to enable software override of over current wake events
  - XUSB_PADCTL_OC_DET_0[SET_OC_DETECTED0]
- Program the following XUSB PADCTL registers to ‘OC_DETECTED0’ to report the overcurrent wake events to XUSB or USB2 ports, according to the platform specific configuration:

- XUSB_PADCTL_SNPS_OC_MAP_0[CONTROLLER1_OC_PIN]
- XUSB_PADCTL_USB2_OC_MAP_0[PORT3_OC_PIN]
- XUSB_PADCTL_USB2_OC_MAP_0[PORT2_OC_PIN]
- XUSB_PADCTL_USB2_OC_MAP_0[PORT1_OC_PIN]
- XUSB_PADCTL_USB2_OC_MAP_0[PORT0_OC_PIN]
- XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE3_OC_MAP]
- XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE2_OC_MAP]
- XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE1_OC_MAP]
- XUSB_PADCTL_VBUS_OC_MAP_0[VBUS_ENABLE0_OC_MAP]

Note: *Once the overcurrent condition has been removed, pad driver should set the OC MAP registers to their original mappings and clear the SET OC DETECTED0 bit.*

Step 7

The pad driver assigns the USB port to the controllers, then programs the port capabilities and pad parameters of ports assigned to XUSB according to the platform specific configuration.

Refer to Step 8, #4 through #7, of “Cold Boot” for the programming sequence.

Step 8

The pad driver programs the clocks and deasserts the resets to the controllers.

1. Refer to Step 9 of “Cold Boot” for the start of the programming sequence.
2. Wait 1 µs.
3. Program the following XUSB PADCTL register bits to ‘0’ to release the XUSB SS wake logic state latching
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_VCORE_DOWN]
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_VCORE_DOWN]
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_VCORE_DOWN]
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_VCORE_DOWN]
4. Wait 100 µs.
5. Program the following XUSB PADCTL register bits to ‘0’ to release the XUSB SS wake logic state latching
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_CLAMP_EN_EARLY]
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_CLAMP_EN_EARLY]
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_CLAMP_EN_EARLY]
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_CLAMP_EN_EARLY]
6. Wait 100 µs.
7. Program the following XUSB PADCTL register bits to ‘0’ to release the XUSB SS wake logic state latching
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_CLAMP_EN]
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_CLAMP_EN]
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_CLAMP_EN]
   - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_CLAMP_EN]

Note: *If XUSB was in ELPG before entering LP0 and the LP0 exit is not due to wake event from ports belong to XUSB, the pad driver should keep XUSB in the ELPG state and only bring XUSB out of ELPG when wake events are detected for the ports owned by XUSB.*

Step 9

The pad driver programs the capability and pad parameters of ports owned by USB2 controllers.

Refer to Step 10 of “Cold Boot” for the USB2 port capability and pad/PLL parameter programming sequence.

Step 10

The pad driver enables the VBUS to the USB ports if VBUS was disabled during LP0.

Refer to Step 11 of “Cold Boot” for the programming sequence.

Step 11

The xHCI PEP driver performs the XUSB specific context restore operation, if XUSB was not in ELPG before entering LP0 or the LP0 exit is due to wake event from ports of XUSB.

The xHCI PEP driver performs XUSB IPFS and XUSB register initialization as described below:

xHCI PEP driver initializes IPFS registers

1. Program the following XUSB Host IPFS registers to allow software accesses to XUSB Host’s MMIO registers:
   - XUSB_HOST_AXI_BAR0_START_0[AXI_BAR0_START] to ‘0x70090’
   - XUSB_HOST_AXI_BAR0_SZ_0[AXI_BAR0_SIZE] to ‘0x00008’
   - XUSB_HOST_FPCI_BAR0_0[FPCI_BAR0_START] to ‘0x0010000’
   - XUSB_HOST_FPCI_BAR0_0[FPCI_BAR0_ACCESS_TYPE] to ‘0’
2. Program the following XUSB Host IPFS register to enable the XUSB host:
   - XUSB_HOST_CONFIGURATION_0[EN_FPCI] to ‘1’

xHCI Device driver initializes IPFS registers

3. Program the following XUSB Device IPFS registers to allow software accesses to XUSB Device’s MMIO registers:
   - XUSB_DEV_AXI_BAR0_START_0[AXI_BAR0_START] to ‘0x700d0’
   - XUSB_DEV_AXI_BAR0_SZ_0[AXI_BAR0_SIZE] to ‘0x00008’
   - XUSB_DEV_FPCI_BAR0_0[FPCI_BAR0_START] to ‘0x0010000’
   - XUSB_DEV_FPCI_BAR0_0[FPCI_BAR0_ACCESS_TYPE] to ‘0’
4. Program the following XUSB Host IPFS register to enable the XUSB host:
   - XUSB_HOST_CONFIGURATION_0[EN_FPCI] to ‘1’

Note: *XUSB Host’s and Device’s configuration address mappings are hardcoded in IPFS starting from offset 0x8000.*

xHCI PEP driver initializes XUSB Host’s configuration registers

5. Program the following XUSB configuration registers to initialize XUSB:
   - NV_PROJ__XUSB_CFG_1_BUS_MASTER to ‘1’
   - NV_PROJ__XUSB_CFG_1_MEMORY_SPACE to ‘1’
   - NV_PROJ__XUSB_CFG_4_BASE_ADDRESS to ‘0x02000’

xHCI Device driver initializes XUSB Host's configuration registers

6. Program the following XUSB configuration registers to initialize XUSB:
   - NV_PROJ__XUSB_DEV_CFG_1_BUS_MASTER to '1'
   - NV_PROJ__XUSB_DEV_CFG_1_MEMORY_SPACE to '1'
   - NV_PROJ__XUSB_DEV_CFG_4_BASE_ADDRESS to '0x02000'

Step 12

The xHCI PEP Driver loads XUSB firmware. Refer to Step 12 in "Cold Boot", if XUSB was not in ELPG before entering LP0 and the LP0 exit is not due to wake event from ports of XUSB.

Step 13

The EHCI driver performs context restore operation.

The xHCI driver performs a context restore operation as described in Section 4.23.2 of the xHCI specification, If XUSB was not in ELPG before entering LP0 and the LP0 exit is not due to wake event from ports of XUSB.

Step 14

The System Power Management driver disables the PMC USB2.0 sleepwalk logic.

The xHCI PEP driver disables the wake event detections.

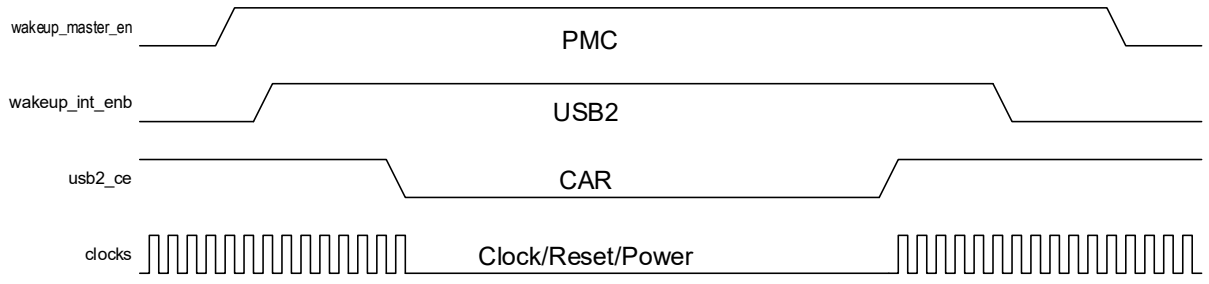
1. Set the following registers to '0' to disable the wake detection:
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P0]
   - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P0]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P1]
   - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P1]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P2]
   - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P2]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_MASTER_ENABLE_P3]
   - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P3]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_MASTER_ENABLE_P0]
   - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UHSIC_LINE_WAKEUP_EN_P0]
2. Set the following registers to '0' to switch the electric control of the USB2.0 pad to XUSB or USB2:
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P0]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P0]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P0]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P1]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P1]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P1]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P2]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P2]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P2]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_FSLS_USE_PMC_P3]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_PCTRL_USE_PMC_P3]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_TCTRL_USE_PMC_P3]

3. Program the following registers to ‘NONE’ to disable wake event triggers of sleepwalk logic:
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P0]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P1]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P2]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_WAKE_VAL_P3]
   - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_WAKE_VAL_P0]
4. Set the following registers to ‘1’ to power down the line state detectors of the pad:
   - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P0]
   - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P0]
   - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P1]
   - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P1]
   - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P2]
   - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P2]
   - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P3]
   - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P3]
   - APBDEV_PMC_USB_AO_0[DATA0_VAL_PD_P0]
   - APBDEV_PMC_USB_AO_0[DATA1_VAL_PD_P0]
   - APBDEV_PMC_USB_AO_0[STROBE_VAL_PD_P0]
5. Write ‘1’ to the following registers to clear alarm of the sleepwalk logic:
   - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P0]
   - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P1]
   - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P2]
   - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P3]
   - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UHSIC_CLR_WAKE_ALARM_P0]

22.8.6 USB2 Controller Clock Gating

USB2 controllers supports controller clock gating, where the port wakeup events are detected via the PMC sleepwalk logic. The following figure illustrates the signal sequences to enable USB2 controller clock gating wake event detection before its clocks are gated.

Figure 57: Signals to Enable USB2 Controller Clock Gating Wake Event Detection



22.8.6.1 Enable Controller Clock Gating

Step 1

The System Power Management driver programs the PMC USB2.0 sleepwalk logic as described in Section 22.8.9.2: Enable PMC Sleepwalk Logic.

The System Power Management driver should enable the wake events according to the port states and Wake-on-Connect, Wake-on-Disconnect, and Wake-on-Over-Current settings of the USB2 ports accordingly.

> ***Note:*** *The line wakeup event from PMC is shared between XUSB and USB2 controllers. There is no per controller masking for the line wakeup event, and when the sleepwalk logic triggers the event, both XUSB and USB2 will log the status even when they are not power gated or clock gated. Thus the system power management driver should ensure the wake status is cleared before enabling the sleepwalk logic.*

Step 2

The System Power Management driver can be used to enable the USB2 controller wakeup interrupt.

- Set the following USB2 register bits to '1' to enable the interrupt.
  - USB2_UTMIP_PMC_WAKEUP0_0[UTMIP_LINE_WAKEUP_EVENT_INT_ENB] for USB2 #1
  - UHSIC_PMC_WAKEUP0_0[UHSIC_LINE_WAKEUP_EVENT_INT_ENB] for USB2 #2

Step 3

The System Power Management driver disables the USB2 controller clocks.

- Set the following CAR register bits to '1' to disable the clocks.
  - CLK_RST_CONTROLLER_CLK_ENB_L_CLR_0[CLR_CLK_ENB_USBD] for USB2 #1
  - CLK_RST_CONTROLLER_CLK_ENB_H_CLR_0[CLR_CLK_ENB_USB2] for USB2 #2

Step 4

The System Power Management driver puts UTMIPLL to IDDQ if all non-HSIC USB2.0 ports are assigned to USB2 controllers and all of these controllers are in reset or suspend states.

- Set the following CAR register bits to '1' to put the PLL to IDDQ.
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_OVERRIDE_VALUE]

The System Power Management driver keeps UTMIPLL's IDDQ control in software control.

- When all USB2 ports are in Disconnected or Suspend states, set the following CAR register bit to '1' to put the PLL to IDDQ:
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_OVERRIDE_VALUE]
- When any USB2 port is exiting Disconnected or Suspend states, clear the following CAR register bit to '0':
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_OVERRIDE_VALUE]

22.8.6.2 Disable Controller Clock Gating

Step 1

The System Power Management driver brings UTMIPLL out of to IDDQ when all non-HSIC USB2.0 ports are assigned to USB2 controllers and any of these controllers are exiting reset or suspend states.

- Set the following CAR register bits to '0' to put the PLL out of IDDQ.
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_OVERRIDE_VALUE]

The System Power Management driver puts UTMIPLL IDDQ to under software control when some, but not all, non-HSIC USB2.0 ports are assigned to USB2 controllers, and any of these controllers are exiting reset or suspend states.

- Set the following CAR register bits to ‘1’ to disable IDDQ hardware control.
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_PD_INCLUDE]
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_SWCTL]

Step 2

The System Power Management driver can be used to enable the USB2 controller clocks.

- Set the following USB2 register bits to ‘1’ to enable the clocks.
  - CLK_RST_CONTROLLER_CLK_ENB_L_SET_0[SET_CLK_ENB_USBD] for USB2 #1
  - CLK_RST_CONTROLLER_CLK_ENB_H_SET_0[SET_CLK_ENB_USB2] for USB2 #2

Step 3

The System Power Management driver disables the USB2 controller wakeup interrupt.

- Set the following USB2 register bits to ‘0’ to disable the interrupt.
  - USB2_UTMIP_PMC_WAKEUP0_0[UTMIP_LINE_WAKEUP_EVENT_INT_ENB] for USB2 #1
  - UHSIC_PMC_WAKEUP0_0[UHSIC_LINE_WAKEUP_EVENT_INT_ENB] for USB2 #2

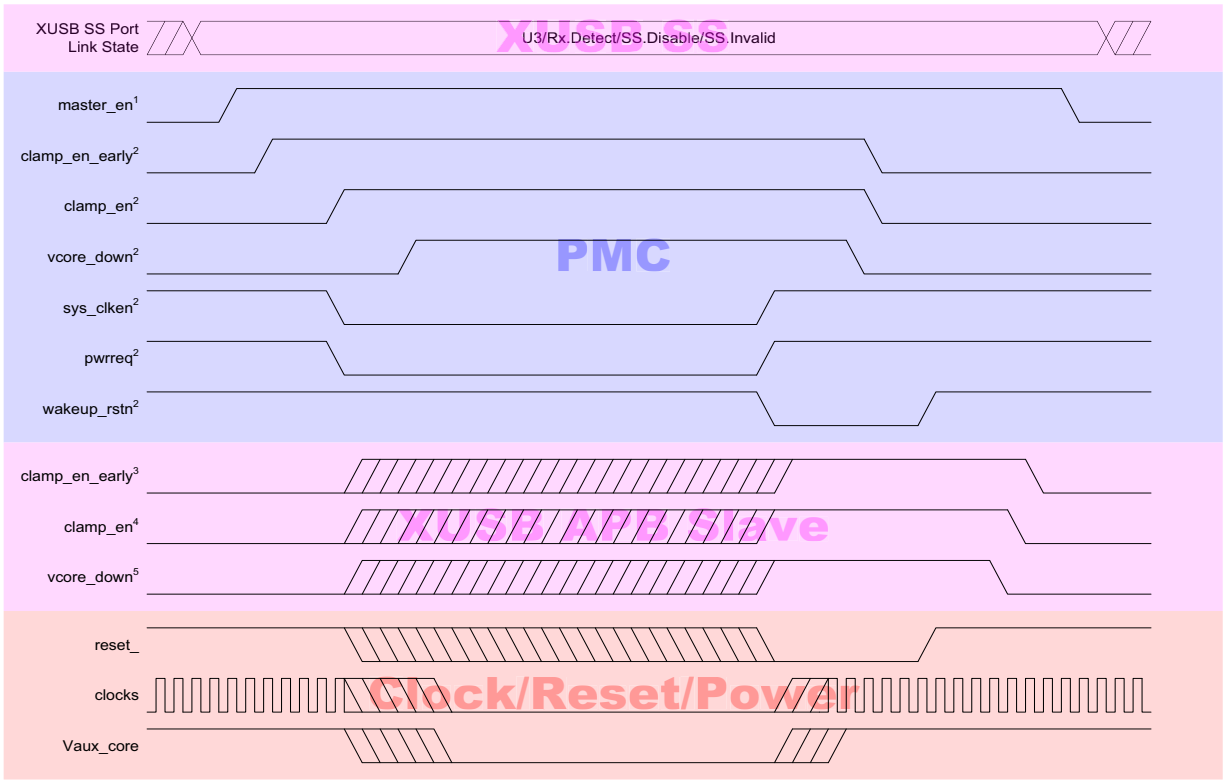
Step 4

The System Power Management driver programs the PMC USB2.0 sleepwalk logic to disable the sleepwalk logic as described in Section 22.8.9.3: Disable PMC Sleepwalk Logic.

22.8.7 XUSB Controller Power Gating

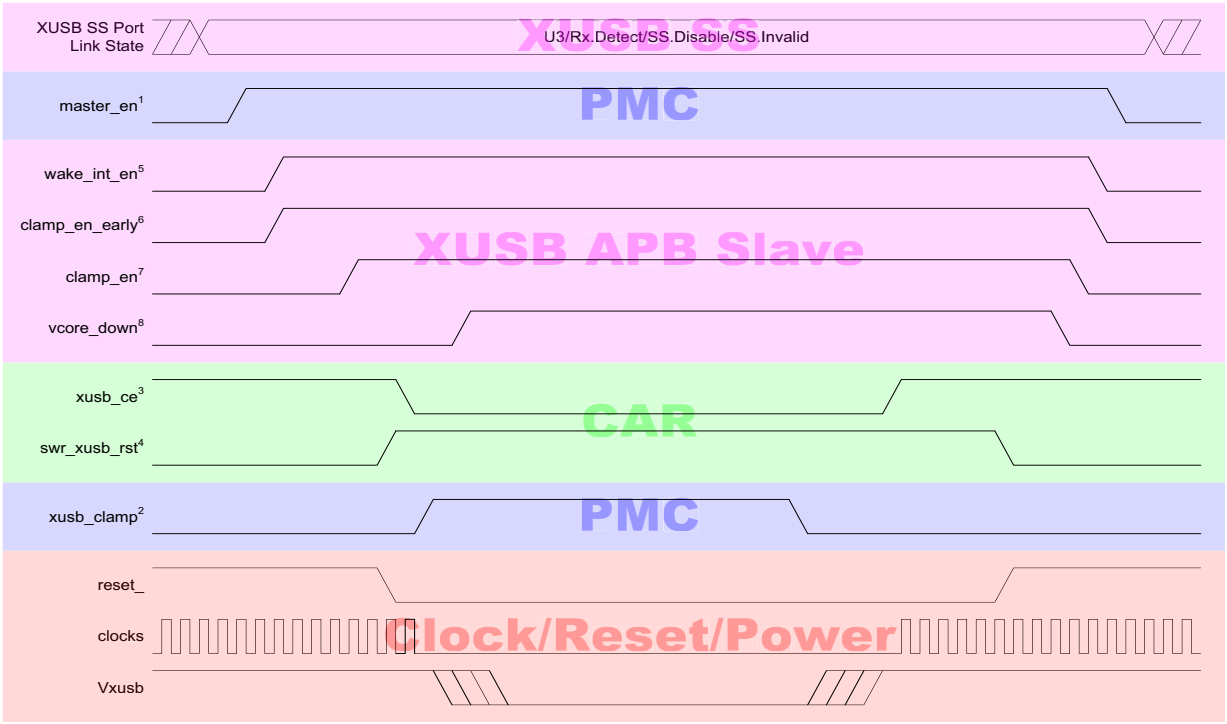
The following figure illustrates the signal sequences from the PMC that are used by XUSB SS Wake logic to enable its wake event detection.

Figure 58: PMC Signals to XUSB SS Wake Logic



The following figure illustrates the signal sequences from the XUSB PADCTL block that are required to follow the same sequence as from the PMC so XUSB SS Wake logic can enable its wake event detection.

Figure 59: XUSB PADCTL Signals to XUSB SS Wake Logic



The XUSB controller has three partitions that can be selectively power gated with the following use cases, where unlisted combinations are not supported:

Table 111: Power Gating of XUSB Partitions

XUSBC (Host/USB2.0)	XUSBB (Device)	XUSBA (SuperSpeed)	Use Case Descriptions
Powered	Powered	Powered	Both Host and Device modes in normal operations, with SuperSpeed links operational.
Powered	Powered	Power Gated	Both Host and Device modes in normal operations, with SuperSpeed links in low power states. SuperSpeed link wake events report through XUSB PADCTL.
Powered	Power Gated	Powered	Host mode in normal operations, with SuperSpeed links operational. Device mode power gated. Device mode SuperSpeed and USB2.0 link wake events report through XUSB PADCTL.
Powered	Power Gated	Power Gated	Host mode in normal operations, with SuperSpeed links in low power states. Device mode power gated. Host Mode SuperSpeed, and Device mode SuperSpeed and USB2.0 link wake events report through XUSB PADCTL.
Power Gated	Powered	Powered	Host mode power gated with USB2.0 buses in low power states, with Device mode and SuperSpeed link in normal operation. Host Mode SuperSpeed and USB2.0 link wake events report through XUSB PADCTL.
Power Gated	Power Gated	Power Gated	Both Host and Device modes power gated, with SuperSpeed links in low power states. All Host and Device modes link wake events report through XUSB PADCTL.

Due to the wake latency requirements, device partition can only be power-gated when the device port is not connected.

22.8.7.1 All Partitions ELPG Entry

Step 1

The xHCI driver performs context save operation as described in Section 4.23.2 of the xHCI specification.

The xHCI PEP driver performs XUSB_HOST specific context save operation. In case the SuperSpeed partition has already been power gated, xHCI FW and XUSB Device Mode drivers should not save the context of the SuperSpeed partition again.

The XUSB Device Mode driver performs XUSB_DEVICE specific context save operations.

The xHCI PEP driver and XUSB Device Mode driver perform XUSB IPFS specific context save operations.

- Read and store the value of the following registers
  - XUSB_{HOST,DEV}_MSI_BAR_SZ_0
  - XUSB_{HOST,DEV}_MSI_AXI_BAR_ST_0
  - XUSB_{HOST,DEV}_MSI_FPCI_BAR_ST_0
  - XUSB_{HOST,DEV}_MSI_VEC0_0
  - XUSB_{HOST,DEV}_MSI_EN_VEC0_0
  - XUSB_{HOST,DEV}_FPCI_ERROR_MASKS_0
  - XUSB_{HOST,DEV}_INTR_MASK_0
  - XUSB_{HOST,DEV}_IPFS_INTR_ENABLE_0
  - XUSB_{HOST,DEV}_UFPCI_CONFIG_0
  - XUSB_{HOST,DEV}_CLKGATE_HYSTERESIS_0
  - XUSB_{HOST,DEV}_XUSB_HOST_MCCIF_FIFOCTRL_0

Step 2

The System Power Management driver programs the PMC USB2.0 sleepwalk logic for ports assigned to XUSB Host Mode and XUSB Device Mode according as described in the “PMC Programming” section.

The System Power Management driver should enable the wake events according to the port states and Wake-on-Connect, Wake-on-Disconnect, and Wake-on-Over-Current settings of the USB2 ports accordingly.

Note: *The line wakeup event from PMC is shared between the XUSB and USB2 controller. There is no per controller masking for the line wakeup event, and when the sleepwalk logic triggers the event, both XUSB and USB2 controllers will log the status even when they are not power gated or clock gated. Thus the system power management driver should ensure the wake status is cleared before enabling the sleepwalk logic.*

Step 3

The xHCI PEP driver and XUSB Device Mode driver enable the XUSB wakeup interrupts for the SuperSpeed and USB2.0 ports assigned to host and device.

- Write '1' to the following XUSB PADCTL register bits to clear the interrupt status.
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT3_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT2_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT1_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT0_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT3_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT2_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT1_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT1_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_HSIC_PORT0_WAKEUP_EVENT]
- Set the following XUSB PADCTL register bits to '1' to enable the interrupt.
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT3_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT2_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT3_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT2_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_HSIC_PORT0_WAKE_INTERRUPT_ENABLE]

Note: *The interrupt status bit could also be set due to previous wake events reported for USB2 controllers, thus the status should be cleared before enabling the interrupt.*

Step 4

The xHCI PEP driver and XUSB Device Mode driver initiate the signal sequence to enable the XUSB SS wake detection logic for the SuperSpeed ports assigned to host and device.

- Write '1' to the following XUSB PADCTL register bits to assert the clamp_en_early signal.
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_CLAMP_EN_EARLY]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_CLAMP_EN_EARLY]

- XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_CLAMP_EN_EARLY]
- XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_CLAMP_EN_EARLY]

- Write '1' to the following XUSB PADCTL register bits to assert the clamp_en signal.
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_CLAMP_EN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_CLAMP_EN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_CLAMP_EN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_CLAMP_EN]
- Wait 250 µs

Note: *These two writes must not be combined.*

Step 5

System Power Management driver flushes MCCIF and partition clients.

- Set the following MC register bits to '1' to enable flush to XUSB
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_HOST_FLUSH_ENABLE] for Host Mode
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_DEV_FLUSH_ENABLE] for Device Mode
- Read the following MC register bits to be '1' to ensure flush to XUSB is enabled
  - MC_CLIENT_HOTRESET_STATUS_0[XUSB_HOST_HOTRESET_STATUS] for Host Mode
  - MC_CLIENT_HOTRESET_STATUS_0[XUSB_DEV_HOTRESET_STATUS] for Device Mode

Step 6

The System Power Management driver asserts reset to XUSB then disables its clocks.

- Set the following CAR register bits to '1' to assert reset to XUSB
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST] for Host Mode
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_DEV_RST] for Device Mode
  - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST] for SuperSpeed ports
- Set the following CAR register bits to '1' to disable the clocks to individual XUSB partitions.
  - CLK_RST_CONTROLLER_CLK_ENB_U_CLR_0[CLR_CLK_ENB_XUSB_HOST] for Host Mode
  - CLK_RST_CONTROLLER_CLK_ENB_U_CLR_0[CLR_CLK_ENB_XUSB_DEV] for Device Mode
  - CLK_RST_CONTROLLER_CLK_ENB_W_CLR_0[CLR_CLK_ENB_XUSB_SS] for SS ports

Step 7

The System Power Management driver disables the XUSB power rails.

- Program the following PMC register bits in a single write to disable the power rail to XUSB host:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to 'enable'
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to 'XUSBC'
- Read the following PMC register bit to confirm the power gating status of XUSB host:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBC] equals 'OFF'
- Program the following PMC register bits in a single write to disable the power rail to XUSB device:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to 'enable'
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to 'XUSBB'

- Read the following PMC register bit to confirm the power gating status of XUSB device:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBB] equals ‘OFF’
- Program the following PMC register bits in a single write to disable the power rail to XUSB SuperSpeed:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBA’
- Read the following PMC register bit to confirm the power gating status of XUSB SuperSpeed:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBA] equals ‘OFF’

Note: *Only one partition can be power gated at a time.*

Step 8

The xHCI PEP driver and XUSB Device Mode driver initiate the signal sequence to enable the XUSB SS wake detection logic for the SuperSpeed ports assigned to host and device.

- Write ‘1’ to the following XUSB PADCTL register bits to assert the vcore_off signal:
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_VCORE_DOWN]

22.8.7.2 Host Mode Partition ELPG Entry

Step 1

The xHCI driver performs context save operation as described in Section 4.23.2 of the xHCI specification.

The xHCI PEP driver performs XUSB_HOST specific context save operations. In case the SuperSpeed partition has already been power gated, xHCI FW should not save the context of the SuperSpeed partition again.

The xHCI PEP driver performs XUSB IPFS specific context save operations.

Step 2

The System Power Management driver programs the PMC USB2.0 sleepwalk logic for ports assigned to XUSB Host Mode as described in the “PMC Programming” section.

The System Power Management driver should enable the wake events according to the port states and Wake-on-Connect, Wake-on-Disconnect, and Wake-on-Over-Current settings of the USB2 ports accordingly.

Note: *The line wakeup event from PMC is shared between XUSB and USB2 controllers. There is no per controller masking for the line wakeup event, and when the sleepwalk logic triggers the event, both XUSB and USB2 controllers will log the status even when they are not power gated or clock gated. Thus the system power management driver should ensure the wake status is cleared before enabling the sleepwalk logic.*

Step 3

The xHCI PEP driver enables the XUSB wakeup interrupts for the SuperSpeed and USB2.0 ports assigned to the host.

Step 4

The System Power Management driver flushes MCCIF and partition clients.

- Set the following MC register bit to ‘1’ to enable flush to XUSB:

- MC_CLIENT_HOTRESET_CTRL_0[XUSB_HOST_FLUSH_ENABLE] for Host Mode

- Read the following MC register bit to be ‘1’ to ensure flush to XUSB is enabled:
  - MC_CLIENT_HOTRESET_STATUS_0[XUSB_HOST_HOTRESET_STATUS] for Host Mode

Step 5

The System Power Management driver asserts reset to XUSB then disables its clocks.

- Set the following CAR register bit to ‘1’ to assert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST] for Host Mode
- Set the following CAR register bit to ‘1’ to disable the clocks to individual XUSB partitions:
  - CLK_RST_CONTROLLER_CLK_ENB_U_CLR_0[CLR_CLK_ENB_XUSB_HOST] for Host Mode

Step 6

The System Power Management driver disables the XUSB power rails.

- Program the following PMC register bits in a single write to disable the power rail to XUSB host:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBC’
- Read the following PMC register bit to confirm the power gating status of XUSB host:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBC] equals ‘OFF’

22.8.7.3 SuperSpeed Partition ELPG Entry

Step 1

The xHCI PEP driver and XUSB Device Mode driver communicate SuperSpeed partition ELPG entry via mailbox protocol.

The xHCI PEP driver and XUSB Device Mode driver communicate SuperSpeed partition ELPG entry with the System Power Management driver.

The xHCI FW and XUSB Device Mode driver perform their SuperSpeed port specific context save operations.

Step 2

The xHCI PEP driver and XUSB Device Mode driver enable the XUSB wakeup interrupts for the SuperSpeed and USB2.0 ports assigned to host and device as described in Step 3 of the “All Partitions ELPG Entry” section.

Step 3

The xHCI PEP driver and XUSB Device Mode driver initiate the signal sequence to enable the XUSB SS wake detection logic for the SuperSpeed portsassigned to host and device as described in Step 4 of the “All Partitions ELPG Entry” section.

Step 4

The System Power Management driver asserts reset to XUSB SuperSpeed partition then disables its clocks.

- Set the following CAR register bit to ‘1’ to assert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST] for SuperSpeed ports
- Set the following CAR register bit to ‘1’ to disable the clocks to individual XUSB partitions:
  - CLK_RST_CONTROLLER_CLK_ENB_W_CLR_0[CLR_CLK_ENB_XUSB_SS] for SS ports

Step 5

The System Power Management driver disables the XUSB SuperSpeed partition power rails.

- Program the following PMC register bits in a single write to disable the power rail to XUSB SuperSpeed:

- APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
- APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBA’

- Read the following PMC register bit to confirm the power gating status of the partitions:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBA] equals ‘OFF’

Note: *Only one partition can be power gated at a time.*

Step 6

The xHCI PEP driver and XUSB Device Mode driver initiate the signal sequence to enable the XUSB SS wake detection logic for the SuperSpeed ports assigned to host and device as described in Step 7 of the “All Partitions ELPG Entry” section.

22.8.7.4 Device Mode Partition ELPG Entry

Device mode partition should only be power gated when the device port is not connected.

Step 1

The XUSB Device Mode driver performs XUSB_DEVICE specific context save operations.

The XUSB Device Mode driver performs XUSB IPFS specific context save operation as described in step 1 of the “All Partitions ELPG Entry” section.

Step 2

The System Power Management driver programs the PMC to enable wake on connect where connection event is triggered by valid VBUS.

Step 3

The System Power Management driver flushes MCCIF and partition clients.

- Set the following MC register bit to ‘1’ to enable flush to XUSB:
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_DEV_FLUSH_ENABLE] for Device Mode
- Read the following MC register bit to be ‘1’ to ensure flush to XUSB is enabled:
  - MC_CLIENT_HOTRESET_STATUS_0[XUSB_DEV_HOTRESET_STATUS] for Device Mode

Step 4

The System Power Management driver asserts reset to XUSB then disables its clocks.

- Set the following CAR register bit to ‘1’ to assert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_DEV_RST] for Device Mode
- Set the following CAR register bit to ‘1’ to disable the clocks to individual XUSB partitions:
  - CLK_RST_CONTROLLER_CLK_ENB_U_CLR_0[CLR_CLK_ENB_XUSB_DEV] for Device Mode

Step 5

The System Power Management driver disables the XUSB power rails.

- Programming the following PMC register bits in a single write to disable the power rail to XUSB device:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBB’
- Read the following PMC register bit to confirm the power gating status of the partitions:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBB] equals ‘OFF’

Note: *Only one partition can be power gated at a time.*

Step 6

The XUSB Device Mode driver initiates the signal sequence to enable the XUSB SS wake detection logic for the SuperSpeed ports assigned to device as described in step 7 of the “All Partitions ELPG Entry” section.

- Write ‘1’ to the following XUSB PADCTL register bit to assert the vcore_off signal.
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_VCORE_DOWN]

22.8.7.5 All Partitions ELPG Exit

In the case the wake event is not generated by SuperSpeed ports, the SuperSpeed related programming should be skipped, where the SuperSpeed partition should exit ELPG due to wake events detected by SuperSpeed ports.

Step 1

The xHCI PEP driver and XUSB Device Mode driver move the USB2.0 port back to XUSB.

- Program the following XUSB PADCTL registers to assign the USB2.0 ports back to XUSB, according to the platform specific configuration:
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT3]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT2]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT1]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT0]

Step 2

The System Power Management driver enables the XUSB power rails.

- Program the following PMC register bits in a single write to enable the power rail to XUSB host:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBC’
- Read the following PMC register bit to confirm the power gating status of XUSB host:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBC] equals ‘ON’
- Program the following PMC register bits in a single write to disable the power rail to XUSB device:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBB’
- Read the following PMC register bit to confirm the power gating status of XUSB device:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBB] equals ‘ON’
- Program the following PMC register bits in a single write to disable the power rail to XUSB SuperSpeed:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBA’
- Read the following PMC register bit to confirm the power gating status of XUSB SuperSpeed:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBA] equals ‘ON’

Note: *Only one partition can be un-power gated at a time.*

Step 3

The System Power Management driver enables XUSB clocks.

- Set the following CAR register bits to '1' to enable the clocks to individual XUSB partitions.
  - CLK_RST_CONTROLLER_CLK_ENB_U_SET_0[SET_CLK_ENB_XUSB_HOST] for Host Mode
  - CLK_RST_CONTROLLER_CLK_ENB_U_SET_0[SET_CLK_ENB_XUSB_DEV] for Device Mode
  - CLK_RST_CONTROLLER_CLK_ENB_W_SET_0[SET_CLK_ENB_XUSB_SS] for SS ports

Step 4

The System Power Management driver removes power clamps to XUSB partitions.

- Set the following PMC register bits to '1' to remove the power clamps to individual XUSB partitions.
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBC] for Host Mode
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBB] for Device Mode
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBA] for SS ports
- Read the following PMC register bits to confirm the power clamps to individual XUSB partitions are removed.
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBC] equals '0'
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBB] equals '0'
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBA] equals '0'

Step 5

The System Power Management driver deasserts reset to XUSB.

- Set the following CAR register bits to '0' to deassert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST] for Host Mode
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_DEV_RST] for Device Mode
  - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST] for SuperSpeed ports
- Wait 1 µs

Step 6

The System Power Management driver disables flushes of MCCIF and partition clients.

- Set the following MC register bits to '0' to enable flush to XUSB:
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_HOST_FLUSH_ENABLE] for Host Mode
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_DEV_FLUSH_ENABLE] for Device Mode

Step 7

The xHCI PEP driver and XUSB Device Mode driver disable the XUSB wakeup interrupts.

- Set the following XUSB PADCTL register bits to '0' to disable the interrupts.
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT3_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT2_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT0_WAKE_INTERRUPT_ENABLE]

- XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT3_WAKE_INTERRUPT_ENABLE]
- XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT2_WAKE_INTERRUPT_ENABLE]
- XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT1_WAKE_INTERRUPT_ENABLE]
- XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT0_WAKE_INTERRUPT_ENABLE]
- XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_HSIC_PORT0_WAKE_INTERRUPT_ENABLE]

Step 8

The xHCI PEP driver and XUSB Device Mode driver initiate the signal sequence to disable the XUSB SS wake detection logic.

- Write ‘0’ to the following XUSB PADCTL register bits to deassert the vcore_off signal.
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_VCORE_DOWN]
- Wait 100 µs.
- Write ‘0’ to the following XUSB PADCTL register bits to deassert the clamp_en_early signals.
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_CLAMP_EN_EARLY]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_CLAMP_EN_EARLY]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_CLAMP_EN_EARLY]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_CLAMP_EN_EARLY]
- Wait 100 µs.
- Write ‘0’ to the following XUSB PADCTL register bits to deassert the clamp_en signals.
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP3_ELPG_CLAMP_EN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP2_ELPG_CLAMP_EN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP1_ELPG_CLAMP_EN]
  - XUSB_PADCTL_ELPG_PROGRAM_1_0[SSP0_ELPG_CLAMP_EN]

Note: *The write to clear vcore_off cannot be combined with the write to clear clamp_en and clamp_en_early.*

Step 9

The xHCI PEP driver performs XUSB IPFS and XUSB register initialization.

The xHCI PEP driver and XUSB Device Mode driver perform XUSB IPFS specific context restore operations for registers listed in Step 1 of the “All Partitions ELPG Entry” section.

The xHCI PEP driver performs XUSB context restore operation.

The XUSB Device Mode driver performs XUSB_DEVICE context restore operations.

Step 10

The xHCI PEP driver performs XUSB HSIC specific context restore operations by reading the wake status of the HSIC ports from PADCTL registers and programming the status to XUSB registers.

- If XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT0_WAKEUP_EVENT] is ‘1’, set the following XUSB register:
  - XUSB_CFG_ARU_CONTEXT_HS_PLS _PORT4 to ‘RESUME’

Else if XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT0_WAKEUP_EVENT] is ‘0’, set the following XUSB register:

- XUSB_CFG_ARU_CONTEXT_HS_PLS _PORT4 to ‘SUSPEND’

- If XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT1_WAKEUP_EVENT] is ‘1’, set the following XUSB register:
  - XUSB_CFG_ARU_CONTEXT_HS_PLS _PORT5 to ‘RESUME’

    Else if XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT1_WAKEUP_EVENT] is ‘0’, set the following XUSB register:
  - XUSB_CFG_ARU_CONTEXT_HS_PLS _PORT5 to ‘SUSPEND’

Step 11

The xHCI PEP driver loads XUSB firmware.

The xHCI PEP driver notifies XUSB firmware whether context of SuperSpeed Partition should be restored.

Step 12

The xHCI driver performs context restore operations as described in Section 4.23.2 of the xHCI specification.

Step 13

The System Power Management driver programs the PMC USB2.0 sleepwalk logic for ports assigned to XUSB Host Mode and XUSB Device Mode to disable the sleepwalk logic as described in the “PMC Programming” section.

The xHCI PEP driver and XUSB Device Mode driver clear the XUSB wakeup events.

- Write ‘1’ to the following XUSB PADCTL register bits to clear the events.
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT3_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT2_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT1_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[SS_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT3_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT2_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT1_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_HSIC_PORT0_WAKE_EVENT]

22.8.7.6 Host Mode ELPG Exit

Step 1

The xHCI PEP driver and XUSB Device Mode driver moves the USB2.0 port back to XUSB.

- Program the following XUSB PADCTL registers to assign the USB2.0 ports to XUSB, according to the platform specific configuration:
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT3]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT2]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT1]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT0]

Step 2

The System Power Management driver enables the XUSB power rails.

- Program the following PMC register bits in a single write to enable the power rail to XUSB host:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBC’
- Read the following PMC register bit to confirm the power gating status of XUSB host:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBC] equals ‘ON’

Step 3

The System Power Management driver enables XUSB clocks.

- Set the following CAR register bit to ‘1’ to enable the clocks to individual XUSB partitions:
  - CLK_RST_CONTROLLER_CLK_ENB_U_SET_0[SET_CLK_ENB_XUSB_HOST] for Host Mode

Step 4

The System Power Management driver removes power clamps to XUSB partitions.

- Set the following PMC register bit to ‘1’ to remove the power clamps to individual XUSB partitions:
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBC] for Host Mode
- Read the following PMC register bit to confirm the power clamps to individual XUSB partitions are removed:
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBC] equals ‘0’

Step 5

The System Power Management driver deasserts reset to XUSB.

- Set the following CAR register bit to ‘0’ to deassert reset to XUSB
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST] for Host Mode
- Wait 1 µs

Step 6

The System Power Management driver disables flushes of MCCIF and partition clients.

- Set the following MC register bits to ‘0’ to disable flush to XUSB
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_HOST_FLUSH_ENABLE] for Host Mode

Step 7

The xHCI PEP driver disables the USB2.0 wakeup interrupts for ports assigned to XUSB.

- Set the following XUSB PADCTL register bits to ‘0’ to disable the interrupts.
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT3_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT2_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_HSIC_PORT0_WAKE_INTERRUPT_ENABLE]

Step 8

The xHCI PEP driver performs XUSB IPFS and XUSB register initialization.

The xHCI PEP driver performs XUSB IPFS context restore operation.

The xHCI PEP driver performs XUSB context restore operations.

Step 9

The xHCI PEP Driver performs HSIC context restore operations as described in Step 10 of the “All Partitions ELPG Exit” section.

The xHCI PEP Driver loads XUSB firmware.

The xHCI PEP Driver notifies XUSB firmware whether context of SuperSpeed Partition should be restored.

Step 10

The xHCI driver performs context restore operation as described in Section 4.23.2 of the xHCI specification.

Step 11

The System Power Management driver programs the PMC USB2.0 sleepwalk logic for ports assigned to XUSB Host Mode to disable the sleepwalk logic as described in the “PMC Programming” section.

The xHCI PEP driver clears the XUSB wakeup events.

- Write ‘1’ to the following XUSB PADCTL register bits to clear the events.
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT3_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT2_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT1_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_HSIC_PORT0_WAKE_EVENT]

22.8.7.7 SuperSpeed Partition ELPG Exit

Step 1

The xHCI FW and xHCI PEP drivers communicate SuperSpeed partition ELPG exit via mailbox protocol.

The xHCI PEP driver and XUSB Device Mode driver communicate SuperSpeed partition ELPG exit with the System Power Management driver.

Step 2

The System Power Management driver enables the XUSB power rails.

- Program the following PMC register bits in a single write to disable the power rail to XUSB SuperSpeed
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBA’
- Read the following PMC register bits to confirm the power gating status of XUSB SuperSpeed
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBA] equals ‘ON’

Note: *Only one partition can be un-power gated at a time*

Step 3

The System Power Management driver enables XUSB clocks.

- Set the following CAR register bit to ‘1’ to enable the clocks to individual XUSB partitions.
  - CLK_RST_CONTROLLER_CLK_ENB_W_SET_0[SET_CLK_ENB_XUSB_SS] for SS ports

Step 4

The xHCI PEP driver and XUSB Device Mode driver initiate the signal sequence to disable the XUSB SS wake detection logic for the SuperSpeed ports assigned to host and device as described in Step 3 of the “All Partitions ELPG Exit” section.

Step 5

The xHCI PEP driver and XUSB Device Mode driver disable the XUSB SS wakeup interrupts.

- Set the following XUSB PADCTL register bits to '0' to disable the interrupts.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT1_WAKE_INTERRUPT_ENABLE]

Step 6

The System Power Management driver removes power clamps to XUSB partitions.

- Set the following PMC register bit to '1' to remove the power clamp to XUSB SS:
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBA]
- Read the following PMC register bits to confirm the power clamp to XUSB SS is removed.
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBA] equals '0'

Step 7

The System Power Management driver deasserts reset to XUSB.

- Set the following CAR register bit to '0' to deassert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST] for SuperSpeed ports

Step 8

The System Power Management driver disables flushes of MCCIF and partition clients.

- Set the following MC register bit to '0' to disable flush to XUSB
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_DEV_FLUSH_ENABLE] for Device Mode

Step 9

The xHCI FW and XUSB Device Mode drivers perform their SuperSpeed port context restore operations.

The xHCI PEP driver and XUSB Device Mode driver clear the XUSB wakeup events.

- Write '1' to the following XUSB PADCTL register bits to clear the events.
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT3_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT2_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT1_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_HSIC_PORT0_WAKE_EVENT]

22.8.7.8 Device Mode Partition ELPG Exit

Step 1

The System Power Management driver enables the XUSB power rails.

- Programming the following PMC register bits in a single write to disable the power rail to the XUSB device:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to 'enable'
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to 'XUSBB'
- Read the following PMC register bit to confirm the power gating status of the XUSB device:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBB] equals 'ON'

Note: *Only one partition can be un-power gated at a time*

Step 2

The System Power Management driver enables XUSB clocks.

- Set the following CAR register bit to '1' to enable the clocks to individual XUSB partitions.
  - CLK_RST_CONTROLLER_CLK_ENB_U_SET_0[SET_CLK_ENB_XUSB_DEV] for Device Mode

Step 3

The XUSB Device Mode driver initiates the signal sequence to disable the *XUSB* SS wake detection logic for the SuperSpeed ports assigned to the device as described in Step 3 of the "All Partitions ELPG Exit" section.

Step 4

XUSB Device Mode driver disables the *XUSB* SS wakeup interrupts for the ports assigned to device as described in Step 4 of the "All Partitions ELPG Exit" section.

Step 5

The System Power Management driver removes power clamps to XUSB partitions:

- Set the following PMC register bit to '1' to remove the power clamp to the XUSB device:
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBB]
- Read the following PMC register bit to confirm the power clamp to the XUSB device is removed:
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBB] equals '0'

Step 6

The System Power Management driver deasserts reset to XUSB.

- Set the following CAR register bit to '0' to deassert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_DEV_RST] for Device Mode

Step 7

The System Power Management driver programs the PMC USB2.0 sleepwalk logic for ports assigned to XUSB Device Mode to disable the sleepwalk logic as described in the "Disable PMC Sleepwalk Logic" section.

The XUSB Device Mode driver clears the XUSB wakeup events:

- Write '1' to the following XUSB PADCTL register bits to clear the events.
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT3_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT2_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT1_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0_0[USB2_PORT0_WAKE_EVENT]

Step 8

The XUSB Device Mode driver performs XUSB IPFS context restore operations for registers listed in Step 1 of "Cold Boot" then enables XUSB IPFS operation.

- Set the following XUSB IPFS register bit to '1':
  - XUSB_DEV_CONFIGURATION_0[EN_FPCI]

The XUSB Device Mode driver performs XUSB_DEVICE context restore operations.

Before power is to be removed from USB3, software should set the Device Mode to stop, then read the contexts from Device Mode MMIO registers and put them in system memory if required. After power is restored to USB3 and hardware reset to USB3 is deasserted, software should pull the contexts from system memory and write them to the Device Mode registers. Software should reprogram the Device Mode registers to re-initialize the data structures and transfer rings before setting the Device Mode to run.

The following Device Mode contexts should be saved and restored by the driver in Linux systems and are assumed to be saved and restored by the OS in Windows systems – if this is not the case, the Windows PEP filter driver will have to perform the context save and restore:

- PCI config registers
  - Command and Status
  - BAR0/1
  - Interrupt Line
  - FLADJ
  - MSI Message Control
  - MSI Address
  - MSI Data
  - Power Management Control and Status

The following Device Mode contexts should be saved and restored by the Device Mode Driver:

- MMIO registers:
  - Device Address
  - U2 Timeout
  - Port Link State and Port State
  - Event Ring enqueue pointer and PCS

22.8.8 XUSB HSIC Programming

22.8.8.1 HSIC Power Up (Airplane Mode Exit)

The default state of pull up and pull down for data and strobe for HSIC is pull down enabled on both Data and Strobe. During power up of the chip, the pull down maintains a reset state on the bus and the device waits for idle on the bus before signaling a connect event. Exit from airplane mode is based on mailbox message from software.

During power up, xHCI PEP driver must:

- enable the power supply for HSIC power rail of Tegra and the external devices
- load firmware
- direct the PSM to disconnect state
- clear CNR
- initiate a mailbox to enable PU/PD configuration to maintain IDLE state as explained in “HSIC Power Down (Airplane Mode Entry)”.

Note: *PLLU must be powered up to detect a connect event. So until all HSIC devices are detected, PLL power down must be disabled.*

Once a connect event is detected and software issues a port reset on the port, the HSIC PSM moves into U0. xHCI FW generates a mailbox to remove the PU/PD on the HSIC port, and after that generates a port status change event for port

reaching U0. The idea is to prevent device enumeration unless PU/PD is removed after going to U0 since it will impact both power and electrical. Note that PLL shutdown can be enabled at this point.

22.8.8.2 HSIC Power Down (Airplane Mode Entry)

In Airplane mode, xHCI PEP Driver must restore the PU/PD to drive pull down on both data and strobe. It also informs FW to direct the port to disconnect state and generate a port status change event to software signaling a disconnect.

22.8.8.3 LP0 Entry/Exit

During LP0, the PADCTL block is under reset. So during exit, it assumes the power on reset value which is pull down on both data/strobe. During LP0 exit, either host initiated / device initiated, after restoring the PSM state to U3/resume, the xHCI PEP driver removes the PU/PD on the HSIC port and transfers control to the controller from PMC ensuring a smooth transition.

22.8.8.4 ELPG Entry/Exit

In ELPG, the state of the PADCTL block is maintained, which is no PU/PD for data and strobe. Once the PSM state is restored to U3/resume, control is transferred from the PMC to XUSB, ensuring a smooth transition.

22.8.8.5 HSIC Pull-Up/Pull-Down Resistors Programming

The xHCI PEP Driver sets the following XUSB PADCTL registers in response to mailbox requests from xHCI FW to disable the HSIC pull-up/pull-down resistors of HSIC port 0.

- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[RPU_STROBE] to ‘0’
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[RPU_DATA0] to ‘0’
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[RPD_STROBE] to ‘0’
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[RPD_DATA0] to ‘0’

The xHCI PEP Driver sets the following XUSB PADCTL registers in response to mailbox requests from xHCI FW to enable the HSIC pull-up/pull-down resistors of HSIC port 0 to keep the bus in IDLE state.

- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[RPU_STROBE] to ‘1’
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[RPU_DATA0] to ‘0’
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[RPD_STROBE] to ‘0’
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0[RPD_DATA0] to ‘1’

22.8.8.6 HSIC Device Reset Toggling/Power Cycling Due to XUSB Host Controller Reset (HCRST)

When the mailbox request message is received from XUSB FW for resetting the HSIC device, the PEP Filter driver should communicate with the system power management driver to either assert then deassert the reset to the HSIC devices or remove then enable the power rail to the HSIC device through platform specific means, and only acknowledge the mailbox request after the HSIC device has been reset.

22.8.8.7 HSIC Device Power Down

The HSIC does not define methods to disconnect and power off a link. The following sequences allow powering down of the HSIC device for use cases such as powering down HSIC modems when enabling flight mode.

Step 1

The xHCI Driver stops all Endpoints of the HSIC device then disables the slot assigned to the HSIC device.

Step 2

The xHCI Driver sets the following bit to put the HSIC port to POWERED OFF state:

- XUSB_XHCI_OP_PORTSC_PP to ‘0’

Step 3

The System Power Management driver asserts the reset to the HSIC device then disables the power rail to the HSIC device.

22.8.8.8 HSIC Device Power Up

The following sequences allow powering up of the HSIC device for use cases such as powering up HSIC modems when disabling flight mode.

Step 1

The xHCI Driver sets the following bit to put the HSIC port to the DISCONNECT state:

- XUSB_XHCI_OP_PORTSC_PP to ‘1’

Step 2

The System Power Management driver enables the power rail to the HSIC device then deasserts the reset to the HSIC device.

Step 3

The xHCI Driver sets the following bit to put the HSIC port to the ENABLED state:

- XUSB_XHCI_OP_PORTSC_PR to ‘1’

Step 4

The xHCI Driver enumerates the HSIC device.

22.8.8.9 Mailbox Details

The message names are listed below. For all messages, the port number is bit-mapped. If it is port 1, bit 1 will be set.

- SW_FW_MBOX_CMD_AIRPLANE_MODE_DISABLED
- SW_FW_MBOX_CMD_AIRPLANE_MODE_ENABLED
- SW_FW_MBOX_CMD_ENABLE_PUPD
- SW_FW_MBOX_CMD_DISABLE_PUPD

22.8.9 PMC Programming

Sleepwalk logic in the PMC is used for wake event detection of USB2.0 ports, including wake on connect, wake on disconnect, and remote wakeup for both USB2 and XUSB.

22.8.9.1 Initialize PMC Sleepwalk Logic

Step 1

The xHCI PEP driver initializes the sleepwalk logic:

- Set the following registers to ‘0’ to ensure sleepwalk logic is disabled:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_MASTER_ENABLE_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_MASTER_ENABLE_P0]
- Set the following registers to ‘1’ to ensure sleepwalk logic is in low power mode:
  - APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UTMIP_PWR_P0]
  - APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UTMIP_PWR_P1]

- APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UTMIP_PWR_P2]
- APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UTMIP_PWR_P3]
- APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UHSIC_PWR_P0]

- Program the following registers to set debounce time:
  - APBDEV_PMC_USB_DEBOUNCE_DEL_0[UTMIP_LINE_DEB_CNT]
  - APBDEV_PMC_USB_DEBOUNCE_DEL_0[UHSIC_LINE_DEB_CNT]
- Set the following registers to '0' to ensure fake events of sleepwalk logic are disabled:
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_VAL_P1]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_VAL_P1]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_VAL_P2]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_VAL_P2]
  - APBDEV_PMC_UTMIP_UHSIC2_FAKE_0[UTMIP_FAKE_USBOP_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC2_FAKE_0[UTMIP_FAKE_USBON_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC2_FAKE_0[UTMIP_FAKE_USBOP_VAL_P3]
  - APBDEV_PMC_UTMIP_UHSIC2_FAKE_0[UTMIP_FAKE_USBON_VAL_P3]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UHSIC_FAKE_DATA_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UHSIC_FAKE_STROBE_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UHSIC_FAKE_DATA_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UHSIC_FAKE_STROBE_VAL_P0]
- Set the following registers to '0' to ensure wake events of sleepwalk logic are not latched:
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UHSIC_LINE_WAKEUP_EN_P0]
- Program the following registers to 'NONE' to disable wake event triggers of sleepwalk logic:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_WAKE_VAL_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_WAKE_VAL_P0]

- Set the following registers to ‘1’ to power down the line state detectors of the pad:
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[DATA0_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[DATA1_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[STROBE_VAL_PD_P0]

22.8.9.2 Enable PMC Sleepwalk Logic

Step 1

The xHCI PEP driver re-initializes the sleepwalk logic as described in the “Initialize PMC Sleepwalk Logic” section.

Step 2

The xHCI PEP driver sets up the sleepwalk logic.

- Program the following registers to match the speed of the port:
  - APBDEV_PMC_UTMIP_UHSIC_SAVED_STATE_0[UTMIP_SPEED_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SAVED_STATE_0[UTMIP_SPEED_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SAVED_STATE_0[UTMIP_SPEED_P2]
  - APBDEV_PMC_UTMIP_UHSIC2_SAVED_STATE_0[UTMIP_SPEED_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SAVED_STATE_0[UHSIC_SPEED_P0]
- Set the following registers to ‘1’ to enable the trigger of the sleepwalk logic:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_WAKE_WALK_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_LINEVAL_WALK_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_WAKE_WALK_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_LINEVAL_WALK_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_WAKE_WALK_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_LINEVAL_WALK_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC2_SLEEPWALK_CFG_0[UTMIP_WAKE_WALK_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC2_SLEEPWALK_CFG_0[UTMIP_LINEVAL_WALK_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UHSIC_WAKE_WALK_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UHSIC_LINEVAL_WALK_EN_P0]
- Write ‘1’ to the following registers to reset the walk pointer and clear the alarm of the sleepwalk logic, as well as capture the configuration of the USB2.0 pad:
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WALK_PTR_P0]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P0]

- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CAP_CFG_P0]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WALK_PTR_P1]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P1]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CAP_CFG_P1]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WALK_PTR_P2]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P2]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CAP_CFG_P2]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WALK_PTR_P3]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P3]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CAP_CFG_P3]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UHSIC_CLR_WALK_PTR_P0]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UHSIC_CLR_WAKE_ALARM_P0]

- Program the following registers with electrical parameters read from XUSB PADCTL:
  - APBDEV_PMC_UTMIP_TERM_PAD_CFG_0[TCTRL_VAL] to XUSB_PADCTL_USB2_BIAS_PAD_CTL_1_0[TCTRL]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[PCTRL_VAL] to XUSB_PADCTL_USB2_BIAS_PAD_CTL_1_0[PCTRL]
- Program the following registers to set up the pull-ups and pull-downs of the signals during the four stages of sleepwalk:
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[USBOP_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[USBON_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[USBOP_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[USBON_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[USBOP_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[USBON_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[USBOP_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[USBON_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[USBOP_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[USBON_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[USBOP_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[USBON_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[USBOP_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[USBON_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[USBOP_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[USBON_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[STROBE_RPD_A] to ‘0’
  - APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA0_RPD_A] to ‘1’
  - APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA1_RPD_A] to ‘1’
  - APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[STROBE_RPU_A] to ‘1’
  - APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA0_RPU_A] to ‘0’
  - APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA1_RPU_A] to ‘0’

- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[STROBE_RPD_{B/C/D}] to ‘1’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA0_RPD_{B/C/D}] to ‘0’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA1_RPD_{B/C/D}] to ‘1’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[STROBE_RPU_{B/C/D}] to ‘0’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA0_RPU_{B/C/D}] to ‘1’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA1_RPU_{B/C/D}] to ‘0’

- Program the following registers to set up the driving values of the signals during the four stages of sleepwalk:
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[AP_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[AN_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[HIGNZ_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[AP_{B/C/D}] to ‘0’ for HS/FS and ‘1’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[AN_{B/C/D}] to ‘1’ for HS/FS and ‘0’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[HIGHZ_{B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[AP_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[AN_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[HIGNZ_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[AP_{B/C/D}] to ‘0’ for HS/FS and ‘1’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[AN_{B/C/D}] to ‘1’ for HS/FS and ‘0’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[HIGHZ_{B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[AP_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[AN_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[HIGNZ_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[AP_{B/C/D}] to ‘0’ for HS/FS and ‘1’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[AN_{B/C/D}] to ‘1’ for HS/FS and ‘0’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[HIGHZ_{B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[AP_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[AN_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[HIGNZ_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[AP_{B/C/D}] to ‘0’ for HS/FS and ‘1’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[AN_{B/C/D}] to ‘1’ for HS/FS and ‘0’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[HIGHZ_{B/C/D}] to ‘1’

Note: *For HSIC, DATA1 is not used for signaling wake.*

Step 3

The xHCI driver puts the ports in the U3 suspend state.

Step 4

The xHCI PEP driver enables the wake event detections.

- Set the following registers to ‘0’ to power up the line state detectors of the pad:

- APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P0]
- APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P0]
- APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P1]
- APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P1]
- APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P2]
- APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P2]
- APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P3]
- APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P3]
- APBDEV_PMC_USB_AO_0[DATA0_VAL_PD_P0]
- APBDEV_PMC_USB_AO_0[DATA1_VAL_PD_P0]
- APBDEV_PMC_USB_AO_0[STROBE_VAL_PD_P0]

- Wait 1 µs.
- Set the following registers to ‘1’ to switch the electric control of the USB2.0 pad to PMC:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_FSLS_USE_PMC_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_PCTRL_USE_PMC_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_TCTRL_USE_PMC_P3]
- Program the following registers to set the wake signaling trigger events
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P0] to ‘ANY’
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P1] to ‘ANY’
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P2] to ‘ANY’
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_WAKE_VAL_P3] to ‘ANY’
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_WAKE_VAL_P0] to ‘SD10’
- Set the following registers to ‘1’ to enable the wake detection
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P0]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P1]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P2]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_MASTER_ENABLE_P3]

- APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P3]
- APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_MASTER_ENABLE_P0]
- APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UHSIC_LINE_WAKEUP_EN_P0]

Notes:

- *For USB2 ports, setting wake value to ANY means any line state change would trigger wake.*
- *For HSIC, DATA1 is not used for wake detection.*

22.8.9.3 Disable PMC Sleepwalk Logic

Step 1

The xHCI PEP driver disables the wake event detections.

- Set the following registers to '0' to disable the wake detection:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P0]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P1]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P2]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_MASTER_ENABLE_P3]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_MASTER_ENABLE_P0]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UHSIC_LINE_WAKEUP_EN_P0]
- Set the following registers to '0' to switch the electric control of the USB2.0 pad to XUSB or USB2:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_FSLS_USE_PMC_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_PCTRL_USE_PMC_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_TCTRL_USE_PMC_P3]
- Program the following registers to 'NONE' to disable wake event triggers of sleepwalk logic:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P1]

- APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P2]
- APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_WAKE_VAL_P3]
- APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_WAKE_VAL_P0]

- Set the following registers to '1' to power down the line state detectors of the pad:
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[DATA0_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[DATA1_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[STROBE_VAL_PD_P0]
- Write '1' to the following registers to clear alarm of the sleepwalk logic:
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P0]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P1]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P2]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P3]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UHSIC_CLR_WAKE_ALARM_P0]

22.8.10 USB2 Pad Tracking Programming

USB2 pad tracking logic should be triggered once during cold boot and LP0 exit to measure and capture the electric parameters of USB2.0 and HSIC pads.

Step 1

Sets up and enables the tracking clocks.

- Set the following CAR register bits to '1' to enable the tracking clocks
  - CLK_RST_CONTROLLER_CLK_ENB_Y_SET_0[SET_CLK_ENB_USB2_TRK]
  - CLK_RST_CONTROLLER_CLK_ENB_Y_SET_0[SET_CLK_ENB_HSIC_TRK]
- Program the following CAR register bits to set the divisor of tracking clocks
  - CLK_RST_CONTROLLER_CLK_SOURCE_USB2_HSIC_TRK_0[USB2_HSIC_TRK_CLK_DIVISOR]

Note: *The frequency for the tracking circuit should be between 1 to 10 MHz. So if the osc_clk frequency is between 10 to 20 MHz, the clock divisor should be set to 0x2; if the osc_clk frequency is between 20 to 30 MHz, the clock divisor should be set to 0x4; and if the osc_clk frequency is between 30 to 40 MHz, the clock divisor should be set to 0x6.*

Step 2

Check the following registers for the ownership of USB2 BIAS pad and HSIC tracking logic:

- Read the following XUSB registers:

- XUSB_PADCTL_USB2_PAD_MUX_0[USB2_BIAS_PAD]
- XUSB_PADCTL_USB2_PAD_MUX_0[HSIC_PAD_TRK]

Set up the timing parameters:

- Program the following USB2 registers if the pads are assigned to the USB2 controllers:
  - USB1_UTMIP_BIAS_CFG1_0[UTMIP_BIAS_TRK_START_COUNT] to ‘0x1E’
  - USB1_UTMIP_BIAS_CFG1_0[UTMIP_BIAS_PDTRK_COUNT] to ‘0xA’
  - USB2_UHSIC_PADS_CFG1_0[UHSIC_TRK_START_COUNT] to ‘0x1E’
- Program the following XUSB registers if the pads are assigned to the XUSB controller:
  - XUSB_PADCTL_USB2_BIAS_PAD_CTL_1_0[TRK_START_TIMER] to ‘0x1E’
  - XUSB_PADCTL_USB2_BIAS_PAD_CTL_1_0[TRK_DONE_RESET_TIMER] to ‘0xA’
  - XUSB_PADCTL_HSIC_PAD_TRK_CTL_0[TRK_START_TIMER] to ‘0x1E’
  - XUSB_PADCTL_HSIC_PAD_TRK_CTL_0[TRK_DONE_RESET_TIMER] to ‘0xA’

Step 3

Power up the pads and the tracking circuit if the pads are assigned to USB2 controllers:

- Set the following USB2 register bits to power up the pads:
  - USB1_UTMIP_BIAS_CFG0_0[UTMIP_BIASPD] to ‘0’
  - USB2_UHSIC_PADS_CFG1_0[UHSIC_PD_TX] to ‘0’
- Wait 1 us
- Set the following USB2 register bits to power up the tracking circuits and enable the hardware state machine:
  - USB1_UTMIP_BIAS_CFG1_0[UTMIP_FORCE_PDTRK_POWERUP] to ‘1’
  - USB1_UTMIP_BIAS_CFG1_0[UTMIP_FORCE_PDTRK_POWERDOWN] to ‘0’
  - USB2_UHSIC_PADS_CFG1_0[UHSIC_PD_TRK] to ‘0’
- USB2 port has a bug that requires the tracking circuit to be disabled and re-enabled via programming the following USB2 register.
  - Wait 100 us
  - USB1_UTMIP_BIAS_CFG1_0[UTMIP_FORCE_PDTRK_POWERDOWN] to ‘1’
  - USB1_UTMIP_BIAS_CFG1_0[UTMIP_BIAS_TRK_DONE] to ‘0’
  - Wait 1 us
  - USB1_UTMIP_BIAS_CFG1_0[UTMIP_FORCE_PDTRK_POWERDOWN] to ‘0’
  - Wait 100 us
  - USB1_UTMIP_BIAS_CFG1_0[UTMIP_FORCE_PDTRK_POWERDOWN] to ‘1’
  - USB1_UTMIP_BIAS_CFG1_0[UTMIP_BIAS_TRK_DONE] to ‘0’
- HSIC port does not have a hardware state machine to automatically disable the tracking, so software should power down the tracking circuits in the following sequence:
  - Read USB2_UHSIC_PADS_CFG1_0[UHSIC_TRK_DONE] equals ‘1’
  - Wait 100 us
  - Set USB2_UHSIC_PADS_CFG1_0[UHSIC_PD_TRK] to ‘1’

Power up the pads and the tracking circuit if the pads are assigned to XUSB controllers:

- Set the following XUSB register bits to power up the pads:

- XUSB_PADCTL_USB2_BIAS_PAD_CTL_0_0[PD] to ‘0’
- XUSB_PADCTL_HSIC_PAD1_CTL_0_0[PD_TX_DATA0] to ‘0’
- XUSB_PADCTL_HSIC_PAD1_CTL_0_0[PD_TX_DATA1] to ‘0’
- XUSB_PADCTL_HSIC_PAD1_CTL_0_0[PD_TX_STROBE] to ‘0’

- Wait 1 µs
- Set the following XUSB register bits to power up the tracking circuits and enable the hardware state machine:
  - XUSB_PADCTL_USB2_BIAS_PAD_CTL_1_0[PD_TRK] to ‘0’
  - XUSB_PADCTL_HSIC_PAD_TRK_CTL_0[PD_TRK] to ‘0’
  - Wait 100 us

Step 4

Disable the tracking clocks after tracking completed.

- Set the following CAR register bits to ‘1’ to disable the tracking clocks:
  - CLK_RST_CONTROLLER_CLK_ENB_Y_CLR_0[CLR_CLK_ENB_USB2_TRK]
  - CLK_RST_CONTROLLER_CLK_ENB_Y_CLR_0[CLR_CLK_ENB_HSIC_TRK]

22.8.11 Charger Detection 1 (Non-compliant Chargers)

There are four conditions for the different kind of non-compliant chargers: SE1, FS-PU, LS-PU, SE0. Any kind of non-compliant charger can be supported by following the generic procedure below:

1. VBUS detection – by whatever means software does it.
2. Set DIV_DET_EN=1 in XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL1_0.
3. Wait about 10 µs to allow divider detector to settle.
4. Read the {VOP_DIV2P7_DET, VOP_DIV2P0_DET, VON_DIV2P7_DET, VON_DIV2P0_DET} registers bits in XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL1_0.

   {VOP_DIV2P7_DET, VON_DIV2P7_DET} = 2'b11: We are connected to charger_A1.

   {VOP_DIV2P7_DET, VON_DIV2P0_DET} = 2'b11: We are connected to charger_A2.

   {VOP_DIV2P0_DET, VON_DIV2P7_DET} = 2'b11: We are connected to charger_A3.

   {VOP_DIV2P0_DET, VON_DIV2P0_DET} = 2'b11: We are connected to charger_A4.
5. Set DIV_DET_EN=0 in XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL1_0.
6. For A1, A2, A3 or A4, enable charging current as per that charger requirement.
7. Read the {ZIP,ZIN} bits {18, 22} in the XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0 register.

   {ZIP,ZIN} = 2'b11: We are connected to charger_B1.

   {ZIP,ZIN} = 2'b01: We are connected to charger_B2.

   {ZIP,ZIN} = 2'b10: We are connected to charger_B3.

   {ZIP,ZIN} = 2'b00: We are connected to either charger_B4, compliant charger, or a PC host.
8. For B1, B2, or B3, enable charging current as per that charger requirement. This could be different for every implementation.
9. For B4, either we are connected to PC host or a charger_B4 (which could be USB compliant charger as well). Go to Step 10.
10. Enable pull ups on DP and DN.
11. Set XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL1_0 [USBON_RPU_OVRD_VAL]

12. Set XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL1_0 [USBOP_RPU_OVRD_VAL]
13. Read the {ZIP,ZIN} bits {18, 22} in the XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0 register

    {ZIP,ZIN} = 2'b11: We are connected to charger_B1.

    {ZIP,ZIN} = 2'b01: We are connected to charger_B2.

    {ZIP,ZIN} = 2'b10: We are connected to charger_B3.

    {ZIP,ZIN} = 2'b00: We are connected to either charger_B4, compliant charger, or a PC host.
14. Disable pull ups on DP and DN.
15. Clear XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL1_0 [USBON_RPU_OVRD_VAL].
16. Clear XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL1_0 [USBOP_RPU_OVRD_VAL].
17. For B1, B2, or B3, enable charging current as per that charger requirement. This could be different for every implementation.
18. For case B4, either we are connected to PC host or a charger_B4 (which could be USB compliant charger as well).

Charger Detection 2 (Compliant Chargers)

This substitutes step 10 in the above.

1. Make sure the UTMIP_PD_CHRG bit in the UTMIP_BAT_CHRG_CFG0_0 register is set to 0, so that charger detection circuit is on.
2. Set the UTMIP_OP_I_SRC_EN bit in the UTMIP_BAT_CHRG_CFG0_0 register to 1.
3. Wait for about 10 microseconds to allow the battery charger detector to settle.
4. Now check that the VDCD_DET_CHG_DET bit is 1, and the VDCD_DET_STS bit is 0 in the USB_PHY_VBUS_WAKEUP_ID register. This ensures that the data pins have made contact.
5. Set the UTMIP_OP_I_SRC_EN bit to 0 in the UTMIP_BAT_CHRG_CFG0_0 register.
6. Set the following register bits in the UTMIP_BAT_CHRG_CFG0_0 register to:

    UTMIP_OP_SRC_EN = 1

    UTMIP_ON_SINK_EN = 1

    UTMIP_OP_SINK_EN = 0

    UTMIP_ON_SRC_EN = 0
7. Wait for about 10 microseconds to allow the battery charger detector to settle.
8. Now check that the VDAT_DET_CHG_DET and VDAT_DET_STS bits in the USB_PHY_VBUS_WAKEUP_ID register are both set to 1. This indicates connection to a USB compliant dedicated charger that supports up to 1.5A current. If these bits are not set, then the connection is to a PC host, where the downstream port may support charging.
9. Set the following bits in the UTMIP_BAT_CHRG_CFG0_0 register to:

    UTMIP_OP_SRC_EN = 0

    UTMIP_ON_SINK_EN = 0

    UTMIP_OP_SINK_EN = 1

    UTMIP_ON_SRC_EN = 1
10. Wait for about 10 microseconds to allow the battery charger detector to settle.
11. Now check that the VDAT_DET_CHG_DET and VDAT_DET_STS bits in the USB_PHY_VBUS_WAKEUP_ID register are both set to 1. This indicates connection to a USB compliant dedicated charger that supports up to 1.5A current. If these bits are not set, then the connection is to a PC host, where the downstream port supports a standard 500mA current when the high power device is enumerated.
12. Set the following bits in the UTMIP_BAT_CHRG_CFG0_0 register to:

    UTMIP_OP_SRC_EN = 0

UTMIP_ON_SINK_EN = 0

UTMIP_OP_SINK_EN = 0

UTMIP_ON_SRC_EN = 0

13. Now normal USB operation can continue if connected to PC host.

Primary Charger Detection

1. Set OP_SRC_EN and ON_SINK_EN.
2. Set XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[OP_SRC_EN].
3. Set XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[ON_SINK_EN].
4. Wait for about 10 microseconds.
5. Check XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[VDAT_DET] and XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[ZIN].

   D- is larger than VLGC when both VDAT_DET and ZIN are 1

   D- is between VLGC and VDAT_REF when VDAT_DET is 1 and ZIN are 0

   D- is smaller than VDAT_REF when both VDAT_DET and ZIN are 0
6. Clear OP_SRC_EN and ON_SINK_EN.
7. Clear XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[OP_SRC_EN].
8. Clear XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[ON_SINK_EN].

Secondary Charger Detection

1. Set ON_SRC_EN and OP_SINK_EN.
2. Set XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[ON_SRC_EN].
3. Set XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[OP_SINK_EN].
4. Wait for about 10 microseconds.
5. Check XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[VDAT_DET] and XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[ZIP].

   D- is larger than VLGC when both VDAT_DET and ZIP are 1

   D- is between VLGC and VDAT_REF when VDAT_DET is 1 and ZIP are 0

   D- is smaller than VDAT_REF when both VDAT_DET and ZIP are 0
6. Clear ON_SRC_EN and OP_SINK_EN.
7. Clear XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[ON_SRC_EN].
8. Clear XUSB_PADCTL_USB2_BATTERY_CHRG_OTGPAD0_CTL0_0[OP_SINK_EN].
9. Write 1’ to ‘Halt EP N OUT’ field in ‘Halt Registers’

Step 3

- Poll the Nth bit in ‘State Change EP IN/OUT’ register to make sure that EP has been halted by the hardware.

Note: *Software should clear ‘State Change EP IN/OUT’ register field by writing ‘1’ to it.*

22.8.11.1 Pause an Endpoint

The endpoint could be put into pause state either by software or hardware in the Device Mode by writing to ‘Pause EP N IN’ or ‘Pause EP N OUT’ registers fields. When in paused state, the Device Mode controller will respond with NRDY TPs for any host requests targeted at this endpoint.

The sequence to pause an Nth EP is as follows,

Step 1

- If ‘Run’ bit in the control register is set
  - Then proceed to Step 2

Else

  - Exit

Step 2

- To pause Nth IN endpoint, write ‘1’ to ‘Pause EP N IN’ field in ‘Pause Register’
- To halt Nth OUT endpoint, write ‘1’ to ‘Pause EP N OUT’ field in ‘Pause Register’

Step 3

- Poll the Nth bit in ‘State Change EP IN/OUT’ register to make sure that EP has been paused by the hardware.

Note: *Software should clear ‘State Change EP IN/OUT’ register field by writing ‘1’ to it.*

Enabling ISO Endpoints

It is the software responsibility to make sure that it pause all non-ISO endpoints while enabling any ISO EP in Device Mode. This will make sure that there are resources available in the Device Mode controller while enabling any ISO endpoint. The non-ISO endpoints could be re-enabled once all ISO EPs are enabled.

Note: *If the control endpoint is ‘halted’ by the software then the device controller will re-enable the control endpoint as soon as a valid SETUP packet is received on the link. This means the hardware will reset the value in “HALT” register.*

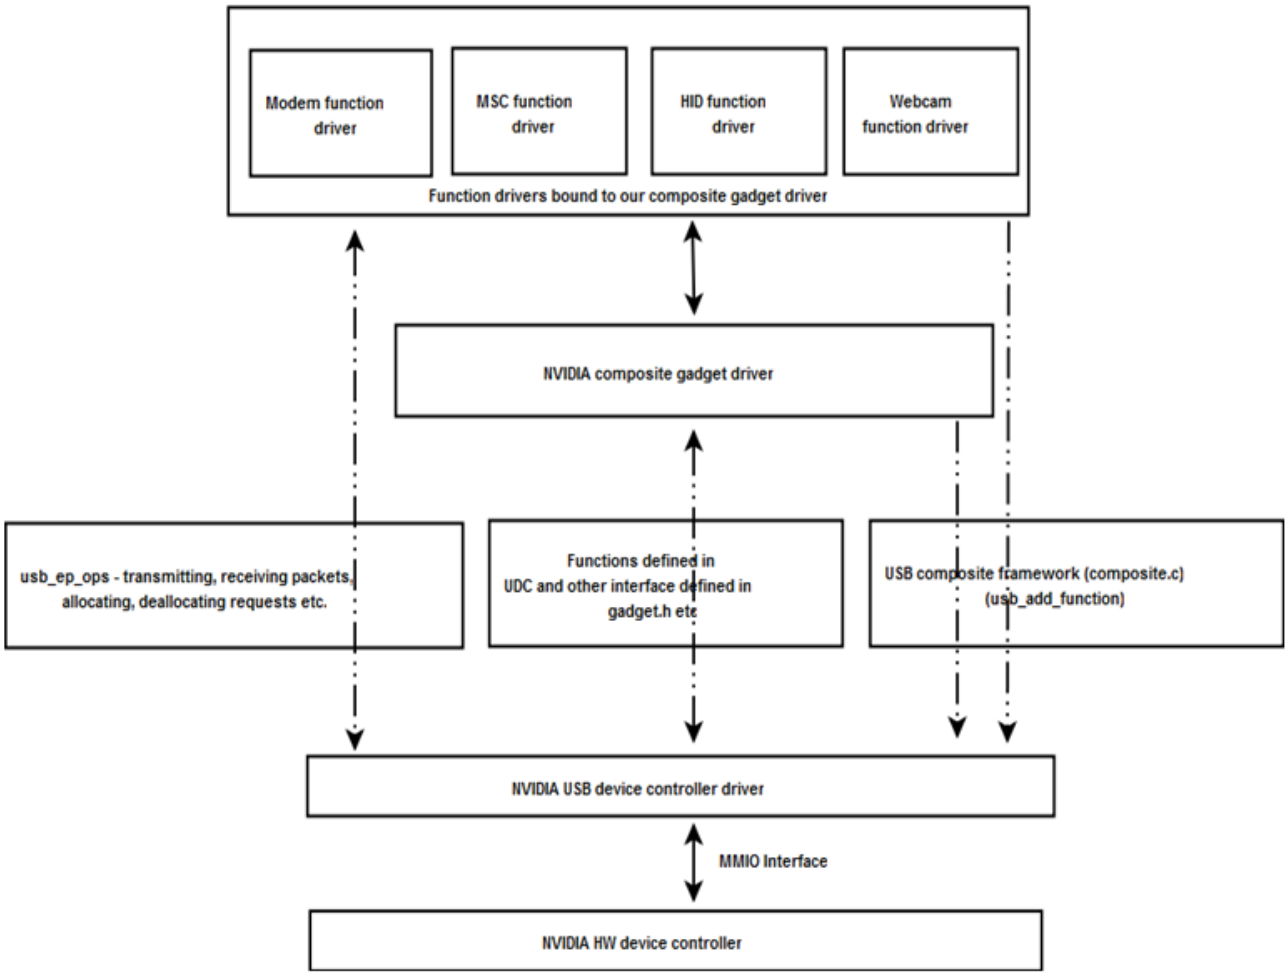
22.8.11.2 Flow Control Threshold

This is purely for the use of the device controller. The software is responsible to enable/disable this feature and to program the threshold number for the consecutive IN/OUT request being flow controller.

22.9 XUSB Programming Guidelines for Device Mode

The pictorial representation of the Device Mode software stack is shown in the below figure.

Figure 60: Device Mode Software Stack



22.9.1 Initialization

The sequence of steps to be performed to initialize the device controller is as follows,

Step 1

- Allocate and initialize all device controller related memory data structures as follows,
  - Device controller event ring segment table and the event ring segments that it points to.
  - Control endpoint contexts (one IN and one OUT) and the transfer rings that they point to.
- Initialize the event ring segment table size register with number of entries in the event ring segment table.
- Initialize the event ring segment table base address register with the physical memory address of the event ring segment table.
- Initialize the event ring segment table dequeue pointer register with the physical memory address of the event ring segment pointed by event ring segment table entry 0.

Step 2

- Initialize the endpoint context register with the physical memory address of the first entry in the array of endpoint contexts (control endpoints).

Step 3

- Enable the Device Mode controller by writing ‘1’ to enable bit (Enumeration mode) in the capability control register.

- Update the ‘Device Address’ field in the control register upon successfully receiving the ‘Set_Address’ request from the host.

Step 4

- Wait for ‘Set_Configuration’ request from the host.
  - Initialize the required endpoint contexts and the transfer rings depending upon the configuration/interface selected.
  - Software has to initialize all 32 EP contexts at this step.
  - Check for the correctness of the requested configuration with ‘Set_Configuration’ as discussion in the subsequent sections.
- Write ‘1’ to ‘Run’ field (Run mode) in the control register as the last step in completing Set_Configuration request from the host.
  - The hardware will fetch all 32 EP contexts before setting ‘Run’ bit to ‘1’. The valid EPs are identified by looking at EP.Type field in the endpoint context.

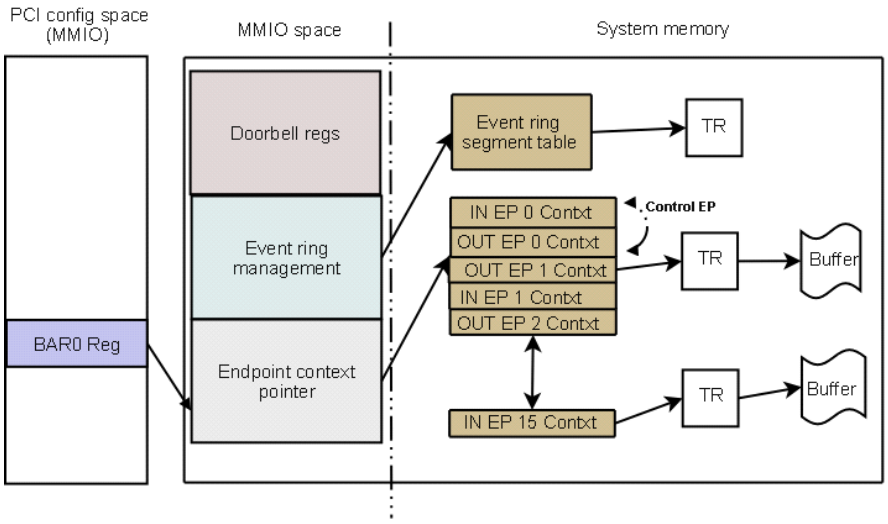
Notes:

- *All registers (PCI configuration space) are memory mapped in Tegra platform.*
- *The device controller has the option to generate an interrupt whenever an event is posted to the event ring (including SETUP).*

22.9.2 Memory Map: Device Mode

The Device Mode software will interact with the Device Mode controller through a set of transfer rings, event rings, various data structures (contexts) and the register interface based on the xHCI specification.

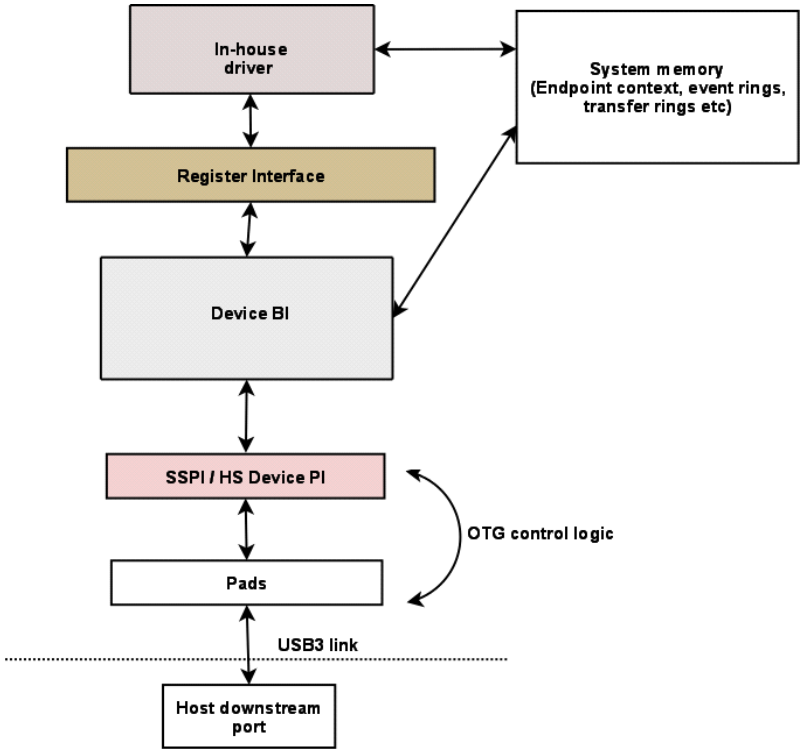
Figure 61: Memory Map for Device Mode



22.9.3 Hardware and Software Interaction

The Device Mode controller could operate either in super speed or high-speed mode.

Figure 62: Software/Hardware Interaction in Device Mode



22.9.4 Modes

22.9.4.1 Enumeration mode

The Device Mode controller will be in enumeration mode when the enable bit transitions from ‘0’ to ‘1’. While in enumeration mode, the software will services the standard USB enumeration related requests from the USB host through the default control endpoint. The standard requests need to be supported by the software are:

- Get_Descriptor
- Get_Configuration
- Get_Interface
- Get_Status
- Synch_Frame
- Set_Address
- Set_Configuration
- Set_Feature
- Clear_Feature
- Set_Interface
- Set_Isoch_Delay
- Set_Sel

The software should also support OTG specific device descriptor fields as described in Chapter 6 of the USB3 OTG specification.

The firmware needs to handle the following device requests in the debug mode:

- Get_Configuration, Get_Descriptor, and Get_Status
- Set_Feature, Clear_Feature
- Set_configuration, Set_Address
- Set_Interface, Get_Interface
  - Only one interface support. Firmware will return STALL upon receiving the requests targeting the non-default interface.
- Set_Isoch_Delay, Set_Sel, Sync_Frame
  - No need to support these requests. Firmware will return STALL upon receiving these requests.

Set_configuration

The software behavior upon receiving this request varies depending upon the device state as discussed below.

Default state: The behavior of the device is unknown upon receiving this request in default state.

Addressed state: If the specified configuration is zero, then the device remains in the addressed state. If the specified configuration value matches the configuration value from a configuration descriptor, then that configuration is selected and the device enters the configured state. Otherwise, the software should respond with STALL by writing to Nth bit in the ‘HALT’ register.

Configured state: If the specified configuration value is zero, then the device enters the address state. If the specified configuration value matches the configuration value from a configuration descriptor, then that configuration is selected and the device remains in the configured state. Otherwise, the device responds with STALL by writing to Nth bit in the ‘HALT’ register.

22.9.4.2 Steps to Handle Set_configuration

In Addressed State to set a new configuration

- Program EP Context for each endpoint that will be enabled by this Configuration
- Set Reload bit for each Endpoint being enabled
- Set Run bit after setting Reload bit for first enabled Endpoint
- Wait for all Reload bits to be cleared
- Clear all Pause bits corresponding to the Reload bits that were set
- Wait for STCHG bits to be set to indicate that Pause has been cleared
- Clear all STCHG bits
- Clear Halt bits for all configured endpoints
- Clear all STCHG bits
- Complete Status Stage for the SET_CONFIG request

In Configured State to de-configure the device (SET_CONFIG 0)

- Pause all active Endpoints
- Program EP State Field in EP context to Disabled for all Endpoints except the default control endpoint
- Clear all Augmented EP Context fields to 0 for all endpoints except for the default control endpoint
- Clear Run bit in Control register
- Wait for all STCHG bits to be set
- Clear all STCHG bits
- Complete Status stage for SET_CONFIG request

In Configured State to Select a Different Configuration

- Do all steps to deconfigure the device as mentioned in In Configured State to de-configure the device (SET_CONFIG 0).
- Do all steps to set a new configuration In Addressed State to set a new configuration.

Removing an Endpoint as part of the Select Alternate Interface

- Set Pause bit for the Endpoint to be disabled
- Wait for corresponding STCHG bit to be set
- Program EP State field in EP Context of the endpoint to Disabled
- Clear all fields in Augmented area of EP context to 0
- Set Reload bit for the Endpoint to be disabled
- Wait for STCHG bit to be set
- Clear STCHG bit

Adding an Endpoint as part of the Select Alternate Interface

- Initialize EP context for endpoint to be enabled
- Set Reload bit for the Endpoint to be enabled
- Wait for STCHG bit to be set
- Clear STCHG bit

Modifying an Endpoint as part of the Select Alternate Interface

- Do all steps in Removing an Endpoint as part of the Select Alternate Interface to remove the endpoint.
- Do all steps in Adding an Endpoint as part of the Select Alternate Interface to add the endpoint again with new parameters.

22.9.4.3 Run Mode

The Device Mode will switch from enumeration mode to run mode after receiving a “Set_Configuration” request from the host. It is the responsibility of the software to write ‘1’ to ‘Run bit’ field in control register upon successfully receiving the ‘Set_Configuration’ request from the host. The software should also move the device state from addressed state to configured state.

22.9.4.4 Test Mode

The Device Mode will switch from enumeration mode or run mode to test mode after receiving a “Set_Feature” request from the host with feature selector set to TEST_MODE. In the test mode, software should trigger the test mode by programming the ‘USB 2.0 Port Test Control’ register to match the test mode selector 1 ms after the control transfer is completed.

22.9.4.5 Device Classes Supported

The Device Mode has to support all device classes. However, the priority will be given to BOT/UAS storage classes and mobile communication classes for driver development and verification.

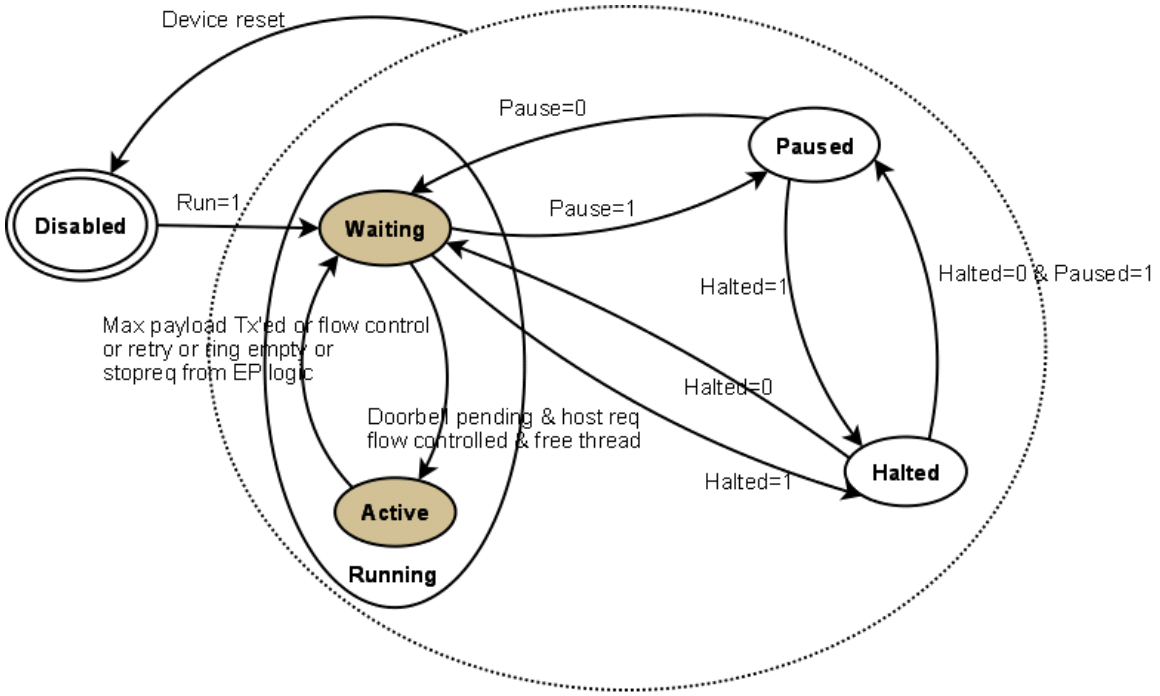
22.9.5 Endpoints

The device controller supports up to 32 endpoints (16 IN and 16 OUT). The endpoint 0 will be the control endpoint which effectively reduces the number of non-control endpoints to 15 IN and 15 OUT. Each endpoint can be set up as IN and OUT direction and as Control, Bulk, or Interrupt transfer type. Isochronous endpoint is not supported.

22.9.5.1 Endpoint Contexts

The device uses 64-byte version of the endpoint context. The data structure of the endpoint contexts for device is identical to Host Mode. However, the Endpoint context pointer points directly to Endpoint context 0 OUT (Control EP). The device controller owns the endpoint context as long as 'Run' bit is set 1.

Figure 63: EP State Transition



22.9.5.2 Default Control Endpoint

The following table lists the initial value for the control endpoint that should be setup by the software for Device Mode and firmware in debug capability.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	DW Offset

* M = 0 for Device Mode, indicating all data structures are located in system memory; X = 1 for debug capability, indicating all data structures are located in DDIRECT.

22.9.5.3 Halt an Endpoint

The software could put an endpoint into the halt state by programming HALT register. When in halt state, the device controller will respond with STALL for any request from the host targeted at this endpoint. The device controller will never put the endpoint into the halt state directly.

The sequence to halt an endpoint is as follows,

Step 1

- If ‘Run’ bit in the control register is set
  - Then proceed to Step 2

  Else
  - Exit

Step 2

- To halt Nth IN endpoint, write ‘1’ to ‘Halt EP N IN’ field in ‘Halt Registers’

- To halt Nth OUT endpoint, write

Step 3

- Poll the Nth bit in ‘State Change EP IN/OUT’ register to make sure that EP has been halted by the hardware.

> ***Note:*** *Software should clear ‘State Change EP IN/OUT’ register field by writing ‘1’ to it.*

22.9.5.4 Pause an Endpoint

The endpoint could be put into pause state either by software or hardware in the Device Mode by writing to ‘Pause EP N IN’ or ‘Pause EP N OUT’ registers fields. When in paused state, the Device Mode controller will respond with NRDY TPs for any host requests targeted at this endpoint.

The sequence to pause an Nth EP is as follows,

Step 1

- If ‘Run’ bit in the control register is set
  - Then proceed to Step 2

  Else
  - Exit

Step 2

- To pause Nth IN endpoint, write ‘1’ to ‘Pause EP N IN’ field in ‘Pause Register’
- To halt Nth OUT endpoint, write ‘1’ to ‘Pause EP N OUT’ field in ‘Pause Register’

Step 3

- Poll the Nth bit in ‘State Change EP IN/OUT’ register to make sure that EP has been paused by the hardware.

> ***Note:*** *Software should clear ‘State Change EP IN/OUT’ register field by writing ‘1’ to it.*

Enabling ISO Endpoints

It is the software responsibility to make sure that it pause all non-ISO endpoints while enabling any ISO EP in Device Mode. This will make sure that there are resources available in the Device Mode controller while enabling any ISO endpoint. The non-ISO endpoints could be re-enabled once all ISO EPs are enabled.

> ***Note:*** *If the control endpoint is ‘halted’ by the software then the device controller will re-enable the control endpoint as soon as a valid SETUP packet is received on the link. This means the hardware will reset the value in “HALT” register.*

22.9.5.5 Flow Control Threshold

This is purely for the use of the device controller. The software is responsible to enable/disable this feature and to program the threshold number for the consecutive IN/OUT request being flow controller.

22.9.6 Transfer Rings

The Device Mode controller makes use of transfer ring mechanism to pass the work from software to hardware. The operation/management of the transfer ring in Device Mode will be similar to Host Mode. Please refer to section 4.9 in the xHCI spec to understand the transfer ring management. The software will initialize the required number of transfer rings depending upon the configuration chosen. The device and will make use of the TRBs and TDs to pass on the work to the hardware.

22.9.6.1 Add a TRB to the Transfer Ring

The sequence of steps to add a TRB to the transfer ring will be as follows:

Step 1

- Make sure that a free entry is available to place the new TRB on to the transfer ring

Step 2

- Write the TRB to the transfer ring pointed by the enqueue pointer
  - Initialize the ‘Cycle bit’ field in the TRB to the PCS value.

Step 3

- Increment the enqueue pointer by the size of the TRB

Step 4

- Inform the hardware to fetch the TRB by writing to the doorbell register present in the MMIO space of the device controller.

22.9.6.2 Doorbell Registers

The software has to ring the doorbell upon adding a new TRB to a transfer ring. The Device Mode controller will start processing the transfer ring after the doorbell from the software.

Note: *The software should make sure that all tasks required to enable the endpoints of the selected configuration (Set_Configuration) are performed before initiating the transaction to acknowledge the status request. This is to avoid the case wherein the received host requests could be dropped due to delay in enabling the EPs at the device side.*

Control Endpoint

There is one major difference while sending a doorbell register write to the control endpoint in the Device Mode compared to Host Mode. The difference is illustrated in the below sequence to handle the SETUP request.

Step 1

- A SETUP packet event TRB is received by the software/firmware.
  - The hardware will pass an unique control sequence number (Say X) as part of the SETUP packet event TRB. Please check section 6.2.1 in this document to know the format of the SETUP packet event TRB.

Step 2

- Software/firmware prepares the status and data stage TRB for the received SETUP request from the opposite side.

Step 3

- Software/firmware informs the hardware about the data and status stage TRB by writing 00h or 01h to ‘Doorbell Target’ and writing X to ‘control sequence number’ field in the doorbell registers

22.9.7 TRB Format

The TRB format of the various endpoints will be similar to the format defined in the xHCI spec for the similar endpoints.

22.9.7.1 Bulk and Interrupt Endpoints

The bulk and interrupt endpoints will use the normal TRB defined in the xHCI specification for their data transfers. Please refer to section 6.4.1.1 in the xHCI specification.

22.9.7.2 Control Endpoints

The control endpoints will use the data and status stage TRB as defined in section 6.4.1.2.2 and 6.4.1.2.3 of the xHCI specification. The data and status stage of the control transfer will make use of EP 0 context.

22.9.7.3 Isochronous Endpoints

The isochronous endpoints use the Isoc TRB defined in section 6.4.1.3 of the xHCI spec. The debug mode does not support isochronous endpoints.

22.9.7.4 Micro-frame Synchronizer

The Device Mode controller implements the local frame timer to track the micro-frames and in turn frame ID. The software could read the current Frame ID by accessing 'FrameID' and 'uFrameID' registers in MMIO space.

22.9.8 Event Ring

The operation and management of the event ring will be similar to device debug capability mode described in xHCI spec. The Device Mode will support one event ring defined through event ring segment table, event ring segment table size, event ring segment table base address, and event ring dequeue pointer registers in the register interfaces. Here, hardware will own the event ring and the software/driver will be the consumer of the event ring.

Note: *Software should always program and use 2 segments for the event ring.*

22.9.8.1 Event Ring Non-Empty

The hardware will generate an interrupt upon posting an event TRB to the system memory. The 'Interrupt Pending' field in the status register (offset 0x24) will be set upon posting the event TRB. The interrupt will be generate depending upon whether the 'Interrupt Enable' field in the control register (offset 0x20) is set or not.

The event TRBs are generated by the hardware for these transactions,

- IN DMA engine
- Out DMA engine
- Control (Setup), Flow control threshold
- Port status change

22.9.8.2 Setup Event TRB

The device controller posts a setup event TRB to the event ring upon receiving a setup transaction from the host. The hardware will also generate an interrupt upon posting the event.

The setup data packet will be sent as part of the setup event TRB posted to the event ring. The software will make use of Endpoint 0 (IN or OUT) to send data stage and status stage transactions in response to SETUP request from the host. The device controller will report errors if the sequence number or the direction of the data/status stage TRB does not match the control transfer.

Notes:

- *If a SETUP request is received when the control EP state is set to "Halted" by software then the hardware will clear the halt condition.*
- *A "serial number" field will be included as part of the SETUP event TRB posted from the hardware. This will be useful for the hardware to identify the valid SETUP transaction.*
- *For example, a new SETUP request was received before the successful completion of the previous SETUP request of the same control endpoint.*

- *An event TRB will be posted by the hardware when there is a mismatch in the serial number stored locally (points to latest SETUP) in the hardware and the serial number present in the data/status TRBs fetched as part of the previous SETUP transaction.*

22.9.8.3 Port Status Change Event Generation (PSCEG)

The hardware places an event TRB of type “PSCEG” whenever the following fields in the control register change,

- Connect status change (CSC)
- Port reset change (PRC)
- Port link state change (PLC)
- Port configuration link error (CEC)

It is the responsibility of the software to check and clear the above register fields upon receiving the PSCEG event TRBs. The format of the PSCEG event TRB is similar to xHCI defined event TRB with port ID being set to 0x0.

22.9.8.4 Host Rejected Stream Selection Transfer Event TRB

This event TRB will be posted to indicate the host rejection for a particular StreamID selected by the device.

22.9.8.5 Prime Pipe Received Transfer Event TRB

This event TRB will be posted to indicate that host has issued a Prime Pipe transaction for a Bulk Stream Endpoint. Software can use this Event to reschedule a StreamID which has previously been rejected by host. Software should not ring Doorbell to a Stream Enabled Endpoint which had the Stream ID selection rejected by host, until it receives a Prime Pipe Received Transfer Event TRB.

22.9.8.6 Stream NumP Error Transfer Event TRB

This Event TRB will be posted to indicate that host has violated NumP and PP fields in an ACK TP sent to a Stream enabled endpoint. Software should HALT the Stream Enabled endpoint on receiving this Transfer Event TRB.

22.9.8.7 Babble Detected Error Transfer Event TRB

This Event TRB will be posted to indicate that host has sent excessive data payload that violates data length field in DP. Software should wait till hardware setting the EP State to Stopped, then clear the EP State and set the Halt bit of the endpoint to trigger the endpoint to respond subsequent host request with STALL.

22.9.8.8 Interrupts

The Device Mode controller will need to support both MSI (one vector) and legacy interrupts. The hardware will generate an interrupt upon posting an event TRB to the event ring. The interrupt generation is moderated (as in Host Mode) and there are dedicated registers to control the interrupt generation interval (‘Interrupt modulation interval’) and to track the current interrupt counter value (‘Interrupt modulation counter’).

22.9.9 Port

22.9.9.1 Generating a device notification packet

The registers to generate the device notification packet are present in the MMIO space. However, these registers are not exposed to the debug software in debug mode and are implemented as internal registers accessible by the firmware. These registers valid are only for super speed mode and when the device controller is enabled.

The software sequence to generate a device notification packet is as follows,

Step 1

- Set the ‘notification type’ bit field in the device notification register

Step 2

- Set the ‘notification type specific’ bits field in the device notification register

Step 3

- Write ‘1’ to ‘device notification packet fire’ bit to generate the packet. The bit will be cleared by the hardware once the device notification packet has been sent on the USB link.

22.9.9.2 Host Connection

The device controller will generate a “Port Status Change Event” upon detection of the host connection. It will also set the “Interrupt pending” bit in the status register whenever event ring is non-empty. An interrupt will be generated to the software if “Interrupt Enable” bit is set.

Note: *‘Link Status Event Enable’ field in the control register should be set to generate the port status change events due to change in the port link status.*

22.9.9.3 Port Reset Handling

Hardware will generate a ‘port status change’ event TRB upon detecting the port reset from the host. Upon receiving the event TRB, the software will check ‘PR’ bit in the control register for any port reset. The following sequence is executed upon port reset detection,

Step 1

- Poll ‘PRC’ field in the control register to make sure that the reset sequence is complete.
- Clear the ‘PRC’ field in the control registers once the reset sequence is completed.

Step 2

- Make sure that the port is enabled by looking at ‘Port Enabled/Disabled’ field of the port status and control register.

Step 3

- Reset the internal states of the software/driver.
- Remove any pending TDs
- Restart transfer rings management

Step 4

- The device will be in enumeration mode waiting to be configured from the host.

Step 5

- Change the device state to ‘addressed’ once the ‘Set_address’ request is received from the host.
- Write the address assigned to ‘Device Address’ field in the control register.

Step 6

- Wait for ‘Set_Configuration’ request from the host.
  - Initialize the required endpoint contexts and the transfer rings depending upon the configuration/interface selected.
- Clear ‘Run Change’ field in the control register.
- Write ‘1’ to run bit (Run mode) in the control register as the last step in completing Set_Configuration request from the host.

Note: *The 'Link Status Event Enable' field in the control registers needs to be set to generate any PSCEG event TRBs from the device controller.*

22.9.9.4 Link States

Connect

The OTG-B device will generate a "Port Status Change Event" when Vbus presence or removal is detected. This is not true in the case of OTG A-device switching from Host Mode to device (Vbus always present).

The Device Mode will also asserts the "PME" when the Vbus presence is detected, and "PME Enable" bit and "Wake on Connection" bit are set to 0x1. The wake on signaling will be controlled by PORTSC register in the case of debug mode.

Both device and debug mode will assert its PME when Vbus is removed and, "PME Enable" bit and "Wake on Disconnection" bit are set 0x1.

Link power management

The software could write to "Port Link State" field of Port Control register to manage the link states. The "Port Link State" field will reflect the software initiated link state once the hardware completes the link state transition.

The Device Mode could initiate only SS U1 and SS U2 states. The software could initiate SS U1 and U2 entry/exit by programming the Port PM registers (With SS U2 timeout value, SS U1 Enable and SS Force Link PM Accept) as required. For high speed, the Device Mode responds to L1 depending upon the value programmed into PortPM registers (High speed L1 State). The U3/L2 state transition is always accepted by the Device Mode /debug mode (only U3).

Suspend

The software should not enable suspend, resume and remote wakeup if the port is connected in high-speed and the port is acting either as a host in OTG B-Device or as a device in OTG A-Device. The resulting behavior is unknown for the above case. The software will be responsible for EP states (disabled or not) when the links are in suspend state.

Resume: Device Initiated

The sequence of steps to generate the resume signaling is described below. The sequence will remain same for both device and debug mode.

Step 1

- The software decides to send the resume signaling to the opposite side.

Step 2

- Make sure Device Remote Wake Enable bit (USB 2.0) or Function Remote Wake Enable bit (USB 3.0) is set.

Step 3

- Transition the link to U0 by writing 'U0' to 'Port Link State' field in the port status and control register.

Step 4

- Write to the device notification register to generate a 'Function_WAKE' device notification packet (for USB3.0 only).

Resume: Host Initiated

The sequence upon detecting host initiated resume signaling is as follows,

Step 1

- A port status event TRB will be posted upon detecting the resume signaling from the host.
- The 'Port Link State' field of the port control and status register will be set to 'Resume'

Step 2

- The software/debug-software should enable the link upon resume signaling by writing ‘U0’ to ‘Port Link’ State field.

22.9.10 Device Mode DVFS Support

Software should set the halt_ltssm and ltssm_state_change_pme_en bits for all SSPI before the SSPI clocks are lowered from their operation frequencies. Software should clear the halt_ltssm and ltssm_state_change_pme_en bits for all SSPI after the SSPI clocks are increased to their operation frequencies.

Software should increase the frequencies of SSPI clocks before clearing the halt_ltssm bit to allow LTSSM state transitions for the following LTSSM state transitions requests:

- Rx.Detect to Polling
- U3 to Recovery
- U2 to Recovery (note, this might not be enabled due to the shorter U2 exit time)

Software should clear the halt_ltssm bit to allow the following state transitions requested by SSPI, since they don’t require SSPI clocks to be in operating frequency, and then set the halt_ltssm bit again to prevent further LTSSM state transitions:

- Rx.Detect to SS.Disabled
- SS.Disabled to Rx.Detect
- U3 to Rx.Detect
- U2 to Rx.Detect (note, this might not be enabled due to the shorter U2 exit time)

22.9.11 On-The-Go (OTG) Support

22.9.11.1 Initial Role

The ID pin will be used to determine the role of the devices during the initialization. It is the responsibility of the software to program ‘Reverse ID’ field in ‘USB 2.0 Port XX Capability’ register field in the OTG port control register appropriately depending upon the value in the ‘ID State’ field and the ‘OTG Enable’ field in the port control register.

- There is an option to generate an interrupt whenever the value of ‘ID State’ changes.

To configure a USB port as an OTG port, software should enable the OTG function during the port configuration step in the XUSB initialization sequence:

- OTG port enable
  - PORTN_CAP = OTG_CAP
  - REVERSE_ID = NO

In OTG port operation, the ID pin is used to determine the role of the OTG port and the VBUS pin is used to determine connection status when the OTG port is identified as a peripheral port. With ID and VBUS pins of USB ports physically connecting to external components outside the Tegra SOC, software is required to update the statuses of ID and VBUS pins to XUSB host and device controllers with the VBUS_OVERRIDE and ID_OVERRIDE fields:

- Cable not connected
  - VBUS_OVERRIDE = VBUS_OFF
  - ID_OVERRODE = ID_FLOAT
- Connecting to a host port
  - VBUS_OVERRIDE = VBUS_ON
  - ID_OVERRODE = ID_FLOAT
- Connecting to a peripheral port

- VBUS_OVERRIDE = VBUS_OFF
- ID_OVERRODE = ID_GND

22.9.11.2 Role Negotiation

The super speed devices make use of LMP packets to communicate the device roles and the USB2 device use the HNP mechanism to requests the role swap. Please refer to section 6.3 and 6.4 in USB3 spec to know more.

Super Speed: Host to Device

This is applicable only when OTG-B device acting as host decides not to remain in this role. The sequence of steps to negotiate the OTG role is as follows,

Step 1

- If ‘OTG Enable’ field in the ‘USB 2.0 Port XX Capability’ register (corresponding to ‘SS Port xx Mapping’ register) register is set then

  Go to Step 2

  Else

  Exit

Step 2

- Write the new role by programming the ‘USB 2.0 Port XX Reverse ID’ field in the ‘USB 2.0 Port XX Capability’ registers to swap the roles (opposite to the current ID pin settings).

Step 3

- Send a ‘Set_feature (B3_NTF_HOST_REL)’ request to the opposite side.
- Send a device notification packet to the opposite side by writing to the device notification registers

Step 4

- Initiate the warm reset of the port by writing ‘1’ to ‘PR’ field in the port control register. The reset should be issued within Thost_Req_Susp

Step 5

- Protocol layer will exchange the LMP packets to inform the role swap request to the other end after the reset.

Super Speed: Device to Host

The sequence of steps to negotiate the OTG role is as follows,

Step 1

- If ‘OTG Enable’ field in the OTG/EH port control register is set then

  Go to Step 2

  Else

  Exit

Step 2

- Write the new role by programming the ‘Port Type’ field in the OTG/EH port control register to host.

Step 3

- Send a device notification packet to the opposite side by writing to the device notification registers.

Step 4

If there is no port reset from the opposite end within Thost_Req_Susp then continue working in Device Mode.

Step 5

Protocol layer will send the LMP packets to inform the role swap request to the other end after the reset.

Notes:

- *Both the OTG A-Device and B-Device can request to switch to be the host by sending the Host Request LMP when they are acting as the devices.*
- *Only the OTG B-Device can request to switch to be the device by sending the Device Request LMP when it is acting as the host.*
- *The OTG A device acting as a host will not send a device notification packet to act in peripheral mode.*
- *Software should warn the users before switching the roles.*
- *If the upstream port (OTG-B) does not receive the warm reset within the timeout period then the port will transition to an error state.*

High-Speed: Device to Host

The sequence of steps to switch the role from device to host is as follows,

Step 1

- If 'OTG Enable' field in the OTG/EH port control register is set then

  Go to Step 2

  Else

  Exit

Step 2

- OTG device needs to set the 'host request flag' in the OTG status information to inform the host of the role swapping.

Step 3

- Wait for Thost_Req_Poll (Table 6-6 in USB3 OTG spec) time to make sure that the host polls the request flag.

Step 4

- Software should change the 'Port Type' in the OTG/EH port control register to host.

Step 5

- Wait for the link disconnect from the host side (suspend done by hardware and disable pull-off resistor on D+ by device) within Thost_REq_Susp (Table 6-6 in the USB3 OTG specification)

Step 6

- Reconnect in the Host Mode (done by hardware)

Notes:

- *An interrupt will be generated by the device in case there is no device connection during device to device to host role switch.*
- *Step 5 and Step 6 are taken care by the hardware once setting the 'Port type' field.*

High-Speed: Host to Device

The sequence of steps to switch the role from device to host is as follows,

Step 1

- If ‘OTG Enable’ field in the OTG/EH port control register is set then

  Go to Step 2

  Else

  Exit

Step 2

- OTG host device reads the ‘host request flag’ from the device to check for role swapping request.

Step 3

- Software should change the ‘Port Type’ in the OTG/EH port control register to host

Step 4

- Suspend the link to. This is an indication to the opposite port that role swapping process is initiated.

Step 5

- Wait for an in band reset from the opposite side to get connected in Device Mode.

Notes:

- *The OTG A device acting as a host may not send a request to switch to Device Mode.*
- *An interrupt will be generated by the hardware in case there is no in band reset from the opposite side during host to device role switch.*
- *Step 4 and Step 5 are taken care by the hardware once ‘Port Type’ is implemented.*

22.9.11.3 Session Request Signaling Protocol

When the device port is connected as OTG-B device it is possible that the opposite side (host) could disable the Vbus when there is no active session on the bus. The device side software could request the host to provide Vbus as follows.

Step 1

- The user initiates the process to start a new session with the host.

Step 2

- Enable the SRP control logic by setting ‘Session Request Signaling Enable’ field in the battery port control and status register.

Step 3

- The ‘Session Request Signaling Enable’ field will be automatically cleared by the hardware once there is a valid Vbus value.

Notes:

- *There is no need to support session request detection protocol as the device acting in OTG-A Host Mode will always keep the Vbus on in Tegra X1.*
- *The device could make use of ‘Vbus State’ field in OTG/EH port status register to detect the Vbus presence.*

22.9.11.4 Attach Detection Protocol

The Vbus will always be on in Tegra X1. Hence, there is no need to support ADP.

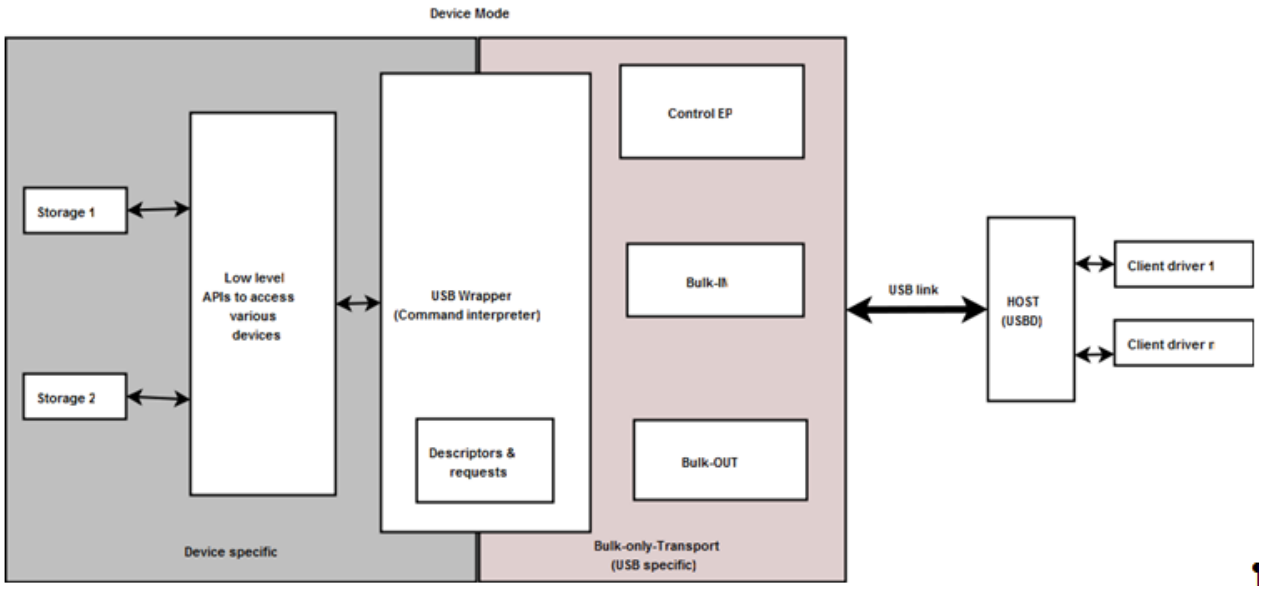
22.9.11.5 Battery Charging Sequence

The software will not be involved in the battery charging sequence. The battery charging for the dead battery provision will be taken care of by the Synopsys USB controllers.

22.9.12 Mass Storage Class

22.9.12.1 Bulk-Only Transport (BOT)

Figure 64: BOT



It makes use of one control EP, one bulk IN endpoint and one bulk OUT endpoint to communicate with the opposite side (host port). However, the throughput achieved using BOT will be less as no command queuing is supported by this protocol. In BOT, every transaction has to be completed before the next transaction could be initiated by the host. For backward compatibility, BOT interface should always be declared as first interface.

BOT requests to be supported by the device driver are listed below.

22.9.12.2 Bulk-Only Mass Storage Reset (BOMSR)

This class-specific request shall ready the device for the next command from the host. This is sent through control endpoint.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
00100001b	11111111b	0000h	Interface	0000h	none

The sequences of actions to be taken by the driver are as follows:

Step 1

- The device driver receives the BOMSR command through the SETUP packet.

Step 2

- Decode the type of command requested.

Step 3

- Place the corresponding request on to storage controller.

Step 4

- Wait for the completion of the storage controller reset.

Step 5

- Clear the internal variable associated with all interfaces enabled for the chosen configuration. (e.g. Reset the transfer rings.)

Step 6

- Prepare and place the Data/status TRB on to the transfer ring once the storage reset is over.
  - The hardware will keep on sending the NRDY till the status TRB are placed on the transfer ring.

Notes:

- *Only BOMSR and Get Max Len requests are received through the control endpoints. All other requests are through bulk-endpoints. BOMSR is issued to clear the stall condition.*
- *The host will send CLEAR_HALT request for bulk-IN and bulk-OUT endpoints.*

22.9.12.3 Get Max LUN

The host will send this command to find out the number of logical storages supported by the device. The BOT protocol supports up to 15 LUNs (0 to 15). Most likely, the multiple LUN will not be supported with BOT.

The SETUP packet fields will look like this for the Get Max LUN.

- bmRequestType: Class, Interface, device to host
  - bRequest field set to 254 (FEh)
  - wValue field set to 0
  - wIndex field set to the interface number
  - wLength field set to 1

bmRequestType	bRequest	wValue	wIndex	wLength	Data
10100001b	11111110b	0000h	Interface	0001h	1 byte

The device will return the number of LUNs supported as part of the data stage. The device could choose to send STALL response if multiple LUNs are not supported or could send zero as part of the data stage.

The driver sequence upon receiving the ‘Get Max LUN’ will be as follows:

Step 1

- ‘Get Max LUN’ request is received as part of the SETUP request

Step 2

- If the command is not supported
  - Then HALT the endpoint by programming the ‘HATL EP xx’ register.
- Else
  - Return the number of LUNs supported as part of the data stage.

22.9.12.4 Host commands to the mass storage device

CBW – Command Block Wrapper

The host sends the CBW to the device's bulk OUT endpoint. The CBW contains a command block and other information about the command. The size of CBW is 31 bytes. The driver steps upon receiving the CBW is as follows,

Step 1

Check the validity of the CBW structure

- CBW is received after a CSW or reset.
- The CBW is 31 bytes.
- The dCBWSignature field has the correct value.

Step 2

Check that the contents are valid.

- All of the reserved bits are zero.
- The bCBWLUN field contains a supported LUN value.
- The bCBWCBLength and CBWCB fields are valid for the interface's subclass.

Step 3

Prepare to receive or send the data to host.

Step 4

If sending data then get the data from the internal storage device and place the corresponding TRBs on the transfer ring.

Step 5

If receiving the data then get the data from the host and write it to the internal storage.

Data Phase

There is no data transfer between CBW phase and CSW phase if dCBWDataTransferLength is zero.

Common Status Write (CSW)

This will be send by the device to the host once the data transfer or the command phase is completed. The size of the CSW will be 13 bytes. This will be send through the bulk-IN endpoint.

Note: *The specification does not specify the timeout for host initiated requests targeted to mass storage device. The windows operation system implements around 20-30 seconds (some source, need to check)*

22.9.12.5 STALL

The bulk-IN endpoints should be halted upon sending a STALL response to the opposite side. The STALL response will be sent in the following scenarios,

- The device sends the less data than the requested amount during bulk-IN data phase.
- If the received CBW request is invalid.

Bulk-OUT could be halted or accept and discard any received data on the endpoint (preferred).

Notes:

- *There is no support for bi-directional data transfer in a single command.*

- *BOT protocol does not support more than one outstanding CBW request to the device (command queuing)*

22.9.12.6 Standard Descriptors

The descriptor data returned by the device to the hose is speed dependent. Depending upon the current operating mode (High speed or Superspeed), the device driver will return the configuration information corresponding to that mode only.

Table 112: Device Descriptor (One per Device)

Offset	Field	Size	Value	Description
0	bLength	1	0x12	Size of this descriptor
1	bDescriptorType	1	0x1	
2	bcdUSB	2	0x0300h	
4	bDeviceClass	1	0	
5	bDeviceSubClass	1	0	
6	bDeviceProtocol	1	0	
7	bMaxPacketSize0	1	HS – 0x40 SS - 0x9	
8	idVendor	2		
10	idProduct	2		
12	bcdDevice	2		
14	iManufacturer	1		
15	iProduct	1		
16	iSerialNumber	1		
17	bNumConfigurations	1		

Table 113: Configuration Descriptor

Offset	Field	Size	Value	Description
0	bLength	1	0x9	
1	bDescriptorType	1	0x2	
2	wTotalLength	2		
4	bNumInterfaces	1		
5	bConfigurationValue	1		
6	iConfiguration	1		
7	bmAttributes	1	8b’01100000	Self powered – Yes Remote wakeup -Yes
8	bMaxPower	1		Expressed in units of 8mA for super speed.

Table 114: Interface Configuration (both SS and HS)

Offset	Field	Size	Value	Description
0	bLength	1	0x9	
1	bDescriptorType	1	0x4	
2	bInterfaceNumber	1	1	
3	bAlternateSetting	1	0	UASP will be secondary setting for backward compatibility. BOT will be the primary alternate setting (0).
4	bNumEndpoints	1	2	
5	bInterfaceClass	1	0x8	
6	bInterfaceSubClass	1		

Table 114: Interface Configuration (both SS and HS)

Offset	Field	Size	Value	Description
7	bInterfaceProtocol	1	0x50	BOT
8	iInterface	1		

Table 115: Endpoint Configuration (both HS/SS)

Offset	Field	Size	Value	Description
Bulk-IN				
0	bLength	1	0x7	
1	bDescriptorType	1	0x5	
2	bEndpointAddress	1	0x81	
3	bmAttributes	1	0x2	
4	wMaxPacketSize	2	HS – 512 SS – 1024	
6	bInterval	1	00h	
Bulk-OUT				
0	bLength	1	0x7	
1	bDescriptorType	1	0x5	
2	bEndpointAddress	1	0x01	
3	bmAttributes	1	0x2	
4	wMaxPacketSize	2	HS – 512 SS - 1024	
6	bInterval	1	00h	

Notes:

- *The values of some fields change as per the device of the speed.*
- *Refer to BOT specification to know more about the descriptor details.*

Table 116: String Descriptor

Offset	Field	Size	Value	Description
0	bLength	1		
1	bDescriptor	1		
2	wString1	2		Serial number character 1
4	WString2	2		Serial number character 2
6				
8				
10	sString12	2		Serial number will be at least 12 character long

22.10 Recommended PHY Settings

Contact your local NVIDIA representative for PHY settings specific to your design.

22.11 BIAS Pad Configuration

The UTMIP BIAS pad is shared across USB_OTG and XUSB controllers and the below common bias pad settings need to be configured from the USB1 controller only.

USB1_UTMIP_BIAS_CFG0_0:

- UTMIP_BIASPD
- UTMIP_HSCHIRP_LEVEL
- UTMIP_HSSQUELCH_LEVEL
- UTMIP_HSDISCON_LEVEL_MSB
- UTMIP_HSDISCON_LEVEL
- UTMIP_ACTIVE_TERM_OFFSET
- UTMIP_ACTIVE_PULLUP_OFFSET
- UTMIP_VBUS_LEVEL_LEVEL
- UTMIP_SESS_LEVEL_LEVEL

USB1_UTMIP_BIAS_CFG1_0:

- UTMIP_FORCE_PDTRK_POWERUP
- UTMIP_FORCE_PDTRK_POWERDOWN

Following is the sequence to configure above parameters of the BIAS pad:

1. Enable the clock to the USB1 controller
2. Set any of above parameters as required.
3. Disable the clock to the USB1 controller if it is not used.

22.12 Boot ROM Initialization Sequence for USB Recovery

1. Program PLL_U.
   - Set the PLLU_BASE register fields, PLLU_DIVM, PLLU_DIVN, PLLU_VCO_FREQ, PLLU_BYPASS and PLLU_ENABLE fields as described in this document.
2. Configure USB_OTG
   a. Bring up USB_OTG clocks by writing 1 to CLK_ENB_USBD in the CLK_OUT_ENB_L register.
   b. Assert and deassert the master USBD reset in the CAR block (SWR_USBD_RST in the RST_DEVICES_L register) to bring USB_OTG out of reset.
   c. Stop the crystal clock by setting UTMIP_PHY_XTAL_CLOCKEN in the UTMIP_MISC_CFG1 register to 0. This only stops the crystal clocks in the UTMIP units.
      - The default value of USB1_UTMIP_PHY_XTAL_CLOCKEN (= 1) now changes to 0.
      - To use the A Session Valid for cable detection logic, set the USB1_VBUS_SENSE_CTL field in the USB1_LEGACY_CTRL register to A_SESS_VLD (2’b11).
   d. Program the automatic PLL start times.

      Set USB1_IF_UTMIP_PLLU_ENABLE_DLY_COUNT, UTMIP_PLLU_STABLE_COUNT, UTMIP_PLL_ACTIVE_DLY_COUNT and UTMIP_XTAL_FREQ_COUNT as per the values given in this document.
   e. Program the tracking duration.

      Set USB1_IF_UTMIP_BIAS_CFG1.UTMIP_BIAS_PDTRK_COUNT as per the values given in this document.
   f. Program the debouncer length times.

      Set UTMIP_DEBOUNCE_CFG0.UTMIP_BIAS_DEBOUNCE_A field.
   g. Program various static parameters of the USB_OTG UTMIP1.

- Set UTMIP_TX_CFG0.UTMIP_FS_PREAMBLE_J to 0x1.
- Set UTMIP_BAT_CHRG_CFG0.UTMIP_PD_CHRG to 1.
- Set UTMIP_XCVR_CFG0.UTMIP_XCVR_LSBIAS_SEL to 0.
- Set the third bit of UTMIP_SPARE_CFG0 to 1. i.e., UTMIP_SPARE_CFG0[3] to 1.
- Set UTMIP_HSRX_CFG0. UTMIP_IDLE_WAIT as per the values given in this document.
- Set UTMIP_HSRX_CFG0.UTMIP_ELASTIC_LIMIT to 16.
- Set UTMIP_HSRX_CFG1.UTMIP_HS_SYNC_START_DLY to 9

h. Restart the crystal clock by setting UTMIP_PHY_XTAL_CLOCKEN in the UTMIP_MISC_CFG1 register to 1 for USB_OTG.

3. Wait for cable connect on the USB_OTG UTMIP1 port. When cable is connected on USB_OTG UTMIP1 port, continue to the next step.
4. Bring UTMIP1 out of reset by writing 0 to the UTMIP_RESET bit of the USB1_IF_SUSP_CTRL register.
5. Wait until USB1_IF_USB_SUSP_CTRL.PHY_CLK_VALID is set to 1.
6. Then perform USB controller initialization.
   a. Reset the bus.
   b. Wait until the bus comes out of reset.
   c. Set the controller in Device Mode.
   d. Perform USB operations.

22.13 Performance Settings for USB Controllers

To meet USB's strict bandwidth/latency requirements, some AHB programming needs to be done. The following gives a guideline on the programming requirements to achieve maximum performance from USB:

- The burst size for the USB controller should be programmed to 8 in the USB2D_BURSTSIZE register. Both TXPBURST and RXPBURST fields should be programmed to the same value of 8.
- The ENB_FAST_REARBITRATE field for AHB_MEM gizmo should be set to 1 in the AHB_GIZMO_AHB_MEM register.
- The IMMEDIATE field for USB gizmos should be set to 1 in the AHB_GIZMO_USB, or AHB_GIZMO_USB2 register, depending on the controller in use.
- USB controllers should be set as high-priority masters on AHB by setting the bits corresponding to each USB controller to 1 in AHB_PRIORITY_SELECT field in the register AHB_ARBITRATION_PRIORITY_CTRL and setting the priority weight to 7 by setting the AHB_PRIORITY_WEIGHT field in the same register. USB master numbers are 6 for USB_OTG and 18 for USB2. The priority weight could be relaxed depending on requirements from other AHB masters in the system as required for different use cases.
- The prefetch engine needs to be set up correctly to enable prefetching of transmit data packets for USB masters. Each USB master needs one channel on the prefetch engine. There are 4 channels on the prefetch engine. If all 3 USB masters enable one channel at the same time, it would leave one more channel for another AHB master. Each prefetch channel is controlled by the AHB_AHB_MEM_PREFETCH_CFG[NO] register, where NO=1,2,3,4. To enable prefetch for a USB controller on a channel, program AHB_MST_ID_USB, or AHB_MST_ID_USB2 in the AHB_MST_ID field for the AHB_AHB_MEM_PREFETCH_CFG[NO] register. The ADDR_BNDRY field should be set to log2 (buffer size) according to the buffer size required for the corresponding USB master. The SPEC_THROTTLE field should be set to 0, and the INACTIVITY_TIMEOUT field should be set to 0x800.
- When a particular USB controller is in Host mode, the TXFIFOTHRES field in the USB2D_TXFILLTUNING register (offset 0x154) should be set to 0x10.

All this programming needs to be done before the RS bit in USB2D_USBCMD is set to RUN (1) for the corresponding USB controller.

22.14 USB Controller Handling of USB Resume Sequence

Following are the steps for how the USB controller handles a USB resume while the port is under PMC control:

1. The PMC maintains suspend mode on the bus.
2. When auto resume happens, the system starts restoring the USB controller.
3. Set the RUN bit from the USB controller to start SOFs.
4. The USB controller is brought back to suspend state.
5. Switch the USB bus from the PMC to the USB controller.
6. Wait until a resume complete notification from the USB controller. This is handled by the EHCI driver.
7. Further USB communication can start from here.

22.15 Accessing Falcon/CSB Registers

CSB registers can be accessed through XUSB PCI CFG register space. The CSB space registers can be mapped to a 512 byte aperture in the XUSB PCI CFG space between offsets 0x800 and 0xA00.

The index of the 512 byte page has to be programmed to the CSBRANGE register in the XUSB PCI Configuration space before accessing CSB registers through this register.

The steps to access a CSB register with address CSB_ADDR is as follows:

1. Write the page index into CSBRANGE register described above. The page index is calculated by dividing CSB_ADDR with the aperture size and using the quotient.

   PAGE_INDEX=CSB_ADDR/0x200

2. Determine the offset into the selected page for the register by using the remainder from the division.

   PAGE_OFFSET=CSB_ADDR%0x200

3. Use this offset into the CSB aperture in the XUSB Config space to read or write to the CSB register. For example, if we were to access offset 0x1_0010 in CSB address space.

   (PAGE_INDEX=0x80 and PAGE_OFFSET=0x10).

Program 0x80 to the CSBRANGE register and then access address 0x7009_8800 + 0x10 = 0x7009_8810.

22.16 USB Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

22.16.1 USB1 Controller Registers

Base address: USB

22.16.1.1 USB2_CONTROLLER_USB2D_ID_0

USB2D Identification Register

Offset: 0x0 | Read/Write: RO |Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31:29	X	CIVERSION: Identifies the CI version
28:25	X	VERSION: Identifies the version of the core
24:21	X	REVISION: Revision number of the USB controller. This is set to 0x0.
20:16	X	TAG: Identifies the tag of the core
15:8	X	NID: One's complement version of ID. This field is set to 0xF9.

Bit	Reset	Description
7:0	X	ID: Configuration number. This field is set to 0x06

22.16.1.2 USB2_CONTROLLER_USB2D_HW_HOST_0

USB2D Hardware Host Register

Offset: 0x8 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
3:1	X	NPORT: VUSB_HS_NUM_PORT-1: This host controller has only 1 port. So this field will always be 0.
0	X	HC: VUSB_HS_HOST: Indicates support for Host Mode. Set to 1.

22.16.1.3 USB2_CONTROLLER_USB2D_HW_DEVICE_0

USB2D Hardware Device Register

Offset: 0xc | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
5:1	X	DEVEP: VUSB_HS_DV_EP: Number of endpoints supported by this device controller. Set to 16. This includes control endpoint 0.
0	X	DC: Device capable: Set to 1 indicating support for Device Mode.

22.16.1.4 USB2_CONTROLLER_USB2D_HW_TXBUF_0

USB2D Hardware TX Buffer Register

Offset: 0x10 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
23:16	X	TXCHANADD: VUSB_HS_TX_CHAN_ADD: Total number of address bits for the transmit buffer of each transmit endpoint. Set to 7. Each transmit buffer is 128 words deep.
15:8	X	TXADD: VUSB_HS_TX_ADD: Total number of address bits for the transmit buffer. Set to 11. The total depth of the transmit buffer is 2048 words.
7:0	X	TCBURST: VUSB_HS_TX_BURST: Maximum burst size supported by the transmit endpoints for data transfers. Set to 8.

22.16.1.5 USB2_CONTROLLER_USB2D_HW_RXBUF_0

USB2D RX Buffer HW Parameters Register

Offset: 0x14 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:8	X	RXADD: VUSB_HS_RX_ADD: Total number of address bits for the receive buffer. Set to 7. The total depth of the receive buffer is 128 words
7:0	X	RXBURST: VUSB_HS_RX_BURST: Maximum burst size supported by the receive endpoints for data transfers. Set to 8.

22.16.1.6 USB2_CONTROLLER_USB2D_GPTIMER0LD_0

The host/device controller drivers can measure time-related activities using these timer registers. These registers are not part of the standard EHCI controller.

Offset: 0x80 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000)

Bit	Reset	Description
23:0	0x0	GPTIMER0LD: This field is the value to be loaded into the GPTCNT countdown timer on a reset action. The value in this register represents the time in microseconds minus 1 for the timer duration.

22.16.1.7 USB2_CONTROLLER_USB2D_GPTIMER0CTRL_0

Offset: 0x84 | Read/Write: R/W | Reset: 0x00XXXXXX (0b00xxxxx0xxxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31	RW	0x0	GTPRUN: This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT counter value.
30	WO	0x0	GPTRST: Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
24	RW	0x0	GPTMODE: This bit selects between a single timer countdown and a looped countdown. In one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by software. In repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	RO	X	GPTCNT: This field is the value of the running timer.

22.16.1.8 USB2_CONTROLLER_USB2D_GPTIMER1LD_0

Offset: 0x88 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000)

Bit	Reset	Description
23:0	0x0	GPTIMER1LD: This field is the value to be loaded into the GPTCNT countdown timer on a reset action. The value in this register represents the time in microseconds minus 1 for the timer duration.

22.16.1.9 USB2_CONTROLLER_USB2D_GPTIMER1CTRL_0

Offset: 0x8c | Read/Write: R/W | Reset: 0x00XXXXXX (0b00xxxxx0xxxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31	RW	0x0	GTPRUN: This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT counter value.
30	WO	0x0	GPTRST: Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
24	RW	0x0	GPTMODE: This bit selects between a single timer countdown and a looped countdown. In one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by software. In repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	RO	X	GPTCNT: This field is the value of the running timer.

22.16.1.10 USB2_CONTROLLER_USB2D_CAPLENGTH_0

USB2D Capability Register Length Register

Offset: 0x100 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
7:0	X	CAPLENGTH: Indicates which offset to add to the register base address at the beginning of the Operational Register. Set to 0x30.

22.16.1.11 USB2_CONTROLLER_USB2D_HCIVERSON_0

USB2D Host Interface Version Number Register

Offset: 0x102 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:0	X	HCIVERSION: Contains a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. This host controller supports EHCI revision 1.00.

22.16.1.12 USB2_CONTROLLER_USB2D_HCSPARAMS_0

USB2D Host Control Structural Parameters Register

Offset: 0x104 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
27:24	X	N_TT: Number of Transaction Translators: Indicates the number of embedded transaction translators associated with the USB2.0 host controller. This field is always set to 1 indicating only 1 embedded TT is implemented in this implementation. This is a non-EHCI field to support embedded TT.
23:20	X	N_PTT: Number of Ports per Transaction Translator: Indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. Field always equals N_PORTS. This is a non-EHCI field to support embedded TT.
15:12	X	N_CC: Number of Companion Controller: Indicates the number of companion controllers. This field is set to 0.
11:8	X	N_PCC: Number of Ports per Companion Controller: Indicates the number of ports supported per internal companion controller. This field is set to 0.
4	X	PPC: Port Power Control: Indicates whether the host controller implementation includes port power control. 1 = Ports have port power switches 0= Ports do not have port power switches. This field affects the functionality of the port Power field in each port status and control register. This field is set to 1.
3:0	X	N_PORTS: Number of downstream ports. This field specifies the number of physical downstream ports implemented on this host controller. This field is fixed to 1, since this host controller only supports 1 port.

22.16.1.13 USB2_CONTROLLER_USB2D_HCCPARAMS_0

USB2D Host Control Capability Parameters Register

Offset: 0x108 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
18	X	PPC: Per-Port Change Event Capability - RO. Default = 1b. This field indicates the support for per-port change events. This field is related to the USBCMD PPE field, USBSTS PPCI field, and USBINTR PPCE field.
17	X	LEN: Link Power Management Capability - RO. Default = 1b. This field indicates the support for LPM L1 state. This field is related to USBCMD HIRD field, POSTSCx SSTS and DA fields and HOSTPCx LEN, BA, and EPLPM fields.
15:8	X	EECP: EHCI Extended Capabilities Pointer: Indicates a capabilities list exists. A value of 00h indicates no extended capabilities are implemented. For this implementation this field is always "0".
7:4	X	IST: Isochronous Scheduling Threshold. This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame. This field will always be "0".
2	X	ASP: Asynchronous Schedule Park Capability. 1 = (Default) the host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule. The feature can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the USBCMD register. This field is always 1.
1	X	PFL: Programmable Frame List Flag. 0 = System software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and must be set to zero. 1 = System software can specify and use a smaller frame list and configure the host controller via the USBCMD register Frame List Size field. The frame list must always be aligned on a 4K-page boundary. This requirement ensures that the frame list is always physically contiguous. This field will always be "1".

22.16.1.14 USB2_CONTROLLER_USB2D_DCIVERSION_0

USB2D Device Interface Version Number Register

Offset: 0x120 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:0	X	DCIVERSION: The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

22.16.1.15 USB2_CONTROLLER_USB2D_DCCPARAMS_0

USB2D Device Control Capabilities Register

Offset: 0x124 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
8	X	HC: Host Capable: 1 = This controller can operate as an EHCI compatible USB 2 0 host controller. This field is set to 1.
7	X	DC: Device Capable: 1 = Controller can operate as a USB 2.0 device. This field is set to 1.
5	X	LEN: Link Power Management Capability - RO. Default = 1b. This field indicates the support for LPM L1 state. This field is related to the DEVLCx ASUS, STL, BA, and NYT fields.
4:0	X	DEN: Device Endpoint Number: Number of endpoints built into the device controller. This is set to 16.

22.16.1.16 USB2_CONTROLLER_USB2D_EXTSTS_0

USB2D EXTSTS Register

Offset: 0x128 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000x

Bit	R/W	Reset	Description
4	RW	0x0	TI1: General Purpose Timer Interrupt 1 - RWC. Default = 0b. This bit is set when the counter in the GPTIMER1CTRL register transitions to zero. Writing a one to this bit will clear it.
3	RW	0x0	TI0: General Purpose Timer Interrupt 0 - RWC. Default = 0b. This bit is set when the counter in the GPTIMER1CTRL register transitions to zero. Writing a one to this bit will clear it.
2	RW	0x0	UPA: USB Host Periodic Interrupt (USBHSTPERINT) R/WC. This bit is set by the Host Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) has an interrupt on complete (IOC) bit set and the TD was from the periodic schedule. This bit is also set by the Host Controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be zero. 0 = DISABLE 1 = ENABLE
1	RW	0x0	UAI: USB Host Asynchronous Interrupt (USBHSTASYNCINT) R/WC. This bit is set by the Host Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set by the Host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be zero. 0 = DISABLE 1 = ENABLE
0	RO	X	NAKI: NAK Interrupt Bit Read Only. This bit is read only. It is set by hardware when for a particular endpoint both the TX/RX Endpoint NAK bit and the corresponding TX/RX Endpoint NAK Enable bit are set. This bit is automatically cleared by hardware when the all the enabled TX/RX Endpoint NAK bits are cleared. 0 = DISABLE 1 = ENABLE

22.16.1.17 USB2_CONTROLLER_USB2D_USBEXTINTR_0

USB2D EXTINTR Register

Offset: 0x12c | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000

Bit	Reset	Description
4	0x0	TIE1: General Purpose Timer Interrupt Enable 1 - RWC. Default = 0b. When this bit is a one, and the TI1 bit in the EXTSTS register is a one, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the TI1 bit.
3	0x0	TIE0: General Purpose Timer Interrupt Enable 0 - RWC. Default = 0b. When this bit is a one, and the TI1 bit in the EXTSTS register is a one, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the TI1 bit.
2	0x0	UPIE: UPIE Interrupt Enable. 1 = USB controller issues an interrupt if the UPA bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
1	0x0	UAIE: UAIE Interrupt Enable. 1 = USB controller issues an interrupt if the UAI bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE
0	0x0	NAKE: NAK Interrupt Enable. 1 = USB controller issues an interrupt if the NAKI bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE

22.16.1.18 USB2_CONTROLLER_USB2D_USBCMD_0

USB2D USB Command Register

Offset: 0x130 | Read/Write: R/W | Reset: 0bxxxx00000000010000000x1x11x0000000

Bit	R/W	Reset	Description
27:24	RW	0x0	HIRD: Host Initiated Resume Duration RW. Default = 0000b. This has the same behavior as bits 7:4 of the BA field of the HOSTPCx register. When writing to this field all BA[7:4] fields of all HOSTPCx registers will be set to this value. This field is used by system software to specify the minimum amount of time the host controller will drive the K-state during a host-initiated resume from an LPM state (e.g., L1), and is conveyed to each LPM-enabled device (via the HIRD bits within an LPM Tokens bmAttributes field) upon entry into a low-power state. Note the host controller is required to drive resume signaling for at least the amount of time specified in the HIRD value conveyed to the device during any proceeding host-initiated resume. Also note that the host controller is not required to observe this requirement during device-initiated resumes. Encoding for this field is identical to the definition for the similarly named HIRD field within an LPM Token, specifically: a value 0000b equals 50 µs and each additional increment adds 75 µs. For example, the value 0001b equals 125 µs, and the value 1111b equals 1,175 µs (~1.2 ms).
23:16	RW	0x8	ITC: Interrupt Threshold Control.Read/Write. Default 08h. The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. ITC contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum Interrupt Interval. 00h: Immediate (no threshold). 01h: 1 micro-frame. 02h: 2 micro-frames. 04h: 4 micro-frames. 08h: 8 micro-frames. 10h: 16 micro-frames. 20h: 32 micro-frames. 40h: 64 micro-frames 0 = IMMEDIATE 2 = ONE_MF 4 = TWO_MF 8 = EIGHT_MF 16 = SIXTEEN_MF 32 = THIRTY_TWO_MF 64 = SIXTY_FOUR_MF
15	RW	0x0	FS2: Bit 2 of Frame List Size.
14	RW	0x0	ATDTW: Add DTD Tripwire. This bit is used as a semaphore when a dTD is added to an active (primed) endpoint. This bit is set and cleared by software and will be cleared by hardware when a hazard exists such that adding a dTD to a primed endpoint may go unnoticed. 0 = CLEAR 1 = SET
13	RW	0x0	SUTW: Setup Tripwire. This bit is used as a semaphore when the 8 bytes of setup data read extracted by the firmware. If the setup lockout mode is off, then there exists a hazard when new setup data arrives and firmware is copying setup data from the QH for a previous setup packet. This bit is set and cleared by software and will be cleared by hardware when a hazard exists. 0 = CLEAR 1 = SET
11	RW	0x1	ASPE: Asynchronous Schedule Park mode Enable. Software uses this bit to enable or disable Park mode. When this bit is one, Park mode is enabled. When this bit is a zero, Park mode is disabled. This field is set to "1" in this implementation. 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
9:8	RW	0x3	ASP1_ASP0: Asynchronous Schedule Park Mode Count (OPTIONAL) Read/Write. If the Asynchronous Park Capability bit in the HCCPARAMS register is a one, then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1h to 3h. Software must not write a zero to this bit when Park Mode Enable is a one as this will result in undefined behavior. This field is set to 3h in this implementation and is Read/Write capable.
7	RO	X	LR: Light Host/Device Controller Reset (OPTIONAL). Read Only. Not Implemented. This field will always be "0".
6	RW	0x0	IAA: Interrupt on Async Advance Doorbell. When the host controller has evicted all appropriate cached schedule states, it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Sync Advance Enable bit in the USBINTR register is one, then the host controller will assert an interrupt at the next interrupt threshold. The host controller sets this bit to zero after it has set the Interrupt on Sync Advance status bit in the USBSTS register to one. Software should not write a one to this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in Host Mode. Writing a one to this bit when Device Mode is selected will have undefined results. 0 = CLEAR 1 = SET
5	RW	0x0	ASE: Asynchronous Schedule Enable. This bit controls whether the host controller skips processing the Asynchronous Schedule. 0 = Do not process the Asynchronous Schedule. 1 = Use the ASYNCLISTADDR register to access the Asynchronous Schedule. Only the host controller uses this bit. 0 = DISABLE 1 = ENABLE
4	RW	0x0	PSE: Periodic Schedule Enable. This bit controls whether the host controller skips processing the Periodic Schedule. 0 = Do not process the Periodic Schedule 1 = Use the PERIODICLISTBASE register to access the Periodic Schedule. Only the host controller uses this bit. 0 = DISABLE 1 = ENABLE
3:2	RW	0x0	FS1_FS0: Frame List Size. (Read/Write). 000 = (Default). This field is Read/Write only if the Programmable Frame List Flag in the HCCPARAMS registers is set to one. Hence this field is Read/Write for this implementation. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3, and 2. 000 = 1024 elements (4096 bytes) Default value 001 = 512 elements (2048 bytes) 010 = 256 elements (1024 bytes) 011 = 128 elements (512 bytes) 100 = 64 elements (256 bytes) 101 = 32 elements (128 bytes) 110 = 16 elements (64 bytes) 111 = 8 elements (32 bytes) Only the host controller uses this field.
1	RW	0x0	RST: Controller Reset. Software uses this bit to reset the controller. This bit is set to zero by the Host/Device Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Host Controller: When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller results in undefined behavior. Device Controller: When software writes a one to this bit, the Device Controller resets its internal pipelines, timers, counters, state machines etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. Writing a one to this bit in Device Mode is not recommended. 0 = CLEAR 1 = SET

Bit	R/W	Reset	Description
0	RW	0x0	RS: Run/Stop: Host Controller: When set to a 1, the Host Controller proceeds with the execution of the schedule. The Host Controller continues execution as long as this bit is set to a one. When this bit is set to 0, the Host Controller completes the current transaction on the USB and then halts. The HCHalted bit in the status register indicates when the Host Controller has finished the transaction and has entered the stopped state. Software should not write a one to this field unless the host controller is in the Halted state (i.e., HCHalted in the USBSTS register is a one). Device Controller: Writing a one to this bit will cause the device controller to enable a pull-up on D+ and initiate an attach event. This control bit is not directly connected to the pull-up enable, as the pull-up will become disabled upon transitioning into high-speed mode. Software should use this bit to prevent an attach event before the device controller has been properly initialized. Writing a 0 to this will cause a detach event. 0 = STOP 1 = RUN

22.16.1.19 USB2_CONTROLLER_USB2D_USBSTS_0

USB2D USB Status Register

Offset: 0x134 | Read/Write: R/W | Reset: 0b00000000000000000x100x0000x0000

Bit	R/W	Reset	Description
31:16	RW	0x0	PPCI: Port-n Change Detect - RW. Default = 0000h. The definition for each bit is identical to the Port Change Detect field (bit 2 of this register) except these bits are specific to a given port, where bit 16 = Port 1, 17 = Port 2, etc. For example, if bit 17 is set to a one then a port change event was detected on Port 2. The N_PORTS field in HCSPARAMS specifies how many ports are exposed by the host controller and thus how many bits in this field are valid.
15	RW	0x0	AS: Asynchronous Schedule Status. This bit reports the current real status of the Asynchronous Schedule. When set to zero the asynchronous schedule status is disabled and if set to one the status is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. If AS = ASE: 1= Enable Asynchronous Schedule. 0= Disable Asynchronous Schedule. Only used by the host controller. 0 = DISABLE 1 = ENABLE
14	RW	0x0	PS: Periodic Schedule Status. This bit reports the current real status of the Periodic Schedule. When set to zero the periodic schedule is disabled, and if set to one the status is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. If PS = PSE then: 1 = Periodic Schedule is enabled or 0 = Periodic Schedule is disabled. Only used by the host controller. 0 = DISABLE 1 = ENABLE
13	RO	X	RCL: Reclamation. This is a read-only status bit used to detect an empty asynchronous schedule. Only used by the host controller. 0 = DISABLE 1 = ENABLE
12	RW	0x1	HCH: HCHalted. 1 = Default. This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to one after it has stopped executing because of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g., internal error). Only used by the host controller. 0 = UNHALTED 1 = HALTED
11	RW	0x0	UALT_INT: ULPI alt_int Interrupt. 0 = Default. This interrupt bit is set when an RXCMD is received through the ULPI interface with bit 7 set (alt_int).The alt_int itself is set when an unmasked event occurs on any bit in the Carkit Interrupt Latch Register, in the ULPI PHY The software should read the Carkit Interrupt Latch Register (Read to Clear) through the ULPI Viewport to check the source of the interrupt. Only present in designs where configuration constant VUSB_HS_PHY_ULPI = 1. 0 = NOT_ULPI_ALT_INT 1 = ULPI_ALT_INT
10	RW	0x0	ULPI_INT: ULPI Interrupt. This bit is set whenever an interrupt is received from ULPI PHY. Software writes 1 to clear it. 0 = NOT_ULPI_INT 1 = ULPI_INT

Bit	R/W	Reset	Description
8	RW	0x0	SLI: DCSuspend. When a device controller enters a suspend state from an active state, this bit will be set to a 1. The device controller clears the bit upon exiting from a suspend state. Only used by the device controller. 0 = NOTSUSPEND 1 = SUSPENDED
7	RW	0x0	SRI: SOF Received. When the device controller detects a Start Of (micro) Frame, this bit will be set to a one. When an SOF is extremely late, the device controller will automatically set this bit to indicate that an SOF was expected. Therefore, this bit will be set roughly every 1 ms in device FS mode and every 125 µs in HS mode and will be synchronized to the actual SOF that is received. Since the device controller is initialized to FS before connect, this bit will be set at an interval of 1 ms during the prelude to the connect and chirp. In Host Mode, this bit will be set every 125 µs and can be used by the host controller driver as a time base. Software writes a 1 to this bit to clear it. This is a non-EHCI status bit. 0 = SOF_NOT_RCVD 1 = SOF_RCVD
6	RW	0x0	URI: USB Reset Received. When the device controller detects a USB Reset and enters the default state, this bit is set to a 1. Software can write a 1 to this bit to clear the USB Reset Received status bit. Only used by the device controller. 0 = NO_USB_RESET 1 = USB_RESET
5	RW	0x0	AAI: Interrupt and Asynchronous Advance. System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. Only used by the host controller 0 = NOT_ADVANCED 1 = ADVANCED
4	RO	X	SEI: System Error. This bit is not used in this implementation and will always be set to "0". 0 = NO_ERROR 1 = ERROR
3	RW	0x0	FRI: Frame List Rollover. The Host Controller sets this bit to a 1 when the Frame List Index rolls over from its maximum value to 0. The exact value at which the rollover occurs depends on the frame list size. For example. If the frame list size (as programmed in the Frame List Size field of the USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX [1 3] toggles. Similarly, if the size is 512, the Host Controller sets this bit to a 1 every time FHINDEX [12] toggles. Only used by the host controller. 0 = NO_ROLLOVER 1 = ROLLOVER
2	RW	0x0	PCI: Port Change Detect. The Host Controller sets this bit to a 1 when on any port a Connect Status occurs, a Port Enable/Disable Change occurs, or the Force Port Resume bit is set as the result of a J-K transition on the suspended port. The Device Controller sets this bit to a one when the port controller enters the full or high-speed operational state. When the port controller exits the full or high-speed operational states due to Reset or Suspend events, the notification mechanisms are the USB Reset Received bit and the DCSuspend bits, respectively. This bit is not EHCI compatible. 0 = NO_PORT_CHANGE 1 = PORT_CHANGE
1	RW	0x0	UEI: USB Error Interrupt. This bit gets set by the Host/Device controller when completion of a USB transaction results in an error condition. This bit is set along with the USBINT bit, if the TD on which the error interrupt occurred also had its interrupt on complete (IOC) bit set. 0 = NO_ERROR 1 = ERROR
0	RW	0x0	UI: USB Interrupt. This bit is set by the Host/Device Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) as an interrupt on complete (IOC) bit set. This bit is also set by the Host/Device Controller when a short packet is detected. A short packet is when the actual number of bytes received was less than the expected number of bytes. 0 = NO_INT 1 = INT

22.16.1.20 USB2_CONTROLLER_USB2D_USBINTR_0

USB2D USB Interrupt Enable Register

Offset: 0x138 | Read/Write: R/W | Reset: 0b0000000000000000xxxx00x000000000

Bit	Reset	Description
31:16	0x0	PPCE: Port-n Change Detect Enable - RW. Default = 0000h. The definition for each bit in this field is identical to bit 2 of this register (Port Change Interrupt Enable) except these bits are specific to a given port, where bit 16 = Port 1, 17 = Port 2, etc. For example, if bit 17 is set (1b) then a port change event was detected on Port 2. When a bit in this field is a one, and the corresponding Port-n Change Detect bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Port-n Change Detect bit.
11	0x0	UALTIE: ULPI alt_int Interrupt Enable. 1 = USB controller issues an interrupt if the ULPI_ALT_INT bit in the USBSTS register transitions. The interrupt is acknowledged by software by writing a 1 to the ULPI_ALT_INT bit. 0 = DISABLE 1 = ENABLE
10	0x0	ULPIE: ULPI Interrupt Enable. 1 = USB controller issues an interrupt if ULPI_INT bit in USBSTS register transitions. The interrupt is acknowledged by software by writing a 1 to the ULPI_INT bit. 0 = DISABLE 1 = ENABLE
8	0x0	SLE: Sleep Enable. 1 = Device controller issues an interrupt if DCSuspend bit in USBSTS register transitions. The interrupt is acknowledged by software by writing a 1 to the DCSuspend bit. Only used by the device controller. 0 = DISABLE 1 = ENABLE
7	0x0	SRE: SOF Received Enable. 1 = Device controller issues an interrupt if SOF Received bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the SOF Received bit. 0 = DISABLE 1 = ENABLE
6	0x0	URE: USB Reset Enable.1 = Device controller issues an interrupt if USB Reset Received bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the USB Reset Received bit. Only used by the device controller. 0 = DISABLE 1 = ENABLE
5	0x0	AAE: Interrupt on Asynchronous Advance Enable. 1 = The host controller issues an interrupt at the next interrupt threshold if Interrupt on Async Advance bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit. Only used by the host controller. 0 = DISABLE 1 = ENABLE
4	0x0	SEE: System Error Enable. 1 = Host/device controller issues an interrupt if the System Error bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the System Error bit. 0 = DISABLE 1 = ENABLE
3	0x0	FRE: Frame List Rollover Enable. 1 = Host controller issues an interrupt if Frame List Rollover bit in the USBSTS register = 1. The interrupt is acknowledged by software clearing the Frame List Rollover bit. Only used by the host controller. 0 = DISABLE 1 = ENABLE
2	0x0	PCE: Port Change Detect Enable. 1 = Host/device controller issues an interrupt if Port Change Detect bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the Port Change Detect bit. 0 = DISABLE 1 = ENABLE
1	0x0	UEE: USB Error Interrupt Enable. 1 = Host controller issues an interrupt at the next interrupt threshold if the USBERRINT bit in USBSTS = 1. The interrupt is acknowledged by software clearing the USBERRINT bit in the USBSTS register. 0 = DISABLE 1 = ENABLE
0	0x0	UE: USB Interrupt Enable. 1 = Host/device issues an interrupt at the next interrupt threshold if the USBINT bit in USBSTS = 1. The interrupt is acknowledged by software clearing the USBINT bit. 0 = DISABLE 1 = ENABLE

22.16.1.21 USB2_CONTROLLER_USB2D_FRINDEX_0

USB2D USB Frame Index Register

Offset: 0x13c | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
13:0	X	FRINDEX: Frame Index. The value in this register increments at the end of each time frame (micro-frame). Bits [N: 3] are used for the Frame List current index. Each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following illustrates values of N based on the value of the Frame List Size field in the USBCMD register, when used in Host Mode. USBCMD [Frame List Size] Number Elements N 000b (1024) 12 001b (512) 11 010b (256) 10 011b (128) 9 100b (64) 8 101b (32) 7 110b (16) 6 111b (8) 5 In Device Mode, the value is the current frame number of the last frame transmitted. It is not used as an index. In either mode bits 2:0 indicate the current micro-frame.

22.16.1.22 USB2_CONTROLLER_USB2D_PERIODICLISTBASE_0

USB2D Host Controller Frame List Base Address Register

Offset: 0x144 | Read/Write: R/W | Reset: 0b00000000000000000000xxxxxxxxxxxx

Bit	Reset	Description
31:25	0x0	USBADR: Device mode. The upper seven bits of this register represent the device address. After any controller reset or a USB reset, the device address is set to the default address (0). The default address will match all incoming addresses. Software shall reprogram the address after receiving a SET_ADDRESS request.
24	0x0	USBADRA: Device Address Advance. Default=0. When this bit is 0, any writes to USBADR are instantaneous. When this bit is written to a 1 at the same time or before USBADR is written, the write to the USBADR field is staged and held in a hidden register. After an IN occurs on endpoint 0 and is ACKed, USBADR will be loaded from the holding register. Hardware will automatically clear this bit on the following conditions: 1) IN is ACKed to endpoint 0. (USBADR is updated from staging register). 2) OUT/SETUP occur to endpoint 0. (USBADR is not updated). 3) Device Reset occurs (USBADR is reset to 0). Note: After the status phase of the SET_ADDRESS descriptor, the DCD has 2 ms to program the USBADR field. This mechanism will ensure this specification is met when the DCD cannot write of the device address within 2 ms from the SET_ADDRESS status phase. If the DCD writes the USBADR with USBADRA=1 after the SET_ADDRESS data phase (before the prime of the status phase), the USBADR will be programmed instantly at the correct time and meet the 2 ms USB requirement.
31:12	0x0	BASEADR: Host mode: This 32-bit register contains the beginning address of the Periodic Frame List in the system memory. The HCD loads this register prior to starting the schedule execution by the Host Controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. Base Address (Low). These bits correspond to memory address signals [31:12], respectively. Only used by the host controller.

22.16.1.23 USB2_CONTROLLER_USB2D_ASYNCLISTADDR_0

USB2D Next Asynchronous List Address Register

Offset: 0x148 | Read/Write: R/W | Reset: 0b00000000000000000000000000xxxxx

Bit	Reset	Description
31:11	0x0	EPBASE: Device mode. This register contains the address of the top of the endpoint list in system memory. These bits correspond to memory address signals [31:11], respectively. This field will reference a list of up to 32 Queue Heads (QHs). Only used by the device controller.

Bit	Reset	Description
31:5	0x0	ASYBASE: Host mode. This 32-bit register contains the address of the next asynchronous queue head to be executed by the host. Link Pointer Low (LPL). These bits correspond to memory address signals [31:5], respectively. This field may only reference a Queue Head (OH). Only used by the host controller.

22.16.1.24 USB2_CONTROLLER_USB2D_ASYNCTTSTS_0

USB2D Asynchronous Buffer Status for Embedded TT Register

Offset: 0x14c | Read/Write: R/W | Reset: 0bx0000000xxxxxxxxxxxxxxxxxxxxxx0x

Bit	R/W	Reset	Description
30:24	RW	0x0	TTHA: Internal TT Hub Address representation. This field is used to match the Hub Address field in Queue Head (QH) and split isochronous transaction descriptor (siTD) to determine if the packet is routed to the internal transaction translator (TT) for directly attached FS/LS devices. If the Hub Address in the QH or siTD does not match this address then the packet will be broadcast on the High Speed ports destined for a downstream High Speed hub with the address in QH/siTD.
1	RW	0x0	TTAC: Embedded TT Async Buffers Clear. (Read/Write to set). This field will clear all pending transactions in the embedded TT Async Buffer(s). The clear will take as much time as necessary to clear buffer without interfering with a transaction in progress. TTAC will return to zero after being set by software only after the actual clear occurs.
0	RO	X	TTAS: Embedded TT Async Buffers Status. (Read Only). This read only bit will be 1 if one or more transactions are being held in the embedded TT Async. Buffers. When this bit is a zero, then all outstanding transactions in the embedded TT have been flushed.

22.16.1.25 USB2_CONTROLLER_USB2D_BURSTSIZE_0

USB2D Burst Size Register

Offset: 0x150 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx0000100000001000

Bit	Reset	Description
15:8	0x8	TXPBURST: Programmable TX Burst Length. (Read/Write). This register represents the maximum length of a burst in 32-bit words while moving data from system memory to the USB bus.
7:0	0x8	RXPBURST: Programmable RX Burst Length. (Read/Write). This register represents the maximum length of a burst in 32-bit words while moving data from the USB bus to system memory.

22.16.1.26 USB2_CONTROLLER_USB2D_TXFILLTUNING_0

USB2D Transmit Fill Tuning Register

Offset: 0x154 | Read/Write: R/W | Reset: 0bxxxxxxxxxxx000010xxx0000000000000

Bit	Reset	Description
21:16	0x2	TXFIFOTHRES: FIFO Burst Threshold. (Read/Write). This register controls the number of data bursts that are posted to the TX latency FIFO in Host Mode before the packet begins on to the bus. The minimum value is 2 and this value should be a low as possible to maximize USB performance. A higher value can be used in systems with unpredictable latency and/or insufficient bandwidth where the FIFO may underrun because the data transferred from the latency FIFO to USB occurs before it can be replenished from system memory. This value is ignored if the Stream Disable bit in USBMODE register is set.
12:8	0x0	TXSCHHEALTH: Scheduler Health Counter. (Read/Write To Clear) [Default = 0] This register increments when the host controller fails to fill the TX latency FIFO to the level programmed by TXFIFOTHRES before running out of time to send the packet before the next Start-Of-Frame. This health counter measures the number of times this occurs to provide feedback to selecting a proper TXSCHOH. Writing to this register will clear the counter and this counter will max out at 31.
7:0	0x0	TXSCHOH: Scheduler Overhead. (Read/Write) [Default = 0] This register adds an additional fixed offset to the schedule time estimator described above as Tff. As an approximation, the value chosen for this register should limit the number of back-off events captured in the TXSCHHEALTH to less than 10 per second in a highly utilized bus. Choosing a value that is too high for this register is not desired as it can needlessly reduce USB utilization. The time unit represented in this register is 1.267 µs when a device is connected in High-Speed Mode. The time unit represented in this register is 6.333 µs when a device is connected in Low/Full Speed Mode

22.16.1.27 USB2_CONTROLLER_USB2D_ULPI_VIEWPORT_0

This register provides indirect access to the ULPI PHY register set. Although the USB controller performs access to the ULPI PHY register set, there may be extraordinary circumstances where software may need direct access.

Notes:

- *Writes to the ULPI through the viewport can substantially harm standard USB operations. Currently no usage model has been defined where software should need to execute writes directly to the ULPI PHY. See exception regarding optional features below.*
- *Executing read operations through the ULPI Viewport should have no harmful side effects to standard USB operations.*

There are two operations that can be performed with the ULPI Viewport: wakeup and read /write operations.

The wakeup operation is used to put the ULPI interface into normal operation mode and re-enable the clock if necessary. A wakeup operation is required before accessing the registers when the ULPI interface is operating in low power mode, serial mode, or carkit mode.

The ULPI state can be determined by reading the sync state bit (ULPI_SYNC_STATE). If this bit is a one, then ULPI interface is running in normal operation mode and can accept read/write operations. If the ULPI_SYNC_STATE indicates a 0 then read/write operations will not be able to execute. Undefined behavior will result if ULPI_SYNC_STATE = 0 and a read or write operation is performed.

To execute a wakeup operation, write all 32-bits of the ULPI Viewport where ULPI_PORT is constructed appropriately and the ULPI_WAKEUP bit is a 1 and ULPI_RUN bit is a 0. Poll the ULPI Viewport until ULPI_WAKEUP is zero for the operation to complete.

To execute a read or write operation, write all 32 bits of the ULPI Viewport where ULPI_DATA_WR, ULPI_REG_ADDR, ULPI_PORT, ULPI_RD_WR are constructed appropriately and the ULPI_RUN bit is a 1. Poll the ULPI Viewport until ULPI_RUN is zero for the operation to complete. Once ULPI_RUN is zero, the ULPI_DATA_RD will be valid if the operation was a read.

The polling method above can be changed to interrupt driven using the ULPI interrupt defined in the USBSTS and USBINTR registers. When a wakeup or read/write operation is complete, the ULPI_INT interrupt will be set.

There are several optional features that may need to be enabled or disabled by system software as part of system configuration. These bits are contained in the Interface and OTG Control registers of the ULPI PHY register set. These registers also contain bits which are controlled by the link dynamically and therefore should be only modified by system software using the Set/Clear access method. Direct writes to these registers could have harmful side effects to the standard USB operations. The optional bits are as follows: Bits 3 through 7 in the Interface Control register and Bits 6 and 7 in the OTG Control register.

Please refer to the ULPI Specification Revision 1.1 for further information on the use of the optional features.

USB2D ULPI Viewport Register

Offset: 0x160 | Read/Write: R/W | Reset: 0b000xx00000000000xxxxxxxx00000000

Bit	R/W	Reset	Description
31	RW	0x0	ULPI_WAKEUP: ULPI Wakeup. Writing the 1 to this bit will begin the wakeup operation. The bit will automatically transition to 0 after the wakeup is complete. Once this bit is set, the driver cannot set it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time. 0 = CLEAR 1 = SET
30	RW	0x0	ULPI_RUN: ULPI read/write Run. Writing the 1 to this bit will begin the read/write operation. The bit will automatically transition to 0 after the read/write is complete. Once this bit is set, the driver cannot set it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time. 0 = CLEAR 1 = SET

Bit	R/W	Reset	Description
29	RW	0x0	ULPI_RD_WR: ULPI read/write control. (0) Read; (1) Write. This bit selects between running a read or write operation. 0 = READ 1 = WRITE
27	RO	X	ULPI_SYNC_STATE: ULPI sync state. (1) Normal Sync. State. (0) In another state (i.e., carkit, serial, low power). This bit represents the state of the ULPI interface. 0 = NOT_NORMAL 1 = NORMAL
26:24	RW	0x0	ULPI_PORT: ULPI PHY port number. This field should be always written as 0.
23:16	RW	0x0	ULPI_REG_ADDR: ULPI PHY register address. When doing a read or write operation to the ULPI PHY, the address of the ULPI PHY register being accessed is written to this field.
15:8	RO	X	ULPI_DATA_RD: ULPI PHY data read. The data from the ULPI PHY register can be read from here after the read operation completes.
7:0	RW	0x0	ULPI_DATA_WR: ULPI PHY data write. The data to write to the ULPI PHY register is written here.

22.16.1.28 USB2_CONTROLLER_USB2D_PORTSC1_0

USB2D Port Status/Control 1 Register

Offset: 0x174 | Read/Write: R/W | Reset: 0b0000000xx0000000xxx1xx00x0xx010x

Bit	R/W	Reset	Description
31:25	RW	0x0	DA: Device Address - RW. Default = 0000000b. The 7-bit USB device address for the device attached to an immediately downstream of the associated root port. A value of zero indicates no device is present or software support for this feature is not present. This is used by the Controller when sending the LPM token. This field is only valid when the core is operating in Host Mode. If in Device Mode it will be read only and always equal to 0000000b.
24:23	RO	X	SSTS: Suspend Status - RO. Default = 00b. These two bits are used by software to determine whether an L1-based suspend request was successful, specifically: 00b - L1 state entered with success. ACK received from peripheral. 01b - NYET received from peripheral. It was not able to enter L1 state this time. 10b - L1 state not supported by peripheral. STALL received. 11b - Peripheral did not respond or an error occurred. The value of this field is only valid when the port resides in the L0 state - that is, the meaning of these bits is invalid whenever bit 7 of this register (SUSP) is one. Ideally, the Controller driver should read this register if it receives an interrupt after issuing a suspend using L1 support. In case of a non-success a port change interrupt will be fired and this field should be checked for a possible L1 failure. This field is only valid when the core is operating in Host Mode. If in Device Mode, it will be always equal to 00b. 0 = L1STATE_ENTERED 1 = NYET_PERIPH 2 = L1STATE_NOT_SUPPORTED 3 = PERIPH_NORESP_ERR
22	RW	0x0	WKOC: Default = 0b. Wake on Over-current Enable: Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. This field is zero if Port Power (PP) is zero. This bit should only be used when operating in Host mode. Writing this bit to 1 while the controller is working in Device Mode can result in undefined behavior. 0 = DISABLE 1 = ENABLE
21	RW	0x0	WKDS: Wake on Disconnect Enable: Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. This field is zero if Port Power (PP) is zero or in Device Mode. This bit should only be used when operating in Host mode. Writing this bit to 1 while the controller is working in Device Mode can result in undefined behavior. This bit should not be written to 1 if there is no device connected. After the device disconnect is detected, this bit should be cleared to 0. 0 = DISABLE 1 = ENABLE
20	RW	0x0	WKCN: Wake on Connect Enable: Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. This field is zero if Port Power (PP) is zero or in Device Mode. This bit should only be used when operating in Host mode. Writing this bit to 1 while the controller is working in Device Mode can result in undefined behavior. This bit should not be written to 1 while the device is connected. After the device connection is detected, this bit should be cleared to 0. 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
19:16	RW	0x0	PTC: Port Test Control: Any value other than zero indicates that the port is operating in test mode. Value Specific Test. 0000b: Not enabled. 0001b: J_ STATE. 0010b: K_STATE. 0011b: SEQ_NAK. 0100b: Packet. 0101b: FORCE_ENABLE. 0110b to 1111b: Reserved. | Refer to Chapter 7 of the USB Specification Revision 2.0 for details on each test mode. 0 = NORMAL_OP 1 = TEST_J 2 = TEST_K 3 = TEST_SE0_NAK 4 = TEST_PKT 5 = TEST_FORCE_ENABLE
15:14	RO	X	PIC: Port Indicator Control: This field is not supported in the current implementation. Please use a GPIO if you wish to use Port Indicators.
13	RO	X	PO: Port Owner. Port owner handoff is not implemented in this design, therefore this bit will always be 0.
12	RW	0x1	PP: Port Power: The function of this bit depends on the value of the Port Power Switching (PPC) field in the HCSPARAMS register. The behavior is as follows: PPC PP Operation 0b 0b Read Only. A device controller with no OTG capability does not have port power control switches. 1b 1b/0b RW. Host/OTG controller requires port power control switches. This bit represents the current setting of the switch (0=off, 1=on). When power is not available on a port (i.e., PP equals a 0), the port is non-functional and will not report attaches, detaches, etc. When an over-current condition is detected on a powered port and PPC is a one, the PP bit in each affected port may be transitioned by the host controller driver from a one to a zero (removing power from the port). 0 = NOT_POWERED 1 = POWERED
11:10	RO	X	LS: These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. The encoding of the bits is: 00b = SE0. 01b = K-state. 10b = L-state. 11b = Undefined. The value of this field is undefined if Port Power (PP) is zero in Host Mode. In Host Mode, the use of line-state by the host controller driver is not necessary (unlike EHCI), because the port controller state machine and the port routing manage the connection of LS and FS. In Device Mode, the use of line-state by the device controller driver is not necessary. 0 = SE0 1 = K_STATE 2 = J_STATE 3 = UNDEFINED
9	RW	0x0	SLP: Suspend using L1 - RW. Default = 0b. When this bit is set to '1' and a non-zero Device Address (DA) is specified, the Controller will instigate L1 entry during suspend (bit 7) and L1 exit during resume (bit 6). When this bit is set to zero, the Controller will use the legacy (L2) mechanism. Software should only set this bit when the device attached immediately downstream supports L1 transitions. When acting as device, this bit is read-only and set to '1' by the hardware when the Controller enters is L1 state (LPM token received and accepted). Note: HSP is redundant with PSPD[27:26]. This bit is not defined in the EHCI specification.
8	RW	0x0	PR: This field is zero if Port Power (PP) is zero. In Host Mode: Read/Write. 1=Port is in Reset. 0=Port is not in Reset. When software writes a one to this bit the bus-reset sequence as defined in the USB Specification Revision 2.0 is started. This bit will automatically change to zero after the reset sequence is complete. This behavior is different from EHCI where the host controller driver is required to set this bit to a zero after the reset duration is timed in the driver. In Device Mode: This bit is a read only status bit. Device reset from the USB bus is also indicated in the USBSTS register. 0 = NOT_USB_RESET 1 = USB_RESET

Bit	R/W	Reset	Description
7	RO	X	SUSP: Port suspend. 1=Port in suspend state. 0=Port not in suspend state. In Host Mode: Read/ Write. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0x Disable 10 Enable 11 Suspend. When in the suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. The host controller will unconditionally set this bit to zero when software sets the Force Port Resume bit to zero. A write of zero to this bit is ignored by the host controller. If host software sets this bit to a one when the port is not enabled (i.e., Port enabled bit is a zero), the results are undefined. This field is zero if Port Power (PP) is zero in Host Mode. In Device Mode: Read Only. This bit is a read only status bit. 0 = NOT_SUSPEND 1 = SUSPEND
6	RW	0x0	FPR: Force Port Resume. 1= Resume detected/driven on port. 0=No resume (K state) detected/ driven on port. In Host Mode: Software sets this bit to one to drive resume signaling. The Host Controller sets this bit to one if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to one. This bit will automatically change to zero after the resume sequence is complete. This behavior is different from EHCI where the host controller driver is required to set this bit to a zero after the resume duration is timed in the driver. Note that when the Host controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. This bit remains a one until the port has switched to the high-speed idle. Writing a zero has no effect because the port controller will time the resume operation to clear the bit when the port control state switches to HS or FS idle. This field is zero if Port Power (PP) is zero in Host Mode. This bit is not-EHCI compatible. In Device mode: After the device has been in Suspend State for 5ms or more, software must set this bit to one to drive resume signaling before clearing. The Device Controller will set this bit to one if a J-to-K transition is detected while the port is in the Suspend state. The bit will be cleared when the device returns to normal operation. Also, when this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to one. Software should ensure that the PHY clock is operational before writing a 1 to this bit to start the resume sequence. This is true for both Device and Host modes. 0 = NO_RESUME 1 = RESUME
5	RO	X	OCC: Over-current Change: Not supported 0 = NO_CHANGE 1 = CHANGE
4	RO	X	OCA: Over-current Active: Not supported 0 = NO_OVER_CURRENT 1 = OVER_CURRENT
3	RW	0x0	PEC: Port Enable/Disable Change: 1=Port enabled/disabled status has changed. 0=No change. In Host Mode: For the root hub, this bit gets set to a one only when a port is disabled due to disconnect on the port or due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification). Software clears this by writing a one to it. This field is zero if Port Power (PP) is zero. In Device mode: The device port is always enabled. (This bit will be zero.) 0 = NO_CHANGE 1 = CHANGE
2	RW	0x1	PE: Port Enabled/Disabled: 1=Enable. 0=Disable (default). In Host Mode: Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a one to this field. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by the host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. When the port is disabled, (0b) downstream propagation of data is blocked except for reset. This field is zero if Port Power (PP) is zero in Host Mode. In Device Mode: The device port is always enabled. (This bit will be one) 0 = PORT_DISABLED 1 = PORT_ENABLED

Bit	R/W	Reset	Description
1	RW	0x0	CSC: Connect Status Change: 1 =Change in Current Connect Status. 0=No change (default) In Host Mode: Indicates a change has occurred in the port's Current Connect Status. The host/ device controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software clears this bit by writing a one to it. This field is zero if Port Power (PP) is zero in Host Mode. This bit is undefined in device controller mode. 0 = NO_CHANGE 1 = CHANGE
0	RO	X	CCS: Current Connect Status. In Host Mode: 1=Device is present on port. 0=No device is present (default). This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. This field is zero if Port Power (PP) is zero in Host Mode. In Device Mode: 1=Attached 0=Not Attached (default) A one indicates that the device successfully attached and is operating in either high speed or full speed as indicated by the High Speed Port bit in this register. A zero indicates that the device did not attach successfully or was forcibly disconnected by the software writing a zero to the Run bit in the USBCMD register. It does not state the device being disconnected or suspended. 0 = NOT_CONNECTED 1 = CONNECTED

22.16.1.29 USB2_CONTROLLER_USB2D_HOSTPC1_DEVLC_0

USB2D Device Mode LPM Behavior and Control Register

This register controls the LPM behavior and controls the behavior of each USB port. Only available in Device Mode. This register shares the same address with the HOSTPC1 register (which is used only in Host Mode).

USB2D Host Mode LPM Behavior and Control Register

This register controls the LPM behavior and controls the behavior of each USB port. Only available in Host Mode. This register shares the same address with the DEVLC register (which is used only in Device Mode).

Offset: 0x1b4 | Read/Write: R/W | Reset: 0b0000xxx0000000000000xxxxxxxxxxx0

Bit	R/W	Reset	Description
31:29	RW	0x0	PTS: Parallel transceiver select. This bit is not defined in the EHCI specification. 0 = UTMI 1 = RESERVED 2 = ULPI 3 = ICUSB_SER 4 = HSIC
28	RW	0x0	STS: Serial transceiver not selected. This is the only value supported. This bit is not defined in the EHCI specification. 0 = PARALLEL_IF 1 = SERIAL_IF
27	RO	X	PTW: Parallel Transceiver Width. Fixed to 0. This bit is not defined in the EHCI specification. 0 = EIGHT_BIT 1 = RESERVED
26:25	RO	X	PSPD: This register field indicates the speed at which the port is operating. 00 = Full Speed 01 = Low Speed 10 = High Speed. This bit is not defined in the EHCI specification. 0 = FULL_SPEED 1 = LOW_SPEED 2 = HIGH_SPEED 3 = RESERVED
24	RW	0x0	ALPD: Auto Low Power While Disconnect - RW. Default = 0b. If set, this feature will be enabled, and every time the port enters the disconnect state it will also enter low power state,disabling the transceiver clock. The behavior will be same as if the PHCD bit was enabled (in fact this bit will be set to 1 as soon as low power mode is enabled).When this field is set the WKCN field of PORTSCx register (Wake on Connect Enable) will also be set. This way the core will wake up in case a connect is detected. There will be a delay between the detection of a disconnect and actually enter in low power mode. This delay can be controlled by writing to the ALPDD field in the register USBMODE. 0 = DONT_AUTO_LOW_POWER_WHILE_DISCONNECT 1 = AUTO_LOW_POWER_WHILE_DISCONNECT

Bit	R/W	Reset	Description
23	RW	0x0	PFSC: Port Force Full Speed Connect - RW. Default = 0b. Writing this bit to a '1b' will force the port to only connect at Full Speed. It disables the chirp sequence that allows the port to identify itself as High Speed. This is useful for testing FS configurations with an HS host, hub or device. This bit is not defined in the EHCI specification. 0 = DONT_FORCE_FULL_SPEED 1 = FORCE_FULL_SPEED
22	RW	0x0	PHCD: PHY Low Power Suspend - Clock disable: Writing this bit to a 1 will disable the PHY clock. Write a 0 enables it. Reading this bit will indicate the status of the PHY clock. NOTE: The PHY clock cannot be disabled if it is being used as the system clock. In Device Mode, the PHY can be put into Low Power Clock Disable when the device is not running (USBCMD RS=0b) or the host has signaled suspend (PORTSCx SUSP=1b). Low Power Clock Disable will be cleared automatically when the host has signaled resume. Before forcing a resume from the device, the Controller driver must clear this bit. In Host Mode, the PHY can be put into Low Power Suspend Clock Disable when the downstream device has been put into suspend mode or when no downstream device is connected. Low Power Clock Disable is completely under the control of software. 0 = DISABLE 1 = ENABLE
21:20	RW	0x0	LPMX: Auto LPM set - RW. Default = 00b. This bit field is **valid during Host Mode Only**. For Device Mode, this bit is reserved. Value Meaning 00b Disables auto LPM. 01b If there is no activity for a certain number of SOFs the controller will send an LPM token, enter in suspend and issue a port change interrupt. 10b Same as above but without issuing an interrupt. 11b Reserved for futures LPM enhancements. The detection of no activity is based on the absence of response from the downstream device. Because of this limitation this feature should not be used if ISO OUT endpoints are being used (as no handshake is expected).
17	RW	0x0	ASUS: Auto Low Power - RW. Default = 0b. This bit field is **valid during Device Mode Only**. In Host Mode, it is part of the ELPM field. This bit is used to control the auto low power feature. If set, the auto low power feature will be enabled and every time the port enters in suspend state it will also enter in low power state, disabling the transceiver clock. The behavior will be the same as if the PHCD bit was enabled (in fact this bit will be set to '1' as soon as low power mode is enabled). 0 = DISABLE 1 = ENABLE
19:16	RW	0x0	EPLPM: Endpoint for LPM token - RW. Default = 0000b. This bit field is **valid during Host Mode Only**. For Device Mode, bits [19:18] are reserved and bit 17 is ASUS, while bit 16 is STL. This sets the endpoint number to which the LPM token will be sent. It will be directly mapped to the ENDP field in the LPM token with the EXT PID.
16	RW	0x0	STL: STALL reply to LPM token - RW. Default = 0b. This bit field is **valid during Device Mode Only**. In Host Mode, it is part of the ELPM field. When this bit is set to '1', the Controller will reply always with STALL to all incoming LPM tokens. This bit overrides the LPM NYET bit (NYT). 0 = DISABLE 1 = ENABLE
15:12	RW	0x0	LPMFRM: Auto LPM SOF Threshold - RW. Default = 0000b. This bit field is **valid during Host Mode Only**. For Device Mode, this field is reserved. This holds the SOF counter threshold. When the number of SOFs with no activity in between reaches this threshold and the auto LPM is enabled, an LPM token will be sent and the port will enter in suspend state. The SOF counter for this threshold is incremented each 125 µs, even if the port is not in HS operation.
11:1	RO	X	BA: bmAttributes - RO. Default = 00000000000b. This holds the bmAttributes field of the LPM sub-token received, after the EXT PID token.
0	RW	0x0	NYT_ASUS: NYET reply to LPM token - RW. Default = 0b. This bit is NYT during Device Mode. Details follow: When this bit is to '1', the device controller will NYET all the LPM tokens. When this bit is set to '0', the Controller will ACK all the LPM tokens if the STALL bit (STL) is also set to '0'. This bit is ASUS in Host Mode. Details follow: This bit is used to control the auto low power feature. If set, the auto low power feature will be enabled and every time the port enters in suspend state it will also enter in low power state, disabling the transceiver clock. The behavior will be the same as if the PHCD bit was enabled (in fact this bit will be set to '1' as soon as low power mode is enabled). 0 = DISABLE 1 = ENABLE

22.16.1.30 USB2_CONTROLLER_USB2D_OTGSC_0

USB2D On-The-Go (OTG) Status and Control Register

Offset: 0x1f4 | Read/Write: R/W | Reset: 0bx0000000x0000000xxxxxxxxxx100x00

Bit	R/W	Reset	Description
30	RW	0x0	DPIE: Data Pulse Interrupt Enable. Setting this bit enables the Data pulse interrupt. 0 = DISABLE 1 = ENABLE
29	RW	0x0	ONEMSE: 1 millisecond timer Interrupt enable. Setting this bit enables the 1 millisecond timer interrupt. 0 = DISABLE 1 = ENABLE
28	RW	0x0	BSEIE: B Session End Interrupt Enable. Setting this bit enables the B session end interrupt 0 = DISABLE 1 = ENABLE
27	RW	0x0	BSVIE: B Session Valid Interrupt Enable. Setting this bit enables the B session valid interrupt 0 = DISABLE 1 = ENABLE
26	RW	0x0	ASVIE: A Session Valid Interrupt Enable. Setting this bit enables the A session valid interrupt 0 = DISABLE 1 = ENABLE
25	RW	0x0	AVVIE: A VBus Valid Interrupt Enable. Setting this bit enables the A VBus valid interrupt 0 = DISABLE 1 = ENABLE
24	RW	0x0	IDIE: USB ID Interrupt Enable. Setting this bit enables the USB ID interrupt 0 = DISABLE 1 = ENABLE
22	RW	0x0	DPIS: Data Pulse Interrupt Status. This bit is set when data bus pulsing occurs on DP or DM. Data bus pulsing is only detected when USBMODE.CM = Host (11) and PORTSC(0). PortPower = Off (0). Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
21	RW	0x0	ONEMSS: 1 millisecond timer Interrupt Status: This bit is set once every millisecond. Software writes a 1 to clear it. 0 = INT_CLEAR 1 = INT_SET
20	RW	0x0	BSEIS: B Session End Interrupt Status. This bit is set when VBus has fallen below the B session end threshold. Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
19	RW	0x0	BSVIS: B Session Valid Interrupt Status. This bit is set when VBus has either risen above or fallen below the B session valid threshold (0.8 VDC). Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
18	RW	0x0	ASVIS: A Session Valid Interrupt Status. This bit is set when VBus has either risen above or fallen below the A session valid threshold (0.8 VDC). Software writes a one to clear this bit. 0 = INT_CLEAR 1 = INT_SET
17	RW	0x0	AVVIS: A VBus Valid Interrupt Status. This bit is set when VBus has either risen above or fallen below the VBus valid threshold (4.4 VDC) on an A device. Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
16	RW	0x0	IDIS: USB ID Interrupt Status. This bit is set when a change on the ID input has been detected. Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
14	RO	X	DPS: Data Bus Pulsing Status. A 1 indicates data bus pulsing is being detected on the port. 0 = STS_CLEAR 1 = STS_SET
13	RO	X	ONEMST: 1 millisecond timer toggle. This bit toggles once per millisecond 0 = STS_CLEAR 1 = STS_SET

Bit	R/W	Reset	Description
12	RO	X	BSE: B session End. Indicates VBus is below the B session end threshold 0 = STS_CLEAR 1 = STS_SET
11	RO	X	BSV: B Session Valid. Indicates VBus is above the B session valid threshold 0 = STS_CLEAR 1 = STS_SET
10	RO	X	ASV: A Session Valid. Indicates VBus is above the A session valid threshold 0 = STS_CLEAR 1 = STS_SET
9	RO	X	AVV: A VBus Valid. Indicates VBus is above the A VBus valid threshold 0 = STS_CLEAR 1 = STS_SET
8	RO	X	ID: USB ID: 0 = A-device 1 = B-device 0 = A_DEV 1 = B_DEV
5	RW	0x1	IDPU: USB ID Pullup 0 = CLEAR 1 = SET
4	RW	0x0	DP: Data Pulsing. Setting this bit causes the pull-up on DP to be asserted for data pulsing during SRP. 0 = NO_DATA_PULSE 1 = DATA_PULSE
3	RW	0x0	OT: OTG Termination. This bit must be set when the OTG device is in Device Mode, this controls the pulldown on DM. 0 = NO_OTG_TERM 1 = OTG_TERM
1	RW	0x0	VC: VBUS Charge. Setting this bit causes the VBus line to be charged. This is used for VBus pulsing during SRP. 0 = NO_VBUS_CHRG 1 = VBUS_CHRG
0	RW	0x0	VD: VBUS_Discharge. Read/write. Setting this bit causes Vbus to discharge through a resistor. 0 = NO_VBUS_DISCHRG 1 = VBUS_DISCHRG

22.16.1.31 USB2_CONTROLLER_USB2D_USBMODE_0

USB2D USB Device Mode Register

Offset: 0x1f8 | Read/Write: R/W | Reset: 0b00000000000000000xxxxxxxxx0xxxxx

Bit	R/W	Reset	Description
31:16	RW	0x0	ALPDD: Auto Low Power While Disconnect Delay, Used when the ALPD field of the HOSTPCx register is set. Defines the delay between disconnect detection and entering in low power mode. The delay is <this register value>*64*100/3 in milliseconds. The maximum value is 65535*64*100/3 = 139,808 ms. The minimum value is 0. Only used in Host Mode.
15	RW	0x0	SRT: Shorten USB Reset Time. Software should never set this to 1.
5	RW	0x0	VBPS: VBUS Power Select This can be used by logic that selects between an on-chip Vbus power source (charge pump) and an off-chip source in systems when both are available. Only to be used in Host Mode. No functionality is implemented for this, so software should not use this bit.
4	RO	X	SDIS: Stream disable: 1: Streaming is disabled - helpful to avoid overruns/underruns when the system load is too high. 0 = STREAM_ENABLE 1 = STREAM_DISABLE
3	RO	X	SLOM: Setup Lockout Mode: In Device Mode, this bit controls the behavior of the setup lockout mechanism. 0: Setup lockout is ON (default). 1: Setup lockout is OFF. Firmware requires the use of setup tripwire semaphore in USB2D_USBCMD register. 0 = LOCKOUT_ON 1 = LOCKOUT_OFF
2	RO	X	ES: Endian Select: Note: For this implementation, this bit should be always set to 0 (little endian). 0 = LITTLE_ENDIAN 1 = RESERVED

Bit	R/W	Reset	Description
1:0	RO	X	CM: Controller Mode: The controller mode will default to an idle state and will need to be initialized to the desired operating mode after reset. This register can only be written once after reset. If it is necessary to switch modes, software must reset the controller by writing to the RESET bit in the USBCMD register before reprogramming this register. 00 = Idle [Default]. 01 = Reserved. 10 = Device Controller. 11 = Host Controller. 0 = IDLE 1 = RESERVED 2 = DEVICE_MODE 3 = HOST_MODE

22.16.1.32 USB2_CONTROLLER_USB2D_ENDPTNAK_0

USB2D Endpoint NAK register

Offset: 0x200 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:16	0x0	EPTN: TX Endpoint NAK R/WC. Each TX endpoint has 1 bit in this field. The bit is set when the device sends a NAK handshake on a received IN token for the corresponding endpoint. 0 = CLEAR 1 = SET
15:0	0x0	EPRN: RX Endpoint NAK R/WC. Each RX endpoint has 1 bit in this field. The bit is set when the device sends a NAK handshake on a received OUT or PING token for the corresponding endpoint. 0 = CLEAR 1 = SET

22.16.1.33 USB2_CONTROLLER_USB2D_ENDPTNAK_ENABLE_0

USB2D Endpoint NAK Enable register

Offset: 0x204 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:16	0x0	EPTNE: TX Endpoint NAK Enable R/W. Each bit is an enable bit for the corresponding TX Endpoint NAK bit. If this bit is set and the corresponding TX Endpoint NAK bit is set, the NAK Interrupt bit is set. 0 = DISABLE 1 = ENABLE
15:0	0x0	EPRNE: RX Endpoint NAK Enable R/W. Each bit is an enable bit for the corresponding RX Endpoint NAK bit. If this bit is set and the corresponding RX Endpoint NAK bit is set, the NAK Interrupt bit is set. 0 = DISABLE 1 = ENABLE

22.16.1.34 USB2_CONTROLLER_USB2D_ENDPTSETUPSTAT_0

USB2D Endpoint Setup Status Register

Offset: 0x208 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx0000000000000000

Bit	Reset	Description
15	0x0	ENDPTSETUPSTAT15: Endpoint 15 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
14	0x0	ENDPTSETUPSTAT14: Endpoint 14 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD

Bit	Reset	Description
13	0x0	ENDPTSETUPSTAT13: Endpoint 13 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
12	0x0	ENDPTSETUPSTAT12: Endpoint 12 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
11	0x0	ENDPTSETUPSTAT11: Endpoint 11 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
10	0x0	ENDPTSETUPSTAT10: Endpoint 10 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
9	0x0	ENDPTSETUPSTAT9: Endpoint 9 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
8	0x0	ENDPTSETUPSTAT8: Endpoint 8 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
7	0x0	ENDPTSETUPSTAT7: Endpoint 7 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
6	0x0	ENDPTSETUPSTAT6: Endpoint 6 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
5	0x0	ENDPTSETUPSTAT5: Endpoint 5 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD

Bit	Reset	Description
4	0x0	ENDPTSETUPSTAT4: Endpoint 4 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
3	0x0	ENDPTSETUPSTAT3: Endpoint 3 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
2	0x0	ENDPTSETUPSTAT2: Endpoint 2 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
1	0x0	ENDPTSETUPSTAT1: Endpoint 1 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. 2	0x0	PERB2: Prime Endpoint Receive Buffer: This bit is used to request that a buffer prepared for a receive operation when a USB host initiates a USB OUT transaction to this endpoint. Software should write a one to this bit whenever posting a new transfer descriptor to this endpoint. Hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. Hardware will clear this bit when this endpoint is successfully primed. This is only used in Device Mode. 0 = DONT_PRIME 1 = PRIME

Bit	Reset	Description
1	0x0	PERB1: Prime Endpoint Receive Buffer: This bit is used to request that a buffer prepared for a receive operation when a USB host initiates a USB OUT transaction to this endpoint. Software should write a one to this bit whenever posting a new transfer descriptor to this endpoint. Hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. Hardware will clear this bit when this endpoint is successfully primed. This is only used in Device Mode. 0 = DONT_PRIME 1 = PRIME
0	0x0	PERB0: Prime Endpoint Receive Buffer: This bit is used to request that a buffer prepared for a receive operation when a USB host initiates a USB OUT transaction to this endpoint. Software should write a one to this bit whenever posting a new transfer descriptor to this endpoint. Hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. Hardware will clear this bit when this endpoint is successfully primed. This is only used in Device Mode. 0 = DONT_PRIME 1 = PRIME

22.16.1.36 USB2_CONTROLLER_USB2D_ENDPTFLUSH_0

USB2D Endpoint De-Initialization Register

Offset: 0x210 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31	0x0	FETB15: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
30	0x0	FETB14: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
29	0x0	FETB13: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
28	0x0	FETB12: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
27	0x0	FETB11: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
26	0x0	FETB10: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
25	0x0	FETB9: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH

Bit	Reset	Description
24	0x0	FETB8: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
23	0x0	FETB7: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
22	0x0	FETB6: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
21	0x0	FETB5: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
20	0x0	FETB4: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
19	0x0	FETB3: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
18	0x0	FETB2: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
17	0x0	FETB1: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
16	0x0	FETB0: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
15	0x0	FERB15: Flush Endpoint Receive Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
14	0x0	FERB14: Flush Endpoint Receive Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH

Bit	Reset	Description
13	0x0	FERB13: Flush Endpoint Receive Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. 22.16.1.37 USB2_CONTROLLER_USB2D_ENDPTSTATUS_0

USB2D Endpoint Status Register

Offset: 0x214 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31	X	ETBR15: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
30	X	ETBR14: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
29	X	ETBR13: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
28	X	ETBR12: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
27	X	ETBR11: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY

Bit	Reset	Description
26	X	ETBR10: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY

22.16.1.38 USB2_CONTROLLER_USB2D_ENDPTCOMPLETE_0

USB2D Endpoint Complete Register

Offset: 0x218 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31	0x0	ETCE15: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
30	0x0	ETCE14: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
29	0x0	ETCE13: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
28	0x0	ETCE12: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
27	0x0	ETCE11: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
26	0x0	ETCE10: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE

Bit	Reset	Description
25	0x0	ETCE9: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
24	0x0	ETCE8: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
23	0x0	ETCE7: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
22	0x0	ETCE6: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
21	0x0	ETCE5: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
20	0x0	ETCE4: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
19	0x0	ETCE3: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
18	0x0	ETCE2: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
17	0x0	ETCE1: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
16	0x0	ETCE0: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
15	0x0	ERCE15: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE

Bit	Reset	Description
14	0x0	ERCE14: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
13	0x0	ERCE13: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
12	0x0	ERCE12: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
11	0x0	ERCE11: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
10	0x0	ERCE10: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
9	0x0	ERCE9: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
8	0x0	ERCE8: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
7	0x0	ERCE7: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
6	0x0	ERCE6: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
5	0x0	ERCE5: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
4	0x0	ERCE4: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE

Bit	Reset	Description
3	0x0	ERCE3: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
2	0x0	ERCE2: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
1	0x0	ERCE1: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
0	0x0	ERCE0: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE

22.16.1.39 USB2_CONTROLLER_USB2D_ENDPTCTRL0_0

USB2D Endpoint Control 0 Register

Offset: 0x21c | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
23	X	TXE: TX Endpoint Enable. Endpoint 0 is always enabled. 0 = DISABLE 1 = ENABLE
19:18	X	TXT: TX Endpoint Type. Endpoint 0 is fixed as a Control Endpoint. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
16	X	TXS: TX Endpoint Stall: Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue returning STALL until the bit is cleared by software or it will automatically be cleared upon receipt of a new SETUP request. 0 = EP_OK 1 = EP_STALL
7	X	RXE: RX Endpoint Enable. Endpoint 0 is always enabled. 0 = DISABLE 1 = ENABLE
3:2	X	RXT: RX Endpoint Type. Endpoint 0 is fixed as a Control Endpoint. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
0	X	RXS: RX Endpoint Stall: Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue returning STALL until the bit is cleared by software or it will automatically be cleared upon receipt of a new SETUP request. 0 = EP_OK 1 = EP_STALL

22.16.1.40 USB2_CONTROLLER_USB2D_ENDPTCTRLn_0

USB2D Endpoint Control 1 through 15 registers have the same field definitions and reset value. In the register offset, the value n is the register number (1 through 15).

USB2D Endpoint Control n Register

Offset: 0x220 + (n – 1) * 0x04 | Read/Write: R/W | Reset: 0bxxxxxxxx000x00x0xxxxxxxx000x00x0

Bit	R/W	Reset	Description
23	RW	0x0	TXE: TX Endpoint Enable. An Endpoint should be enabled only after it has been configured. 0 = DISABLE 1 = ENABLE
22	RW	0x0	TXR: TX Data Toggle Reset: Whenever a configuration event is received for this Endpoint, software must write a one to this bit in order to synchronize the data PIDs between the Host and device. 0 = KEEP_GOING 1 = RESET_PID_SEQ
21	RW	0x0	TXI: TX Data Toggle Inhibit: This bit is only used for test and should always be written as zero. Writing a one to this bit will cause this endpoint to ignore the data toggle sequence and always transmit DATA0 for a data packet. 0 = DIS_PID_SEQ 1 = ENB_PID_SEQ
19:18	RW	0x0	TXT: TX Endpoint Type: 00 = Control. 01 = Isochronous. 10 = Bulk. 11 = Interrupt. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
17	RO	X	TXD: This bit is fixed to 0.
16	RW	0x0	TXS: TX Endpoint Stall: This bit will be set automatically upon receipt of a SETUP request if this Endpoint is not configured as a Control Endpoint. It will be cleared automatically upon receipt of a SETUP request if this Endpoint is configured as a Control Endpoint. Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue to returning STALL until this bit is either cleared by software or automatically cleared as above. 0 = EP_OK 1 = EP_STALL
7	RW	0x0	RXE: RX Endpoint Enable. An Endpoint should be enabled only after it has been configured. 0 = DISABLE 1 = ENABLE
6	RW	0x0	RXR: RX Data Toggle Reset: Whenever a configuration event is received for this Endpoint, software must write a one to this bit in order to synchronize the data PIDs between the host and device. 0 = KEEP_GOING 1 = RESET_PID_SEQ
5	RW	0x0	RXI: RX Data Toggle Inhibit: This bit is only used for test and should always be written as zero. Writing a one to this bit will cause this endpoint to ignore the data toggle sequence and always accept data packet regardless of their data PID. 0 = DIS_PID_SEQ 1 = ENB_PID_SEQ
3:2	RW	0x0	RXT: RX Endpoint Type: 00 = Control. 01 = Isochronous. 10 = Bulk. 11 = Interrupt. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
1	RO	X	RXD: This bit is fixed to 0.
0	RW	0x0	RXS: RX Endpoint Stall: This bit will be set automatically upon receipt of a SETUP request if this Endpoint is not configured as a Control Endpoint. It will be cleared automatically upon receipt a SETUP request if this Endpoint is configured as a Control Endpoint. Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue to returning STALL until this bit is either cleared by software or automatically cleared as above. 0 = EP_OK 1 = EP_STALL

22.16.2 USB1 Controller Interface Registers

These are used to generate the actual RTL registers for USB1 controller interface.

Base Address: USB

22.16.2.1 USB1_IF_USB_SUSP_CTRL_0

This register controls the suspend and resume behavior of USB controller/PHY.

USB Suspend Control Register

Offset: 0x400 | Read/Write: R/W | Reset: 0bxxxxx00xxxxxx000xxx01000xx000000

Bit	R/W	Reset	Description
26	RW	0x0	FAST_WAKEUP_RESP: Enable Fast Response from UTMIP PHY for a Remote Wakeup request from device. This is used only for cases where wakeup response needs to be within 1 ms of spec. Used for Host mode ONLY. 0 = DISABLE 1 = ENABLE
25	RW	0x0	UTMIP_SUSPL1_SET: Enable SuspendL1 for UTMIP PHY. Enabling this will only cut off clocks to the UTMIP logic. The USB PLLs, PllU and UTMIP PLL will still be running. 0 = DISABLE 1 = ENABLE
18:16	RW	0x0	USB_WAKEUP_DEBOUNCE_COUNT: USB PHY wakeup debounce counter. USB will debounce any wakeup event by the number of clocks programmed in this counter. A value of 0 results in no debounce.
12	RW	0x0	UTMIP_PHY_ENB: Enable UTMIP PHY mode. Set this to 1 if using UTMIP PHY. Otherwise set this to 0. 0 = DISABLE 1 = ENABLE
11	RW	0x1	UTMIP_RESET: Reset going to UTMIP PHY (active high). This should be set to 1 whenever programming the UTMIP config registers. It should be cleared to 0 after the programming of UTMIP config registers is done. UTMIP config registers should be programmed only once before doing any transactions on USB. The UTMIP PHY registers should be programmed while UTMIP is in reset. 0 = DISABLE 1 = ENABLE
10	RW	0x0	USB_SUSP_POL: Polarity of the suspend signal going to USB PHY. 0 = Active low (default). 1 = Active high. This should not be changed by software. 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
9	RW	0x0	USB_PHY_CLK_VALID_INT_ENB: USB PHY clock valid interrupt enable. If this bit is enabled, interrupt is generated whenever USB clocks are resumed from a suspend. 0 = DISABLE 1 = ENABLE
8	RO	0x0	USB_PHY_CLK_VALID_INT_STS: USB PHY clock valid interrupt status. This bit is set whenever the USB PHY clock is woken up from suspend. Software must write a 1 to clear this bit. 0 = UNSET 1 = SET
7	RO	X	USB_PHY_CLK_VALID: USB PHY clock valid status. This bit indicates whether the USB PHY is generating a valid clock to the USB controller. If USB PHY clock is running, this bit is set to 1, else it is set to 0. 0 = UNSET 1 = SET
6	RO	X	USB_CLKEN: USB AHB clock enable status. Indicates whether the AHB clock to the USB controller is enabled or not. If AHB clock to USB controller is enabled, this bit is set to 1, else it is set to 0. NOTE: even when this is set to 0, all essential blocks that are required to resume USB clocks from suspend will be active and their AHB clock will not be suspended. 0 = UNSET 1 = SET
5	RW	0x0	USB_SUSP_CLR: Suspend Clear. Software must write a 1 to this bit to bring the PHY out of suspend mode. This is used when the software stops the PHY clock during suspend and then wants to initiate a resume. Software should also write 0 to clear it. NOTE: It is required that software generate a positive pulse on this bit to guarantee proper operation. 0 = UNSET 1 = SET
4	RW	0x0	USB_WAKE_ON_DISCON_EN_DEV: Wake on Disconnect Enable (Device Mode). When enabled (1), the USB device will wake up from suspend on a disconnect event. This is only valid when USB controller is in Device Mode, it is not applicable when USB controller is in Host Mode. 0 = DISABLE 1 = ENABLE
3	RW	0x0	USB_WAKE_ON_CNNT_EN_DEV: Wake on Connect Enable (Device Mode). When enabled (1), USB device will wake up from suspend on a connect event. This is only valid when USB controller is in Device Mode, it is not applicable when USB controller is in Host Mode. 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
2	RW	0x0	USB_WAKE_ON_RESUME_EN: Wake on resume enable. If this bit is enabled, USB will wake up from suspend whenever a resume event is detected on USB. This is valid for both USB device and USB Host Modes. 0 = DISABLE 1 = ENABLE
1	RW	0x0	USB_WAKEUP_INT_ENB: USB wakeup interrupt enable. If this bit is enabled, interrupt is generated whenever USB wakeup event is generated. 0 = DISABLE 1 = ENABLE
0	RO	0x0	USB_WAKEUP_INT_STS: USB wakeup interrupt status. This bit is set whenever USB wakes up from suspend (a wakeup event is generated). Software must write a 1 to clear this bit. Note that during the wakeup sequence, PHY clocks will be resumed from suspend. Software can check when the PHY clocks are resumed by reading the bit USB_PHY_CLK_VALID. There is also a separate interrupt generated when PHY clock is resumed if USB_PHY_CLK_VALID_INT_EN is set. During the wakeup sequence, first USB_WAKEUP_INT_STS will be set, and it will take some time for the PHY clock to resume, which can be detected by checking USB_PHY_CLK_VALID. 0 = UNSET 1 = SET

22.16.2.2 USB1_IF_USB_PHY_VBUS_SENSORS_0

This register controls the OTG VBUS sensors in the USB PHY. There are 4 VBUS sensors:

- A_VBUS_VLD
- A_SESS_VLD
- B_SESS_VLD
- B_SESS_END

The debounced status of each sensor can be read from the corresponding _STS bit field of the sensor in this register. The _CHG_DET field is set to 1 whenever a change is detected in the value of the _STS bit field of the corresponding sensor. If _INT_EN is set, then an interrupt is generated to the processor. This interrupt can be routed to CPU/BPMP-Lite by appropriately writing the USBD bits in the interrupt controller registers.

In case software wants to override the value for a sensor, it can set the corresponding _SW_EN to 1, and set the corresponding sensor _SW_VALUE to 1 or 0 as per the requirement.

There are two debouncers for each sensor - DEBOUNCE_A and DEBOUNCE_B. The debounce values for them are controlled by the register UTMIP_DEBOUNCE_CFG0, fields UTMIP_BIAS_DEBOUNCE_A and UTMIP_BIAS_DEBOUNCE_B. For each sensor, we can select whether to use DEBOUNCE_A or DEBOUNCE_B by setting the field _DEB_SEL_B to the appropriate value (SEL_A or SEL_B).

Note: *Do not set either UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B to 0x0. If not using one of the debouncers, keep it at the default value of 0xFFFF.*

USB PHY VBUS SENSORS Control Register

Offset: 0x404 | Read/Write: R/W | Reset: 0bx0000x00x0000x00x0000x00x0000x00

Bit	R/W	Reset	Description
30	RW	0x0	A_VBUS_VLD_WAKEUP_EN: A_VBUS_VLD wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on A_VBUS_VLD. 0 = DISABLE 1 = ENABLE
29	RW	0x0	A_VBUS_VLD_DEB_SEL_B: A_VBUS_VLD debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B

Bit	R/W	Reset	Description
28	RW	0x0	A_VBUS_VLD_SW_VALUE: A_VBUS_VLD software value. Software should write the appropriate value (1/0) to set/unset the A_VBUS_VLD status. This is only valid when A_VBUS_VLD_SW_EN is set. 0 = UNSET 1 = SET
27	RW	0x0	A_VBUS_VLD_SW_EN: A_VBUS_VLD software enable. Enable Software Controlled A_VBUS_VLD. Software sets this bit to drive the value in A_VBUS_VLD_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
26	RO	X	A_VBUS_VLD_STS: A_VBUS_VLD status. This is set to 1 whenever A_VBUS_VLD sensor output is 1. 0 = UNSET 1 = SET
25	RO	0x0	A_VBUS_VLD_CHG_DET: A_VBUS_VLD change detect. This field is set by hardware whenever a change is detected in the value of A_VBUS_VLD. software writes a 1 to clear it 0 = UNSET 1 = SET
24	RW	0x0	A_VBUS_VLD_INT_EN: A_VBUS_VLD interrupt enable. If this field is set to 1, an interrupt is generated whenever A_VBUS_VLD_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
22	RW	0x0	A_SESS_VLD_WAKEUP_EN: A_SESS_VLD wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on A_SESS_VLD. 0 = DISABLE 1 = ENABLE
21	RW	0x0	A_SESS_VLD_DEB_SEL_B: A_SESS_VLD debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
20	RW	0x0	A_SESS_VLD_SW_VALUE: A_SESS_VLD software value. Software should write the appropriate value (1/0) to set/unset the A_SESS_VLD status. This is only valid when A_SESS_VLD_SW_EN is set. 0 = UNSET 1 = SET
19	RW	0x0	A_SESS_VLD_SW_EN: A_SESS_VLD software enable. Enable Software Controlled A_SESS_VLD. Software sets this bit to drive the value in A_SESS_VLD_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
18	RO	X	A_SESS_VLD_STS: A_SESS_VLD status. This is set to 1 whenever A_SESS_VLD sensor output is 1. 0 = UNSET 1 = SET
17	RO	0x0	A_SESS_VLD_CHG_DET: A_SESS_VLD change detect. This field is set by hardware whenever a change is detected in the value of A_SESS_VLD. software writes a 1 to clear it 0 = UNSET 1 = SET
16	RW	0x0	A_SESS_VLD_INT_EN: A_SESS_VLD interrupt enable. If this field is set to 1, an interrupt is generated whenever A_SESS_VLD_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
14	RW	0x0	B_SESS_VLD_WAKEUP_EN: B_SESS_VLD wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on B_SESS_VLD. 0 = DISABLE 1 = ENABLE
13	RW	0x0	B_SESS_VLD_DEB_SEL_B: B_SESS_VLD debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
12	RW	0x0	B_SESS_VLD_SW_VALUE: B_SESS_VLD software value. Software should write the appropriate value (1/0) to set/unset the B_SESS_VLD status. This is only valid when B_SESS_VLD_SW_EN is set. 0 = UNSET 1 = SET

Bit	R/W	Reset	Description
11	RW	0x0	B_SESS_VLD_SW_EN: B_SESS_VLD software enable. Enable Software Controlled B_SESS_VLD. Software sets this bit to drive the value in B_SESS_VLD_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
10	RO	X	B_SESS_VLD_STS: B_SESS_VLD status. This is set to 1 whenever B_SESS_VLD sensor output is 1. 0 = UNSET 1 = SET
9	RO	0x0	B_SESS_VLD_CHG_DET: B_SESS_VLD change detect. This field is set by hardware whenever a change is detected in the value of B_SESS_VLD. software writes a 1 to clear it 0 = UNSET 1 = SET
8	RW	0x0	B_SESS_VLD_INT_EN: B_SESS_VLD interrupt enable. If this field is set to 1, an interrupt is generated whenever B_SESS_VLD_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
6	RW	0x0	B_SESS_END_WAKEUP_EN: B_SESS_END wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on B_SESS_END. 0 = DISABLE 1 = ENABLE
5	RW	0x0	B_SESS_END_DEB_SEL_B: B_SESS_END debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
4	RW	0x0	B_SESS_END_SW_VALUE: B_SESS_END software value. Software should write the appropriate value (1/0) to set/unset the B_SESS_END status. This is only valid when B_SESS_END_SW_EN is set. 0 = UNSET 1 = SET
3	RW	0x0	B_SESS_END_SW_EN: B_SESS_END software enable. Enable Software Controlled B_SESS_END Software sets this bit to drive the value in B_SESS_END_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
2	RO	X	B_SESS_END_STS: B_SESS_END status. This is set to 1 whenever B_SESS_END sensor output is 1. 0 = UNSET 1 = SET
1	RO	0x0	B_SESS_END_CHG_DET: B_SESS_END change detect. This field is set by hardware whenever a change is detected in the value of B_SESS_END. software writes a 1 to clear it 0 = UNSET 1 = SET
0	RW	0x0	B_SESS_END_INT_EN: B_SESS_END interrupt enable. If this field is set to 1, an interrupt is generated whenever B_SESS_END_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE

22.16.2.3 USB1_IF_USB_PHY_VBUS_WAKEUP_ID_0

This register controls the battery charger (VDCD_DET, VDAT_DET), VBUS_WAKEUP and ID sensors. The following sensors are in this register:

- VBUS_WAKEUP
- ID
- VDAT_DET
- VDCD_DET

The debounced status of each sensor can be read from the corresponding _STS bit field of the sensor in this register. The _CHG_DET field is set to 1 whenever a change is detected in the value of the _STS bit field of the corresponding sensor. If _INT_EN is set, then an interrupt is generated to the processor. This interrupt can be routed to CPU/BPMP-Lite by appropriately writing the USBD bits in the interrupt controller registers.

In case software wants to override the value for a sensor, it can set the corresponding _SW_EN to 1, and set the corresponding sensor _SW_VALUE to 1 or 0 as per the requirement.

There are two debouncers for each sensor - DEBOUNCE_A and DEBOUNCE_B. The debounce values for them are controlled by the register UTMIP_DEBOUNCE_CFG0, fields UTMIP_BIAS_DEBOUNCE_A and UTMIP_BIAS_DEBOUNCE_B. For each sensor, we can select whether to use DEBOUNCE_A or DEBOUNCE_B by setting the field _DEB_SEL_B to the appropriate value (SEL_A or SEL_B).

Note: *Do not set either UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B to 0x0. If not using one of the debouncers, keep it at the default value of 0xFFFF.*

There are debouncers for VDAT_DET and VDCD_DET. These use separate debouncers -CHRG_DEBOUNCE_PERIOD_A and CHRG_DEBOUNCE_PERIOD_B. The debounce values for them are controlled by the register UTMIP_CHRG_DEB_CFG0, fields UTMIP_CHRG_DEBOUNCE_PERIOD_A and UTMIP_CHRG_DEBOUNCE_PERIOD_B. For each sensor, we can select whether to use CHRG_DEBOUNCE_PERIOD_A or CHRG_DEBOUNCE_PERIOD_B by setting the field _DEB_SEL_B to the appropriate value (SEL_A or SEL_B).

Note: *Do not set either UTMIP_CHRG_DEBOUNCE_PERIOD_A or UTMIP_CHRG_DEBOUNCE_PERIOD_B to 0x0. If not using one of the debouncers, keep it at the default value of 0xFFFF.*

USB PHY VBUS Wakeup and ID Control Register

Offset: 0x408 | Read/Write: R/W | Reset: 0b00000x00xx000x00xx000x00x1000x00

Bit	R/W	Reset	Description
31	RW	0x0	DIV_DET_EN: Battery charger divider detection enable. This goes to the USB2OTG pad. 0 = DISABLE 1 = ENABLE
30	RW	0x0	VBUS_WAKEUP_WAKEUP_EN: VBUS_WAKEUP wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on VBUS_WAKEUP. 0 = DISABLE 1 = ENABLE
29	RW	0x0	VDCD_DET_DEB_SEL_B: VCDT_DET debounce A/B select. Selects the debounce value from UTMIP_CHRG_DEBOUNCE_PERIOD_A or UTMIP_CHRG_DEBOUNCE_PERIOD_B from the register UTMIP_CHRG_DEB_CFG0. 0 = SEL_A 1 = SEL_B
28	RW	0x0	VDCD_DET_SW_VALUE: VDCD_DET software value. Software should write the appropriate value (1/0) to set/unset the VDCD_DET status. This is only valid when VDCD_DET_SW_EN is set. 0 = UNSET 1 = SET
27	RW	0x0	VDCD_DET_SW_EN: VDCD_DET software enable. Enable Software Controlled VDCD_DET. Software sets this bit to drive the value in VDCD_DET_SW_VALUE to the USB controller 0 = DISABLE 1 = ENABLE
26	RO	X	VDCD_DET_STS: VDCD_DET status. This is set to 1 whenever VDCD_DET sensor output is 1. 0 = UNSET 1 = SET
25	RO	0x0	VDCD_DET_CHG_DET: VDCD_DET change detect. This field is set by hardware whenever a change is detected in the value of VDCD_DET. software writes a 1 to clear it 0 = UNSET 1 = SET
24	RW	0x0	VDCD_DET_INT_EN: VDCD_DET interrupt enable. If this field is set to 1, an interrupt is generated whenever VDCD_DET_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
23	RO	X	VOP_DIV2P7_DET: This read-only status bit is from the battery charging divider circuit of the USB2OTG pad 0 = UNSET 1 = SET

Bit	R/W	Reset	Description
22	RO	X	VOP_DIV2P0_DET:This read-only status bit is from the battery charging divider circuit of the USB2OTG pad 0 = UNSET 1 = SET
21	RW	0x0	VDAT_DET_DEB_SEL_B: VDAT_DET debounce A/B select. Selects between the two debounce values UTMIP_CHRG_DEBOUNCE_PERIOD_A or UTMIP_CHRG_DEBOUNCE_PERIOD_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
20	RW	0x0	VDAT_DET_SW_VALUE: VDAT_DET software value. Software should write the appropriate value (1/0) to set/unset the VDAT_DET status. This is only valid when VDAT_DET_SW_EN is set. 0 = UNSET 1 = SET
19	RW	0x0	VDAT_DET_SW_EN: VDAT_DET software enable. Enable Software Controlled VDAT_DET. Software sets this bit to drive the value in VDAT_DET_SW_VALUE to the USB controller 0 = DISABLE 1 = ENABLE
18	RO	X	VDAT_DET_STS: VDAT_DET status. This is set to 1 whenever the VDAT_DET sensor output is 1. 0 = UNSET 1 = SET
17	RO	0x0	VDAT_DET_CHG_DET: VDAT_DET change detect. This field is set by hardware whenever a change is detected in the value of VDAT_DET. software writes a 1 to clear it 0 = UNSET 1 = SET
16	RW	0x0	VDAT_DET_INT_EN: VDAT_DET interrupt enable. If this field is set to 1, an interrupt is generated whenever VDAT_DET_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
15	RO	X	VON_DIV2P7_DET: This read-only status bit is from the battery charging divider circuit of the USB2OTG pad 0 = UNSET 1 = SET
14	RO	X	VON_DIV2P0_DET: This read-only status bit is from the battery charging divider circuit of the USB2OTG pad 0 = UNSET 1 = SET
13	RW	0x0	VBUS_WAKEUP_DEB_SEL_B: VBUS_WAKEUP debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
12	RW	0x0	VBUS_WAKEUP_SW_VALUE: VBUS wakeup software value. Software should write the appropriate value (1/0) to set/unset the VBUS_WAKEUP status. This is only valid when VBUS_WAKEUP_SW_EN is set. 0 = UNSET 1 = SET
11	RW	0x0	VBUS_WAKEUP_SW_EN: VBUS wakeup software enable. Enable Software Controlled VBUS_WAKEUP. Software sets this bit to drive the value in VBUS_WAKEUP_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
10	RO	X	VBUS_WAKEUP_STS: VBUS wakeup status. This is set to 1 whenever VBUS_WAKEUP sensor output is 1. 0 = UNSET 1 = SET
9	RO	0x0	VBUS_WAKEUP_CHG_DET: VBUS wakeup change detect. This field is set by hardware whenever a change is detected in the value of VBUS_WAKEUP. software writes a 1 to clear it 0 = UNSET 1 = SET
8	RW	0x0	VBUS_WAKEUP_INT_EN: VBUS wakeup interrupt enable. If this field is set to 1, an interrupt is generated whenever VBUS_WAKEUP_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
7	RO	X	STATIC_GPI: Static GPI status 0 = UNSET 1 = SET
6	RW	0x1	ID_PU: ID pullup enable. Set to 1. 0 = DISABLE 1 = ENABLE
5	RW	0x0	ID_DEB_SEL_B: ID debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
4	RW	0x0	ID_SW_VALUE: ID software value. Software should write the appropriate value (1/0) to set/unset the ID status. This is only valid when ID_SW_EN is set. 0 = UNSET 1 = SET
3	RW	0x0	ID_SW_EN: ID software enable. Enable Software Controlled ID. Software sets this bit to drive the value in ID_SW_VALUE to the USB controller 0 = DISABLE 1 = ENABLE
2	RO	X	ID_STS: ID status. This is set to 1 whenever ID sensor output is 1. 0 = UNSET 1 = SET
1	RO	0x0	ID_CHG_DET: ID change detect. This field is set by hardware whenever a change is detected in the value of ID. software writes a 1 to clear it 0 = UNSET 1 = SET
0	RW	0x0	ID_INT_EN: ID interrupt enable. If this field is set to 1, an interrupt is generated whenever ID_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE

22.16.2.4 USB1_IF_USB_PHY_ALT_VBUS_STS_0

USB PHY Alternate VBUS/ID Status Register

Offset: 0x40c | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
14	X	ID_DIG_C_ALT: IDDIG_C alternate status 0 = UNSET 1 = SET
13	X	ID_DIG_C: IDDIG_C status 0 = UNSET 1 = SET
12	X	ID_DIG_B_ALT: IDDIG_B alternate status 0 = UNSET 1 = SET
11	X	ID_DIG_B: IDDIG_B status 0 = UNSET 1 = SET
10	X	ID_DIG_A_ALT: IDDIG_A alternate status 0 = UNSET 1 = SET
9	X	ID_DIG_A: IDDIG_A status 0 = UNSET 1 = SET
8	X	VDCD_DET_ALT: VDCD_DET alternate status 0 = UNSET 1 = SET

Bit	Reset	Description
7	X	VDAT_DET_ALT: VDAT_DET alternate status 0 = UNSET 1 = SET
6	X	A_SESS_VLD_ALT: A_SESS_VLD alternate status 0 = UNSET 1 = SET

1	X	A_VBUS_VLD_ALT: A_VBUS_VLD alternate status 0 = UNSET 1 = SET
0	X	VBUS_WAKEUP_ALT: Vbus wakeup alternate status 0 = UNSET 1 = SET

22.16.2.5 USB1_IF_USB_INTER_PKT_DELAY_CTRL_0

This controls the interpacket delay between two consecutive transmit packets in HS mode. This only applies to Host Mode as device never transmits two packets in a row.

Inter Packet Delay Control

Offset: 0x420 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxx0010010

Bit	Reset	Description
6:0	0x12	IP_DELAY_TX2TX_HS: HS Tx to Tx inter-packet delay. Software should not change this.

22.16.2.6 USB1_IF_USB_RSM_DLY_0

USB Controller Resume Signaling Delay

Offset: 0x490 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx0110100101111000

Bit	Reset	Description
15:0	0x6978	TIME_TO_RESUME: Send the resume back in number of 60 MHz cycles. Default gives 900 µs delay. Only applicable in Host Mode.

22.16.2.7 USB1_IF_SPARE_0

Note: *Software neither reads nor writes this register.*

For ICUSB PADCTLs. Spare Register

Offset: 0x498 | Read/Write: R/W | Reset: 0b11111111111111110000000000000000

Bit	Reset	Description
31:16	0xffff	SPARE_HI: Spare register bits, defaulted to 1. SPARE_HI[0] - usb_port_reset_fix_en. Enable port-reset fix.

Bit	Reset	Description
15:0	0x0	SPARE_LO: Spare register bits, defaulted to 0. SPARE_LO[4] - usb_hs_rsm_eop_fix_en, Enable HS_RESUME EOP fix. SPARE_LO[5] - usb_port_suspend_fix_en.

22.16.2.8 USB1_IF_USB1_NEW_CONTROL_0

USB Coherency and Memory Alignment Controls

Offset: 0x4c0 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx00001111xxxxxx00

Bit	Reset	Description
15:8	0xf	REQUEST_EXPIRY_COUNTER: Time to wait for coalescing the request
1	0x0	MEM_ALIGNMENT_MUX_EN: Mux to select between Tegra 3 style (0) and Tegra X1 style (1) DMA request generation mechanism. 0 = DISABLE 1 = ENABLE
0	0x0	COHERENCY_EN: Enable fence mechanism. 0 = DISABLE 1 = ENABLE.

22.16.3 USB1 UTMIP Configuration Registers

Note: *Current UTMIP configuration registers use settings that support NV software drivers and should NOT be modified. If designing custom drivers, consult your NV representative prior to modifying these registers*

Base Address: USB

22.16.3.1 USB1_UTMIP_XCVR_CFG0_0

UTMIP Transceiver Cell Configuration Register 0

Offset: 0x808 | Read/Write: R/W | Reset: 0x20a56500 (0b00100000101001010110010100000000

Bit	Reset	Description
31:25	0x10	UTMIP_XCVR_HSSLEW_MSB: Most significant bits of HS_SLEW.
24:22	0x2	UTMIP_XCVR_SETUP_MSB: Most significant bits of SETUP.
21	0x1	UTMIP_XCVR_LSBIAS_SEL: Low speed bias selection method for USB transceiver pad
20	0x0	UTMIP_XCVR_DISCON_METHOD: Disconnect method on the USB transceiver pad
19	0x0	UTMIP_FORCE_PDZI_POWERUP: Force PDZI input into power up.
18	0x1	UTMIP_FORCE_PDZI_POWERDOWN: Force PDZI input into power down. (Overrides FORCE_PDZI_POWERUP.)
17	0x0	UTMIP_FORCE_PD2_POWERUP: Force PD2 input into power up.
16	0x1	UTMIP_FORCE_PD2_POWERDOWN: Force PD2 input into power down. (Overrides FORCE_PD2_POWERUP.)
15	0x0	UTMIP_FORCE_PD_POWERUP: Force PD input into power up.
14	0x1	UTMIP_FORCE_PD_POWERDOWN: Force PD input into power down. (Overrides FORCE_PD_POWERUP.)
13	0x1	UTMIP_XCVR_TERMEN: Enable HS termination.
12	0x0	UTMIP_XCVR_HSLOOPBACK: Internal loopback inside XCVR cell. Used for IOBIST.
11:10	0x1	UTMIP_XCVR_LSFSLEW: LS falling slew rate control.
9:8	0x1	UTMIP_XCVR_LSRSLEW: LS rising slew rate control.
7:6	0x0	UTMIP_XCVR_FSSLEW: FS slew rate control.
5:4	0x0	UTMIP_XCVR_HSSLEW: HS slew rate control. The two LSBs.

Bit	Reset	Description
3:0	0x0	UTMIP_XCVR_SETUP: SETUP[3:0] input of XCVR cell. HS driver output control. 4 LSBs.

22.16.3.2 USB1_UTMIP_BIAS_CFG0_0

UTMIP Bias Cell Configuration Register 0

Offset: 0x80c | Read/Write: R/W | Reset: 0x00c00c08 (0bx00000001100000000000110000001000

Bit	Reset	Description
30	0x0	UTMIP_IDDIG_C_VAL: See IDDIG_C_SEL.
29	0x0	UTMIP_IDDIG_C_SEL: 0: IdDig_c = IdDig_c. 1: IdDig_c = IDDIG_C_VAL.
28	0x0	UTMIP_IDDIG_B_VAL: See IDDIG_B_SEL.

24	0x0	UTMIP_HSDISCON_LEVEL_MSB: Most significant bit of UTMIP_HSDISCON_LEVEL, bit 2
23	0x1	UTMIP_IDPD_VAL: See IDPD_SEL.
22	0x1	UTMIP_IDPD_SEL: 0: Reserved. Refer to the PMC registers for this feature.
21	0x0	UTMIP_IDDIG_VAL: See IDDIG_SEL.
20	0x0	UTMIP_IDDIG_SEL: 0: IdDig = IdDig. 1: IdDig = IDDIG_VAL.
19	0x0	UTMIP_GPI_VAL: See GPI_SEL.
18	0x0	UTMIP_GPI_SEL: 0: StaticGpi = IdDig. 1: StaticGpi = GPI_VAL.
17:15	0x0	UTMIP_ACTIVE_TERM_OFFSET: Active termination control offset.
14:12	0x0	UTMIP_ACTIVE_PULLUP_OFFSET: Active 1.5K pullup control offset.
11	0x1	UTMIP_OTGPD: Power down OTG circuit.
10	0x1	UTMIP_BIASPD: Power down bias circuit.
9:8	0x0	UTMIP_VBUS_LEVEL_LEVEL: Vbus detector level.
7:6	0x0	UTMIP_SESS_LEVEL_LEVEL: SessionEnd detector level.
5:4	0x0	UTMIP_HSCHIRP_LEVEL: HS chirp detector level.
3:2	0x2	UTMIP_HSDISCON_LEVEL: HS disconnect detector level.
1:0	0x0	UTMIP_HSSQUELCH_LEVEL: HS squelch detector level.

22.16.3.3 USB1_UTMIP_HSRX_CFG0_0

UTMIP High Speed Receive Config 0

Offset: 0x810 | Read/Write: R/W | Reset: 0b10010001011001010011010000000000

Bit	Reset	Description
31:30	0x2	UTMIP_KEEP_PATT_ON_ACTIVE: Keep the stay alive pattern on active
29	0x0	UTMIP_ALLOW_CONSEC_UPDN: Allow consecutive ups and downs on the bits, debug only, set to 0.
28	0x1	UTMIP_REALIGN_ON_NEW_PKT: Realign the inertia counters on a new packet
27:24	0x1	UTMIP_PCOUNT_UPDN_DIV: The number of (edges-1) needed to move the sampling point
23:21	0x3	UTMIP_SQUELCH_EOP_DLY: Limit the delay of the squelch at EOP time
20	0x0	UTMIP_NO_STRIPPING: Do not strip incoming data
19:15	0xa	UTMIP_IDLE_WAIT: Number of idle cycles to declare IDLE.
14:10	0xd	UTMIP_ELASTIC_LIMIT: Depth of elastic input store
9	0x0	UTMIP_ELASTIC_OVERRUN_DISABLE: Do not declare overrun errors until overflow of FIFO
8	0x0	UTMIP_ELASTIC_UNDERRUN_DISABLE: Do not declare underrun errors
7	0x0	UTMIP_PASS_CHIRP: When in Chirp Mode, allow chirp RX data through
6	0x0	UTMIP_PASS_FEEDBACK: Pass through the feedback, do not block it.

Bit	Reset	Description
5:4	0x0	UTMIP_PCOUNT_INERTIA: Retime the path.
3:2	0x0	UTMIP_PHASE_ADJUST: Based on incoming edges and current sampling position, adjust phase
1	0x0	UTMIP_THREE_SYNCBITS: Sync pattern detection needs 3 consecutive samples instead of 4
0	0x0	UTMIP_USE4SYNC_TRAN: Require 4 sync pattern transitions (01) instead of 3

22.16.3.4 USB1_UTMIP_HSRX_CFG1_0

UTMIP High Speed Receive Config 1

Offset: 0x814 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxx010011

Bit	Reset	Description
5:1	0x9	UTMIP_HS_SYNC_START_DLY: How long to wait before start of sync launches RxActive
0	0x1	UTMIP_HS_ALLOW_KEEP_ALIVE: Allow Keep Alive packets

22.16.3.5 USB1_UTMIP_FSLSRX_CFG0_0

UTMIP Full and Low Speed Receive Config 0

Offset: 0x818 | Read/Write: R/W | Reset: 0b11111101010101001000010000101001

Bit	Reset	Description
31	0x1	UTMIP_FSLS_SE1_DRIBBLE_FILTER: One SE1, do not allow dribble
30	0x1	UTMIP_FSLS_SE1_FILTER: Filter SE1
29	0x1	UTMIP_FSLS_SERIAL_SE0_RCV
28:26	0x7	UTMIP_FSLS_UPR_DRIBBLE_SIZE: Do not allow <= dribble bits
25:23	0x2	UTMIP_FSLS_LWR_DRIBBLE_SIZE: Do not allow >= dribble bits
22	0x1	UTMIP_FSLS_EOP_ENDS_AT_SE0: Only look for transitioning out of EOP
21:16	0x14	UTMIP_FSLS_KCOUNT_MAX: Number of K bits in question
15	0x1	UTMIP_FSLS_KCOUNT_LIMIT: Limit the number of bit times a K can last
14	0x0	UTMIP_FSLS_ACTIVE_ON_FULL_SYNC: Require a full sync pattern to declare the data received
13:8	0x4	UTMIP_FSLS_IDLE_WAIT_MAX: 4 bits of SEO should exceed the time limit
7	0x0	UTMIP_FSLS_IDLE_WAIT_LIMIT: Enable the reset of the state machine on extended SE0
6:1	0x14	UTMIP_FSLS_IDLE_COUNT_MAX: 20 bits of idle should end the packet if FsLsIdleCountLimitCfg=1.
0	0x1	UTMIP_FSLS_IDLE_COUNT_LIMIT: Give up on packet if a long sequence of J

22.16.3.6 USB1_UTMIP_FSLSRX_CFG1_0

UTMIP Full and Low Speed Receive Config 1

Offset: 0x81c | Read/Write: R/W | Reset: 0bxxxxx01000100110011110100000000000

Bit	Reset	Description
26	0x0	UTMIP_EARLY_LINE_STATE_FILTER: Assumes line state filtering table is inclusive, not exclusive
25:23	0x4	UTMIP_LS_BOUNCE_LENGTH: Number of clock cycle of LS stable
22:17	0x13	UTMIP_LS_EXTRACTION_COUNT: Phase count on which LS bits are extracted
16:11	0xe	UTMIP_LS_EOP_START_COUNT: Number of SEO clock cycles to block bit extraction
10:5	0x20	UTMIP_LS_SE0_COUNT: Only for this number of 60MHz of SEO and Idle to end packet
4	0x0	UTMIP_LS_LENIENT_DRIBBLE: Allow for large dribble in low speed mode
3	0x0	UTMIP_FS_LENIENT_DRIBBLE: Allow for large dribble in full speed mode
2	0x0	UTMIP_FS_WEAK_SYNC: Only look for a KK pattern, instead of KJKK
1	0x0	UTMIP_FS_DEBOUNCE: Whether full speed uses debouncing
0	0x0	UTMIP_FS_EOP_LENGTH: Whether full speed EOP is determined within 3(0) or 4(1) 60 MHz cycles

22.16.3.7 USB1_UTMIP_TX_CFG0_0

UTMIP Transmit Config Signals

Offset: 0x820 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxx00010000001000000000

Bit	Reset	Description
19	0x0	UTMIP_FS_PREAMBLE_J: Output enable sends an initial J before sync pattern
18	0x0	UTMIP_FS_POSTAMBLE_OUTPUT_ENABLE: Output enable turns off 1/2 cycle after
17	0x0	UTMIP_FS_PREAMBLE_OUTPUT_ENABLE: Output enable turns on 1/2 cycle before
16	0x1	UTMIP_FSLS_ALLOW_SOP_TX_STUFF_ERR: Allow SOP to be source of transmit error stuffing
15	0x0	UTMIP_HS_READY_WAIT_FOR_VALID
14:10	0x0	UTMIP_HS_TX_IPG_DLY
9	0x1	UTMIP_HS_DISCON_EOP_ONLY: Only check during EOP
8	0x0	UTMIP_HS_DISCON_DISABLE: Disable high speed disconnect
7	0x0	UTMIP_HS_POSTAMBLE_OUTPUT_ENABLE: Output enable turns off 1 cycle after
6	0x0	UTMIP_HS_PREAMBLE_OUTPUT_ENABLE: Output enable turns on 1 cycle before
5	0x0	UTMIP_SIE_RESUME_ON_LINESTATE: SIE, not macrocell, detects LineState change to resume
4	0x0	UTMIP_SOF_ON_NO_STUFF: SOF when OpMode 3 -- perhaps, when sending controller made packets
3	0x0	UTMIP_SOF_ON_NO_ENCODE: SOF when OpMode 2 -- not likely, for Chirp
2	0x0	UTMIP_NO_STUFFING: No bit stuffing, static programming
1	0x0	UTMIP_NO_ENCODING: No encoding, static programming
0	0x0	UTMIP_NO_SYNC_NO_EOP: Do not send SYNC or EOP

22.16.3.8 USB1_UTMIP_MISC_CFG0_0

UTMIP Miscellaneous Configurations

Offset: 0x824 | Read/Write: R/W | Reset: 0bx00000111110000000000000001111000

Bit	Reset	Description
30:27	0x0	UTMIP_DPDM_OBSERVE_SEL: Select DP/DM obs signals
26	0x0	UTMIP_DPDM_OBSERVE: Use DP/DM as obs bus
25	0x1	UTMIP_KEEP_XCVR_PD_ON_SOFT_DISCON
24	0x1	UTMIP_ALLOW_LS_ON_SOFT_DISCON
23	0x1	UTMIP_FORCE_FS_DISABLE_ON_DEV_CHIRP
22	0x1	UTMIP_SUSPEND_EXIT_ON_EDGE: Suspend exit requires edge or simply a value.
21	0x1	UTMIP_LS_TO_FS_SKIP_4MS: Do not block changes for 4 ms when going from LS to FS (should not happen)
20:19	0x0	UTMIP_INJECT_ERROR_TYPE: Force error insertion into RX path. (Used for IOBIST.) 0 = DISABLE 1 = BIT_ERR 2 = RX_ERR 3 = BIT_RX_ERR
18	0x0	UTMIP_FORCE_HS_CLOCK_ON: Force HS clock always on.
17	0x0	UTMIP_DISABLE_HS_TERM: Force HS termination inactive.
16	0x0	UTMIP_FORCE_HS_TERM: Force HS termination active.
15	0x0	UTMIP_DISABLE_PULLUP_DP: Force DP pullup inactive. (Overrides FORCE_PULLUP_DP.)
14	0x0	UTMIP_DISABLE_PULLUP_DM: Force DM pullup inactive. (Overrides FORCE_PULLUP_DM.)
13	0x0	UTMIP_DISABLE_PULLDN_DP: Force DP pulldown inactive. (Overrides FORCE_PULLDN_DP.)
12	0x0	UTMIP_DISABLE_PULLDN_DM: Force DM pulldown inactive. (Overrides FORCE_PULLDN_DM.)
11	0x0	UTMIP_FORCE_PULLUP_DP: Force DP pullup active.
10	0x0	UTMIP_FORCE_PULLUP_DM: Force DM pullup active.
9	0x0	UTMIP_FORCE_PULLDN_DP: Force DP pulldown active.

Bit	Reset	Description
8	0x0	UTMIP_FORCE_PULLDN_DM: Force DM pulldown active.
7:5	0x3	UTMIP_STABLE_COUNT: Number of cycles of crystal clock of signal not changing to consider stable.
4	0x1	UTMIP_STABLE_ALL: Determines if all signal need to be stable to not change a config.
3	0x1	UTMIP_NO_FREE_ON_SUSPEND: Do not use free running terminations during suspend.
2	0x0	UTMIP_NEVER_FREE_RUNNING_TERMS: Ignore free-running terminations, even when no clock
1	0x0	UTMIP_ALWAYS_FREE_RUNNING_TERMS: Use free-running terminations at all time
0	0x0	UTMIP_COMB_TERMS: Use combinational terminations or synced through CLKXTAL

22.16.3.9 USB1_UTMIP_MISC_CFG1_0

UTMIP Miscellaneous Configurations

Offset: 0x828 | Read/Write: R/W | Reset: 0bx10000000001100110000000000100100

Bit	Reset	Description
30	0x1	UTMIP_PHY_XTAL_CLOCKEN: Selects whether to enable the crystal clock in the module.
29	0x0	UTMIP_LINESTATE_BYPASS: Bypass LineState reclocking logic

2	0x1	UTMIP_SUSPEND_TERMSEL
1:0	0x0	UTMIP_XCVRSEL3: Bit 0: 0: 0xa5 -> treat as KeepAlive 1: treat as regular packet Bit 1: 0: Turn on FS EOP detection 1: Turn off FS EOP detection

22.16.3.10 USB1_UTMIP_DEBOUNCE_CFG0_0

UTMIP Avalid and Bvalid Debounce

Debounce values IdDig, Avalid, Bvalid, VbusValid, VbusWakeUp, and SessEnd. Each of these signals has its own debouncer, and for each of those one out of 2 debouncing times can be chosen (BIAS_DEBOUNCE_A or BIAS_DEBOUNCE_B.)

The values of DEBOUNCE_A and DEBOUNCE_B are calculated as follows:

0xffff -> No debouncing at all

ms = *1000 / (1/19.2 MHz) / 4

So to program a 1 ms debounce for BIAS_DEBOUNCE_A:

BIAS_DEBOUNCE_A[15:0] = 1000 * 19.2 / 4 = 4800 = 0x12c0

Offset: 0x82c | Read/Write: R/W | Reset: 0b11111111111111111111111111111111

Bit	Reset	Description
31:16	0xffff	UTMIP_BIAS_DEBOUNCE_B: simulation value -- Used for interrupts
15:0	0xffff	UTMIP_BIAS_DEBOUNCE_A: simulation value -- Used for interrupts

Bit	Reset	Description
13:8	0x0	UTMIP_CHRG_DEBOUNCE_TIMESCALE: Debouncer time scaling, factor-1 to slow down debouncing by. So 0 is 1, 1 is 2, etc.
5	0x0	UTMIP_OP_I_SRC_EN
4	0x0	UTMIP_ON_SRC_EN
3	0x0	UTMIP_OP_SRC_EN
2	0x0	UTMIP_ON_SINK_EN
1	0x0	UTMIP_OP_SINK_EN
0	0x1	UTMIP_PD_CHRG: Power down charger circuit

22.16.3.12 USB1_UTMIP_SPARE_CFG0_0

UTMIP Spare Configuration Bits

Offset: 0x834 | Read/Write: R/W | Reset: 0b11111111111111110000000111111000

Bit	Reset	Description
31:0	-65032	UTMIP_SPARE: Spare register bits 0: HS_RX_IPG_ERROR_ENABLE 1: HS_RX_FLUSH_ALAP. Flush as late as possible 2: HS_RX_LATE_SQUELCH. Delay Squelch by 1 CLK480 cycle. 3: FUSE_SETUP_SEL. Select between regular CFG value and JTAG values for UX_SETUP 4: FUSE_TERM_RANGE_ADJ_SEL. Select between regular CFG value and JTAG values for UX_TERM_RANGE_ADJ 5: FUSE_SPARE. Select between regular CFG value and JTAG values. For any ECOs. 6: FUSE_HS_SQUELCH_LEVEL. Select between regular CFG value and JTAG values 7: FUSE_HS_IREF_CAP_CFG. Select between regular CFG value and JTAG values 8: FUSE_RPD_CTRL. Select between regular CFG value and JTAG values 9: PD2_OLD_SCHEME_SEL. Select between old and new scheme. 31 to 10: Reserved

22.16.3.13 USB1_UTMIP_XCVR_CFG1_0

UTMIP Transceiver Cell Configuration Register 1

Offset: 0x838 | Read/Write: R/W | Reset: 0bxxxx00000010000010000010000010101

Bit	Reset	Description
27:26	0x0	UTMIP_XCVR_RPU_RANGE_ADJ: 1.5k pull-up resistor range shift.
25:24	0x0	UTMIP_XCVR_HS_IREF_CAP: High-speed Iref cap control for bias current stability.
23:22	0x0	UTMIP_XCVR_SPARE: Spare bits for USB transceiver pad.
21:18	0x8	UTMIP_XCVR_TERM_RANGE_ADJ: Range adjustment on terminations.
17	0x0	UTMIP_RCTRL_SW_SET: Use a software override on RCTRL instead of automatic bias control.
16:12	0x8	UTMIP_RCTRL_SW_VAL: Encoded value to use on RCTRL when software override is enabled, 0 to 16 only.
11	0x0	UTMIP_TCTRL_SW_SET: Use a software override on TCTRL instead of automatic bias control
10:6	0x8	UTMIP_TCTRL_SW_VAL: Encoded value to use on TCTRL when software override is enabled, 0 to 16 only.
5	0x0	UTMIP_FORCE_PDDR_POWERUP: Force PDDR input into power up.
4	0x1	UTMIP_FORCE_PDDR_POWERDOWN: Force PDDR input into power down. (Overrides FORCE_PDDR_POWERUP.)
3	0x0	UTMIP_FORCE_PDCHRP_POWERUP: Force PDCHRP input into power up.

Bit	Reset	Description
2	0x1	UTMIP_FORCE_PDCHRP_POWERDOWN: Force PDCHRP input into power down. (Overrides FORCE_PDCHRP_POWERUP.)
1	0x0	UTMIP_FORCE_PDDISC_POWERUP: Force PDDISC input into power up.
0	0x1	UTMIP_FORCE_PDDISC_POWERDOWN: Force PDDISC input into power down. (Overrides FORCE_PDDISC_POWERUP.)

22.16.3.14 USB1_UTMIP_BIAS_CFG1_0

UTMIP Bias Cell Configuration Register 1

Offset: 0x83c | Read/Write: R/W | Reset: 0bxxxxxxxx00000000000000000101101

Bit	Reset	Description
23	0x0	UTMIP_BIAS_TRK_DONE: TRK cycle done status. UTMIP REGISTER: UTMIP_BIAS_STS0
22	0x0	UTMIP_BIAS_TRK_START_OVERRIDE: The Track cycle starts after removing power downs on TRK circuit(PD_TRK).Alternatively, this track cycle can be started with this override bit, auto-cleared by hardware after TRK_START happens.
21:14	0x0	UTMIP_BIAS_TRK_START_COUNT: The lag between PD_TRK and TRK_START.
13:8	0x0	UTMIP_BIAS_DEBOUNCE_TIMESCALE: Debouncer time scaling. Slows down debouncing by a factor-1. So 0 is 1, 1 is 2, etc.
7:3	0x5	UTMIP_BIAS_PDTRK_COUNT: Control the BIAS cell power down lag. The lag should be 20 µs. For a crystal clock of 13 MHz, it should be set to 5.
2	0x1	UTMIP_VBUS_WAKEUP_POWERDOWN: Reserved. See the PMC registers for this functionality.
1	0x0	UTMIP_FORCE_PDTRK_POWERUP: Force PDTRK input into power up.
0	0x1	UTMIP_FORCE_PDTRK_POWERDOWN: Force PDTRK input into power down. (Overrides FORCE_PDTRK_POWERUP.)

22.16.3.15 USB1_UTMIP_BIAS_STS0_0

UTMIP Bias Cell Status Register 0

Offset: 0x840 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31:16	X	UTMIP_TCTRL: Thermal encoding output from USB bias pad.
15:0	X	UTMIP_RCTRL: Thermal encoding output from USB bias pad.

22.16.3.16 USB1_UTMIP_CHRG_DEB_CFG0_0

UTMIP VDcd_Det and VDat_Det Debounce

Debounce values VDcd_Det and VDat_Det. Each of these signals has its own debouncer and for each of those, 1 out of 2 debouncing times can be chosen (CHRG_DEBOUNCE_PERIOD_A or CHRG_DEBOUNCE_PERIOD_B).

The values of DEBOUNCE_PERIOD_A and DEBOUNCE_PERIOD_B are calculated as follows:

0xffff -> No debouncing at all

ms = *1000 / (1/19.2 MHz) / 4

So to program a 1 ms debounce for CHG_DEBOUNCE_PERIOD:

CHG_DEBOUNCE_PERIOD[15:0] = 1000 * 19.2 / 4 = 4800 = 0x12c0

Offset: 0x844 | Read/Write: R/W | Reset: 0b11111111111111111111111111111111

Bit	Reset	Description
31:16	0xffff	UTMIP_CHRG_DEBOUNCE_PERIOD_B: Simulation value -- Used for interrupts
15:0	0xffff	UTMIP_CHRG_DEBOUNCE_PERIOD_A: Simulation value -- Used for interrupts

22.16.3.17 USB1_UTMIP_MISC_STS0_0

UTMIP MISC Status Register

Offset: 0x848 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
21	X	UTMIP_FS_DRV_EN: Indicates when the controller is driving on the bus
20:0	X	UTMIP_SPARE_FUSES: Spare Fuses value to keep the connections preserved

22.16.3.18 USB1_UTMIP_PMC_WAKEUP0_0

UTMIP PMC Wakeup value

Offset: 0x84c | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0

Bit	R/W	Reset	Description
1	RO	X	UTMIP_LINE_WAKEUP_EVENT_INT_STS: Indicates the status of the PMC wakeup event
0	RW	0x0	UTMIP_LINE_WAKEUP_EVENT_INT_ENB: Interrupt mask for the PMC wakeup event

22.16.3.19 USB1_UTMIP_BIAS_CFG2_0

UTMIP Bias cell configuration register 0

UTMIP REGISTER: UTMIP_BIAS_CFG2

Offset: 0x850 | Read/Write: R/W | Reset: 0x000180e0 (0bxxxxxxxxxxxxxx0011000000011100000)

Bit	Reset	Description
18:15	0x3	UTMIP_BIAS_SPARE: Spare bits for bias circuit
14:11	0x0	UTMIP_CHG_DIV: Apple charger divider reference control
10:9	0x0	UTMIP_TEST_SELECT: ATE test mode test tracking logic function
8:6	0x3	UTMIP_TEMP_COEFF: Bandgap temp coefficient control.
5:3	0x4	UTMIP_VREF_CTRL: Bandgap voltage control
2:0	0x0	UTMIP_HSSQUELCH_LEVEL_NEW: HS squelch detector level.

22.16.3.20 USB1_UTMIP_XCVR_CFG2_0

UTMIP transceiver cell configuration register 0

UTMIP REGISTER: UTMIP_XCVR_CFG2

Offset: 0x854 | Read/Write: R/W | Reset: 0x02200100 (0bxxxxxx10001000000000000100000000)

Bit	Reset	Description
25:22	0x8	UTMIP_XCVR_FSFSLEW_NEW: FS slew falling rate control.
21:18	0x8	UTMIP_XCVR_FSRSLEW_NEW: FS slew rising rate control.
17:14	0x0	UTMIP_XCVR_SPARE_NEW: spare pins for io pad
13:12	0x0	UTMIP_XCVR_VREG_DYN_DLY: Internal voltage regulator, voltage dynamic switching delay control
11:10	0x0	UTMIP_XCVR_VREG_LEV: Internal voltage regulator, control divided voltage level
9	0x0	UTMIP_XCVR_VREG_FIX18: Internal voltage regulator control to generate some divided voltage or follow VCLAMP.
8:5	0x8	UTMIP_PTERM_RANGE_ADJ: Termination range resistor select window.
4:2	0x0	UTMIP_XCVR_HSSLEW_NEW: HS slew rate control.
1:0	0x0	UTMIP_HS_COUP_EN: HighSpeed Ibias coupling control.

22.16.3.21 USB1_UTMIP_XCVR_CFG3_0

UTMIP transceiver cell configuration register 0

Offset: 0x858 | Read/Write: R/W | Reset: 0x00000066 (0bxxxxxx00000000000000000001100110)

Bit	Reset	Description
25:20	0x0	UTMIP_PCTRL_SW_VAL_NEW: PCTRL when software override is enabled
19:14	0x0	UTMIP_TCTRL_SW_VAL_NEW: TCTRL when software override is enabled
13:9	0x0	UTMIP_XCVR_RPD_CTRL: Active pull-down control signals
8	0x0	UTMIP_TERM_SEL: Auto termination enable.
7:4	0x6	UTMIP_XCVR_LSFSLEW_NEW: LS slew falling rate control.
3:0	0x6	UTMIP_XCVR_LSRSLEW_NEW: LS slew falling rate control.

22.16.3.22 USB2_QH_USB2D_QH_EP_n_OUT_0

USB2D Queue Head for OUT Endpoint n

There are 16 USB2D Queue Head for OUT Endpoint registers, where n = 0 through 15.

Offset: 0x1000 + (n * 0x80) | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:0	0x0	USB2D_QH: Queue Head for OUT endpoint n. This is used to store a local Queue Head data structure for either Device Mode or Host Mode. In Device Mode, it holds the Queue Head for OUT endpoint n.

22.16.3.23 USB2_QH_USB2D_QH_EP_n_IN_0

USB2D Queue Head for IN Endpoint n

There are 16 USB2D Queue Head for IN Endpoint registers, where n = 0 through 15.

Offset: 0x1040 + (n * 0x80) | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:0	0x0	USB2D_QH: Queue Head for IN endpoint n. This is used to store a local Queue Head data structure for either Device Mode or Host Mode. In Device Mode, it holds the Queue Head for IN endpoint n.

22.16.4 USB2 Controller Registers

22.16.4.1 USB2_CONTROLLER_1_USB2D_ID_0

Base Address: USB2

USB2D Identification Register

Offset: 0x0 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31:29	X	CIVERSION: Identifies the CI version
28:25	X	VERSION: Identifies the version of the core
24:21	X	REVISION: Revision number of the USB controller. This is set to 0x0.
20:16	X	TAG: Identifies the tag of the core
15:8	X	NID: One's complement version of ID. This field is set to 0xF9.
7:0	X	ID: Configuration number. This field is set to 0x06

22.16.4.2 USB2_CONTROLLER_1_USB2D_HW_HOST_0

USB2D Hardware Host Register

Offset: 0x8 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
3:1	X	NPORT: VUSB_HS_NUM_PORT-1: This host controller has only 1 port. So this field will always be 0.
0	X	HC: VUSB_HS_HOST: Indicates support for Host Mode. Set to 1.

22.16.4.3 USB2_CONTROLLER_1_USB2D_HW_DEVICE_0

USB2D Hardware Device Register

Offset: 0xc | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
5:1	X	DEVEP: VUSB_HS_DV_EP: Number of endpoints supported by this device controller. Set to 16. This includes control endpoint 0.
0	X	DC: Device capable: Set to 1 indicating support for Device Mode.

22.16.4.4 USB2_CONTROLLER_1_USB2D_HW_TXBUF_0

USB2D Hardware TX Buffer Register

Offset: 0x10 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
23:16	X	TXCHANADD: VUSB_HS_TX_CHAN_ADD: Total number of address bits for the transmit buffer of each transmit endpoint. Set to 7. Each transmit buffer is 128 words deep.
15:8	X	TXADD: VUSB_HS_TX_ADD: Total number of address bits for the transmit buffer. Set to 11. The total depth of the transmit buffer is 2048 words.
7:0	X	TCBURST: VUSB_HS_TX_BURST: Maximum burst size supported by the transmit endpoints for data transfers. Set to 8.

22.16.4.5 USB2_CONTROLLER_1_USB2D_HW_RXBUF_0

USB2D RX Buffer HW Parameters Register

Offset: 0x14 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:8	X	RXADD: VUSB_HS_RX_ADD: Total number of address bits for the receive buffer. Set to 7. The total depth of the receive buffer is 128 words.
7:0	X	RXBURST: VUSB_HS_RX_BURST: Maximum burst size supported by the receive endpoints for data transfers. Set to 8.

22.16.4.6 USB2_CONTROLLER_1_USB2D_GPTIMER0LD_0

The host/device controller drivers can measure time-related activities using these timer registers. These registers are not part of the standard EHCI controller.

Offset: 0x80 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000)

Bit	Reset	Description
23:0	0x0	GPTIMER0LD: This field has the value to be loaded into the GPTCNT countdown timer on a reset action. The value in this register represents the time in microseconds minus 1 for the timer duration.

22.16.4.7 USB2_CONTROLLER_1_USB2D_GPTIMER0CTRL_0

Offset: 0x84 | Read/Write: R/W | Reset: 0x00XXXXXX (0b00xxxxx0xxxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31	RW	0x0	GTPRUN: This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT counter value.
30	WO	0x0	GPTRST: Writing a one to this bit reloads the GPTCNT with the value in GPTLD.
24	RW	0x0	GPTMODE: This bit selects between a single timer countdown and a looped countdown. In one-shot mode, the timer counts down to zero, generates an interrupt, and stops until the counter is reset by software. In repeat mode, the timer counts down to zero, generates an interrupt, and automatically reloads the counter to begin again.
23:0	RO	X	GPTCNT: This field has the value of the running timer.

22.16.4.8 USB2_CONTROLLER_1_USB2D_GPTIMER1LD_0

Offset: 0x88 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000)

Bit	Reset	Description
23:0	0x0	GPTIMER1LD: This field has the value to be loaded into the GPTCNT countdown timer on a reset action. The value in this register represents the time in microseconds minus 1 for the timer duration.

22.16.4.9 USB2_CONTROLLER_1_USB2D_GPTIMER1CTRL_0

Offset: 0x8c | Read/Write: R/W | Reset: 0x00XXXXXX (0b00xxxxx0xxxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31	RW	0x0	GTPRUN: This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT counter value.
30	WO	0x0	GPTRST: Writing a one to this bit reloads the GPTCNT with the value in GPTLD.
24	RW	0x0	GPTMODE: This bit selects between a single timer countdown and a looped countdown. In one-shot mode, the timer counts down to zero, generates an interrupt, and stops until the counter is reset by software. In repeat mode, the timer counts down to zero, generates an interrupt, and automatically reloads the counter to begin again.
23:0	RO	X	GPTCNT: This field has the value of the running timer.

22.16.4.10 USB2_CONTROLLER_1_USB2D_CAPLENGTH_0

USB2D Capability Register Length Register

Offset: 0x100 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
7:0	X	CAPLENGTH: Indicates which offset to add to the register base address at the beginning of the Operational Register. Set to 0x30.

22.16.4.11 USB2_CONTROLLER_1_USB2D_HCIVERSON_0

USB2D Host Interface Version Number Register

Offset: 0x102 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:0	X	HCIVERSION: Contains a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. This host controller supports EHCI revision 1.00.

22.16.4.12 USB2_CONTROLLER_1_USB2D_HCSPARAMS_0

USB2D Host Control Structural Parameters Register

Offset: 0x104 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
27:24	X	N_TT: Number of Transaction Translators: Indicates the number of embedded transaction translators associated with the USB2.0 host controller. This field is always set to 1 indicating only 1 embedded TT is implemented in this implementation. This is a non-EHCI field to support embedded TT.
23:20	X	N_PTT: Number of Ports per Transaction Translator: Indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. Field always equals N_PORTS. This is a non-EHCI field to support embedded TT.
15:12	X	N_CC: Number of Companion Controller: Indicates the number of companion controllers. This field is set to 0.
11:8	X	N_PCC: Number of Ports per Companion Controller: Indicates the number of ports supported per internal companion controller. This field is set to 0.
4	X	PPC: Port Power Control: Indicates whether the host controller implementation includes port power control. 1 = Ports have port power switches 0= Ports do not have port power switches. This field affects the functionality of the port Power field in each port status and control register. This field is set to 1.
3:0	X	N_PORTS: Number of downstream ports. This field specifies the number of physical downstream ports implemented on this host controller. This field is fixed to 1, since this host controller only supports 1 port.

22.16.4.13 USB2_CONTROLLER_1_USB2D_HCCPARAMS_0

USB2D Host Control Capability Parameters Register

Offset: 0x108 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
18	X	PPC: Per-Port Change Event Capability. Default = 1b. This field indicates the support for per-port change events. This field is related to the USBCMD PPE field, USBSTS PPCI field, and USBINTR PPCE field.
17	X	LEN: Link Power Management Capability. Default = 1b. This field indicates the support for LPM L1 state. This field is related to the USBCMD HIRD field, POSTSCx SSTS and DA fields, and HOSTPCx LEN, BA, and EPLPM fields.
15:8	X	EECP: EHCI Extended Capabilities Pointer: Indicates a capabilities list exists. A value of 00h indicates no extended capabilities are implemented. For this implementation this field is always "0".
7:4	X	IST: Isochronous Scheduling Threshold. This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame. This field will always be "0".
2	X	ASP: Asynchronous Schedule Park Capability. 1 = (Default) the host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule. The feature can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the USBCMD register. This field is always 1.
1	X	PFL: Programmable Frame List Flag. 0 = System software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and must be set to zero. 1 = System software can specify and use a smaller frame list and configure the host controller via the USBCMD register Frame List Size field. The frame list must always be aligned on a 4K-page boundary. This requirement ensures that the frame list is always physically contiguous. This field will always be "1".

22.16.4.14 USB2_CONTROLLER_1_USB2D_DCIVERSION_0

USB2D Device Interface Version Number Register

Offset: 0x120 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:0	X	DCIVERSION: The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

22.16.4.15 USB2_CONTROLLER_1_USB2D_DCCPARAMS_0

USB2D Device Control Capabilities Register

Offset: 0x124 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
8	X	HC: Host Capable: 1 = This controller is capable of operating as an EHCI compatible USB 2 0 host controller operating as an EHCI compatible USB 2.0 host controller. This field is set to 1.
7	X	DC: Device Capable: 1 = Controller is capable of operating as USB 2.0 device. This field is set to 1
5	X	LEN: Link Power Management Capability - RO. Default = 1b. This field indicates the support for LPM L1 state. This field is related to the DEVLCx ASUS, STL,BA and NYT fields.
4:0	X	DEN: Device Endpoint Number: Number of endpoints built into the device controller. This is set to 16.

22.16.4.16 USB2_CONTROLLER_1_USB2D_EXTSTS_0

USB2D EXTSTS Register

Offset: 0x128 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000x

Bit	R/W	Reset	Description
4	RW	0x0	TI1: General Purpose Timer Interrupt 1 - RWC. Default = 0b. This bit is set when the counter in the GPTIMER1CTRL register transitions to zero. Writing a one to this bit will clear it.
3	RW	0x0	TI0: General Purpose Timer Interrupt 0 - RWC. Default = 0b. This bit is set when the counter in the GPTIMER1CTRL register transitions to zero. Writing a one to this bit will clear it.
2	RW	0x0	UPA: USB Host Periodic Interrupt (USBHSTPERINT) R/WC. This bit is set by the Host Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) has an interrupt on complete (IOC) bit set and the TD was from the periodic schedule. This bit is also set by the Host Controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be zero. 0 = DISABLE 1 = ENABLE
1	RW	0x0	UAI: USB Host Asynchronous Interrupt (USBHSTASYNCINT) R/WC. This bit is set by the Host Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set by the Host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be zero. 0 = DISABLE 1 = ENABLE
0	RO	X	NAKI: NAK Interrupt Bit Read Only. This bit is read only. It is set by hardware when for a particular endpoint both the TX/RX Endpoint NAK bit and the corresponding TX/RX Endpoint NAK Enable bit are set. This bit is automatically cleared by hardware when the all the enabled TX/RX Endpoint NAK bits are cleared. 0 = DISABLE 1 = ENABLE

22.16.4.17 USB2_CONTROLLER_1_USB2D_USBEXTINTR_0

USB2D EXTINTR Register

Offset: 0x12c | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000

Bit	Reset	Description
4	0x0	TIE1: General Purpose Timer Interrupt Enable 1 - RWC. Default = 0b. When this bit is a one, and the TI1 bit in the EXTSTS register is a one, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the TI1 bit.
3	0x0	TIE0: General Purpose Timer Interrupt Enable 0 - RWC. Default = 0b. When this bit is a one, and the TI1 bit in the EXTSTS register is a one, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the TI1 bit.
2	0x0	UPIE: UPIE Interrupt Enable. 1 = USB controller issues an interrupt if the UPA bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE
1	0x0	UAIE: UAIE Interrupt Enable. 1 = USB controller issues an interrupt if the UAI bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE
0	0x0	NAKE: NAK Interrupt Enable. 1 = USB controller issues an interrupt if the NAKI bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE

22.16.4.18 USB2_CONTROLLER_1_USB2D_USBCMD_0

USB2D USB Command Register

Offset: 0x130 | Read/Write: R/W | Reset: 0bxxxx00000000010000000x1x11x0000000

Bit	R/W	Reset	Description
27:24	RW	0x0	HIRD: Host Initiated Resume Duration RW. Default = 0000b. This has the same behavior as bits 7:4 of the BA field of the HOSTPCx register. When writing to this field all BA[7:4] fields of all HOSTPCx registers will be set to this value. This field is used by system software to specify the minimum amount of time the host controller will drive the K-state during a host-initiated resume from an LPM state (e.g., L1), and is conveyed to each LPM-enabled device (via the HIRD bits within an LPM Tokens bmAttributes field) upon entry into a low-power state. Note the host controller is required to drive resume signaling for at least the amount of time specified in the HIRD value conveyed to the device during any proceeding host-initiated resume. Also note that the host controller is not required to observe this requirement during device-initiated resumes. Encoding for this field is identical to the definition for the similarly named HIRD field within an LPM Token, specifically: a value 0000b equals 50µs and each additional increment adds 75µs. For example, the value 0001b equals 125µs, and a value 1111b equals 1,175µs (~1.2ms).
23:16	RW	0x8	ITC: Interrupt Threshold Control .Read/Write. Default 08h. The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. ITC contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum Interrupt Interval 00h Immediate (no threshold) 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames 10h 16 micro-frames 20h 32 micro-frames 40h 64 micro-frames 0 = IMMEDIATE 2 = ONE_MF 4 = TWO_MF 8 = EIGHT_MF 16 = SIXTEEN_MF 32 = THIRTY_TWO_MF 64 = SIXTY_FOUR_MF
15	RW	0x0	FS2: Bit 2 of Frame List Size.

Bit	R/W	Reset	Description
14	RW	0x0	ATDTW: Add DTD Tripwire. This bit is used as a semaphore when a dTD is added to an active (primed) endpoint. This bit is set and cleared by software and will be cleared by hardware when a hazard exists such that adding a dTD to a primed endpoint may go unnoticed. 0 = CLEAR 1 = SET
13	RW	0x0	SUTW: Setup Tripwire. This bit is used as a semaphore when the 8 bytes of setup data read extracted by the firmware. If the setup lockout mode is off, then there exists a hazard when new setup data arrives and firmware is copying setup data from the QH for a previous setup packet. This bit is set and cleared by software and will be cleared by hardware when a hazard exists. 0 = CLEAR 1 = SET
11	RW	0x1	ASPE: Asynchronous Schedule Park mode Enable. Software uses this bit to enable or disable Park mode. When this bit is one, Park mode is enabled. When this bit is a zero, Park mode is disabled. This field is set to "1" in this implementation. 0 = DISABLE 1 = ENABLE
9:8	RW	0x3	ASP1_ASP0: Asynchronous Schedule Park Mode Count (OPTIONAL) Read/Write. If the Asynchronous Park Capability bit in the HCCPARAMS register is a one, then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1h to 3h. Software must not write a zero to this bit when Park Mode Enable is a one as this will result in undefined behavior. This field is set to 3h in this implementation and is Read/Write capable.
7	RO	X	LR: Light Host/Device Controller Reset (OPTIONAL). Read Only. Not Implemented. This field will always be "0".
6	RW	0x0	IAA: Interrupt on Async Advance Doorbell. When the host controller has evicted all appropriate cached schedule states, it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Sync Advance Enable bit in the USBINTR register is one, then the host controller will assert an interrupt at the next interrupt threshold. The host controller sets this bit to zero after it has set the Interrupt on Sync Advance status bit in the USBSTS register to one. Software should not write a one to this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in Host Mode. Writing a one to this bit when Device Mode is selected will have undefined results. 0 = CLEAR 1 = SET
5	RW	0x0	ASE: Asynchronous Schedule Enable. This bit controls whether the host controller skips processing the Asynchronous Schedule. 0 = Do not process the Asynchronous Schedule. 1 = Use the ASYNCLISTADDR register to access the Asynchronous Schedule. Only the host controller uses this bit. 0 = DISABLE 1 = ENABLE
4	RW	0x0	PSE: Periodic Schedule Enable. This bit controls whether the host controller skips processing the Periodic Schedule. 0 = Do not process the Periodic Schedule 1 = Use the PERIODICLISTBASE register to access the Periodic Schedule. Only the host controller uses this bit. 0 = DISABLE 1 = ENABLE
3:2	RW	0x0	FS1_FS0: Frame List Size. (Read/Write). 000 = Default. This field is Read/Write only if Programmable Frame List Flag in the HCCPARAMS registers is set to one. Hence this field is Read/Write for this implementation. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3, and 2. 000 = 1024 elements (4096 bytes) Default value 001 = 512 elements (2048 bytes) 010 = 256 elements (1024 bytes) 011 = 128 elements (512 bytes) 100 = 64 elements (256 bytes) 101 = 32 elements (128 bytes) 110 = 16 elements (64 bytes) 111 = 8 elements (32 bytes) Only the host controller uses this field.

Bit	R/W	Reset	Description
1	RW	0x0	RST: Controller Reset. Software uses this bit to reset the controller. This bit is set to zero by the Host/Device Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Host Controller: When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller results in undefined behavior. Device Controller: When software writes a one to this bit, the Device Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. Writing a one to this bit in Device Mode is not recommended. 0 = CLEAR 1 = SET
0	RW	0x0	RS: Run/Stop: Host Controller: When set to a 1, the Host Controller proceeds with the execution of the schedule. The Host Controller continues execution as long as this bit is set to a one. When this bit is set to 0, the Host Controller completes the current transaction on the USB and then halts. The HCHalted bit in the status register indicates when the Host Controller has finished the transaction and has entered the stopped state. Software should not write a one to this field unless the host controller is in the Halted state (i.e., HCHalted in the USBSTS register is a one). Device Controller: Writing a one to this bit will cause the device controller to enable a pull-up on D+ and initiate an attach event. This control bit is not directly connected to the pull-up enable, as the pull-up will become disabled upon transitioning into high-speed mode. Software should use this bit to prevent an attach event before the device controller has been properly initialized. Writing a 0 to this will cause a detach event. 0 = STOP 1 = RUN

22.16.4.19 USB2_CONTROLLER_1_USB2D_USBSTS_0

USB2D USB Status Register

Offset: 0x134 | Read/Write: R/W | Reset: 0b00000000000000000x100x0000x0000

Bit	R/W	Reset	Description
31:16	RW	0x0	PPCI: Port-n Change Detect - RW. Default = 0000h. The definition for each bit is identical to the Port Change Detect field (bit 2 of this register) except these bits are specific to a given port, where bit 16 = Port 1, 17 = Port 2, etc. For example, if bit 17 is set to a one then a port change event was detected on Port 2. The N_PORTS field in HCSPARAMS specifies how many ports are exposed by the host controller and thus how many bits in this field are valid.
15	RW	0x0	AS: Asynchronous Schedule Status. This bit reports the current status of the Asynchronous Schedule. When set to zero the asynchronous schedule status is disabled and if set to one the status is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. If AS = ASE: 1= Enable Asynchronous Schedule. 0= Disable Asynchronous Schedule. Only used by the host controller. 0 = DISABLE 1 = ENABLE
14	RW	0x0	PS: Periodic Schedule Status. This bit reports the current status of the Periodic Schedule. When set to zero the periodic schedule is disabled, and if set to one the status is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. If PS = PSE: 1 = Periodic Schedule is enabled. 0 = Periodic Schedule is disabled. Only used by the host controller. 0 = DISABLE 1 = ENABLE
13	RO	X	RCL: Reclamation. This is a read-only status bit used to detect an empty asynchronous schedule. Only used by the host controller. 0 = DISABLE 1 = ENABLE
12	RW	0x1	HCH: HCHalted. 1 = Default. This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to one after it has stopped executing because of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g., internal error). Only used by the host controller. 0 = UNHALTED 1 = HALTED

Bit	R/W	Reset	Description
11	RW	0x0	UALT_INT: ULPI alt_int Interrupt. 0 = Default. This interrupt bit is set when an RXCMD is received through the ULPI interface with bit 7 set (alt_int). The alt_int bit is set when an unmasked event occurs on any bit in the Carkit Interrupt Latch Register, in the ULPI PHY. The software should read the Carkit Interrupt Latch Register (Read to Clear) through the ULPI Viewport to check the source of the interrupt. Only present in designs where configuration constant VUSB_HS_PHY_ULPI = 1. 0 = NOT_ULPI_ALT_INT 1 = ULPI_ALT_INT
10	RW	0x0	ULPI_INT: ULPI Interrupt. This bit is set whenever an interrupt is received from ULPI PHY. Software writes 1 to clear it. 0 = NOT_ULPI_INT 1 = ULPI_INT
8	RW	0x0	SLI: DCSuspend. When a device controller enters a suspend state from an active state, this bit will be set to a 1. The device controller clears the bit upon exiting from a suspend state. Only used by the device controller. 0 = NOTSUSPEND 1 = SUSPENDED
7	RW	0x0	SRI: SOF Received. When the device controller detects a Start Of (micro) Frame, this bit will be set to a one. When an SOF is extremely late, the device controller will automatically set this bit to indicate that an SOF was expected. Therefore, this bit will be set roughly every 1ms in device FS mode and every 125 µs in HS mode and will be synchronized to the actual SOF that is received. Since device controller is initialized to FS before connect, this bit will be set at an interval of 1ms during the prelude to the connect and chirp. In Host Mode, this bit will be set every 125 µs and can be used by host controller driver as a time base. Software writes a 1 to this bit to clear it. This is a non-EHCI status bit. 0 = SOF_NOT_RCVD 1 = SOF_RCVD
6	RW	0x0	URI: USB Reset Received. When the device controller detects a USB Reset and enters the default state, this bit is set to a 1. Software can write a 1 to this bit to clear the USB Reset Received status bit. Only used by the device controller. 0 = NO_USB_RESET 1 = USB_RESET
5	RW	0x0	AAI: Interrupt and Asynchronous Advance. System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. Only used by the host controller. 0 = NOT_ADVANCED 1 = ADVANCED
4	RO	X	SEI: System Error. This bit is not used in this implementation and will always be set to "0". 0 = NO_ERROR 1 = ERROR
3	RW	0x0	FRI: Frame List Rollover. The Host Controller sets this bit to a 1 when the Frame List Index rolls over from its maximum value to 0. The exact value at which the rollover occurs depends on the frame list size. For example. If the frame list size (as programmed in the Frame List Size field of the USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX [1 3] toggles. Similarly, if the size is 512, the Host Controller sets this bit to a 1 every time FHINDEX [12] toggles. Only used by the host controller. 0 = NO_ROLLOVER 1 = ROLLOVER
2	RW	0x0	PCI: Port Change Detect. The Host Controller sets this bit to a 1 when on any port a Connect Status occurs, a Port Enable/Disable Change occurs, or the Force Port Resume bit is set as the result of a J-K transition on the suspended port. The Device Controller sets this bit to a one when the port controller enters the full or high-speed operational state. When the port controller exits the full or high-speed operational states due to Reset or Suspend events, the notification mechanisms are the USB Reset Received bit and the DCSuspend bits respectively. This bit is not EHCI compatible. 0 = NO_PORT_CHANGE 1 = PORT_CHANGE
1	RW	0x0	UEI: USB Error Interrupt. This bit gets set by the Host/Device controller when completion of a USB transaction results in an error condition. This bit is set along with the USBINT bit, if the TD on which the error interrupt occurred also ad its interrupt on complete (IOC) bit set. 0 = NO_ERROR 1 = ERROR

Bit	R/W	Reset	Description
0	RW	0x0	UI: USB Interrupt. This bit is set by the Host/Device Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) as an interrupt on complete (IOC) bit set. This bit is also set by the Host/Device Controller when a short packet is detected. A short packet is when the actual number of bytes received was less than the expected number of bytes. 0 = NO_INT 1 = INT

22.16.4.20 USB2_CONTROLLER_1_USB2D_USBINTR_0

USB2D USB Interrupt Enable Register

Offset: 0x138 | Read/Write: R/W | Reset: 0b0000000000000000xxxx00x000000000

Bit	Reset	Description
31:16	0x0	PPCE: Port-n Change Detect Enable - RW. Default = 0000h. The definition for each bit in this field is identical to bit 2 of this register (Port Change Interrupt Enable) except these bits are specific to a given port, where bit 16 = Port 1, 17 = Port 2, etc. For example, if bit 17 is set (1b) then a port change event was detected on Port 2. When a bit in this field is a one, and the corresponding Port-n Change Detect bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Port-n Change Detect bit.
11	0x0	UALTIE: ULPI alt_int Interrupt Enable. 1 = USB controller issues an interrupt if the ULPI_ALT_INT bit in the USBSTS register transitions. The interrupt is acknowledged by software writing a 1 to the ULPI_ALT_INT bit. 0 = DISABLE 1 = ENABLE
10	0x0	ULPIE: ULPI Interrupt Enable. 1 = USB controller issues an interrupt if ULPI_INT bit in USBSTS register transitions. The interrupt is acknowledged by software by writing a 1 to the ULPI_INT bit. 0 = DISABLE 1 = ENABLE
8	0x0	SLE: Sleep Enable. 1 = Device controller issues an interrupt if DCSuspend bit in USBSTS register transitions. The interrupt is acknowledged by software by writing a 1 to the DCSuspend bit. Only used by the device controller. 0 = DISABLE 1 = ENABLE
7	0x0	SRE: SOF Received Enable. 1 = Device controller issues an interrupt if SOF Received bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the SOF Received bit. 0 = DISABLE 1 = ENABLE
6	0x0	URE: USB Reset Enable.1 = Device controller issues an interrupt if USB Reset Received bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the USB Reset Received bit. Only used by the device controller. 0 = DISABLE 1 = ENABLE
5	0x0	AAE: Interrupt on Asynchronous Advance Enable. 1 = the host controller issues an interrupt at the next interrupt threshold if the Interrupt on Async Advance bit in the USBSTS register = 1. The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit. Only used by the host controller. 0 = DISABLE 1 = ENABLE
4	0x0	SEE: System Error Enable. 1 = Host/device controller issues an interrupt if the System Error bit in the USBSTS register = 1. The interrupt is acknowledged by software clearing the System Error bit. 0 = DISABLE 1 = ENABLE
3	0x0	FRE: Frame List Rollover Enable. 1 = Host controller issues an interrupt if the Frame List Rollover bit in the USBSTS register = 1. The interrupt is acknowledged by software clearing the Frame List Rollover bit. Only used by the host controller. 0 = DISABLE 1 = ENABLE
2	0x0	PCE: Port Change Detect Enable. 1 = Host/device controller issues an interrupt if Port Change Detect bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the Port Change Detect bit. 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
1	0x0	UEE: USB Error Interrupt Enable. 1 = Host controller issues an interrupt at the next interrupt threshold if the USBERRINT bit in USBSTS = 1. The interrupt is acknowledged by software clearing the USBERRINT bit in the USBSTS register. 0 = DISABLE 1 = ENABLE
0	0x0	UE: USB Interrupt Enable. 1 = Host/device issues an interrupt at the next interrupt threshold if the USBINT bit in USBSTS = 1. The interrupt is acknowledged by software clearing the USBINT bit. 0 = DISABLE 1 = ENABLE

22.16.4.21 USB2_CONTROLLER_1_USB2D_FRINDEX_0

USB2D USB Frame Index Register

Offset: 0x13c | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
13:0	X	FRINDEX: Frame Index. The value in this register increments at the end of each time frame (micro-frame). Bits [N: 3] are used for the Frame List current index. Each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following illustrates values of N based on the value of the Frame List Size field in the USBCMD register, when used in Host Mode. USBCMD [Frame List Size] Number Elements N 000b (1024) 12 001b (512) 11 010b (256) 10 011b (128) 9 100b (64) 8 101b (32) 7 110b (16) 6 111b (8) 5 In Device Mode, the value is the current frame number of the last frame transmitted. It is not used as an index. In either mode, bits 2:0 indicate the current micro-frame.

22.16.4.22 USB2_CONTROLLER_1_USB2D_PERIODICLISTBASE_0

USB2D Host Controller Frame List Base Address Register

Offset: 0x144 | Read/Write: R/W | Reset: 0b00000000000000000000xxxxxxxxxxxx

Bit	Reset	Description
31:25	0x0	USBADR: Device mode. The upper seven bits of this register represent the device address. After any controller reset or a USB reset, the device address is set to the default address (0). The default address will match all incoming addresses. Software shall reprogram the address after receiving a SET_ADDRESS request.
24	0x0	USBADRA: Device Address Advance. Default=0. When this bit is 0, any writes to USBADR are instantaneous. When this bit is written to a 1 at the same time or before USBADR is written, the write to the USBADR field is staged and held in a hidden register. After an IN occurs on endpoint 0 and is ACKed, USBADR will be loaded from the holding register. Hardware will automatically clear this bit on the following conditions: 1) IN is ACKed to endpoint 0. (USBADR is updated from staging register). 2) OUT/SETUP occur to endpoint 0. (USBADR is not updated). 3) Device Reset occurs (USBADR is reset to 0). Note: After the status phase of the SET_ADDRESS descriptor, the DCD has 2 ms to program the USBADR field. This mechanism will ensure this specification is met when the DCD cannot write of the device address within 2ms from the SET_ADDRESS status phase. If the DCD writes the USBADR with USBADRA=1 after the SET_ADDRESS data phase (before the prime of the status phase), the USBADR will be programmed instantly at the correct time and meet the 2ms USB requirement.
31:12	0x0	BASEADR: Host mode: This 32-bit register contains the beginning address of the Periodic Frame List in the system memory. HCD loads this register prior to starting the schedule execution by the Host Controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. Base Address (Low). These bits correspond to memory address signals [31:12], respectively. Only used by the host controller.

22.16.4.23 USB2_CONTROLLER_1_USB2D_ASYNCLISTADDR_0

USB2D Next Asynchronous List Address Register

Offset: 0x148 | Read/Write: R/W | Reset: 0b00000000000000000000000000xxxxx

Bit	Reset	Description
31:11	0x0	EPBASE: Device mode. This register contains the address of the top of the endpoint list in system memory. These bits correspond to memory address signals [31:11], respectively. This field will reference a list of up to 32 Queue Heads (QH). Only used by the device controller.
31:5	0x0	ASYBASE: Host mode. This 32-bit register contains the address of the next asynchronous queue head to be executed by the host. Link Pointer Low (LPL). These bits correspond to memory address signals [31:5], respectively. This field may only reference a Queue Head (OH). Only used by the host controller.

22.16.4.24 USB2_CONTROLLER_1_USB2D_ASYNCTTSTS_0

USB2D Asynchronous Buffer Status for Embedded TT Register

Offset: 0x14c | Read/Write: R/W | Reset: 0bx0000000xxxxxxxxxxxxxxxxxxxxxx0x

Bit	R/W	Reset	Description
30:24	RW	0x0	TTHA: Internal TT Hub Address representation. This field is used to match the Hub Address field in QH (queue head) and siTD to determine if the packet is routed to the internal TT for directly attached FS/LS devices. If the Hub Address in the QH or siTD does not match this address, then the packet will be broadcast on the High-Speed ports destined for a downstream High Speed hub with the address in QH/siTD.
1	RW	0x0	TTAC: Embedded TT Async Buffers Clear. (Read/Write to set). This field will clear all pending transactions in the embedded TT Async Buffer(s). The clear will take as much time as necessary to clear buffer without interfering with a transaction in progress. TTAC will return to zero after being set by software only after the actual clear occurs.
0	RO	X	TTAS: Embedded TT Async Buffers Status. (Read Only). This read-only bit will be 1 if one or more transactions are being held in the embedded TT Async. Buffers. When this bit is a zero, then all outstanding transactions in the embedded TT have been flushed.

22.16.4.25 USB2_CONTROLLER_1_USB2D_BURSTSIZE_0

USB2D Burst Size register

Offset: 0x150 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx0000100000001000

Bit	Reset	Description
15:8	0x8	TXPBURST: Programmable TX Burst Length. (Read/Write). This register represents the maximum length of a burst in 32-bit words while moving data from system memory to the USB bus.
7:0	0x8	RXPBURST: Programmable RX Burst Length. (Read/Write). This register represents the maximum length of a burst in 32-bit words while moving data from the USB bus to system memory.

22.16.4.26 USB2_CONTROLLER_1_USB2D_TXFILLTUNING_0

USB2D Transmit Fill Tuning Register

Offset: 0x154 | Read/Write: R/W | Reset: 0bxxxxxxxxxx000010xxx0000000000000

Bit	Reset	Description
21:16	0x2	TXFIFOTHRES: FIFO Burst Threshold. (Read/Write). This register controls the number of data bursts that are posted to the TX latency FIFO in Host Mode before the packet begins on to the bus. The minimum value is 2, and this value should be a low as possible to maximize USB performance. A higher value can be used in systems with unpredictable latency and/or insufficient bandwidth where the FIFO may underrun because the data transferred from the latency FIFO to USB occurs before it can be replenished from system memory. This value is ignored if the Stream Disable bit in USBMODE register is set.
12:8	0x0	TXSCHHEALTH: Scheduler Health Counter. (Read/Write To Clear) [Default = 0] This register increments when the host controller fails to fill the TX latency FIFO to the level programmed by TXFIFOTHRES before running out of time to send the packet before the next Start-Of-Frame. This health counter measures the number of times this occurs to provide feedback to selecting a proper TXSCHOH. Writing to this register will clear the counter and this counter will max out at 31.

Bit	Reset	Description
7:0	0x0	TXSCHOH: Scheduler Overhead. (Read/Write) [Default = 0] This register adds an additional fixed offset to the schedule time estimator described above as Tff. As an approximation, the value chosen for this register should limit the number of back-off events captured in the TXSCHHEALTH to less than 10 per second in a highly utilized bus. Choosing a value that is too high for this register is not desired as it can needlessly reduce USB utilization. The time unit represented in this register is 1.267 µs when a device is connected in High-Speed Mode. The time unit represented in this register is 6.333 µs when a device is connected in Low/Full Speed Mode

22.16.4.27 USB2_CONTROLLER_1_USB2D_ULPI_VIEWPORT_0

This register provides indirect access to the ULPI PHY register set. Although the USB controller performs access to the ULPI PHY register set, there may be extraordinary circumstances where software may need direct access.

Notes:

- *Writes to the ULPI through the viewport can substantially harm standard USB operations. Currently no usage model has been defined where software should need to execute writes directly to the ULPI PHY. See exception regarding optional features below.*
- *Executing read operations through the ULPI viewport should have no harmful side effects to standard USB operations.*

There are two operations that can be performed with the ULPI Viewport-- wakeup and read /write operations.

The wakeup operation is used to put the ULPI interface into normal operation mode and re-enable the clock if necessary. A wakeup operation is required before accessing the registers when the ULPI interface is operating in low power mode, serial mode, or Carkit mode.

The ULPI state can be determined by reading the sync state bit (ULPI_SYNC_STATE). If this bit is a one, then ULPI interface is running in normal operation mode and can accept read/write operations. If the ULPI_SYNC_STATE indicates a 0 then read/write operations will not be able to execute. Undefined behavior will result if ULPI_SYNC_STATE = 0 and a read or write operation is performed.

To execute a wakeup operation, write all 32 bits of the ULPI Viewport where ULPI_PORT is constructed appropriately and the ULPI_WAKEUP bit is a 1 and ULPI_RUN bit is a 0. Poll the ULPI Viewport until ULPI_WAKEUP is zero for the operation to complete.

To execute a read or write operation, write all 32 bits of the ULPI Viewport where ULPI_DATA_WR, ULPI_REG_ADDR, ULPI_PORT, ULPI_RD_WR are constructed appropriately and the ULPI_RUN bit is a 1. Poll the ULPI Viewport until ULPI_RUN is zero for the operation to complete. Once ULPI_RUN is zero, the ULPI_DATA_RD will be valid if the operation was a read.

The polling method above can be changed to interrupt driven using the ULPI interrupt defined in the USBSTS and USBINTR registers. When a wakeup or read/write operation is complete, the ULPI_INT interrupt will be set.

There are several optional features that may need to be enabled or disabled by system software as part of system configuration. These bits are contained in the Interface and OTG Control registers of the ULPI PHY register set. These registers also contain bits which are controlled by the link dynamically and therefore should be only modified by system software using the Set/Clear access method. Direct writes to these registers could have harmful side effects to the standard USB operations. The optional bits are as follows: Bits 3 through 7 in the Interface Control register and Bits 6 and 7 in the OTG Control register.

Please refer to the ULPI Specification Revision 1.1 for further information on the use of the optional features.

USB2D ULPI Viewport Register

Offset: 0x160 | Read/Write: R/W | Reset: 0b000xx00000000000xxxxxxxx00000000

Bit	R/W	Reset	Description
31	RW	0x0	ULPI_WAKEUP: ULPI Wakeup. Writing the 1 to this bit will begin the wakeup operation. The bit will automatically transition to 0 after the wakeup is complete. Once this bit is set, the driver cannot set it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time. 0 = CLEAR 1 = SET
30	RW	0x0	ULPI_RUN: ULPI read/write Run. Writing the 1 to this bit will begin the read/write operation. The bit will automatically transition to 0 after the read/write is complete. Once this bit is set, the driver cannot set it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time. 0 = CLEAR 1 = SET
29	RW	0x0	ULPI_RD_WR: ULPI read/write control. (0) Read; (1) Write. This bit selects between running a read or write operation. 0 = READ 1 = WRITE
27	RO	X	ULPI_SYNC_STATE: ULPI sync state. (1) Normal Sync. State. (0) In another state (i.e., Carkit, serial, low power). This bit represents the state of the ULPI interface. 0 = NOT_NORMAL 1 = NORMAL
26:24	RW	0x0	ULPI_PORT: ULPI PHY port number. This field should be always written as 0.
23:16	RW	0x0	ULPI_REG_ADDR: ULPI PHY register address. When doing a read or write operation to the ULPI PHY, the address of the ULPI PHY register being accessed is written to this field.
15:8	RO	X	ULPI_DATA_RD: ULPI PHY data read. The data from the ULPI PHY register can be read from here after the read operation completes.
7:0	RW	0x0	ULPI_DATA_WR: ULPI PHY data write. The data to write to the ULPI PHY register is written here.

22.16.4.28 USB2_CONTROLLER_1_USB2D_PORTSC1_0

USB2D Port Status/Control 1 Register

Offset: 0x174 | Read/Write: R/W | Reset: 0b0000000xx0000000xxx1xx00x0xx010x

Bit	R/W	Reset	Description
31:25	RW	0x0	DA: Device Address. Default = 0000000b. The 7-bit USB device address for the device attached to an immediately downstream of the associated root port. A value of zero indicates no device is present or software support for this feature is not present. This is used by the Controller when sending the LPM token. This field is only valid when the core is operating in Host Mode. If in Device Mode it will be read only and always equal to 0000000b.
24:23	RO	X	SSTS: Suspend Status. Default = 00b. These two bits are used by software to determine whether an L1-based suspend request was successful, specifically: 00b - L1 state entered with success. ACK received from peripheral. 01b - NYET received from peripheral. It was not able to enter L1 state this time. 10b - L1 state not supported by peripheral. STALL received. 11b - Peripheral did not respond or an error occurred. The value of this field is only valid when the port resides in the L0 state - that is, the meaning of these bits is invalid whenever bit 7 of this register (SUSP) is one. Ideally, the Controller driver should read this register if it receives an interrupt after issuing a suspend using L1 support. In case of a non-success a port change interrupt will be fired and this field should be checked for a possible L1 failure. This field is only valid when the core is operating in Host Mode. If in Device Mode it will be always equal to 00b. 0 = L1STATE_ENTERED 1 = NYET_PERIPH 2 = L1STATE_NOT_SUPPORTED 3 = PERIPH_NORESP_ERR

Bit	R/W	Reset	Description
22	RW	0x0	WKOC: Default = 0b. Wake on Over-current Enable: Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. This field is zero if Port Power (PP) is zero. This bit should only be used when operating in Host mode. Writing this bit to 1 while the controller is working in Device Mode can result in undefined behavior. 0 = DISABLE 1 = ENABLE
21	RW	0x0	WKDS: Wake on Disconnect Enable: Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. This field is zero if Port Power (PP) is zero or in Device Mode. This bit should only be used when operating in Host mode. Writing this bit to 1 while the controller is working in Device Mode can result in undefined behavior. This bit should not be written to 1 if there is no device connected. After the device disconnect is detected, this bit should be cleared to 0. 0 = DISABLE 1 = ENABLE
20	RW	0x0	WKCN: Wake on Connect Enable: Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. This field is zero if Port Power (PP) is zero or in Device Mode. This bit should only be used when operating in Host mode. Writing this bit to 1 while the controller is working in Device Mode can result in undefined behavior. This bit should not be written to 1 while the device is connected. After the device connection is detected, this bit should be cleared to 0. 0 = DISABLE 1 = ENABLE
19:16	RW	0x0	PTC: Port Test Control: Any value other than zero indicates that the port is operating in test mode. Value Specific Test. 0000b Not enabled. 0001b J_ STATE. 0010b K_STATE. 0011b SEQ_NAK. 0100b Packet. 0101b FORCE_ENABLE. 0110b to 1111b Reserved. Refer to Chapter 7 of the USB Specification Revision 2.0 for details on each test mode. 0 = NORMAL_OP 1 = TEST_J 2 = TEST_K 3 = TEST_SE0_NAK 4 = TEST_PKT 5 = TEST_FORCE_ENABLE
15:14	RO	X	PIC: Port Indicator Control: This field is not supported in the current implementation. Please use a GPIO if you wish to use Port Indicators.
13	RO	X	PO: Port Owner. Port owner handoff is not implemented in this design, therefore this bit will always be 0.
12	RW	0x1	PP: Port Power: The function of this bit depends on the value of the Port Power Switching (PPC) field in the HCSPARAMS register. The behavior is as follows: PPC PP Operation 0b 0b Read Only. A device controller with no OTG capability does not have port power control switches. 1b 1b/0b RW. Host/OTG controller requires port power control switches. This bit represents the current setting of the switch (0=off, 1=on). When power is not available on a port (i.e., PP equals a 0), the port is non-functional and will not report attaches, detaches, etc. When an over-current condition is detected on a powered port and PPC is a one, the PP bit in each affected port may be transitioned by the host controller driver from a one to a zero (removing power from the port). 0 = NOT_POWERED 1 = POWERED

Bit	R/W	Reset	Description
11:10	RO	X	LS: These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. The encoding of the bits is: 00b = SE0 10b = J-state 01b = K-state 11b = Undefined The value of this field is undefined if Port Power (PP) is zero in Host Mode. In Host Mode, the use of line state by the host controller driver is not necessary (unlike EHCI), because the port controller state machine and the port routing manage the connection of LS and FS. In Device Mode, the use of line state by the device controller driver is not necessary. 0 = SE0 1 = K_STATE 2 = J_STATE 3 = UNDEFINED
9	RW	0x0	SLP: Suspend using L1 - RW. Default = 0b. When this bit is set to '1' and a non-zero Device Address (DA) is specified Controller will instigate L1 entry during suspend (bit 7) and L1 exit during resume (bit 6). When set to zero the Controller will use the legacy (L2) mechanism. Software should only set this bit when the device attached immediately downstream supports L1 transitions. When acting as device, this bit is read-only and set to '1' by the hardware when the Controller enters is L1 state (LPM token received and accepted). Note: HSP is redundant with PSPD(27:26). This bit is not defined in the EHCI specification.
8	RW	0x0	PR: This field is zero if Port Power (PP) is zero. In Host Mode: Read/Write. 1=Port is in Reset. 0=Port is not in Reset. When software writes a one to this bit, the bus-reset sequence as defined in the USB Specification Revision 2.0 is started. This bit will automatically change to zero after the reset sequence is complete. This behavior is different from EHCI where the host controller driver is required to set this bit to a zero after the reset duration is timed in the driver. In Device Mode: This bit is a read-only status bit. Device reset from the USB bus is also indicated in the USBSTS register. 0 = NOT_USB_RESET 1 = USB_RESET
7	RO	X	SUSP: Port suspend. 1=Port in suspend state. 0=Port not in suspend state. In Host Mode: Read/Write. Port Enabled bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0x Disable 10 Enable 11 Suspend When in the suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. The host controller will unconditionally set this bit to zero when software sets the Force Port Resume bit to zero. A write of zero to this bit is ignored by the host controller. If host software sets this bit to a one when the port is not enabled (i.e., Port enabled bit is a zero), the results are undefined. This field is zero if Port Power (PP) is zero in Host Mode. In Device Mode: Read Only. This bit is a read-only status bit. 0 = NOT_SUSPEND 1 = SUSPEND

Bit	R/W	Reset	Description
6	RW	0x0	FPR: Force Port Resume. 1= Resume detected/driven on port. 0=No resume (K state) detected/ driven on port. In Host Mode: Software sets this bit to one to drive resume signaling. The Host Controller sets this bit to one if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to one. This bit will automatically change to zero after the resume sequence is complete. This behavior is different from EHCI where the host controller driver is required to set this bit to a zero after the resume duration is timed in the driver. Note that when the Host controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. This bit remains a one until the port has switched to the high-speed idle. Writing a zero has no effect because the port controller will time the resume operation to clear the bit when the port control state switches to HS or FS idle. This field is zero if Port Power (PP) is zero in Host Mode. This bit is not-EHCI compatible. In Device mode: After the device has been in Suspend State for 5 ms or more, software must set this bit to one to drive resume signaling before clearing. The Device Controller will set this bit to one if a J-to-K transition is detected while the port is in the Suspend state. The bit will be cleared when the device returns to normal operation. Also, when this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to one. Software should ensure that the PHY clock is operational before writing a 1 to this bit to start the resume sequence. This is true for both Device and Host modes. 0 = NO_RESUME 1 = RESUME
5	RO	X	OCC: Over-current Change: Not supported 0 = NO_CHANGE 1 = CHANGE
4	RO	X	OCA: Over-current Active: Not supported 0 = NO_OVER_CURRENT 1 = OVER_CURRENT
3	RW	0x0	PEC: Port Enable/Disable Change: 1=Port enabled/disabled status has changed. 0=No change. In Host Mode: For the root hub, this bit gets set to a one only when a port is disabled due to disconnect on the port or due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification). Software clears this by writing a one to it. This field is zero if Port Power (PP) is zero. In Device mode: The device port is always enabled. (This bit will be zero) 0 = NO_CHANGE 1 = CHANGE
2	RW	0x1	PE: Port Enabled/Disabled: 1=Enable. 0=Disable (default) In Host Mode: Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a one to this field. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by the host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. When the port is disabled, (0b) downstream propagation of data is blocked except for reset. This field is zero if Port Power (PP) is zero in Host Mode. In Device Mode: The device port is always enabled. (This bit will be one) 0 = PORT_DISABLED 1 = PORT_ENABLED
1	RW	0x0	CSC: Connect Status Change: 1 =Change in Current Connect Status. 0=No change (default) In Host Mode: Indicates a change has occurred in the port's Current Connect Status. The host/ device controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software clears this bit by writing a one to it. This field is zero if Port Power (PP) is zero in Host Mode. This bit is undefined in device controller mode. 0 = NO_CHANGE 1 = CHANGE

Bit	R/W	Reset	Description
0	RO	X	CCS: Current Connect Status. In Host Mode: 1=Device is present on port. 0=No device is present (default). This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. This field is zero if Port Power (PP) is zero in Host Mode. In Device Mode: 1=Attached. 0=Not Attached (default). A one indicates that the device successfully attached and is operating in either high speed or full speed as indicated by the High Speed Port bit in this register. A zero indicates that the device did not attach successfully or was forcibly disconnected by the software writing a zero to the Run bit in the USBCMD register. It does not state the device being disconnected or suspended. 0 = NOT_CONNECTED 1 = CONNECTED

22.16.4.29 USB2_CONTROLLER_1_USB2D_HOSTPC1_DEVLC_0

USB2D Device Mode LPM Behavior and Control Register

This register controls the LPM behavior and controls the behavior of each USB port. Only available when in Device Mode. This register shares the same address with the HOSTPC1 register (which is used only in Host Mode).

USB2D Host Mode LPM Behav and Control Register

This register controls the LPM behavior and controls the behavior of each USB port. Only available when in Host Mode. This register shares the same address with the DEVLC register (which is used only in Device Mode).

Offset: 0x1b4 | Read/Write: R/W | Reset: 0b0000xxx0000000000000xxxxxxxxxxx0

Bit	R/W	Reset	Description
31:29	RW	0x0	PTS: Parallel transceiver select. This bit is not defined in the EHCI specification. 0 = UTMI 1 = RESERVED 2 = ULPI 3 = ICUSB_SER
28	RW	0x0	STS: Serial transceiver not selected. This is the only value supported. This bit is not defined in the EHCI specification. 0 = PARALLEL_IF 1 = SERIAL_IF
27	RO	X	PTW: Parallel Transceiver Width. Fixed to 0. This bit is not defined in the EHCI specification. 0 = EIGHT_BIT 1 = RESERVED
26:25	RO	X	PSPD: This register field indicates the speed at which the port is operating. 00 = Full Speed 01 = Low Speed 10 = High Speed. This bit is not defined in the EHCI specification. 0 = FULL_SPEED 1 = LOW_SPEED 2 = HIGH_SPEED 3 = RESERVED
24	RW	0x0	ALPD: Auto Low Power While Disconnect - RW. Default = 0b. If set, this feature will be enabled, and every time the port enters the disconnect state, it will also enter in low power state, disabling the transceiver clock. The behavior will be same as if the PHCD bit was enabled (in fact this bit will be set to 1 as soon as low power mode is enabled).When this field is set the WKCN field of PORTSCx register (Wake on Connect Enable) will also be set. This way the core will wake up in case a connect is detected. There will be a delay between the detection of a disconnect and actually enter in low power mode. This delay can be controlled by writing to the ALPDD field in the register USBMODE 0 = DONT_AUTO_LOW_POWER_WHILE_DISCONNECT 1 = AUTO_LOW_POWER_WHILE_DISCONNECT
23	RW	0x0	PFSC: Port Force Full Speed Connect - RW. Default = 0b. Writing this bit to a '1b' will force the port to only connect at Full Speed. It disables the chirp sequence that allows the port to identify itself as High Speed. This is useful for testing FS configurations with an HS host, hub or device. This bit is not defined in the EHCI specification. 0 = DONT_FORCE_FULL_SPEED 1 = FORCE_FULL_SPEED

Bit	R/W	Reset	Description
22	RW	0x0	PHCD: PHY Low Power Suspend - Clock disable: Writing this bit to a 1 will disable the PHY clock. Writing a 0 enables it. Reading this bit will indicate the status of the PHY clock. NOTE: The PHY clock cannot be disabled if it is being used as the system clock. In Device Mode, the PHY can be put into Low Power Clock Disable when the device is not running (USBCMD RS=0b) or the host has signaled suspend (PORTSCx SUSP=1b). Low Power Clock Disable will be cleared automatically when the host has signaled resume. Before forcing a resume from the device, the Controller driver must clear this bit. In Host Mode, the PHY can be put into Low Power Suspend Clock Disable when the downstream device has been put into suspend mode or when no downstream device is connected. Low Power Clock Disable is completely under the control of software. 0 = DISABLE 1 = ENABLE
21:20	RW	0x0	LPMX: Auto LPM set - RW. Default = 00b. This bit field is valid during Host Mode Only. For Device Mode this is reserved. Value Meaning 00b Disables auto LPM. 01b If there is no activity for a certain number of SOFs the controller will send an LPM token, enter in suspend and issue a port change interrupt. 10b Same as above but without issuing an interrupt. 11b Reserved for futures LPM enhancements. The detection of no activity is based on the absence of response from the downstream device. Because of this limitation this feature should not be used if ISO OUT endpoints are being used (as no handshake is expected).
17	RW	0x0	ASUS: Auto Low Power - RW. Default = 0b. This bit field is valid during Device Mode Only. In Host Mode it is part of ELPM field. This bit is used to control the auto low power feature. If set, the auto low power feature will be enabled and every time the port enters in suspend state it will also enter in low power state, disabling the transceiver clock. The behavior will be the same as if the PHCD bit was enabled (in fact this bit will be set to '1' as soon as low power mode is enabled). 0 = DISABLE 1 = ENABLE
19:16	RW	0x0	EPLPM: Endpoint for LPM token - RW. Default = 0000b. This bit field is valid during Host Mode only. For Device Mode [19:18] is reserved and 17 is ASUS, while 16 is STL. This sets the endpoint number to which the LPM token will be sent. It will be directly mapped to the ENDP field in the LPM token with the EXT PID.
16	RW	0x0	STL: STALL reply to LPM token - RW. Default = 0b. This bit field is valid during Device Mode Only. In Host Mode it is a part of ELPM field. When this bit is set to '1', the Controller will reply always with STALL to all incoming LPM tokens. This bit overrides the LPM NYET bit (NYT). 0 = DISABLE 1 = ENABLE
15:12	RW	0x0	LPMFRM: Auto LPM SOF Threshold - RW. Default = 0000b. This bit field is valid during Host Mode Only. For Device Mode this is reserved. This holds the SOF counter threshold. When the number of SOFs with no activity in between reaches this threshold and the auto LPM is enabled, an LPM token is sent and the port enters the suspend state. The SOF counter for this threshold is incremented each 125 µs, even if the port is not in HS operation.
11:1	RO	X	BA: bmAttributes - RO. Default = 00000000000b. This holds the bmAttributes field of the LPM sub-token received, after the EXT PID token.
0	RW	0x0	NYT_ASUS: NYET reply to LPM token - RW. Default = 0b. This bit is NYT during Device Mode. When this bit is '1', the device controller will NYET all the LPM tokens. When this bit is set to '0', the Controller will ACK all the LPM tokens if the STALL bit (STL) is also set to '0'. This bit is ASUS in Host Mode. This bit is used to control the auto low power feature. If set, the auto low power feature is enabled and every time the port enters the suspend state, it also enters the low power state, disabling the transceiver clock. The behavior is the same as if the PHCD bit was enabled (this bit is set to '1' as soon as low power mode is enabled). 0 = DISABLE 1 = ENABLE

22.16.4.30 USB2_CONTROLLER_1_USB2D_OTGSC_0

USB2D On-The-Go (OTG) Status and Control Register

Offset: 0x1f4 | Read/Write: R/W | Reset: 0bx0000000x0000000xxxxxxxxxx100x00

Bit	R/W	Reset	Description
30	RW	0x0	DPIE: Data Pulse Interrupt Enable. Setting this bit enables the Data pulse interrupt. 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
29	RW	0x0	ONEMSE: 1 millisecond timer Interrupt enable. Setting this bit enables the 1 millisecond timer interrupt. 0 = DISABLE 1 = ENABLE
28	RW	0x0	BSEIE: B Session End Interrupt Enable. Setting this bit enables the B session end interrupt 0 = DISABLE 1 = ENABLE
27	RW	0x0	BSVIE: B Session Valid Interrupt Enable. Setting this bit enables the B session valid interrupt 0 = DISABLE 1 = ENABLE
26	RW	0x0	ASVIE: A Session Valid Interrupt Enable. Setting this bit enables the A session valid interrupt 0 = DISABLE 1 = ENABLE
25	RW	0x0	AVVIE: A VBus Valid Interrupt Enable. Setting this bit enables the A VBus valid interrupt 0 = DISABLE 1 = ENABLE
24	RW	0x0	IDIE: USB ID Interrupt Enable. Setting this bit enables the USB ID interrupt 0 = DISABLE 1 = ENABLE
22	RW	0x0	DPIS: Data Pulse Interrupt Status. This bit is set when data bus pulsing occurs on DP or DM. Data bus pulsing is only detected when USBMODE.CM = Host (11) and PORTSC(0). PortPower = Off (0). Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
21	RW	0x0	ONEMSS: 1 millisecond timer Interrupt Status: This bit is set once every millisecond. Software writes a 1 to clear it. 0 = INT_CLEAR 1 = INT_SET
20	RW	0x0	BSEIS: B Session End Interrupt Status. This bit is set when VBus has fallen below the B session end threshold. Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
19	RW	0x0	BSVIS: B Session Valid Interrupt Status. This bit is set when VBus has either risen above or fallen below the B session valid threshold (0.8 VDC). Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
18	RW	0x0	ASVIS: A Session Valid Interrupt Status. This bit is set when VBus has either risen above or fallen below the A session valid threshold (0.8 VDC). Software writes a one to clear this bit. 0 = INT_CLEAR 1 = INT_SET
17	RW	0x0	AVVIS: A VBus Valid Interrupt Status. This bit is set when VBus has either risen above or fallen below the VBus valid threshold (4.4 VDC) on an A device. Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
16	RW	0x0	IDIS: USB ID Interrupt Status. This bit is set when a change on the ID input has been detected. Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
14	RO	X	DPS: Data Bus Pulsing Status. A 1 indicates data bus pulsing is being detected on the port. 0 = STS_CLEAR 1 = STS_SET
13	RO	X	ONEMST: 1 millisecond timer toggle. This bit toggles once per millisecond 0 = STS_CLEAR 1 = STS_SET
12	RO	X	BSE: B session End. Indicates VBus is below the B session end threshold 0 = STS_CLEAR 1 = STS_SET
11	RO	X	BSV: B Session Valid. Indicates VBus is above the B session valid threshold 0 = STS_CLEAR 1 = STS_SET
10	RO	X	ASV: A Session Valid. Indicates VBus is above the A session valid threshold 0 = STS_CLEAR 1 = STS_SET

Bit	R/W	Reset	Description
9	RO	X	AVV: A VBus Valid. Indicates VBus is above the A VBus valid threshold 0 = STS_CLEAR 1 = STS_SET
8	RO	X	ID: USB ID: 0 = A-device 1 = B-device 0 = A_DEV 1 = B_DEV
5	RW	0x1	IDPU: USB ID Pullup 0 = CLEAR 1 = SET
4	RW	0x0	DP: Data Pulsing. Setting this bit causes the pull-up on DP to be asserted for data pulsing during SRP. 0 = NO_DATA_PULSE 1 = DATA_PULSE
3	RW	0x0	OT: OTG Termination. This bit must be set when the OTG device is in Device Mode, this controls the pulldown on DM. 0 = NO_OTG_TERM 1 = OTG_TERM
1	RW	0x0	VC: VBUS Charge. Setting this bit causes the VBus line to be charged. This is used for VBus pulsing during SRP. 0 = NO_VBUS_CHRG 1 = VBUS_CHRG
0	RW	0x0	VD: VBUS_Discharge. Read/write. Setting this bit causes Vbus to discharge through a resistor. 0 = NO_VBUS_DISCHRG 1 = VBUS_DISCHRG

22.16.4.31 USB2_CONTROLLER_1_USB2D_USBMODE_0

USB2D USB Device Mode Register

Offset: 0x1f8 | Read/Write: R/W | Reset: 0b00000000000000000xxxxxxxxx0xxxxx

Bit	R/W	Reset	Description
31:16	RW	0x0	ALPDD: Auto Low Power While Disconnect Delay. Used when the ALPD field of the HOSTPCx register is set. Defines the delay between disconnect detection and entering in low power mode. The delay is <this register value>*64*100/3 in milliseconds. The maximum value is 65535*64*100/3 = 139,808 ms. The minimum value is 0. Only used in Host mode.
15	RW	0x0	SRT: Shorten USB Reset Time. Software should never set this to 1.
5	RW	0x0	VBPS: VBUS Power Select This can be used by logic that selects between an on-chip Vbus power source (charge pump) and an off-chip source in systems when both are available. Only to be used in Host Mode. Software should not use this.
4	RO	X	SDIS: Stream disable: 1 Streaming is disabled - helpful to avoid overruns/underruns when system load is too high. 0 = STREAM_ENABLE 1 = STREAM_DISABLE
3	RO	X	SLOM: Setup Lockout Mode: In Device Mode, this bit controls the behavior of the setup lockout mechanism. 0 - Setup lockout is ON (default) 1 Setup lockout is OFF. Firmware requires the use of setup tripwire semaphore in USB2D_USBCMD register. 0 = LOCKOUT_ON 1 = LOCKOUT_OFF
2	RO	X	ES: Endian Select: Note: For this implementation, this should be always set to 0 (little endian). 0 = LITTLE_ENDIAN 1 = RESERVED
1:0	RO	X	CM: Controller Mode: The controller mode will default to an idle state and will need to be initialized to the desired operating mode after reset. This register can only be written once after reset. If it is necessary to switch modes, software must reset the controller by writing to the RESET bit in the USBCMD register before reprogramming this register. 00 = Idle [Default]. 01 = Reserved. 10 = Device Controller. 11 = Host Controller. 0 = IDLE 1 = RESERVED 2 = DEVICE_MODE 3 = HOST_MODE

22.16.4.32 USB2_CONTROLLER_1_USB2D_ENDPTNAK_0

USB2D Endpoint NAK register

Offset: 0x200 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:16	0x0	EPTN: TX Endpoint NAK R/WC. Each TX endpoint has 1 bit in this field. The bit is set when the device sends a NAK handshake on a received IN token for the corresponding endpoint. 0 = CLEAR 1 = SET
15:0	0x0	EPRN: RX Endpoint NAK R/WC. Each RX endpoint has 1 bit in this field. The bit is set when the device sends a NAK handshake on a received OUT or PING token for the corresponding endpoint. 0 = CLEAR 1 = SET

22.16.4.33 USB2_CONTROLLER_1_USB2D_ENDPTNAK_ENABLE_0

USB2D Endpoint NAK Enable Register

Offset: 0x204 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:16	0x0	EPTNE: TX Endpoint NAK Enable R/W. Each bit is an enable bit for the corresponding TX Endpoint NAK bit. If this bit is set and the corresponding TX Endpoint NAK bit is set, the NAK Interrupt bit is set. 0 = DISABLE 1 = ENABLE
15:0	0x0	EPRNE: RX Endpoint NAK Enable R/W. Each bit is an enable bit for the corresponding RX Endpoint NAK bit. If this bit is set and the corresponding RX Endpoint NAK bit is set, the NAK Interrupt bit is set. 0 = DISABLE 1 = ENABLE

22.16.4.34 USB2_CONTROLLER_1_USB2D_ENDPTSETUPSTAT_0

USB2D Endpoint Setup Status Register

Offset: 0x208 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx0000000000000000

Bit	Reset	Description
15	0x0	ENDPTSETUPSTAT15: Endpoint 15 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
14	0x0	ENDPTSETUPSTAT14: Endpoint 14 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
13	0x0	ENDPTSETUPSTAT13: Endpoint 13 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
12	0x0	ENDPTSETUPSTAT12: Endpoint 12 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD

Bit	Reset	Description
11	0x0	ENDPTSETUPSTAT11: Endpoint 11 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
10	0x0	ENDPTSETUPSTAT10: Endpoint 10 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
9	0x0	ENDPTSETUPSTAT9: Endpoint 9 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
8	0x0	ENDPTSETUPSTAT8: Endpoint 8 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
7	0x0	ENDPTSETUPSTAT7: Endpoint 7 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
6	0x0	ENDPTSETUPSTAT6: Endpoint 6 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
5	0x0	ENDPTSETUPSTAT5: Endpoint 5 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
4	0x0	ENDPTSETUPSTAT4: Endpoint 4 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
3	0x0	ENDPTSETUPSTAT3: Endpoint 3 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD

Bit	Reset	Description
2	0x0	ENDPTSETUPSTAT2: Endpoint 2 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in Device Mode. 0 = NOT_RCVD 1 = SETUP_RCVD
1	0x0	ENDPTSETUPSTAT1: Endpoint 1 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. Hardware will clear this bit when this endpoint is successfully primed. This is only used in Device Mode. 0 = DONT_PRIME 1 = PRIME
3	0x0	PERB3: Prime Endpoint Receive Buffer: This bit is used to request that a buffer prepared for a receive operation when a USB host initiates a USB OUT transaction to this endpoint. Software should write a one to this bit whenever posting a new transfer descriptor to this endpoint. Hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. Hardware will clear this bit when this endpoint is successfully primed. This is only used in Device Mode. 0 = DONT_PRIME 1 = PRIME
2	0x0	PERB2: Prime Endpoint Receive Buffer: This bit is used to request that a buffer prepared for a receive operation when a USB host initiates a USB OUT transaction to this endpoint. Software should write a one to this bit whenever posting a new transfer descriptor to this endpoint. Hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. Hardware will clear this bit when this endpoint is successfully primed. This is only used in Device Mode. 0 = DONT_PRIME 1 = PRIME
1	0x0	PERB1: Prime Endpoint Receive Buffer: This bit is used to request that a buffer prepared for a receive operation when a USB host initiates a USB OUT transaction to this endpoint. Software should write a one to this bit whenever posting a new transfer descriptor to this endpoint. Hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. Hardware will clear this bit when this endpoint is successfully primed. This is only used in Device Mode. 0 = DONT_PRIME 1 = PRIME
0	0x0	PERB0: Prime Endpoint Receive Buffer: This bit is used to request that a buffer prepared for a receive operation when a USB host initiates a USB OUT transaction to this endpoint. Software should write a one to this bit whenever posting a new transfer descriptor to this endpoint. Hardware will automatically use this bit to begin parsing for a new transfer descriptor from the queue head and prepare a receive buffer. Hardware will clear this bit when this endpoint is successfully primed. This is only used in Device Mode. 0 = DONT_PRIME 1 = PRIME

22.16.4.36 USB2_CONTROLLER_1_USB2D_ENDPTFLUSH_0

USB2D Endpoint De-Initialization Register

Offset: 0x210 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31	0x0	FETB15: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
30	0x0	FETB14: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
29	0x0	FETB13: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
28	0x0	FETB12: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
27	0x0	FETB11: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
26	0x0	FETB10: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
25	0x0	FETB9: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
24	0x0	FETB8: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
23	0x0	FETB7: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
22	0x0	FETB6: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH

Bit	Reset	Description
21	0x0	FETB5: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
20	0x0	FETB4: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. If a packet is in progress for the associated endpoint that transfer will continue until completion. Hardware clears this register after the endpoint flush operation is successful. This is only used in Device Mode. 0 = DONT_FLUSH 1 = FLUSH
19	0x0	FETB3: Flush Endpoint Transmit Buffer: Writing a one to this bit causes the associated endpoint to clear any primed buffers. 22.16.4.37 USB2_CONTROLLER_1_USB2D_ENDPTSTATUS_0

USB2D Endpoint Status Register

Offset: 0x214 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31	X	ETBR15: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
30	X	ETBR14: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
29	X	ETBR13: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
28	X	ETBR12: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
27	X	ETBR11: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
26	X	ETBR10: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY
25	X	ETBR9: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY

This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY

Bit	Reset	Description
0	X	ERBR0: Endpoint Receive Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in Device Mode. 0 = NOT_READY 1 = READY

22.16.4.38 USB2_CONTROLLER_1_USB2D_ENDPTCOMPLETE_0

USB2D Endpoint Complete Register

Offset: 0x218 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31	0x0	ETCE15: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
30	0x0	ETCE14: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
29	0x0	ETCE13: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
28	0x0	ETCE12: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
27	0x0	ETCE11: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
26	0x0	ETCE10: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
25	0x0	ETCE9: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
24	0x0	ETCE8: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE

Bit	Reset	Description
23	0x0	ETCE7: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
22	0x0	ETCE6: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
21	0x0	ETCE5: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
20	0x0	ETCE4: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
19	0x0	ETCE3: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
18	0x0	ETCE2: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
17	0x0	ETCE1: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
16	0x0	ETCE0: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
15	0x0	ERCE15: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
14	0x0	ERCE14: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
13	0x0	ERCE13: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE

Bit	Reset	Description
12	0x0	ERCE12: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
11	0x0	ERCE11: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
10	0x0	ERCE10: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
9	0x0	ERCE9: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
8	0x0	ERCE8: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
7	0x0	ERCE7: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
6	0x0	ERCE6: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
5	0x0	ERCE5: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
4	0x0	ERCE4: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
3	0x0	ERCE3: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
2	0x0	ERCE2: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE

Bit	Reset	Description
1	0x0	ERCE1: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE
0	0x0	ERCE0: Endpoint Receive Complete Event: Each bit indicates a received event (OUT/SETUP) occurred and software should read the corresponding endpoint queue to determine the transfer status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in Device Mode. 0 = NOT_COMPLETE 1 = COMPLETE

22.16.4.39 USB2_CONTROLLER_1_USB2D_ENDPTCTRL0_0

USB2D Endpoint Control 0 Register

Offset: 0x21c | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
23	X	TXE: TX Endpoint Enable. Endpoint 0 is always enabled. 0 = DISABLE 1 = ENABLE
19:18	X	TXT: TX Endpoint Type. Endpoint 0 is fixed as a Control Endpoint. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
16	X	TXS: TX Endpoint Stall: Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue returning STALL until the bit is cleared by software or it will automatically be cleared upon receipt of a new SETUP request. 0 = EP_OK 1 = EP_STALL
7	X	RXE: RX Endpoint Enable. Endpoint 0 is always enabled. 0 = DISABLE 1 = ENABLE
3:2	X	RXT: RX Endpoint Type. Endpoint 0 is fixed as a Control Endpoint. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
0	X	RXS: RX Endpoint Stall: Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue returning STALL until the bit is cleared by software or it will automatically be cleared upon receipt of a new SETUP request. 0 = EP_OK 1 = EP_STALL

22.16.4.40 USB2_CONTROLLER_1_USB2D_ENDPTCTRL<n>_0

USB2D Endpoint Control n Register

USB2D Endpoint Control 1 through 15 registers have the same field definitions and reset value. In the register offset, the value n is the register number (1 through 15).

Offset: 0x220 + (n – 1) * 0x04 | Read/Write: R/W | Reset: 0bxxxxxxxx000x00x0xxxxxxxx000x00x0

Bit	R/W	Reset	Description
23	RW	0x0	TXE: TX Endpoint Enable. An Endpoint should be enabled only after it has been configured. 0 = DISABLE 1 = ENABLE
22	RW	0x0	TXR: TX Data Toggle Reset: Whenever a configuration event is received for this Endpoint, software must write a one to this bit in order to synchronize the data PIDs between the Host and device. 0 = KEEP_GOING 1 = RESET_PID_SEQ

Bit	R/W	Reset	Description
21	RW	0x0	TXI: TX Data Toggle Inhibit: This bit is only used for test and should always be written as zero. Writing a one to this bit will cause this endpoint to ignore the data toggle sequence and always transmit DATA0 for a data packet. 0 = DIS_PID_SEQ 1 = ENB_PID_SEQ
19:18	RW	0x0	TXT: TX Endpoint Type: 00 = Control. 01 = Isochronous. 10 = Bulk. 11 = Interrupt. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
17	RO	X	TXD: This bit is fixed to 0.
16	RW	0x0	TXS: TX Endpoint Stall: This bit will be set automatically upon receipt of a SETUP request if this Endpoint is not configured as a Control Endpoint. It will be cleared automatically upon receipt of a SETUP request if this Endpoint is configured as a Control Endpoint. Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue to returning STALL until this bit is either cleared by software or automatically cleared as above. 0 = EP_OK 1 = EP_STALL
7	RW	0x0	RXE: RX Endpoint Enable. An Endpoint should be enabled only after it has been configured. 0 = DISABLE 1 = ENABLE
6	RW	0x0	RXR: RX Data Toggle Reset: Whenever a configuration event is received for this Endpoint, software must write a one to this bit in order to synchronize the data PIDs between the host and device. 0 = KEEP_GOING 1 = RESET_PID_SEQ
5	RW	0x0	RXI: RX Data Toggle Inhibit: This bit is only used for test and should always be written as zero. Writing a one to this bit will cause this endpoint to ignore the data toggle sequence and always accept data packet regardless of their data PID. 0 = DIS_PID_SEQ 1 = ENB_PID_SEQ
3:2	RW	0x0	RXT: RX Endpoint Type: 00 = Control. 01 = Isochronous. 10 = Bulk. 11 = Interrupt. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
1	RO	X	RXD: This bit is fixed to 0.
0	RW	0x0	RXS: RX Endpoint Stall: This bit will be set automatically upon receipt of a SETUP request if this Endpoint is not configured as a Control Endpoint. It will be cleared automatically upon receipt a SETUP request if this Endpoint is configured as a Control Endpoint. Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue to returning STALL until this bit is either cleared by software or automatically cleared as above, 0 = EP_OK 1 = EP_STALL

22.16.5 USB2 Controller Interface Registers

These are used to generate the actual RTL registers for USB2 controller interface.

ULPIS2S resets to be used as follows:

- Assert ULPIS2S_SLV0_CLAMP_XMIT to ensure that the signals between SLV0 and the line simulator are clean.
- Assert ULPIS2S_SLV0_RESET
- Do a functional asynchronous reset of the ChipIdea controller
- Deassert ULPIS2S_SLV0_RESET
- Deassert ULPIS2S_SLV0_CLAMP_XMIT

NULPI_SLV1_RESET should be used in the same way if there is some explicit way to reset the external ULPI controller (which is not necessarily the case). There is usually no reason to assert ULPIS2S_LINE_RESET.

Base Address: USB2

22.16.5.1 USB2_IF_USB_SUSP_CTRL_0

This register controls the suspend and resume behavior of the USB controller/PHY.

USB Suspend Control Register

Offset: 0x400 | Read/Write: R/W | Reset: 0bxxxxx00111110000x1001000xx000000

Bit	R/W	Reset	Description
26	RW	0x0	FAST_WAKEUP_RESP: Enable Fast Response from UTMIP PHY for a Remote Wakeup request from device. This is used only for cases where wakeup response needs to be within 1ms of spec. Used for Host mode ONLY. 0 = DISABLE 1 = ENABLE
25	RW	0x0	UTMIP_SUSPL1_SET: Enable SuspendL1 for UTMIP PHY Enabling this will only cutoff clocks to the UTMIP logic. The USB PLLs, PllU and UTMIP PLL will still be running. 0 = DISABLE 1 = ENABLE
24	RW	0x1	ULPI_PADS_CLKEN_RESET: Async reset for the synchronizers that are used in the external and loopback ULPI 60 MHz clock. 0 = DISABLE 1 = ENABLE
23	RW	0x1	ULPI_PADS_RESET: Async reset for trimmers and line state logic that is implemented in the pad macros. 0 = DISABLE 1 = ENABLE
22	RW	0x1	ULPIS2S_LINE_RESET: Async reset of the line simulator logic that sits between the two virtual PHYs (active high). The ULPI PHY registers should be programmed while ULPI is in reset. 0 = DISABLE 1 = ENABLE
21	RW	0x1	ULPIS2S_SLV1_RESET: Async reset of the SLV1 ULPI logic. This corresponds to resetting the virtual PHY that is connected to the internal ULPI controller (active high). The ULPI PHY registers should be programmed while ULPI is in reset. 0 = DISABLE 1 = ENABLE
20	RW	0x1	ULPIS2S_SLV0_RESET: Async reset of the SLV0 ULPI logic. This corresponds to resetting the virtual PHY that is connected to the external ULPI controller. (active high). The ULPI PHY registers should be programmed while ULPI is in reset. 0 = DISABLE 1 = ENABLE
19	RW	0x0	UHSIC_PHY_ENB: Enable UHSIC PHY mode. Set this to 1 if using UHSIC PHY. Otherwise set this to 0. 0 = DISABLE 1 = ENABLE
18:16	RW	0x0	USB_WAKEUP_DEBOUNCE_COUNT: USB PHY wakeup debounce counter USB will debounce any wakeup event by the number of clocks programmed in this counter. A value of 0 results in no debounce.
14	RW	0x1	UHSIC_RESET: Reset going to UHSIC PHY (active high). This should be set to 1 whenever programming the UHSIC config registers. It should be cleared to 0 after the programming of UHSIC config registers is done. UHSIC config registers should be programmed only once before doing any transactions on UHSIC. The UHSIC PHY registers should be programmed while UHSIC is in reset. 0 = DISABLE 1 = ENABLE
13	RW	0x0	ULPI_PHY_ENB: Enable ULPI PHY mode. Set this to 1 if using null or link ULPI PHY. Otherwise set this to 0. 0 = DISABLE 1 = ENABLE
12	RW	0x0	UTMIP_PHY_ENB: Enable UTMIP PHY mode Set this to 1 if using UTMIP PHY. Otherwise set this to 0. 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
11	RW	0x1	UTMIP_RESET: Reset going to UTMIP PHY (active high). This should be set to 1 whenever programming the UTMIP config registers. It should be cleared to 0 after the programming of UTMIP config registers is done. UTMIP config registers should be programmed only once before doing any transactions on UTMIP. The UTMIP PHY registers should be programmed while UTMIP is in reset. 0 = DISABLE 1 = ENABLE
10	RW	0x0	USB_SUSP_POL: Polarity of the suspend signal going to UHSIC PHY. 0 = Active low (default) 1 = Active high. This should not be changed by software. 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
9	RW	0x0	USB_PHY_CLK_VALID_INT_ENB: USB PHY clock valid interrupt enable. If this bit is enabled, interrupt is generated whenever USB clocks are resumed from a suspend. 0 = DISABLE 1 = ENABLE
8	RO	0x0	USB_PHY_CLK_VALID_INT_STS: USB PHY clock valid interrupt status. This bit is set whenever USB PHY clock is woken up from suspend. Software must write a 1 to clear this bit. 0 = UNSET 1 = SET
7	RO	X	USB_PHY_CLK_VALID: USB PHY clock valid status. This bit indicates whether the USB PHY is generating a valid clock to the USB controller. If USB PHY clock is running, this bit is set to 1, else it is set to 0. 0 = UNSET 1 = SET
6	RO	X	USB_CLKEN: USB AHB clock enable status. Indicates whether the AHB clock to the USB controller is enabled or not. If AHB clock to USB controller is enabled, this bit is set to 1, else it is set to 0. NOTE: even when this is set to 0, all essential blocks that are required to resume USB clocks from suspend will be active and their AHB clock will not be suspended. 0 = UNSET 1 = SET
5	RW	0x0	USB_SUSP_CLR: Suspend Clear Software must write a 1 to this bit to bring the PHY out of suspend mode. This is used when the software stops the PHY clock during suspend and then wants to initiate a resume. Software should also write 0 to clear it. NOTE: It is required that software generate a positive pulse on this bit to guarantee proper operation. 0 = UNSET 1 = SET
4	RW	0x0	USB_WAKE_ON_DISCON_EN_DEV: Wake on Disconnect Enable (Device Mode). When enabled (1), USB device will wake up from suspend on a disconnect event. This is only valid when USB controller is in Device Mode, it is not applicable when USB controller is in Host Mode. 0 = DISABLE 1 = ENABLE
3	RW	0x0	USB_WAKE_ON_CNNT_EN_DEV: Wake on Connect Enable (Device Mode). When enabled (1), USB device will wake up from suspend on a connect event. This is only valid when USB controller is in Device Mode, it is not applicable when USB controller is in Host Mode. 0 = DISABLE 1 = ENABLE
2	RW	0x0	USB_WAKE_ON_RESUME_EN: Wake on resume enable. If this bit is enabled, the USB will wake up from suspend whenever a resume event is detected on USB. This is valid for both USB device and USB Host Modes. 0 = DISABLE 1 = ENABLE
1	RW	0x0	USB_WAKEUP_INT_ENB: USB wakeup interrupt enable. If this bit is enabled, interrupt is generated whenever USB wakeup event is generated. 0 = DISABLE 1 = ENABLE
0	RO	0x0	USB_WAKEUP_INT_STS: USB wakeup interrupt status. This bit is set whenever the USB wakes up from suspend (a wakeup event is generated). Software must write a 1 to clear this bit. Note that during the wakeup sequence, PHY clocks will be resumed from suspend. Software can check when the PHY clocks are resumed by reading the bit USB_PHY_CLK_VALID. There is also a separate interrupt generated when PHY clock is resumed if USB_PHY_CLK_VALID_INT_EN is set. During the wakeup sequence, first USB_WAKEUP_INT_STS will be set, and it will take some time for the PHY clock to resume, which can be detected by checking USB_PHY_CLK_VALID. 0 = UNSET 1 = SET

22.16.5.2 USB2_IF_USB_ULPIS2S_CTRL_0

This register is used to set up parameters for ULPI null PHY mode.

> ***Note:*** *Current ULPI configuration registers use settings that support NV software drivers and should NOT be modified. If designing custom drivers, consult your NV representative prior to modifying these registers*

ULPI NULL PHY Control Register

Offset: 0x418 | Read/Write: R/W | Reset: 0bxxxxxxxx0000xx0000000000xxxx0000

Bit	Reset	Description
23:20	0x0	ULPIS2S_CLAMP_LINE_DRIVE: The line drive value that should be sent into the line simulator during transmit clamping. The suggested value is 0x1: tri-state.
17	0x0	ULPIS2S_SLV1_CLAMP_XMIT: When set to 1, the outputs of the SLV1 transmit state machine are clamped to 0. This bit should be set before the SLV0 async reset is asserted to prevent meta-stability issues in the line simulator.
16	0x0	ULPIS2S_SLV0_CLAMP_XMIT: When set to 1, the outputs of the SLV0 transmit state machine are clamped to 0. This bit should be set before the SLV0 async reset is asserted to prevent meta-stability issues in the line simulator.
15	0x0	ULPIS2S_DISABLE_STP_PU: When set to 1 and in ULPIS2S mode, the pullup on the STP pin will NOT be active, even if the remote LINK asks to do so. In this case, an external pullup resistor would be required to ensure valid levels when the remote link is not powered.
14	0x0	ULPIS2S_SUPPORT_HS_KEEP_ALIVE: When enabled, the PHY will support HS KeepAlive packets. In that case, this would be the only thing that is supported in Opmode3. All other Opmode3 generate packets are not supported under any circumstances. 0 = DISABLE 1 = ENABLE
13	0x0	ULPIS2S_DISCON_DONT_CHECK_SE0: When enabled, the disconnect detection logic will only check that the other side is 'driving' tri-state. It will not check whether or not the local side is driving SE0. 0 = DISABLE 1 = ENABLE
12	0x0	ULPIS2S_FORCE_ULPI_CLK_OUT: When enabled and ULPIS2S_ENA is ENABLED, the external ULPI_CLOCK pad will always carry the internal 60 MHz clock, even if the interface is in shutdown mode. 0 = DISABLE 1 = ENABLE
11:8	0x0	ULPIS2S_SPARE: Reserved bits.
3	0x0	ULPIS2S_PLLU_MASTER_BLASTER60: When enabled, the PLLU 60 MHz clock will be forced on. 0 = DISABLE 1 = ENABLE
2	0x0	ULPIS2S_SUPPORT_DISCONNECT: When disabled, the PHY will never detect a Disconnect. 0 = DISABLE 1 = ENABLE
1	0x0	ULPIS2S_SLV1_FORCE_DEVICE: When disabled, the slave port that is connected to the pins can be programmed to be host or a device depending on the value of the DpPulldown and DmPulldown bits in the OTG_CTRL ULPI register. When enabled, the values of those bits in the OTG_CTRL register is ignored and the port will always behave like a device. 0 = DISABLE 1 = ENABLE
0	0x0	ULPIS2S_ENA: When enabled, the ULPI link interface coming out of the USB2 controller enters a NULL PHY with two slaves. As a result the external pins will have a slave ULPI interface. When disabled, the ULPI link interface coming out of the USB2 controller go straight to the pins. 0 = DISABLE 1 = ENABLE

22.16.5.3 USB2_IF_USB_ULPIS2S_SLV1_ID_0

This register controls the product and vendor ID fields for ULPI null PHY presented to external ULPI master.

Note: *Current ULPI configuration registers use settings that support NV software drivers and should NOT be modified. If designing custom drivers, consult your NV representative prior to modifying these registers*

Offset: 0x41c | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:16	0x0	ULPIS2S_SLV1_VENDOR_ID: PHY vendor_id as seen by the external ULPI master
15:0	0x0	ULPIS2S_SLV1_PRODUCT_ID: PHY product_id as seen by the external ULPI master

22.16.5.4 USB2_IF_USB_INTER_PKT_DELAY_CTRL_0

Inter Packet Delay Control

This register controls the interpacket delay between two consecutive transmit packets in HS mode. This only applies to Host Mode as device never transmits two packets in a row.

Offset: 0x420 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0010010

Bit	Reset	Description
6:0	0x12	IP_DELAY_TX2TX_HS: HS Tx to Tx inter-packet delay. This is valid only for UHSIC PHY. Software should not change this.

22.16.5.5 USB2_IF_USB_RSM_DLY_0

USB Controller Resume Signaling Delay

Offset: 0x490 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx0110100101111000

Bit	Reset	Description
15:0	0x6978	TIME_TO_RESUME: Send the resume back in number of 60 MHz cycles. Default gives 900 µs delay. Only applicable in Host Mode.

22.16.5.6 USB2_IF_SPARE_0

Note: *Software neither reads nor writes this register.*

For ICUSB PADCTLs

Spare Register

Offset: 0x498 | Read/Write: R/W | Reset: 0b11111111111111110000000000000000

Bit	Reset	Description
31:16	0xffff	SPARE_HI: Spare register bits, defaulted to 1. SPARE_HI[0] - usb_port_reset_fix_en. Enable port-reset fix SPARE_HI[1] - hsic_conn_det_feature_enable. Enable HSIC connect detection
15:0	0x0	SPARE_LO: Spare register bits, defaulted to 0. SPARE_LO[4] - usb_hs_rsm_eop_fix_en. Enable HS_RESUME EOP fix SPARE_LO[5] - usb_port_suspend_fix_en

22.16.5.7 USB2_IF_ULPI_DIR_OVERRIDE_0

ULPI Override

Offset: 0x49c | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1

Bit	Reset	Description
0	0x1	ULPI_DIR_OVERRIDE: By default, this bit is set. This will override ulpi_dir; i.e., when this bit is set, ulpi_dir is always asserted. Software needs to explicitly clear this bit, once slv1 Lp0 context is restored.

22.16.5.8 USB2_IF_USB2_NEW_CONTROL_0

USB Coherency and Memory Alignment Controls

Offset: 0x4c0 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx00001111xxxxxx00

Bit	Reset	Description
15:8	0xf	REQUEST_EXPIRY_COUNTER: Time to wait for coalescing the request.
1	0x0	MEM_ALIGNMENT_MUX_EN: Mux to select between Tegra 3 style (0) and Tegra X1 style (1) DMA request generation mechanism. 0 = DISABLE 1 = ENABLE
0	0x0	COHERENCY_EN: Enable fence mechanism. 0 = DISABLE 1 = ENABLE

22.16.6 UHSIC Configuration Registers

Note: *Current HSIC configuration registers use settings that support NV software drivers and should NOT be modified. If designing custom drivers, consult your NV representative prior to modifying these registers*

Base Address: USB2

22.16.6.1 USB2_UHSIC_MISC_STS0_0

UHSIC SPARE Fuse Value

Offset: 0xc30 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
0	X	UHSIC_TX_HS_VLD: Indicates when the controller is driving on the bus

22.16.6.2 USB2_UHSIC_PMC_WAKEUP0_0

UHSIC PMC Wakeup Value

Offset: 0xc34 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0

Bit	R/W	Reset	Description
1	RO	X	UHSIC_LINE_WAKEUP_EVENT_INT_STS: Indicates the status of the PMC wakeup event
0	RW	0x0	UHSIC_LINE_WAKEUP_EVENT_INT_ENB: Interrupt mask for the PMC wakeup event

22.16.6.3 USB2_UHSIC_UHSIC_PAD_TERM_0

UHSIC terminations

Offset: 0xc38 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
4:0	X	UHSIC_RTERM

22.16.6.4 USB2_QH_USB2D_QH_EP_n_OUT_0

USB2D Queue Head for OUT Endpoint n

There are 16 USB2D Queue Head for OUT Endpoint registers, where n = 0 through 15.

Offset: 0x1000 + (n * 0x80) | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:0	0x0	USB2D_QH: Queue Head for OUT endpoint n. This is used to store a local Queue Head data structure for either Device Mode or Host Mode. In Device Mode, it holds the Queue Head for OUT endpoint n.

22.16.6.5 USB2_QH_USB2D_QH_EP_n_IN_0

There are 16 USB2D Queue Head for IN Endpoint registers, where n = 0 through 15.

USB2D Queue Head for IN Endpoint n

Offset: 0x1040 + (n * 0x80) | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:0	0x0	USB2D_QH: Queue Head for IN endpoint n. This is used to store a local Queue Head data structure for either Device Mode or Host Mode. In Device Mode, it holds the Queue Head for IN endpoint n.

22.16.7 XUSB PADCTL Registers

Base Address: XUSB_PADCTL_BASE

22.16.7.1 XUSB_PADCTL_BOOT_MEDIA_0

22.16.8.14 XUSB_HOST_MSI_AXI_BAR_ST_0

MSI AXI BAR START

Offset: 0xc4 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000xxxxxxxxxxxx)

Bit	Reset	Description
31:12	0x0	MSI_AXI_BAR_START: The start of the upstream AXI address space for MSI BAR. The upstream FPCI address is compared to start/1KB range for the MSI BAR to determine if the access is MSI. Bits 31:12 of MSI BAR start correspond to AXI address bits 31:12.

22.16.8.15 XUSB_HOST_MSI_FPCI_BAR_ST_0

MSI FPCI BAR START

Offset: 0xc8 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000xxxx)

Bit	Reset	Description
31:4	0x0	MSI_FPCI_BAR_START: The start of the upstream FPCI address space for MSI BAR. The upstream FPCI address is compared to start/1KB range for MSI BAR to determine if the access is MSI. Bits 31:4 of MSI BAR start correspond to UFPCI address bits 39:12.

22.16.8.16 XUSB_HOST_MSI_VEC0_0

MSI VECTORi i in [0 7] RW

Offset: 0x100 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_VECTOR0: Each vector register corresponds to 32 of the possible 256 MSI vectors.VECTOR0 corresponds to MSI vectors 31-0. Vector7 corresponds to MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.The bit is set to 0 if a 1 is written to its location.

22.16.8.17 XUSB_HOST_MSI_VEC1_0

Offset: 0x104 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_VECTOR1: Each vector register corresponds to 32 of the possible 256 MSI vectors.VECTOR0 corresponds to MSI vectors 31-0. Vector7 corresponds to MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.The bit is set to 0 if a 1 is written to its location.

22.16.8.18 XUSB_HOST_MSI_VEC2_0

Offset: 0x108 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_VECTOR2: Each vector register corresponds to 32 of the possible 256 MSI vectors.VECTOR0 corresponds to MSI vectors 31-0. Vector7 corresponds to MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.The bit is set to 0 if a 1 is written to its location.

22.16.8.19 XUSB_HOST_MSI_VEC3_0

Offset: 0x10c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_VECTOR3: Each vector register corresponds to 32 of the possible 256 MSI vectors.VECTOR0 corresponds to MSI vectors 31-0. Vector7 corresponds to MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.The bit is set to 0 if a 1 is written to its location.

22.16.8.20 XUSB_HOST_MSI_VEC4_0

Offset: 0x110 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_VECTOR4: Each vector register corresponds to 32 of the possible 256 MSI vectors.VECTOR0 corresponds to MSI vectors 31-0. Vector7 corresponds to MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.The bit is set to 0 if a 1 is written to its location.

22.16.8.21 XUSB_HOST_MSI_VEC5_0

Offset: 0x114 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_VECTOR5: Each vector register corresponds to 32 of the possible 256 MSI vectors.VECTOR0 corresponds to MSI vectors 31-0. Vector7 corresponds to MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.The bit is set to 0 if a 1 is written to its location.

22.16.8.22 XUSB_HOST_MSI_VEC6_0

Offset: 0x118 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_VECTOR6: Each vector register corresponds to 32 of the possible 256 MSI vectors.VECTOR0 corresponds to MSI vectors 31-0. Vector7 corresponds to MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.The bit is set to 0 if a 1 is written to its location.

22.16.8.23 XUSB_HOST_MSI_VEC7_0

Offset: 0x11c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_VECTOR7: Each vector register corresponds to 32 of the possible 256 MSI vectors.VECTOR0 corresponds to MSI vectors 31-0. Vector7 corresponds to MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.The bit is set to 0 if a 1 is written to its location.

22.16.8.24 XUSB_HOST_MSI_EN_VEC0_0

MSI ENABLE VECTORi□i in [0□7]□RW

Offset: 0x140 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_ENABLE_VECTOR0: Each vector register corresponds to the enable bit for 32 of the possible 256 MSI vectors. ENABLE VECTOR0 corresponds to enable bits for MSI vectors 31-0. Vector7 corresponds to enable bits for MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.

22.16.8.25 XUSB_HOST_MSI_EN_VEC1_0

Offset: 0x144 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_ENABLE_VECTOR1: Each vector register corresponds to the enable bit for 32 of the possible 256 MSI vectors. ENABLE VECTOR0 corresponds to enable bits for MSI vectors 31-0. Vector7 corresponds to enable bits for MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.

22.16.8.26 XUSB_HOST_MSI_EN_VEC2_0

Offset: 0x148 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_ENABLE_VECTOR2: Each vector register corresponds to the enable bit for 32 of the possible 256 MSI vectors. ENABLE VECTOR0 corresponds to enable bits for MSI vectors 31-0. Vector7 corresponds to enable bits for MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.

22.16.8.27 XUSB_HOST_MSI_EN_VEC3_0

Offset: 0x14c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_ENABLE_VECTOR3: Each vector register corresponds to the enable bit for 32 of the possible 256 MSI vectors. ENABLE VECTOR0 corresponds to enable bits for MSI vectors 31-0. Vector7 corresponds to enable bits for MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.

22.16.8.28 XUSB_HOST_MSI_EN_VEC4_0

Offset: 0x150 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_ENABLE_VECTOR4: Each vector register corresponds to the enable bit for 32 of the possible 256 MSI vectors. ENABLE VECTOR0 corresponds to enable bits for MSI vectors 31-0. Vector7 corresponds to enable bits for MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.

22.16.8.29 XUSB_HOST_MSI_EN_VEC5_0

Offset: 0x154 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_ENABLE_VECTOR5: Each vector register corresponds to the enable bit for 32 of the possible 256 MSI vectors. ENABLE VECTOR0 corresponds to enable bits for MSI vectors 31-0. Vector7 corresponds to enable bits for MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.

22.16.8.30 XUSB_HOST_MSI_EN_VEC6_0

Offset: 0x158 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_ENABLE_VECTOR6: Each vector register corresponds to the enable bit for 32 of the possible 256 MSI vectors. ENABLE VECTOR0 corresponds to enable bits for MSI vectors 31-0. Vector7 corresponds to enable bits for MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.

22.16.8.31 XUSB_HOST_MSI_EN_VEC7_0

Offset: 0x15c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MSI_ENABLE_VECTOR7: Each vector register corresponds to the enable bit for 32 of the possible 256 MSI vectors. ENABLE VECTOR0 corresponds to enable bits for MSI vectors 31-0. Vector7 corresponds to enable bits for MSI vectors 255-223.When an upstream MSI is sent, the bit corresponding to the MSI vector is set to 1 by hardware if the corresponding enable bit is 1.

22.16.8.32 XUSB_HOST_CONFIGURATION_0

Configuration

Offset: 0x180 | Read/Write: R/W | Reset: 0x800X8X40 (0b1xxxxxxxxxxx1xxx10xxxxxx01000000)

Bit	R/W	Reset	Description
31	RW	0x1	CLKEN_OVERRIDE: This can override the clock enable in case of a malfunction.
19	RW	0x1	PW_NO_DEVSEL_ERR_CYA: Setting this bit disables detection of DECERR due to no DEVSEL for DS PWs only.
18	RO	X	INITIATOR_READ_IDLE: This read-only bit provides status reads on AFI upstream A value of 1b indicates there are no outstanding reads to the initiator.
17	RO	X	INITIATOR_WRITE_IDLE: This read-only bit provides status writes on AFI upstream A value of 1b indicates there are no outstanding writes to the initiator.
15	RW	0x1	WDATA_LEAD_CYA: Used to enable/disable the handling of write data ahead of requests on IPFS AXI target.
14	RW	0x0	WR_INTRLV_CYA: Used to enable/disable the handling of interleaved write requests on IPFS AXI target.
11	RO	X	TARGET_READ_IDLE: This read-only bit provides status reads to IPFS target. A value of 1b indicates there are no outstanding reads to the downstream FPCI.
10	RO	X	TARGET_WRITE_IDLE: This read-only bit provides status writes to IPFS target. A value of 1b indicates there are no outstanding writes to the downstream FPCI.
9	RO	X	MSI_VEC_EMPTY: This read-only bit provides status on whether MSI Vector registers have any active bits valid or not.
7	RW	0x0	UFPCI_MSIAW: MSI After Write ordering rule. 1 = Whenever MSI is ready assert the interrupt 0 = Default behavior, apply MSIAW ordering rule
6	RW	0x1	UFPCI_PWPASSPW: Input to the upstream FPCI 1 = Whenever write is ready, send it. 0 = Write goes only when outstanding PWs outside of new write's region are retired (default).
5	RW	0x0	UFPCI_PASSPW: Input to the upstream FPCI. Allows the upstream FPCI reads to pass writes.
4	RW	0x0	UFPCI_PWPASSNPW: Used for the upstream FPCI. Allows the upstream FPCI PWs to pass NPWs.
3	RW	0x0	DFPCI_PWPASSNPW: Used for the downstream FPCI. Allows the downstream FPCI PWs to pass NPWs.
2	RW	0x0	DFPCI_RSPPASSPW: Input to the downstream FPCI. Allows the downstream FPCI responses to pass writes
1	RW	0x0	DFPCI_PASSPW: Input to the downstream FPCI. Allow the downstream FPCI reads to pass writes.
0	RW	0x0	EN_FPCI: When the IPFS device block is disabled, it is completely invisible on the IPFS bus; i.e., it does not even process IPFS configuration accesses.

22.16.8.33 XUSB_HOST_FPCI_ERROR_MASKS_0

FPCI Error Masks

Offset: 0x184 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2	0x0	MASK_FPCI_MASTER_ABORT: This bit allows an FPCI error to be forwarded to an AXI response when the FPCI error response indicates a Master Abort. 1 = Forward error 0 = Return AXI OKAY response (2'b0)
1	0x0	MASK_FPCI_DATA_ERROR: This bit allows an FPCI error to be forwarded to an AXI response when the FPCI error response indicates a Data Error. 1 = Forward error 0 = Return AXI OKAY response (2'b0)
0	0x0	MASK_FPCI_TARGET_ABORT: This bit allows an FPCI error to be forwarded to an AXI response when FPCI error response indicates a Target Abort. This bit also covers a decode error generated when there is no DEVSEL received. 1 = Forward error 0 = Return AXI OKAY response (2'b0)

22.16.8.34 XUSB_HOST_INTR_MASK_0

Interrupt Masks

Offset: 0x188 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0xxxxxxx0xxxxxxx0)

Bit	Reset	Description
16	0x0	IP_INT_MASK: IP (SATA/AZA) interrupt to the CPU complex gated by the mask.
8	0x0	MSI_MASK: MSI to the CPU complex gated by the mask.
0	0x0	INT_MASK: Interrupt to the CPU complex gated by the mask.

22.16.8.35 XUSB_HOST_INTR_CODE_0

Interrupt Control

Offset: 0x18c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4:0	0x0	INT_CODE: Eight interrupt codes. If the code is 0, logging of the next interrupt is enabled 0 = INT_CODE_CLEAR: Clear interrupt code 1 = INT_CODE_INI_SLVERR: Interrupt code for CPU AXI SLVERR response to IPFS 2 = INT_CODE_INI_DECERR: Interrupt code for CPU AXI DECERR response to IPFS 3 = INT_CODE_TGT_SLVERR: Interrupt code for PCIe endpoint FPCI target abort or data error response to IPFS 4 = INT_CODE_TGT_DECERR: Interrupt code for PCIe2 FPCI master abort response to IPFS 5 = INT_CODE_TGT_WRERR: Interrupt code for bufferable write to non-posted write address region 6 = RSVD1: Reserved 7 = INT_CODE_DFPCI_DECERR: Interrupt code for PCIe2 response to downstream request when downstream FPCI address does not fall in a claimable downstream region 8 = INT_CODE_AXI_DECERR: Interrupt code for IPFS response to downstream request when AXI target AXI address does not fall in any IPFS downstream BARs 9 = INT_CODE_FPCI_TIMEOUT: Interrupt code for FPCI Timeout 10 = RSVD2: Reserved for future expansion 11 = RSVD3 12 = RSVD4 13 = RSVD5 14 = RSVD6 15 = INT_CODE_SM_FATAL_ERROR: Interrupt code for SM fatal error 16 = INT_CODE_SM_NON_FATAL_ERROR: Interrupt code for SM non-fatal error

22.16.8.36 XUSB_HOST_INTR_SIGNATURE_0

Interrupt Signature

Offset: 0x190 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000x0)

Bit	Reset	Description
31:2	0x0	INT_INFO: For interrupt codes 1-5/7-8, this field contains address bits [31:2], either in FPCI memory space or AXI space. For FPCI generated errors, the field contains the FPCI address. For AXI/IPFS generated errors, the field contains the AXI address.
0	0x0	DIR: Indicates the direction of the AXI/FPCI transaction. 1=RD/0=WRIF signature type is 6 (sideband message), this field is 1. 0 = WRITE: Interrupt due to a write transaction 1 = READ: Interrupt due to a read transaction

22.16.8.37 XUSB_HOST_UPPER_FPCI_ADDR_0

Upper FPCI Address

Offset: 0x194 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	INT_INFO_UPPER: These 8 bits are the upper byte of the captured FPCI address (bits [39:32]) when the interrupt code is 3, 4, or 7. These bits determine the region in the Hypertransport Address Map that was accessed.

22.16.8.38 XUSB_HOST_IPFS_INTR_ENABLE_0

IPFS Interrupt Enable

Offset: 0x198 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxx00xxxx00000000)

Bit	Reset	Description
13	0x0	EN_SM_NON_FATAL_ERROR: Enable bit for interrupt code 15
12	0x0	EN_SM_FATAL_ERROR: Enable bit for interrupt code 14
7	0x0	EN_FPCI_TIMEOUT: Enable bit for interrupt code 9
6	0x0	EN_AXI_DECERR: Enable bit for interrupt code 8
5	0x0	EN_DFPCI_DECERR: Enable bit for interrupt code 7
4	0x0	EN_TGT_WRERR: Enable bit for interrupt code 5
3	0x0	EN_TGT_DECERR: Enable bit for interrupt code 4
2	0x0	EN_TGT_SLVERR: Enable bit for interrupt code 3
1	0x0	EN_INI_DECERR: Enable bit for interrupt code 2
0	0x0	EN_INI_SLVERR: Enable bit for interrupt code 1

22.16.8.39 XUSB_HOST_UFPCI_CONFIG_0

Upstream FPCI Configuration

Offset: 0x19c | Read/Write: R/W | Reset: 0x00000002 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00010)

Bit	Reset	Description
4:0	0x2	UNITID_T0C0: Upstream FPCI Unit ID for controller 0. HyperTransport, upstream FPCI request

22.16.8.40 XUSB_HOST_CFG_REVID_0

CFG_REVID Register

Offset: 0x1a0 | Read/Write: R/W | Reset: 0x000X10XX (0bxxxxxxxxxxxxxxxxxx0100xxxxxxx1xx)

Bit	R/W	Reset	Description
19	RO	X	DEV2SM_NONISO_REQUEST_PEND: This bit indicates if there is a non-ISO request pending. 0 = NO 1 = YES
18	RO	X	DEV2SM_ISO_REQUEST_PEND: This bit indicates if there is an ISO request pending. 0 = NO 1 = YES
13:12	RW	0x1	STRAP_CPU_MODE: MCP: Mode to send MSI. It can be programmable. 0 = NB_INTEL 1 = NB_AMD 2 = AMD 3 = TMTA
11	RW	0x0	CFG_REVID_WRITE_ENABLE: MCP: The enable to override the rev ID. It can be programmable. 0 = CLEAR 1 = SET
10	RW	0x0	CFG_REVID_OVERRIDE: MCP: Provides a way to override the current revision ID. It can be programmable. 0 = DISABLE 1 = ENABLE
4	RO	X	DEV2LEG_NONCOH_REQUEST_PEND: MCP: Tells the leg block that a non-coherent request is pending. 0 = NO 1 = YES
3	RO	X	DEV2LEG_COH_REQUEST_PEND: MCP comment: Tells the leg block that a coherent request is pending. 0 = NO 1 = YES

Bit	R/W	Reset	Description
2	RW	0x1	SM2DEV_FPCI_TIMEOUT_EN: FPCI timeout enable bit for Controller 0 = DISABLE 1 = ENABLE

22.16.8.41 XUSB_HOST_FPCI_TIMEOUT_0

FPCI_TIMEOUT Register

Offset: 0x1a4 | Read/Write: R/W | Reset: 0x000f0000 (0bxxxxxxxxxxxx11110000000000000000)

Bit	Reset	Description
19:0	0xf0000	SM2ALL_FPCI_TIMEOUT_THRESH: This field sets the timeout threshold value for the FPCI bus. It starts counting for each queue (ISO/NISO- RD/WR) with a pending request in the FPCI wrapper, the count resets when the requests are popped.

22.16.8.42 XUSB_HOST_TOM_0

Top of Memory Limit

Offset: 0x1a8 | Read/Write: R/W | Reset: 0x3fff0fff (0bxx11111111111111xxxx111111111111)

Bit	Reset	Description
29:16	0x3fff	LEG2ALL_TOM2: Top of Memory Limit 2.
11:0	0xfff	LEG2ALL_TOM1: Top of Memory Limit 1.

22.16.8.43 XUSB_HOST_INITIATOR_ISO_PW_RESP_PENDING_0

Initiator ISO PW Response Pending

Offset: 0x1ac | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	NUM_INITIATOR_ISO_PW_RESP_PEND: Number of pending initiator ISO PW responses

22.16.8.44 XUSB_HOST_INITIATOR_NISO_PW_RESP_PENDING_0

Initiator Non-ISO PW Response Pending

Offset: 0x1b0 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	NUM_INITIATOR_NISO_PW_RESP_PEND: Number of pending initiator NISO PW responses

22.16.8.45 XUSB_HOST_INTR_STATUS_0

IPFS Interrupt Status

Offset: 0x1b4 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
2	X	IP_INTR_STATUS: Status of IP (SATA/AZA) interrupt
1	X	MSI_INTR_STATUS: Status of MSI interrupt
0	X	IPFS_INTR_STATUS: Status of IPFS interrupt

22.16.8.46 XUSB_HOST_DFPCI_BEN_0

Downstream FPCI Byte Enables

Offset: 0x1b8 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
31	0x0	EN_DFPCI_BEN: Enable bit for BEN. When set, the programmed BE is sent on the DFPCI bus
3:0	0x0	DFPCI_BYTE_ENABLE_N: Active low byte enables

22.16.8.47 XUSB_HOST_CLKGATE_HYSTERESIS_0

Offset: 0x1bc | Read/Write: R/W | Reset: 0x00000014 (0bxxxxxxxxxxxxxxxxxxxxxxxx00010100)

Bit	Reset	Description
7:0	0x14	CLK_DISABLE_CNT: Number of IPFS clock cycles to wait after clock gating criteria are met to disable IPFS/FPCI clocks

22.16.8.48 XUSB_HOST_XUSB_HOST_MCCIF_FIFOCTRL_0

Memory Client Interface FIFO Control Register

Note: *The FIFO timing aspects of this register are no longer supported, but are retained for software compatibility.*

The clock override/ovr_mode fields of this register control the second-level clock gating for the client and MC side of the MCCIF. All clock gating is enabled by default.

A '1' written to the rclk/wclk field results in one of the following:

- With wclk/rclk override mode = LEGACY, the clock reverts to the legacy mode of operation (where the clock is on whenever the client clock is enabled).
- With wclk/rclk override mode = ON, the clock is always on inside the MCCIF and PC.

A '1' written to the cclk override field keeps the client's clock always on inside the MCCIF.Offset: 0x1dc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000xxxxxxxxxxxx0000)

Bit	Reset	Description
20	LEGACY	XUSB_HOST_RCLK_OVR_MODE: 0 = LEGACY 1 = ON
19	LEGACY	XUSB_HOST_WCLK_OVR_MODE: 0 = LEGACY 1 = ON
18	0x0	XUSB_HOST_CCLK_OVERRIDE
17	0x0	XUSB_HOST_RCLK_OVERRIDE
16	0x0	XUSB_HOST_WCLK_OVERRIDE
3	DISABLE	XUSB_HOST_MCCIF_RDCL_RDFAST: 0 = DISABLE 1 = ENABLE
2	DISABLE	XUSB_HOST_MCCIF_WRMC_CLLE2X: 0 = DISABLE 1 = ENABLE
1	DISABLE	XUSB_HOST_MCCIF_RDMC_RDFAST: 0 = DISABLE 1 = ENABLE
0	DISABLE	XUSB_HOST_MCCIF_WRCL_MCLE2X: 0 = DISABLE 1 = ENABLE

22.16.8.49 XUSB_HOST_ORDERING_RULES_0

Offset: 0x1e0 | Read/Write: R/W | Reset: 0x00000000 (0b000)

Bit	Reset	Description

22.16.9.2 T_XUSB_CFG_1

FPCI Configuration Register

Offset: 0x04 | Read/Write: R/W

Bits	Reset	R/W	Description
31	0	R	T_XUSB_CFG_1_DETECTED_PERR: The DETECTED_PERR bit indicates that the device has detected a parity error, even if parity error handing is disabled. (Bit 6 - T_CONFIG_FPCI_PERR_DISABLED) 0h: DETECTED_PERR_NOT_ACTIVE (default) 1h: DETECTED_PERR_ACTIVE 1h: DETECTED_PERR_CLEAR
30	0	R	T_XUSB_CFG_1_SIGNALED_SERR: The SIGNALED_SERR bit indicates that the device has asserted SERR#. 0h: SIGNALED_SERR_NOT_ACTIVE (default) 1h: SIGNALED_SERR_ACTIVE 1h: SIGNALED_SERR_CLEAR
29	0	R	T_XUSB_CFG_1_RECEIVED_MASTER: The RECEIVED_MASTER bit indicates that a master device's transaction (except for Special Cycle) was terminated with a master-abort. This means that no device on the PCI bus responded to the address of the mastered transaction. All master devices must implement this bit. When this bit is set, an interrupt is signaled in the PBUS_INTR_0 register. 0h: RECEIVED_MASTER_NO_ABORT (default) 1h: RECEIVED_MASTER_ABORT 1h: RECEIVED_MASTER_CLEAR
28	0	R	T_XUSB_CFG_1_RECEIVED_TARGET: The RECEIVED_TARGET bit indicates that a master device's transaction was terminated with a target-abort. All master devices must implement this bit. When this bit is set, an interrupt is signaled in the PBUS_INTR_0 register. 0h: RECEIVED_TARGET_NO_ABORT (default) 1h: RECEIVED_TARGET_ABORT 1h: RECEIVED_TARGET_CLEAR
27	0	R	T_XUSB_CFG_1_SIGNALED_TARGET: The SIGNALED_TARGET bit indicates that the device has terminated a transaction with target-abort. Devices that will never signal target-abort do not need to implement this bit. When this bit is set, an interrupt is signaled in the PBUS_INTR_0 register. 0h: SIGNALED_TARGET_NO_ABORT (default) 1h: SIGNALED_TARGET_ABORT 1h: SIGNALED_TARGET_CLEAR
26:25	0	R	T_XUSB_CFG_1_DEVSEL_TIMING: The DEVSEL_TIMING bits contain the timing of DEVSEL#. There are three allowable timings for assertion of DEVSEL#. These are encoded as 00b for fast, 01b for medium, and 10b for slow (11b is reserved). These bits are read only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write. FPCI positive decode device are required to respond with fast DEVSEL# (0-cycle). Only the subtractive FPCI function will respond with medium DEVSEL# to accept the cycle for the subtractive bus. 0h: DEVSEL_TIMING_FAST (default) 1h: DEVSEL_TIMING_MEDIUM 2h: DEVSEL_TIMING_SLOW
24	0	R	T_XUSB_CFG_1_MASTER_DATA_PERR: 0h: MASTER_DATA_PERR_NOT_ACTIVE (default) 1h: MASTER_DATA_PERR_ACTIVE 1h: MASTER_DATA_PERR_CLEAR
23	1h	R	T_XUSB_CFG_1_FAST_BACK2BACK: The FAST_BACK2BACK bit indicates that the device is capable of handling back-to-back transfers when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions, and must be set to 0 otherwise. 0h: FAST_BACK2BACK_INCAPABLE 1h: FAST_BACK2BACK_CAPABLE (default)
22	0	R	Reserved
21	1h	R	T_XUSB_CFG_1_66 MHZ: 0h: 66 MHZ_INCAPABLE 1h: 66 MHZ_CAPABLE (default)

Bits	Reset	R/W	Description
20	1h	R	T_XUSB_CFG_1_CAPLIST: The CAPLIST bit indicates that the device configuration space includes a capabilities list starting at the offset indicated by T_XUSB_DEV_CFG_13. 0h: CAPLIST_NOT_PRESENT 1h: CAPLIST_PRESENT (default)
19	None	R	T_XUSB_CFG_1_INTR_STATUS: The INTR_STATUS bit is read-only and reflects the state of the interrupt in the device/function. Only when the INTR_DISABLE bit in the command register is a 0 and this INTR_STATUS bit is a 1, will the device's/function's INTx# signal be asserted. Setting the INTR_DISABLE bit to 1 has no effect on the state of this bit. 0h: INTR_STATUS_0 1h: INTR_STATUS_1
18:11	0	R	Reserved
10	0	R/W	T_XUSB_CFG_1_INTR_DISABLE: The INTR_DISABLE bit indicates that it could disable the device/function from asserting INTx#. A value of 0 enables the assertion of INTx#, and a value of 1 disables the assertion of INTx# signal. The Device Status register is used to record status information for PCI bus related events. 0h: INTR_DISABLE_ON (default) 1h: INTR_DISABLE_OFF
9	0	R	T_XUSB_CFG_1_BACK2BACK: 0h: BACK2BACK_DISABLED (default) 1h: BACK2BACK_ENABLED
8	0	R	T_XUSB_CFG_1_SERR: 0h: SERR_DISABLED (default) 1h: SERR_ENABLED
7	0	R	T_XUSB_CFG_1_STEP: 0h: STEP_DISABLED (default) 1h: STEP_ENABLED
6	0	R	T_XUSB_CFG_1_PERR: 0h: PERR_DISABLED (default) 1h: PERR_ENABLED
5	0	R	T_XUSB_CFG_1_PALETTE_SNOOP: The PALETTE_SNOOP bit indicates that VGA compatible devices should snoop their palette registers. When this bit is set, special palette snooping behavior is enabled (i.e., device must not respond). When the bit is reset, the device should treat palette accesses like all other accesses. VGA compatible devices should implement this bit. PALETTE_SNOOP is writable. 0h: PALETTE_SNOOP_DISABLED (default) 1h: PALETTE_SNOOP_ENABLED
4	0	R	T_XUSB_CFG_1_WRITE_AND_INVAL: The WRITE_AND_INVAL bit indicates that the device can use the Memory Write and Invalidate command when the transfer is aligned and 16 bytes and the contents of the Cache Line Size Register is 4 DWORDS. When this bit is 1, masters may generate the command. When it is 0, Memory Write must be used instead. State after RST# is 0. This bit must be implemented by master devices that can generate the Memory Write and Invalidate command. 0h: WRITE_AND_INVAL_DISABLED (default) 1h: WRITE_AND_INVAL_ENABLED
3	0	R	T_XUSB_CFG_1_SPECIAL_CYCLE: 0h: SPECIAL_CYCLE_DISABLED (default) 1h: SPECIAL_CYCLE_ENABLED
2	0	R/W	T_XUSB_CFG_1_BUS_MASTER: The BUS_MASTER bit indicates that the device can act as a master on the PCI bus. A value of 0 disables the device from generating PCI accesses. A value of 1 allows the device to behave as a bus master. BUS_MASTER is writable. 0h: BUS_MASTER_DISABLED (default) 1h: BUS_MASTER_ENABLED
1	0	R/W	T_XUSB_CFG_1_MEMORY_SPACE: The MEMORY_SPACE bit indicates that the device will respond to memory space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to Memory space accesses. MEMORY_SPACE is writable. 0h: MEMORY_SPACE_DISABLED (default) 1h: MEMORY_SPACE_ENABLED

Bits	Reset	R/W	Description
0	0	R/W	T_XUSB_CFG_1_IO_SPACE: The IO_SPACE bit indicates that the device will respond to I/O space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O space accesses. IO_SPACE is writable. 0h: IO_SPACE_DISABLED (default) 1h: IO_SPACE_ENABLED

22.16.9.3 T_XUSB_CFG_2

PCI Revision ID and Class Code Register

Offset: 0x08 | Read/Write: R

Bits	Reset	R/W	Description
31:24	Ch	R	T_XUSB_CFG_2_BASE_CLASS: The CLASS_CODE bits identify the generic function of the device and (in some cases) a specific register-level programming interface. The register is broken into three byte-size fields. The upper byte (at offset 0BH) is a base class code which broadly classifies the type of function the device performs. The middle-byte (at offset 0BH) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09H) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. The Class Code and Revision ID are defined by parameters per block. Ch: BASE_CLASS_SBC (default)
23:16	3h	R	T_XUSB_CFG_2_SUB_CLASS: 3h: SUB_CLASS_XUSB (default)
15:8	FEh	R	T_XUSB_CFG_2_PROG_IF: FEh: PROG_IF_XHCI (default)
7:0	A1h	R	T_XUSB_CFG_2_REVISION_ID: The REVISION_ID bits specify a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the DEVICE_ID. A1h: REVISION_ID_VAL (default) A1h: REVISION_ID_A01

22.16.9.4 T_XUSB_CFG_3

PCI Configuration Register

Offset: 0x0C | Read/Write: R

Bits	Reset	R/W	Description
31:24	0	R	Reserved
23	0	R	T_XUSB_CFG_3_HEADER_TYPE_FUNC: 0h: HEADER_TYPE_FUNC_SINGLE (default) 1h: HEADER_TYPE_FUNC_MULTI
22:16	0	R	T_XUSB_CFG_3_HEADER_TYPE_DEVICE: The HEADER_TYPE bits identify the layout of the bytes 10h through 3Fh in configuration space and also whether or not the device contains multiple functions. Bit 7 in this register is used to identify a multi-function device. If the bit is 0, then the device is single function. If the bit is 1, then the device has multiple functions. Bits 6 through 0 specify the layout of bytes 10h through 3Fh. The LATENCY_TIMER and HEADER_TYPE are defined by parameters per block. 0h: HEADER_TYPE_DEVICE_NON_BRIDGE (default) 1h: HEADER_TYPE_DEVICE_P2P_BRIDGE
15:11	0	R	T_XUSB_CFG_3_LATENCY_TIMER: The LATENCY_TIMER bits contain, in units of PCI bus clocks, the value of the Latency Timer for this PCI bus master. This register must be implemented as writable by any master that can burst more than two data phases. This register may be implemented as read-only for devices that burst two or fewer data phases, but the hardwired value must be limited to 16 or less. A typical implementation would be to build the five high-order bits (leaving the bottom three as read-only), resulting in a timer granularity of eight clocks. At reset, the register should be set to 0 (if programmable). LATENCY_TIMER bits are writable. 0h: LATENCY_TIMER_0_CLOCKS (default) 1h: LATENCY_TIMER_8_CLOCKS 1Eh: LATENCY_TIMER_240_CLOCKS 1Fh: LATENCY_TIMER_248_CLOCKS

Bits	Reset	R/W	Description
10:8	0	R	Reserved
7:0	0	R	T_XUSB_CFG_3_CACHE_LINE_SIZE: 0h: CACHE_LINE_SIZE_0 (default) 20h: CACHE_LINE_SIZE_32 40h: CACHE_LINE_SIZE_64

22.16.9.5 T_XUSB_CFG_4

PCI Configuration Register

Offset: 0x10 | Read/Write: R/W

Bits	Reset	R/W	Description
31:15	0	R/W	T_XUSB_CFG_4_BASE_ADDRESS: The BASE_ADDRESS bits contain the base address of the device. The number of upper bits that a device actually implements depends on how much of the address space the device will respond to. A device that wants a 1 MB memory address space (using a 32-bit base address register) would build the top 12 bits of the address register, hardwiring the other bits to 0. Power-up software can determine how much address space the device required by writing a value of all 1's to the register and then reading the value back. The device will return 0's in all don't-care address bits, effectively specifying the address space required. 0h: BASE_ADDRESS_DEFAULT (default)
14:4	0	R	T_XUSB_CFG_4_BAR_SIZE_32KB: 0h: BAR_SIZE_32KB_RSVD (default)
3	1h	R	T_XUSB_CFG_4_PREFETCHABLE: 0h: PREFETCHABLE_NOT 1h: PREFETCHABLE_MERGABLE (default)
2:1	2h	R	T_XUSB_CFG_4_ADDRESS_TYPE: The ADDRESS_TYPE bits contain the type of the Base Address. It can be 32 bits, 20 bits, or 64 bits wide. 0h: ADDRESS_TYPE_32_BIT 2h: ADDRESS_TYPE_64_BIT (default)
0	0	R	T_XUSB_CFG_4_SPACE_TYPE: The SPACE_TYPE bit indicates whether the register maps into Memory or I/O space. 0h: SPACE_TYPE_MEMORY (default) 1h: SPACE_TYPE_IO

31:0	0	R	T_XUSB_CFG_6_RSVD: 0h: RSVD_00 (default)

22.16.9.8 T_XUSB_CFG_11

PCI Configuration Register

The SUBSYSTEM_VENDOR_ID bits and SUBSYSTEM_ID bits are used to uniquely identify the add-in board or subsystem where the device resides. When the device is on the motherboard, there is no serial ROM and the registers both initialize to NONE. The motherboard BIOS must set the values of the Subsystem ID and Subsystem Vendor ID by writing the proper values to the SUBSYSTEM_VENDOR_ID and SUBSYSTEM_ID bits in the PCI_T_16 register (NOT PCI_T_11).

Offset: 0x2c | Read/Write: R

Bits	Reset	R/W	Description
31:16	0	R	T_XUSB_CFG_11_SUBSYSTEM_ID: 0h: SUBSYSTEM_ID_NONE (default)

Bits	Reset	R/W	Description
31:0	0	R	T_XUSB_CFG_12_RESERVED: 0h: RESERVED_0 (default)

22.16.9.10 T_XUSB_CFG_13

PCI Capability Pointer Register

Offset: 0x34 | Read/Write: R

Bits	Reset	R/W	Description
31:8	0	R	Reserved
7:0	44h	R	T_XUSB_CFG_13_CAP_PTR: The CAP_PTR bits indicate the offset into configuration space where the capabilities list begins. This always points to 0x44 where at least the PCI-PM registers are expected to reside. 44h: CAP_PTR_PMCAP C0h: CAP_PTR_MSI 70h: CAP_PTR_MSIX DCh: CAP_PTR_MMAP 44h: CAP_PTR_DEFAULT (default)

22.16.9.11 T_XUSB_CFG_14

PCI Configuration Register

Offset: 0x38 | Read/Write: R

Bits	Reset	R/W	Description
31:0	0	R	T_XUSB_CFG_14_RESERVED: 0h: RESERVED_0 (default)

22.16.9.12 T_XUSB_CFG_15

PCI Configuration Register

Offset: 0x3c | Read/Write: R/W

Bits	Reset	R/W	Description
31:24	0	R	T_XUSB_CFG_15_MAX_LAT: The MAX_LAT bits contain the maximum time the device requires to gain access to the CPI bus. This read-only register is used to specify the device's desired settings for Latency Timer values. The value specifies a period of time in units of 1/4 microseconds. Values of 0 indicate that the device has no major requirements for the settings of Latency Timers. MAX_LAT is nonzero. The INTR_PIN, MIN_GNT, and MAX_LAT are configurable per block. For a 64-byte buffer with two 32-byte sections, the maximum tolerable latency for the XHCI once a large XUSB ISO transaction has begun is about 23 µs. The latency timer is hardwired to 20 µs. This value only applies in External PCI operation. 0h: MAX_LAT_NO_REQUIREMENTS (default) 14h: MAX_LAT_5US 50h: MAX_LAT_20US
23:16	0	R	T_XUSB_CFG_15_MIN_GNT: The MIN_GNT bits contain the length of the burst period a device needs assuming a clock rate of 33 MHz. This read-only register is used to specify the device's desired settings for Latency Timer values. The value specifies a period of time in units of 1/4 microsecond. Values of 0 indicate that the device has no major requirements for the settings of Latency Timers. MIN_GNT is nonzero. 0h: MIN_GNT_NO_REQUIREMENTS (default) 1h: MIN_GNT_240NS
15:8	1h	R	T_XUSB_CFG_15_INTR_PIN: The INTR_PIN bits contain the interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. 0h: INTR_PIN_NONE 1h: INTR_PIN_INTA (default) 2h: INTR_PIN_INTB 3h: INTR_PIN_INTC 4h: INTR_PIN_INTD
7:0	0	R/W	T_XUSB_CFG_15_INTR_LINE: The INTR_LINE bits contain the interrupt routing information. The register is read/write and must be implemented by any device (or device function) that uses an interrupt pin. POST software will write the routing information into this register as it initializes and configures the system. The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. Device drivers and operating systems can use this information to determine priority and vector information. INTR_LINE is initialized to 0xff (no connection) at reset. Some PCI BIOS' cannot handle aliased INTR_LINEs. Some PCI BIOS' cannot handle INTR_LINE initialized to 0xff. 0h: INTR_LINE_IRQ0 (default) 1h: INTR_LINE_IRQ1 Fh: INTR_LINE_IRQ15 FFh: INTR_LINE_UNKNOWN

31:16	0	R	Reserved
15:14	0	R	T_XUSB_CFG_24_RSVDP: 0h: RSVDP_VALUE
13:8	20h	R/W	T_XUSB_CFG_24_FLADJ: Frame Length Adjustment Register. This register is in the auxiliary power well. This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results. It should not be reprogrammed by USB system software unless the default or BIOS programmed values are incorrect, or the system is restoring the register while returning from a suspended state. 20h: FLADJ_VALUE (default)
7:0	30h	R	T_XUSB_CFG_24_SBRN: Serial Bus Release Number Register. This register contains the release of the Universal Serial Bus Specification with which this Universal Serial Bus Host Controller module is compliant. 30h: SBRN_VALUE

22.16.9.17 T_XUSB_MSI_CTRL

MSI Message Control and Capability Register B0h

MSI_CTRL is the main control register for MSI support.

Offset: 0xc0 | Read/Write: R/W

Bits	Reset	R/W	Description
31:25	0	R	Reserved

Bits	Reset	R/W	Description
24	0	R	T_XUSB_MSI_CTRL_VECTOR_MASK_CAP: The VECTOR_MASK_CAP field indicates whether or not the controller supports MSI-per-vector masking. 0h: VECTOR_MASK_CAP_DIS 1h: VECTOR_MASK_CAP_EN 0h: VECTOR_MASK_CAP_DEFAULT (default)
23	1h	R	T_XUSB_MSI_CTRL_64_ADDR_CAP: The 64_ADDR_CAP field indicates whether or not the controller is capable of generating a 64-bit message address. A value of 1 means the controller is capable of generating a 64-bit message address. 0h: 64_ADDR_CAP_DIS 1h: 64_ADDR_CAP_EN 1h: 64_ADDR_CAP_DEFAULT (default)
22:20	0	R/W	T_XUSB_MSI_CTRL_MULT_MSG_ENABLE: System software writes to this field to indicate the number of allocated vectors (less than or equal to the number of vectors requested). The number of vectors is aligned as a power of two. When MSI is enabled, the controller will be allocated at least one vector. 0h: MULT_MSG_ENABLE_1 1h: MULT_MSG_ENABLE_2 2h: MULT_MSG_ENABLE_4 3h: MULT_MSG_ENABLE_8 4h: MULT_MSG_ENABLE_16 5h: MULT_MSG_ENABLE_32 0h: MULT_MSG_ENABLE_DEFAULT (default)
19:17	0	R	T_XUSB_MSI_CTRL_MULT_MSG_CAP: System software reads this field to determine the number of requested vectors. The number of requested vectors must be aligned to a power of two. Values of 6 and 7 in this field are reserved. 0h: MULT_MSG_CAP_1 1h: MULT_MSG_CAP_2 2h: MULT_MSG_CAP_4 3h: MULT_MSG_CAP_8 4h: MULT_MSG_CAP_16 5h: MULT_MSG_CAP_32 0h: MULT_MSG_CAP_DEFAULT (default)
16	0	R/W	T_XUSB_MSI_CTRL_MSI_ENABLE: The MSI_ENABLE field enables the MSI capability. If MSI_ENABLE is written to a 1, the controller is permitted to use MSI to request service and is prohibited from using the legacy interrupt. System configuration software sets this bit to enable MSI. A device driver is prohibited from writing this bit to mask the controller's service request. If this bit is written to a 0, the controller is prohibited from using MSI to request service. 0h: MSI_ENABLE_OFF 1h: MSI_ENABLE_ON 0h: MSI_ENABLE_DEFAULT (default)
15:8	E0h	R	T_XUSB_MSI_CTRL_NEXT_PTR: The NEXT_PTR field identifies the next item in the capabilities list. It is a read-only field. 70h: NEXT_PTR_MSIX DCh: NEXT_PTR_MMAP 44h: NEXT_PTR_PMCAP 0h: NEXT_PTR_NULL E0h: NEXT_PTR_MAILBOX E0h: NEXT_PTR_DEFAULT (default)
7:0	5h	R	T_XUSB_MSI_CTRL_CAP_ID: The CAP_ID field identifies this capability block as the MSI capability block. This is read-only as 0x5. 5h: CAP_ID_MSI (default)

22.16.9.18 T_XUSB_MSI_ADDR1

MSI Message Address Register 84h

MSI_ADDR1 specifies the lower 32 bits to which an MSI memory write transaction should occur.

Offset: 0xc4 | Read/Write: R/W

Bits	Reset	R/W	Description
31:2	0	R/W	T_XUSB_MSI_ADDR1_MSG_ADDR: System-specified message address. When MSI is enabled, this field specifies the Dword-aligned address for the MSI memory write transaction. 0h: MSG_ADDR_DEFAULT (default)
1:0	0	R	Reserved

22.16.9.19 T_XUSB_MSI_ADDR2

MSI Message Upper Address Register 88h

MSI_ADDR2 specifies the upper 32 bits to which an MSI memory write transaction should occur.

Offset: 0xc8 | Read/Write: R/W

Bits	Reset	R/W	Description
31:0	0	R/W	T_XUSB_MSI_ADDR2_MSG_ADDR: System-specified message address. When MSI is enabled, this field specifies the upper 32 bits of the address for the MSI memory write transaction. The contents of this register only apply when T_XUSB_CFG_MSI_CTRL_64_ADDR_CAP bit is set. 0h: MSG_ADDR_DEFAULT (default)

22.16.9.20 T_XUSB_MSI_DATA

MSI Message Data Register 8Ch

The MSI_DATA register contains the system-specified message.

Offset: 0xcc | Read/Write: R/W

Bits	Reset	R/W	Description
31:16	0	R	Reserved
15:0	0	R/W	T_XUSB_MSI_DATA_MSG_DATA: System-specified message When MSI is enabled, the message data is driven onto the lower 16 bits of the MSI memory write. The MULT_MSG_ENABLE field in configuration register 80h specifies the number of low-order message data bits that the XHCI is permitted to modify to generate its system software allocated vectors. 0h: MSG_DATA_DEFAULT (default)

22.16.9.21 T_XUSB_MSI_MASK

MSI Message Data Register 60h

The MSI_MASK register enables software to mask or defer message generation on a per-vector basis.

Offset: 0xD0 | Read/Write: R/W

Bits	Reset	R/W	Description
31:1	0	R/W	Reserved
0	0	R/W	T_XUSB_MSI_MASK_BIT: For each mask bit that is set, the controller is prohibited from generating the associated message. bit 0 corresponds to MSI vector 0 bit 1 corresponds to MSI vector 1 bit 2 corresponds to MSI vector 2 bit 3 corresponds to MSI vector 3 bit 4 corresponds to MSI vector 4 bit 5 corresponds to MSI vector 5 bit 6 corresponds to MSI vector 6 bit 7 corresponds to MSI vector 7, etc. 0h: MSI_MASK_BIT_DEFAULT (default)

22.16.9.22 T_XUSB_MSI_PEND

MSI Pending Bits Register 64h

The MSI_PEND register shows which MSI vectors have pending interrupts.

Offset: 0xD4 | Read/Write: R/W

Bits	Reset	R/W	Description
31:16	0	R	Reserved
15:0	0	R	T_XUSB_MSI_PEND_BIT: For each Pending bit that is set, XUSB has a pending associated message. bit 0 corresponds to MSI vector 0 bit 1 corresponds to MSI vector 1 bit 2 corresponds to MSI vector 2 bit 3 corresponds to MSI vector 3 bit 4 corresponds to MSI vector 4 bit 5 corresponds to MSI vector 5 bit 6 corresponds to MSI vector 6 bit 7 corresponds to MSI vector 7, etc. 0h: MSI_PEND_BIT_DEFAULT (default)

22.16.10 XUSB Mailbox Registers

22.16.10.1 T_XUSB_CFG_ARU_MAILBOX_CAP

Offset: 0xe0 | Read/Write: R/W | Reset: 0xXXXXXXXX (0b00000000000000000000000000000000)

Bits	Reset	R/W	Description

22.16.12.7 FALCON_CPUCTL_0

Offset: 0x100 | Read/Write: R/W | Reset: 0b00000000000000000000000000xxxxx

Bit	Reset	R/W	Description
5	X	RO	STOPPED: This bit indicates whether the CPU is currently in the stopped state. The Falcon processor will exit this state if a 1 is written to the STARTCPU bit, or if an interrupt arrives on one of its two inputs and the corresponding IE bit in CSW is set 0: STOPPED_FALSE 1: STOPPED_TRUE
4	X	RO	HALTED: This bit indicates whether the CPU is currently in the halted state. The Falcon processor can only exit this state when a 1 is written to the STARTCPU bit. 0: HALTED_FALSE 1: HALTED_TRUE
3	X	WO	HRESET: Setting HRESET to true will apply a hard reset. This bit will auto-clear and setting to false has no effect. 0: HRESET_FALSE 1: HRESET_TRUE
2	X	WO	SRESET: Setting SRESET to true will apply a soft reset. This bit will auto-clear and setting to false has no effect. 0: SRESET_FALSE 1: SRESET_TRUE
1	X	WO	STARTCPU: Setting STARTCPU to true will start CPU execution while in a HALTED state. If a start request is still pending, setting to false cancel the start request. Writing any value has no effect while the CPU is running. 0: STARTCPU_FALSE 1: STARTCPU_TRUE
0	X	WO	IINVAL: Setting IINVAL to true causes all blocks in IMEM except block 0 to be marked as INVALID. This bit will auto-clear and setting to false has no effect. 0: IINVAL_FALSE 1: IINVAL_TRUE

22.16.12.8 FALCON_BOOTVEC_0

The BOOTVEC register stores the initial execution start address of the CPU when it is first started after a reset.

Offset: 0x104 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:0	0x0	VEC 0: VEC_INIT

22.16.12.9 FALCON_DMACTL_0

Offset: 0x10c | Read/Write: R/W | Reset: 0b00000000000000000000000000xxxxxx1

Bit	Reset	R/W	Description
6:3	X	RO	DMAQ_NUM: Indicates the valid request number at the DMA request queue
2	X	RO	IMEM_SCRUBBING: 0: Indicates scrubbing is done. For a non-secure Falcon, this value is always 0. 1: Indicates secure scrubber is pending and scrubbing IMEM, any access to IMEM will be blocked until scrubbing is done 0: IMEM_SCRUBBING_DONE 1: IMEM_SCRUBBING_PENDING
1	X	RO	DMEM_SCRUBBING: 0: Indicates scrubbing is done. For a non-secure Falcon, this value is always 0. 1: Indicates secure scrubber is pending and scrubbing DMEM, any access to DMEM will be blocked until scrubbing is done 0: DMEM_SCRUBBING_DONE 1: DMEM_SCRUBBING_PENDING
0	0x1	RW	REQUIRE_CTX: When REQUIRE_CTX is set to true, a valid context must be loaded before any DMA request can be serviced. Pending requests without a valid current context remain pending, and do not prevent the engine from reporting idle. When this bit is set to false, DMA requests are serviced regardless of the current context. Note that once a request is issued, it must complete before the engine will be able to report idle, as needed for example to process WFI context switch requests. 0:REQUIRE_CTX_FALSE 1: REQUIRE_CTX_TRUE 1: REQUIRE_CTX_INIT

22.16.12.10 FALCON_IMFILLRNG1_0

IMFILLRNG1 indicates tag values for the low and high end of the PC range to be auto-filled. The PC range is [tag_lo<<8. tag_hi<<8+255].

If the user enables the auto-fill feature and leaves IMFILLRNG1 as zero, instruction 0x0~0x0ff always works as auto-fill range.

22.16.13.32 XUSB_DEV_CONFIGURATION_0

Configuration

Offset: 0x180 | Read/Write: R/W | Reset: 0x800X8X40 (0b1xxxxxxxxxxx1xxx10xxxxxx01000000)

Bit	R/W	Reset	Description
31	RW	0x1	CLKEN_OVERRIDE:This can override the clock enable in case of malfunction.
19	RW	0x1	PW_NO_DEVSEL_ERR_CYA: Set this to not detect DECERR due to no DEVSEL for DS PWs only.
18	RO	X	INITIATOR_READ_IDLE:This read-only bit provides status reads on AFI upstream. A value of 1b indicates there are no outstanding reads to initiator.
17	RO	X	INITIATOR_WRITE_IDLE: This read-only bit provides status writes on AFI upstream. A value of 1b indicates there are no outstanding writes to initiator.
15	RW	0x1	WDATA_LEAD_CYA: Used to enable/disable the handling of write data ahead of requests on IPFS axi target
14	RW	0x0	WR_INTRLV_CYA: Used to enable/disable the handling of interleaved write requests on IPFS AXI target
11	RO	X	TARGET_READ_IDLE: This read-only bit provides status reads to IPFS target. A value of 1b indicates there are no outstanding reads to downstream FPCI.
10	RO	X	TARGET_WRITE_IDLE: This read-only bit provides status writes to IPFS target. A value of 1b indicates there are no outstanding writes to downstream FPCI.
9	RO	X	MSI_VEC_EMPTY: This read-only bit provides status on whether MSI Vector registers have any active bits valid or not
7	RW	0x0	UFPCI_MSIAW: MSI After Write ordering rule. 1 = whenever MSI is ready assert the interrupt 0 = default behavior, apply MSIAW ordering rule
6	RW	0x1	UFPCI_PWPASSPW: Input to upstream FPCI 1 = whenever write is ready, send it; 0 = write goes only when outstanding PWs outside of new write's region are retired (default).
5	RW	0x0	UFPCI_PASSPW: Input to upstream FPCI. Allow upstream FPCI reads to pass writes.
4	RW	0x0	UFPCI_PWPASSNPW: Used for upstream FPCI. Allow upstream FPCI PWs to pass NPWs.
3	RW	0x0	DFPCI_PWPASSNPW: Used for downstream FPCI. Allow downstream FPCI PWs to pass NPWs.
2	RW	0x0	DFPCI_RSPPASSPW: Input to downstream FPCI. Allow downstream FPCI responses to pass writes
1	RW	0x0	DFPCI_PASSPW: Input to downstream FPCI. Allow downstream FPCI reads to pass writes.
0	RW	0x0	EN_FPCI: When the IPFS device block is disabled, it is completely invisible on the IPFS bus, i.e. it doesn’t even process IPFS configuration accesses.

22.16.13.33 XUSB_DEV_FPCI_ERROR_MASKS_0

FPCI Error Masks

Offset: 0x184 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2	0x0	MASK_FPCI_MASTER_ABORT: This bit allows FPCI error to be forwarded to AXI response when FPCI error response indicates Master Abort. 1 = forward error, 0 = return AXI OKAY response (2'b0)
1	0x0	MASK_FPCI_DATA_ERROR: This bit allows FPCI error to be forwarded to AXI response when FPCI error response indicates Data Error. 1 = forward error, 0 = return AXI OKAY response (2'b0)
0	0x0	MASK_FPCI_TARGET_ABORT: This bit allows FPCI error to be forwarded to AXI response when FPCI error response indicates Target Abort. This bit also covers decode error generated when there is no devsel received. 1 = forward error, 0 = return AXI OKAY response (2'b0)

22.16.13.34 XUSB_DEV_INTR_MASK_0

Interrupt Masks

Offset: 0x188 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0xxxxxxx0xxxxxxx0)

Bit	Reset	Description
16	0x0	IP_INT_MASK:IP (SATA/AZA) interrupt to MPCORE gated by mask.
8	0x0	MSI_MASK:MSI to MPCORE gated by mask.
0	0x0	INT_MASK: Interrupt to MPCORE gated by mask.

22.16.13.35 XUSB_DEV_INTR_CODE_0

Interrupt Control

Offset: 0x18c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4:0	0x0	INT_CODE: Eight interrupt codes If the code is 0, logging of the next interrupt is enabled 0 = INT_CODE_CLEAR: Clear interrupt code 1 = INT_CODE_INI_SLVERR: Interrupt code for MPCORE AXI SLVERR response to IPFS 2 = INT_CODE_INI_DECERR: Interrupt code for MPCORE AXI DECERR response to IPFS 3 = INT_CODE_TGT_SLVERR: Interrupt code for PCIe endpoint FPCI target abort or data error response to IPFS 4 = INT_CODE_TGT_DECERR: Interrupt code for PCIe2 FPCI master abort response to IPFS 5 = INT_CODE_TGT_WRERR: Interrupt code for bufferable write to non-posted write address region 6 = RSVD1 : Reserved 7 = INT_CODE_DFPCI_DECERR: Interrupt code for PCIe2 response to downstream request when downstream FPCI address does not fall in a claimable downstream region 8 = INT_CODE_AXI_DECERR: Interrupt code for IPFS response to downstream request when AXI target AXI address does not fall in any of IPFS downstream BARs 9 = INT_CODE_FPCI_TIMEOUT: Interrupt code for FPCI Timeout 10 = RSVD2: Reserved for future expansion 11 = RSVD3 12 = RSVD4 13 = RSVD5 14 = RSVD6 15 = INT_CODE_SM_FATAL_ERROR: Interrupt code for SM fatal error 16 = INT_CODE_SM_NON_FATAL_ERROR: Interrupt code for SM non-fatal error

22.16.13.36 XUSB_DEV_INTR_SIGNATURE_0

Interrupt Signature

Offset: 0x190 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000x0)

Bit	Reset	Description
31:2	0x0	INT_INFO: For interrupt codes 1-5/7-8, it contains address bits [31:2], either in FPCI memory space or AXI space. For FPCI generated errors, the information contains FPCI address. For AXI/IPFS generated errors, the information contains AXI address.
0	0x0	DIR: Indicates direction of the AXI/FPCI transaction. 1=rd/0=wr. If signature type is 6 (sideband message), this field is 1. 0 = WRITE: Interrupt due to a write transaction 1 = READ: Interrupt due to a read transaction

22.16.13.37 XUSB_DEV_UPPER_FPCI_ADDR_0

Upper FPCI Address

Offset: 0x194 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	INT_INFO_UPPER: These 8 bits are the upper byte of captured FPCI address (bits[39:32])when interrupt code is 3, 4, or 7. These bits determine the region in the Hypertransport Address Map that was accessed.

22.16.13.38 XUSB_DEV_IPFS_INTR_ENABLE_0

IPFS Interrupt Enable

Offset: 0x198 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxx00xxxx00000000)

Bit	Reset	Description
13	0x0	EN_SM_NON_FATAL_ERROR: Enable bit for interrupt code 15
12	0x0	EN_SM_FATAL_ERROR: Enable bit for interrupt code 14
7	0x0	EN_FPCI_TIMEOUT: Enable bit for interrupt code 9
6	0x0	EN_AXI_DECERR: Enable bit for interrupt code 8
5	0x0	EN_DFPCI_DECERR: Enable bit for interrupt code 7
4	0x0	EN_TGT_WRERR: Enable bit for interrupt code 5
3	0x0	EN_TGT_DECERR: Enable bit for interrupt code 4
2	0x0	EN_TGT_SLVERR: Enable bit for interrupt code 3
1	0x0	EN_INI_DECERR: Enable bit for interrupt code 2
0	0x0	EN_INI_SLVERR: Enable bit for interrupt code 1

22.16.13.39 XUSB_DEV_UFPCI_CONFIG_0

Upstream FPCI Configuration

Offset: 0x19c | Read/Write: R/W | Reset: 0x00000002 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00010)

Bit	Reset	Description
4:0	0x2	UNITID_T0C0:Upstream FPCI Unit ID for controller 0. HyperTransport, upstream FPCI request

22.16.13.40 XUSB_DEV_CFG_REVID_0

CFG_REVID register

Offset: 0x1a0 | Read/Write: R/W | Reset: 0x000X10XX (0bxxxxxxxxxxxxxxxxxx0100xxxxxxx1xx)

Bit	R/W	Reset	Description
19	RO	X	DEV2SM_NONISO_REQUEST_PEND: This is to tell if there is a non ISO request pending. 0 = NO 1 = YES
18	RO	X	DEV2SM_ISO_REQUEST_PEND: This is to tell if there is an ISO request pending. 0 = NO 1 = YES
13:12	RW	0x1	STRAP_CPU_MODE: MCP: mode to send MSI. Can have it programmable 0 = NB_INTEL 1 = NB_AMD 2 = AMD 3 = TMTA
11	RW	0x0	CFG_REVID_WRITE_ENABLE: MCP: the enable to override the REVID. Can have it programmable 0 = CLEAR 1 = SET
10	RW	0x0	CFG_REVID_OVERRIDE: MCP: a way to override the current revision ID. Can have it programmable 0 = DISABLE 1 = ENABLE
4	RO	X	DEV2LEG_NONCOH_REQUEST_PEND: MCP: Tells the leg block that we have a non coherent request pending. 0 = NO 1 = YES
3	RO	X	DEV2LEG_COH_REQUEST_PEND: MCP comment: Tells the leg block that we have a coherent request pending 0 = NO 1 = YES

Bit	R/W	Reset	Description
2	RW	0x1	SM2DEV_FPCI_TIMEOUT_EN: FPCI timeout enable bit for Controller 0: disable 1: enable 0 = DISABLE 1 = ENABLE

22.16.13.41 XUSB_DEV_FPCI_TIMEOUT_0

FPCI_TIMEOUT register

Offset: 0x1a4 | Read/Write: R/W | Reset: 0x000f0000 (0bxxxxxxxxxxxx11110000000000000000)

Bit	Reset	Description
19:0	0xf0000	SM2ALL_FPCI_TIMEOUT_THRESH: This sets the timeout threshold value for the FPCI bus. The starts counting for each queues (ISO/NISO- RD/WR) have pending request in FPCI wrapper, the count resets when the requests popped.

22.16.13.42 XUSB_DEV_TOM_0

Top of Memory Limit

Offset: 0x1a8 | Read/Write: R/W | Reset: 0x3fff0fff (0bxx11111111111111xxxx111111111111)

Bit	Reset	Description
29:16	0x3fff	LEG2ALL_TOM2:Top of Memory Limit 2.
11:0	0xfff	LEG2ALL_TOM1:Top of Memory Limit 1.

22.16.13.43 XUSB_DEV_INITIATOR_ISO_PW_RESP_PENDING_0

Initiator ISO PW Response Pending

Offset: 0x1ac | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	NUM_INITIATOR_ISO_PW_RESP_PEND: Number of pending initiator ISO PW responses

22.16.13.44 XUSB_DEV_INITIATOR_NISO_PW_RESP_PENDING_0

Initiator Non-ISO PW Response Pending

Offset: 0x1b0 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	NUM_INITIATOR_NISO_PW_RESP_PEND: Number of pending initiator NISO PW responses

22.16.13.45 XUSB_DEV_INTR_STATUS_0

IPFS Interrupt Status

Offset: 0x1b4 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
2	X	IP_INTR_STATUS: status of IP (SATA/AZA) interrupt
1	X	MSI_INTR_STATUS: status of MSI interrupt
0	X	IPFS_INTR_STATUS: status of IPFS interrupt

22.16.13.46 XUSB_DEV_DFPCI_BEN_0

Downstream FPCI Byte Enables

Offset: 0x1b8 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
31	0x0	EN_DFPCI_BEN: Enable bit for BEN; when set, programmed BE is sent on DFPCI bus
3:0	0x0	DFPCI_BYTE_ENABLE_N: Active low byte enables

22.16.13.47 XUSB_DEV_CLKGATE_HYSTERESIS_0

Offset: 0x1bc | Read/Write: R/W | Reset: 0x00000014 (0bxxxxxxxxxxxxxxxxxxxxxxxx00010100)

Bit	Reset	Description
7:0	0x14	CLK_DISABLE_CNT: Number of IPFS clock cycles to wait after clock gating criteria is met to disable IPFS/ FPCI clocks

22.16.13.48 XUSB_DEV_XUSB_DEV_MCCIF_FIFOCTRL_0

Memory Client Interface FIFO Control (where applicable) and Clock Gating Control Register

Note: *The FIFO timing aspects of this register are no longer supported, but retained for software compatibility.*

The clock override/ovr_mode fields of this register control the second-level clock gating for the client and MC side of the MCCIF. All clock gating is enabled by default.

A '1' written to the rclk/wclk override field will result in one of the following:

- With wclk/rclk override mode = LEGACY, the clock reverts to legacy mode of operation where the clock is on whenever the client clk is enabled.
- With wclk/rclk override mode = ON, the clock is always on inside MCCIF and PC.

A '1' written to the cclk override field keeps client's clk always on inside MCCIF.

Offset: 0x1dc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000xxxxxxxxxxxx0000)

Bit	Reset	Description
20	LEGACY	XUSB_DEV_RCLK_OVR_MODE: 0 = LEGACY 1 = ON

22.16.14.3 T_XUSB_DEV_CFG_2

PCI Revision ID and Class Code Register

Offset: 0x08 | Read/Write: R

Bits	Reset	R/W	Description
31:24	Ch	R	T_XUSB_DEV_CFG_2_BASE_CLASS: The CLASS_CODE bits identify the generic function of the device and (in some cases) a specific register-level programming interface. The register is broken into three byte-size fields. The upper byte (at offset 0BH) is a base class code which broadly classifies the type of function the device performs. The middle-byte (at offset 0BH) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09H) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. The Class Code and Revision ID are defined by parameters per block. Ch: BASE_CLASS_SBC (default)
23:16	3h	R	T_XUSB_DEV_CFG_2_SUB_CLASS: 3h: SUB_CLASS_XUSB (default)
15:8	FEh	R	T_XUSB_DEV_CFG_2_PROG_IF: 30h: PROG_IF_XHCI (default)
7:0	A1h	R	T_XUSB_DEV_CFG_2_REVISION_ID: The REVISION_ID bits specify a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the DEVICE_ID. A1h: REVISION_ID_VAL (default) A1h: REVISION_ID_A01

22.16.14.4 T_XUSB_DEV_CFG_3

PCI Configuration Register

Offset: 0x0C | Read/Write: R

Bits	Reset	R/W	Description
31:24	0	R	Reserved
23	0	R	T_XUSB_DEV_CFG_3_HEADER_TYPE_FUNC: 0h: HEADER_TYPE_FUNC_SINGLE (default) 1h: HEADER_TYPE_FUNC_MULTI

Bits	Reset	R/W	Description
22:16	0	R	T_XUSB_DEV_CFG_3_HEADER_TYPE_DEVICE: The HEADER_TYPE bits identify the layout of the bytes 10h through 3Fh in configuration space and also whether or not the device contains multiple functions. Bit 7 in this register is used to identify a multi-function device. If the bit is 0, then the device is single function. If the bit is 1, then the device has multiple functions. Bits 6 through 0 specify the layout of bytes 10h through 3Fh. The LATENCY_TIMER and HEADER_TYPE are defined by parameters per block. 0h: HEADER_TYPE_DEVICE_NON_BRIDGE (default) 1h: HEADER_TYPE_DEVICE_P2P_BRIDGE
15:11	0	R	T_XUSB_DEV_CFG_3_LATENCY_TIMER: The LATENCY_TIMER bits contain, in units of PCI bus clocks, the value of the Latency Timer for this PCI bus master. This register must be implemented as writable by any master that can burst more than two data phases. This register may be implemented as read-only for devices that burst two or fewer data phases, but the hardwired value must be limited to 16 or less. A typical implementation would be to build the five high-order bits (leaving the bottom three as read-only), resulting in a timer granularity of eight clocks. At reset, the register should be set to 0 (if programmable). LATENCY_TIMER bits are writable. 0h: LATENCY_TIMER_0_CLOCKS (default) 1h: LATENCY_TIMER_8_CLOCKS 1Eh: LATENCY_TIMER_240_CLOCKS 1Fh: LATENCY_TIMER_248_CLOCKS
10:8	0	R	Reserved
7:0	0	R	T_XUSB_DEV_CFG_3_CACHE_LINE_SIZE: 0h: CACHE_LINE_SIZE_0 (default) 20h: CACHE_LINE_SIZE_32 40h: CACHE_LINE_SIZE_64

22.16.14.5 T_XUSB_DEV_CFG_4

PCI Configuration Register

Offset: 0x10 | Read/Write: R/W

Bits	Reset	R/W	Description
31:15	0	R/W	T_XUSB_DEV_CFG_4_BASE_ADDRESS: The BASE_ADDRESS bits contain the base address of the device. The number of upper bits that a device actually implements depends on how much of the address space the device will respond to. A device that wants a 1 MB memory address space (using a 32-bit base address register) would build the top 12 bits of the address register, hardwiring the other bits to 0. Power-up software can determine how much address space the device required by writing a value of all 1's to the register and then reading the value back. The device will return 0's in all don't-care address bits, effectively specifying the address space required. 0h: BASE_ADDRESS_DEFAULT (default)
14:4	0	R	T_XUSB_DEV_CFG_4_BAR_SIZE_32KB: 0h: BAR_SIZE_32KB_RSVD (default)
3	1h	R	T_XUSB_DEV_CFG_4_PREFETCHABLE: 0h: PREFETCHABLE_NOT 1h: PREFETCHABLE_MERGABLE (default)
2:1	2h	R	T_XUSB_DEV_CFG_4_ADDRESS_TYPE: The ADDRESS_TYPE bits contain the type of the Base Address. It can be 32 bits, 20 bits, or 64 bits wide. 0h: ADDRESS_TYPE_32_BIT 2h: ADDRESS_TYPE_64_BIT (default)
0	0	R	T_XUSB_DEV_CFG_4_SPACE_TYPE: The SPACE_TYPE bit indicates whether the register maps into Memory or I/O space. 0h: SPACE_TYPE_MEMORY (default) 1h: SPACE_TYPE_IO

22.16.14.6 T_XUSB_DEV_CFG_5

Offset: 0x14 | Read/Write: R/W

Bits	Reset	R/W	Description

22.16.14.8 T_XUSB_DEV_CFG_11

PCI Configuration Register

The SUBSYSTEM_VENDOR_ID bits and SUBSYSTEM_ID bits are used to uniquely identify the add-in board or subsystem where the device resides. When the device is on the motherboard, there is no serial ROM and the registers both initialize to NONE. The motherboard BIOS must set the values of the Subsystem ID and Subsystem Vendor ID by writing the proper values to the SUBSYSTEM_VENDOR_ID and SUBSYSTEM_ID bits in the PCI_T_16 register (NOT PCI_T_11).

Offset: 0x2c | Read/Write: R

Bits	Reset	R/W	Description
31:16	0	R	T_XUSB_DEV_CFG_11_SUBSYSTEM_ID: 0h: SUBSYSTEM_ID_NONE (default)
15:0	0	R	T_XUSB_DEV_CFG_11_SUBSYSTEM_VENDOR_ID: 0h: SUBSYSTEM_VENDOR_ID_NONE (default)

22.16.14.9 T_XUSB_DEV_CFG_12

PCI Configuration Register

Offset: 0x30 | Read/Write: R

Bits	Reset	R/W	Description
31:0	0	R	T_XUSB_DEV_CFG_12_RESERVED: 0h: RESERVED_0 (default)

22.16.14.10 T_XUSB_CFG_13

PCI Capability Pointer Register

Offset: 0x34 | Read/Write: R

Bits	Reset	R/W	Description
31:8	0	R	Reserved
7:0	44h	R	T_XUSB_DEV_CFG_13_CAP_PTR: The CAP_PTR bits indicate the offset into configuration space where the capabilities list begins. This always points to 0x44 where at least the PCI-PM registers are expected to reside. 44h: CAP_PTR_PMCAP C0h: CAP_PTR_MSI 70h: CAP_PTR_MSIX DCh: CAP_PTR_MMAP 44h: CAP_PTR_DEFAULT (default)

22.16.14.11 T_XUSB_DEV_CFG_14

PCI Configuration Register

Offset: 0x38 | Read/Write: R

Bits	Reset	R/W	Description
31:0	0	R	T_XUSB_DEV_CFG_14_RESERVED: 0h: RESERVED_0 (default)

22.16.14.12 T_XUSB_DEV_CFG_15

PCI Configuration Register

Offset: 0x3c | Read/Write: R/W

Bits	Reset	R/W	Description
31:24	0	R	T_XUSB_DEV_CFG_15_MAX_LAT: The MAX_LAT bits contain the maximum time the device requires to gain access to the CPI bus. This read-only register is used to specify the device's desired settings for Latency Timer values. The value specifies a period of time in units of 1/4 microseconds. Values of 0 indicate that the device has no major requirements for the settings of Latency Timers. MAX_LAT is nonzero. The INTR_PIN, MIN_GNT, and MAX_LAT are configurable per block. For a 64-byte buffer with two 32-byte sections, the maximum tolerable latency for the XHCI once a large XUSB ISO transaction has begun is about 23 µs. The latency timer is hardwired to 20 µs. This value only applies in External PCI operation. 0h: MAX_LAT_NO_REQUIREMENTS (default) 14h: MAX_LAT_5US 50h: MAX_LAT_20US
23:16	0	R	T_XUSB_DEV_CFG_15_MIN_GNT: The MIN_GNT bits contain the length of the burst period a device needs assuming a clock rate of 33 MHz. This read-only register is used to specify the device's desired settings for Latency Timer values. The value specifies a period of time in units of 1/4 microsecond. Values of 0 indicate that the device has no major requirements for the settings of Latency Timers. MIN_GNT is nonzero. 0h: MIN_GNT_NO_REQUIREMENTS (default) 1h: MIN_GNT_240NS
15:8	1h	R	T_XUSB_DEV_CFG_15_INTR_PIN: The INTR_PIN bits contain the interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. 0h: INTR_PIN_NONE 1h: INTR_PIN_INTA (default) 2h: INTR_PIN_INTB 3h: INTR_PIN_INTC 4h: INTR_PIN_INTD
7:0	0	R/W	T_XUSB_DEV_CFG_15_INTR_LINE: The INTR_LINE bits contain the interrupt routing information. The register is read/write and must be implemented by any device (or device function) that uses an interrupt pin. POST software will write the routing information into this register as it initializes and configures the system. The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. Device drivers and operating systems can use this information to determine priority and vector information. INTR_LINE is initialized to 0xff (no connection) at reset. Some PCI BIOS' cannot handle aliased INTR_LINEs. Some PCI BIOS' cannot handle INTR_LINE initialized to 0xff. 0h: INTR_LINE_IRQ0 (default) 1h: INTR_LINE_IRQ1 Fh: INTR_LINE_IRQ15 FFh: INTR_LINE_UNKNOWN

22.16.14.13 T_XUSB_DEV_CFG_16

22.16.14.16 T_XUSB_DEV_MSI_CTRL

MSI Message Control and Capability Register B0h

MSI_CTRL is the main control register for MSI support.

Offset: 0xc0 | Read/Write: R/W

Bits	Reset	R/W	Description
31:25	0	R	Reserved
24	0	R	T_XUSB_DEV_MSI_CTRL_VECTOR_MASK_CAP: The VECTOR_MASK_CAP field indicates whether or not the controller supports MSI-per-vector masking. 0h: VECTOR_MASK_CAP_DIS 1h: VECTOR_MASK_CAP_EN 0h: VECTOR_MASK_CAP_DEFAULT (default)
23	1h	R	T_XUSB_MSI_CTRL_64_ADDR_CAP: The 64_ADDR_CAP field indicates whether or not the controller is capable of generating a 64-bit message address. A value of 1 means the controller is capable of generating a 64-bit message address. 0h: 64_ADDR_CAP_DIS 1h: 64_ADDR_CAP_EN 1h: 64_ADDR_CAP_DEFAULT (default)
22:20	0	R/W	T_XUSB_DEV_MSI_CTRL_MULT_MSG_ENABLE: System software writes to this field to indicate the number of allocated vectors (less than or equal to the number of vectors requested). The number of vectors is aligned as a power of two. When MSI is enabled, the controller will be allocated at least one vector. 0h: MULT_MSG_ENABLE_1 1h: MULT_MSG_ENABLE_2 2h: MULT_MSG_ENABLE_4 3h: MULT_MSG_ENABLE_8 4h: MULT_MSG_ENABLE_16 5h: MULT_MSG_ENABLE_32 0h: MULT_MSG_ENABLE_DEFAULT (default)

Bits	Reset	R/W	Description
19:17	0	R	T_XUSB_DEV_MSI_CTRL_MULT_MSG_CAP: System software reads this field to determine the number of requested vectors. The number of requested vectors must be aligned to a power of two. Values of 6 and 7 in this field are reserved. 0h: MULT_MSG_CAP_1 1h: MULT_MSG_CAP_2 2h: MULT_MSG_CAP_4 3h: MULT_MSG_CAP_8 4h: MULT_MSG_CAP_16 5h: MULT_MSG_CAP_32 0h: MULT_MSG_CAP_DEFAULT (default)
16	0	R/W	T_XUSB_DEV_MSI_CTRL_MSI_ENABLE: The MSI_ENABLE field enables the MSI capability. If MSI_ENABLE is written to a 1, the controller is permitted to use MSI to request service and is prohibited from using the legacy interrupt. System configuration software sets this bit to enable MSI. A device driver is prohibited from writing this bit to mask the controller's service request. If this bit is written to a 0, the controller is prohibited from using MSI to request service. 0h: MSI_ENABLE_OFF 1h: MSI_ENABLE_ON 0h: MSI_ENABLE_DEFAULT (default)
15:8	E0h	R	T_XUSB_DEV_MSI_CTRL_NEXT_PTR: The NEXT_PTR field identifies the next item in the capabilities list. It is a read-only field. 70h: NEXT_PTR_MSIX DCh: NEXT_PTR_MMAP 44h: NEXT_PTR_PMCAP 0h: NEXT_PTR_NULL 0h: NEXT_PTR_DEFAULT (default)
7:0	5h	R	T_XUSB_DEV_MSI_CTRL_CAP_ID: The CAP_ID field identifies this capability block as the MSI capability block. This is read-only as 0x5. 5h: CAP_ID_MSI (default)

22.16.14.17 T_XUSB_DEV_MSI_ADDR1

MSI Message Address Register 84h

MSI_ADDR1 specifies the lower 32 bits to which an MSI memory write transaction should occur.

Offset: 0xc4 | Read/Write: R/W

Bits	Reset	R/W	Description
31:2	0	R/W	T_XUSB_DEV_MSI_ADDR1_MSG_ADDR: System-specified message address. When MSI is enabled, this field specifies the Dword-aligned address for the MSI memory write transaction. 0h: MSG_ADDR_DEFAULT (default)
1:0	0	R	Reserved

22.16.14.18 T_XUSB_DEV_MSI_ADDR2

MSI Message Upper Address Register 88h

MSI_ADDR2 specifies the upper 32 bits to which an MSI memory write transaction should occur.

Offset: 0xc8 | Read/Write: R/W

Bits	Reset	R/W	Description
31:0	0	R/W	T_XUSB_DEV_MSI_ADDR2_MSG_ADDR: System-specified message address. When MSI is enabled, this field specifies the upper 32 bits of the address for the MSI memory write transaction. The contents of this register only apply when T_XUSB_CFG_MSI_CTRL_64_ADDR_CAP bit is set. 0h: MSG_ADDR_DEFAULT (default)

22.16.14.19 T_XUSB_DEV_MSI_DATA

MSI Message Data Register 8Ch

The MSI_DATA register contains the system-specified message.

Offset: 0xcc | Read/Write: R/W

Bits	Reset	R/W	Description
31:16	0	R	Reserved
15:0	0	R/W	T_XUSB_DEV_MSI_DATA_MSG_DATA: System-specified message When MSI is enabled, the message data is driven onto the lower 16 bits of the MSI memory write. The MULT_MSG_ENABLE field in configuration register 80h specifies the number of low-order message data bits that the XHCI is permitted to modify to generate its system software allocated vectors. 0h: MSG_DATA_DEFAULT (default)

22.16.14.20 T_XUSB_DEV_MSI_MASK

MSI Message Data Register 60h

The MSI_MASK register enables software to mask or defer message generation on a per-vector basis.

Offset: 0xD0 | Read/Write: R/W

Bits	Reset	R/W	Description
31:1	0	R/W	Reserved
0	0	R/W	XUSB_DEV_MSI_MASK_BIT: 0h: MSI_MASK_BIT_DEFAULT (default)

22.16.14.21 XUSB_DEV_MSI_PEND

MSI Pending Bits Register 64h

The MSI_PEND register shows which MSI vectors have pending interrupts.

Offset: 0xD4 | Read/Write: R/W

Bits	Reset	R/W	Description
31:16	0	R	Reserved
15:0	0	R	XUSB_DEV_MSI_MASK_BIT: 0h: MSI_PEND_BIT_DEFAULT (default)

22.16.15 XUSB Device Controller Registers

Base Address: XUSB_DEV_BASE

22.16.15.1 T_XUSB_DEV_XHCI_SPARAM

ID Register

Offset: 0x00 | Read/Write: R

Bits	Reset	R/W	Description
31:21	0	R	Reserved
20:16	2h	R	XUSB_DEV_XHCI_SPARAM_ERSTMAX: Event Ring Segment Table Max Indicates the maximum value supported in the Event Ring Segment Table Base Size, where the maximum size of the Event Ring Segment Table is 2ERST Max 2h: SPARAM_ERSTMAX_VALUE

22.16.15.9 T_XUSB_DEV_XHCI_ERDPLO

Event Ring Dequeue Pointer Register

Reflects the current value of ERDP, software updates this register after it has popped events

Offset: 0x20 | Read/Write: R/W

Bits	Reset	R/W	Description
31:4	0	R/W	T_XUSB_DEV_XHCI_ERDPLO_ADDRLO: 0h: ADDRLO_INIT (default)
3	0	RW1C	T_XUSB_DEV_XHCI_ERDPLO_EHB: EHB is set by hardware when an event is posted and is cleared by software after it has processed all events. 0h: EHB_INIT (default) 1h: EHB_CLEAR
2:0	0	R	T_XUSB_DEV_XHCI_ERDPLO_RSVD0: 0h: RSVD0_00 (default)

22.16.15.10 T_XUSB_DEV_XHCI_ERDPHI

Offset: 0x24 | Read/Write: R/W

Bits	Reset	R/W	Description
31:0	0	R/W	T_XUSB_DEV_XHCI_ERDPHI_ADDRHI: 0h: ADDRHI_INIT (default)

22.16.15.11 T_XUSB_DEV_XHCI_EREPLO

Event Ring Enqueue Pointer

Reflects the current value of Event Ring Enqueue Pointer; it is updated by hardware after posting an event software can write to the register when Control Enable bit is cleared. Software specifies the segment index to be used and hardware samples the value written by software on a positive edge of control enable.

Offset: 0x28 | Read/Write: R/W

Bits	Reset	R/W	Description
31:4	0	R/W	T_XUSB_DEV_XHCI_EREPLO_ADDRLO: 0h: ADDRLO_INIT (default)

22.16.15.21 T_XUSB_DEV_XHCI_EP_HALT

EP HALT register used by software to program an EP to respond to host request with STALL transaction

Offset: 0x50 | Read/Write: R

Bits	Reset	R/W	Description
31:0	0	R/W	T_XUSB_DEV_XHCI_EP_HALT_DCI: 0h: DCI_NO (default) 1h: DCI_YES

22.16.15.22 T_XUSB_DEV_XHCI_EP_PAUSE

EP Pause register used by software to program the DUT to stop processing the EP and respond host requests with a NRDY/ NAK

Offset: 0x54 | Read/Write: R

Bits	Reset	R/W	Description
31:0	0	R/W	T_XUSB_DEV_XHCI_EP_PAUSE_DCI: 0h: DCI_NO (default) 1h: DCI_YES

22.16.15.23 T_XUSB_DEV_XHCI_EP_RELOAD

EP Reload bits are used by software to direct the Device BI to reload the EP context for that EP and update its internal EP related variables like EP state.

Offset: 0x58 | Read/Write: R

Bits	Reset	R/W	Description
31:0	0	R/W	T_XUSB_DEV_XHCI_EP_RELOAD_DCI: 0h: DCI_NO (default) 1h: DCI_YES

22.16.15.24 T_XUSB_DEV_XHCI_EP_STCHG

EP STCHG is set by hardware whenever halt/pause/run bit is cleared by software, to indicate completion of processing of the software request.

Offset: 0x5C | Read/Write: R

Bits	Reset	R/W	Description
31	0	RW1C	T_XUSB_DEV_XHCI_EP_STCHG_IN15 0h: IN15_NO 1h:IN15_YES 1h: IN15_CLEAR

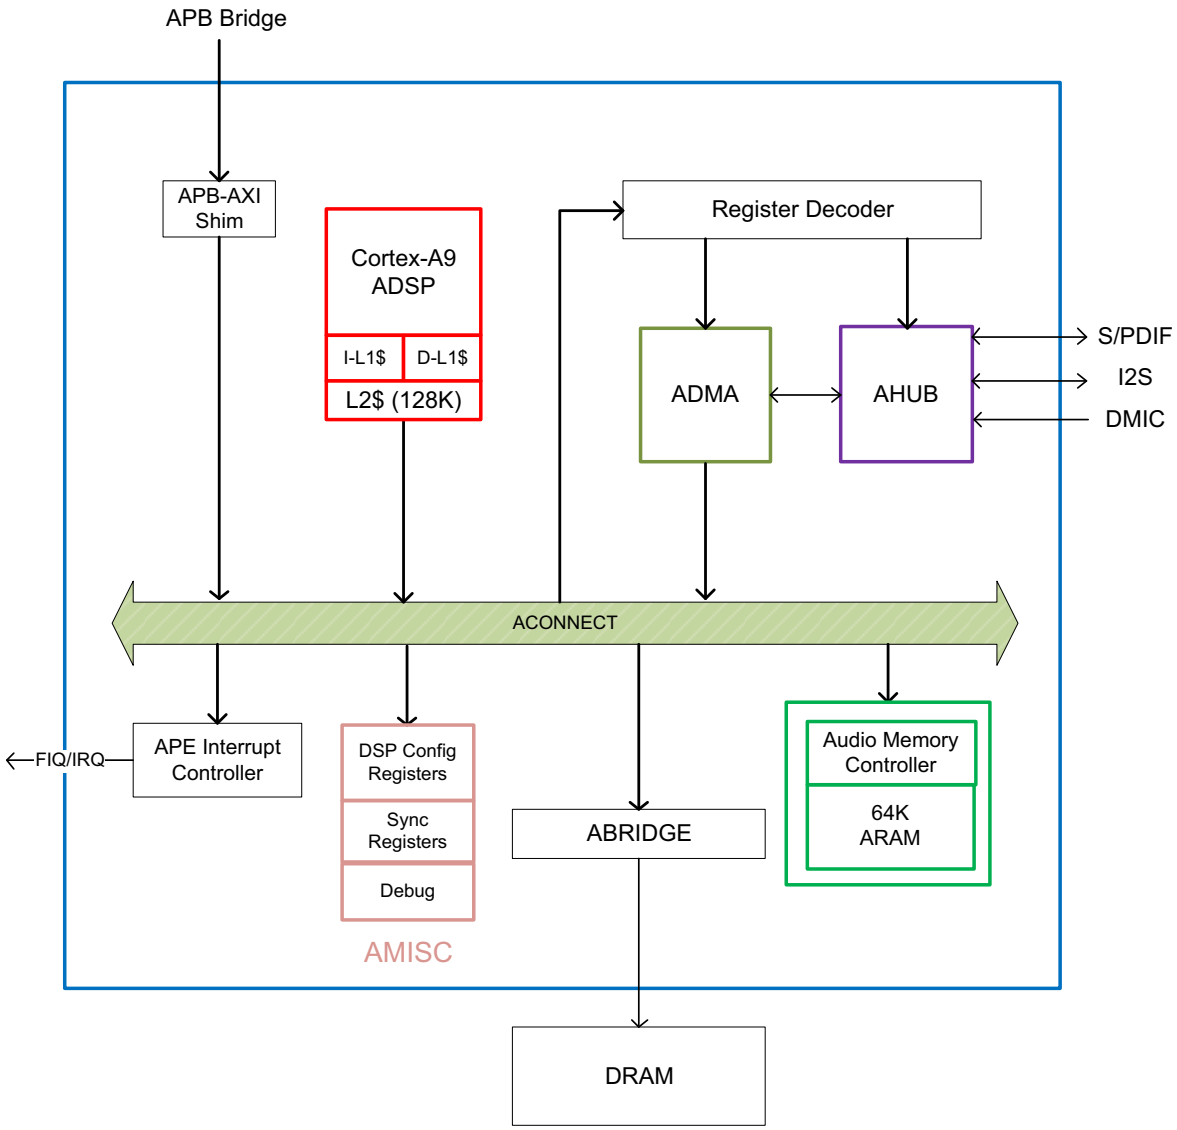
CHAPTER 23: AUDIO PROCESSING ENGINE

The audio processing engine (APE) in Tegra® X1 mobile processors takes care of all the audio needs of Tegra chips with minimal supervision from the CPU. The APE contains an audio DSP (ADSP), an internal RAM, an “Audio Hub” or AHUB containing many hardware accelerators, and a DMA engine as shown below. The AHUB has external I2S, S/PDIF, and DMIC interfaces. The AHUB supports multiple interfaces to the audio devices in the system cellular baseband; different audio codecs; Bluetooth modules; A/V receivers; etc. The AHUB can support the different interface, protocol, and signal quality requirements of these audio devices.

Note: *For the APE address map, see Section 2.2: APE Address Map.*

Figure 65: Audio Processing Engine Functional Block Diagram



The audio processing engine (APE) provides these interfaces:

- APB Interface
- Audio Interfaces:
  - I2S x 5
  - SPDIF x1
  - DMIC x 3
- Interrupts
  - IRQCPU, FIQCPU – Interrupts to CPU
- Debug Port
  - CoreSight™ interface to ADSP
  - UART (no DMA engine)
- Clocks
  - MC_CLK
  - PCLK (apb_clock)
  - APE_CLK
  - ADSP_CLK
- Resets
  - APE_reset
  - ADSP_reset
  - PCLK
- Memory Interface
- External Signaling
  - 56-bit gray scale TSC signals

23.1 APE Overview

APE 1.0 consists of the following modules:

- ADSP includes the ARM based CPU and its cache
- AHUB contains the audio hardware accelerators. It also interfaces with audio I/O
- ADMA is responsible for moving data between AHUB and DRAM/ARAM
- REGDEC serves as the register interface for ADMA and AHUB
- ACONNECT is an AXI based backbone which directs requests from different masters to targeted slaves
- AMC is the local memory controller for local memory residing in this module
- ABRIDGE is the memory interface to DRAM
- AGIC is the interrupt controller
- AMISC contains the configuration registers and synchronizations registers
- AAS converts APB transactions from CPU to AXI transactions

23.1.1 Audio Digital Signal Processor (ADSP)

The ADSP contains the following modules:

- Cortex®-A9 ADSP with 32K-I/32K-D L1 cache and NEON extension
- PL310 L2 Cache controller
- 128KB L2 cache

Coherency

Coherent Request: A read or write request from ADSP to main memory. Coherent indicates that the CPU's caches will be checked for modified data.

Non-Coherent Request: A read or write request from ADSP to main memory. Coherent indicates that the CPU's caches will NOT be checked for modified data.

CPU producer – ADSP consumer

- Example use case is normal audio decode by ADSP:
  - CPU reads file data and writes into <file_buffer> in main memory.
  - ADSP reads <file_buffer> from main memory and processes data
- Assumptions:
  - ADSP does not need to modify data in <file_buffer>
- Recommended Settings:
  - CPU: Cacheable Write-Back

    Don't have to go to DRAM. Reduced latency/power.
  - ADSP: Cacheable Read-Allocate
    - CPU reuses buffer for new data and pings ADSP to invalidate the data in the cache.
    - The data in ADSP cache has to be flushed/invalidated when the CPU reuses the buffer in main memory. Otherwise, ADSP would access stale data.
  - DMA
    - DMA copy from memory into ARAM.
    - ADSP reads ARAM cacheable.
    - Increased amount of requests by through ACONNECT (meaning there is more memory traffic through ACONNECT if DMA transfers data from memory to ARAM first and ADSP reads from ARAM vs. ADSP reading from memory directly).

      DMA RD

      DMA WR

      ADSP RD

ADSP producer – CPU consumer

- Example use case: Audio Recording
  - ADSP processes and encodes data, writes to <file_buffer>
  - CPU reads <file_buffer> from main memory
- Assumptions:
  - CPU does not need to modify data in <file_buffer>
- Recommended Settings:
  - ADSP: Write-Through or Non-Cacheable
    - Both of these instances will result in sub-cacheline writes. This hurts bandwidth.

- DMA
  - ADSP writes to ARAM.
  - DMA copies from ARAM to memory
  - Increased traffic through ACONNECT

ADSP – CPU sharing

Both CPU/BPMP-Lite can write/modify data

Memory Aliasing due to TrustZone bit

PL310 L2 cache controller supports TrustZone accesses. It treats NS bit as an address tag bit. A secure and a non-secure to the same physical memory location will result in 2 separate copies in the cache. If data is modified inside the cache, data corruption could result. Software needs to be aware of this data coherency issue. Note that ABRIDGE and AMC are non-secure slaves and simply ignore the NS bit.

Exclusive Cache Configuration

Cortex-A9 L1 and PL310 L2 are configured as inclusive cache by default. Exclusive cache is supported by modifying the exclusive cache bit in ACTLR of A9 and bit 12 in Auxiliary Control Register of PL310. In exclusive, a cache line is either valid in L1 or L2 but not both. See the CoreLink™ Level 2 Cache Controller L2C-310, Revision r3p3, Section 2.3.4 for cache behavior.

It is recommended that ADSP L1 and L2 are configured as exclusive cache to maximize the amount of data cached.

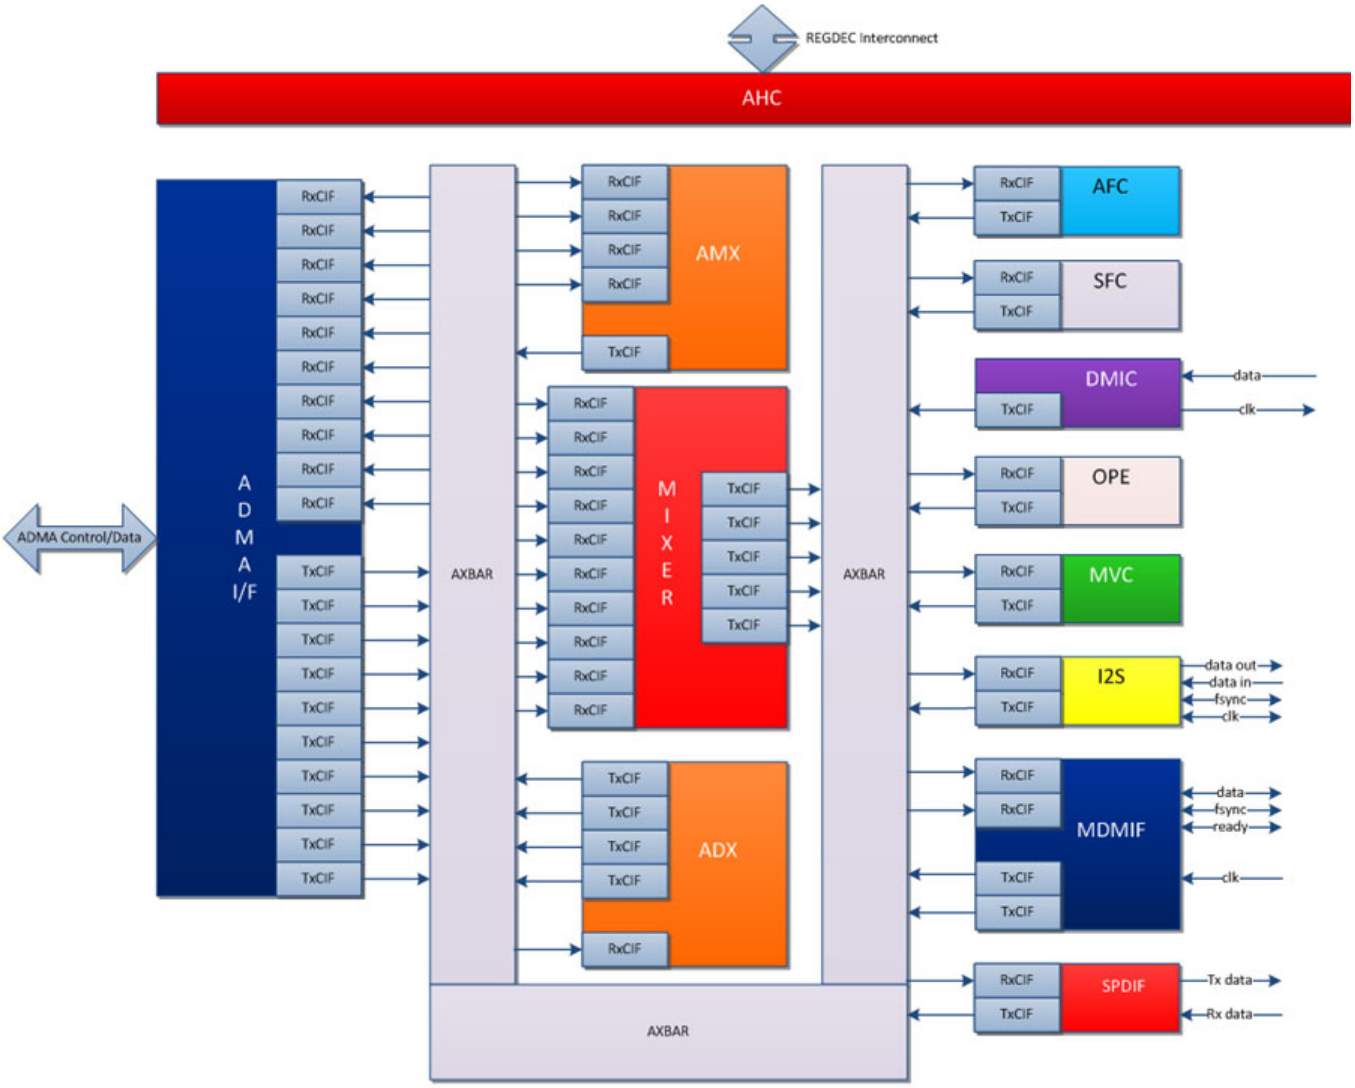
Cache Lockdown

L2 cache supports “lockdown by way”. PL310 provides bit mask that specifies which way can be allocated for cache line fill. There is a separate bitmask for data and instruction cache.

23.1.2 AHUB

Audio Hub (AHUB) is a collection of hardware accelerators with a means for audio data to be routed through these accelerators. The purpose of AHUB is to offload repetitive tasks that do not need constant decision-making from CPU/Audio DSP (ADSP).

Figure 66: AHUB Block Diagram



The hardware accelerators contained in the AHUB are:

- Inter-IC Sound Controller (I2S)
- Digital MIC Controller (DMIC)
- Sony/Philips Digital Interface Controller (SPDIF)
- Mixer
- Audio Multiplexer (AMX)
- Audio De-Multiplexer (ADX)
- Sampling Frequency Converter (SFC)
- Audio Flow Controller (AFC)
- Output Processing Engine (OPE)
- Master Volume Control (MVC)
- Audio Direct Memory Access Interface (ADMA I/F)

A proprietary interface called Audio Client Interface (ACIF) is used to route audio samples through these accelerators and hence forms the fabric of AHUB. A switch called Audio Crossbar (AXBAR) is used to configure/modify the audio routing path

between these accelerators. The accelerator modules and the audio routing are both configured via an AHUB Configuration (AHC) unit.

23.1.2.1 Audio Client Interface (ACIF)

Audio streams are routed through the AHUB by interconnecting various modules using the Audio Client Interface (ACIF).

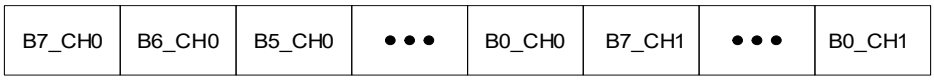
ACIF Protocol

Before a session starts, both TX and RX clients should know the frame length by their register configurations. The frame length is determined by the number of bits in each sample and the number of channels that the audio data carries. In the case of stereo audio data with 16 bit, a frame is 32 bits long.

Whenever TX has data available to transmit to the RX, it raises the fsync signal. Simultaneously the first bit of the data is put out on the data bus. The TX should hold this *fsync* active for at least one clock but until the RX client is ready. Similarly, it should also hold the data bus to the first bit of the frame until the RX client is ready. When the RX asserts ready, the TX should lower the fsync at the end of that clock cycle. From the next clock cycle, TX should transmit the rest of the frame (from second bit onwards), 1 bit for each bit clock.

The figure below shows the transmission ordering of 2-channel 8-bit audio data. Note that the bit ordering is each channel is big-endian.

Figure 67: Bit Ordering



Frame Length

The frame length is simply a product of the bit width and the number of channels in an audio stream. The register fields of the TX and RX clients should be programmed accordingly before the transmission starts to avoid incorrect frame parsing.

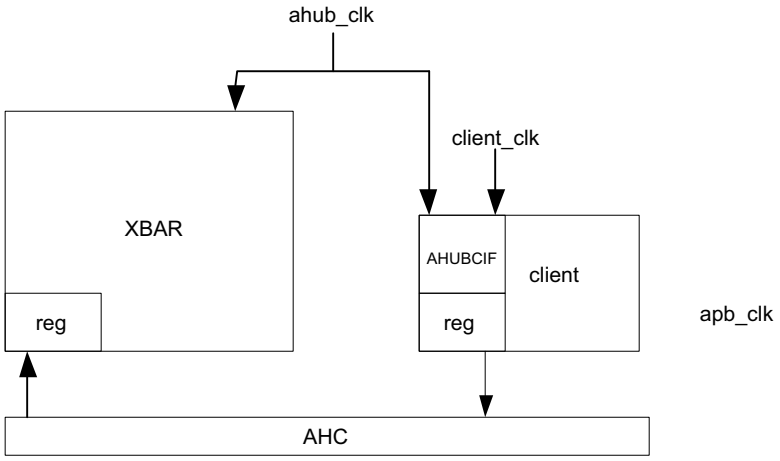
Clocking

Since all sessions are AHUB run under an AHUB clock, the clock should be fast enough to transmit audio stream data in all sessions. If a session is used for sending 8 kHz, stereo 16-bit audio stream, the AHUB clock should be at least 256 kHz. While a faster clock is better for data transmission, it is not necessarily good for power consumption. For the typical audio application like MP3 music playing, using the clock directly from the crystal without going through PLLs is recommended. Depending on the applications, users can program the clock registers to satisfy the requirement of clock frequency. The following table shows the various clock frequencies for AHUB.

Clock Frequency	Description
64 kHz	Slowest clock to carry 8-bit mono voice data in 8kHz sampling
1.4112 MHz	Clock to carry 16-bit stereo audio data in 44.1 kHz sampling
1.536 MHz	Clock to carry 16-bit stereo audio data in 48 kHz sampling
4.608 MHz	Clock to carry 24-bit stereo audio data in 96 kHz sampling or 16-bit 6 channel audio data in 48 kHz sampling
12 MHz	Minimum crystal frequency
18.432 MHz	Clock to carry 24-bit 8 channel audio data in 96 kHz sampling
36.864 MHz	Clock to carry 24-bit 8 channel audio data in 192 kHz sampling (HDMI maximum)

While AHUB runs under one clock, *ahub_clk,* its clients have their own clocks. AHUBCIF is the clock boundary in the clients. The following figure shows the clocking scheme around AHUB.

Figure 68: Clock Domains



Packing/Unpacking Data

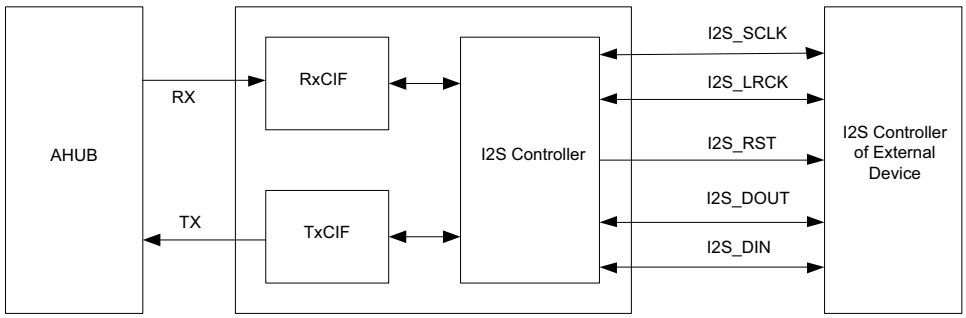
This feature is only available for ADMA Interface. The TxCIFs have the capability to unpack 32-bit packet (coming from ADMA) into smaller data of 8 or 16 bits before transmitting to the AXBAR. The RxCIFs have the reverse capability of packing 8- or 16-bit words into a 32-bit packet.

The caveat is that, in the packing can only be done if the incoming bits are 8-bit or 16-bit. It is wrong programming to try to pack data that is 24 bits. Similarly one cannot unpack 32-bit data into 24-bit data. So the AXBAR_BITS in both cases can be only 8 or 16.

23.1.2.2 I^2S Controller

The Inter-IC Sound (I^2S) controller implements full-duplex and bidirectional and single direction point-to-point serial interfaces. It can interface with I^2S-compatible products, such as compact disc players, digital audio tape devices, digital sound processors, modems, Bluetooth chips, etc.

Figure 69: I2S Interaction with External Device



The I^2S controller can operate both as master and slave. It supports the following data transfer modes:

- I^2S mode
- Left Justified Mode (LJM)
- Right Justified Mode (RJM)
- DSP mode, as defined in the Philips inter-IC-sound (I^2S) bus specification
- PCM mode with short (one-bit-clock wide) and long-fsync (two bit-clocks wide
- Network (Telephony) mode with independent slot selection for both Tx and Rx

- TDM mode with flexibility in number of slots with up to 16 slots.
- Capability to drive-out a High-Z outside the prescribed slot for transmission

The I^2S controller can transmit and receive word lengths of 8, 16, 24, and 32.

It supports u-Law and A-Law compression/decompression.

The I^2S controller can control the flow of traffic from another I^2S controller operating on an independent bit clock (with a ppm difference compared with its own bit clock).

Transmission/Reception Data Formats

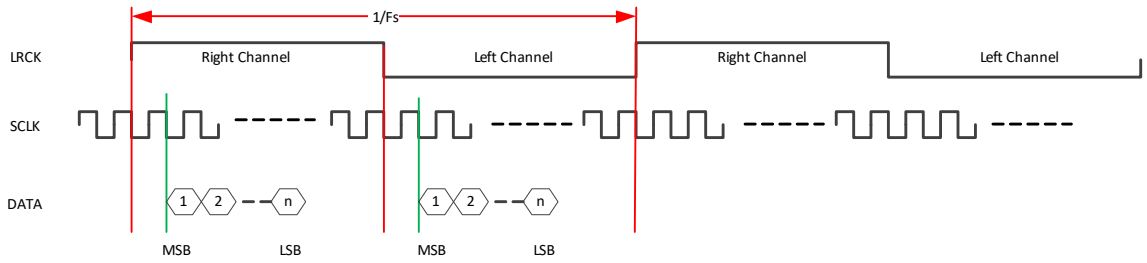
LRCK Modes

This subsection illustrates three LRCK modes: Basic I2S mode, Right Justified mode, and Left Justified mode.

Basic I2S Mode

In Basic I2S mode, data starts one sclk after the LRCK edge (offset = 1).

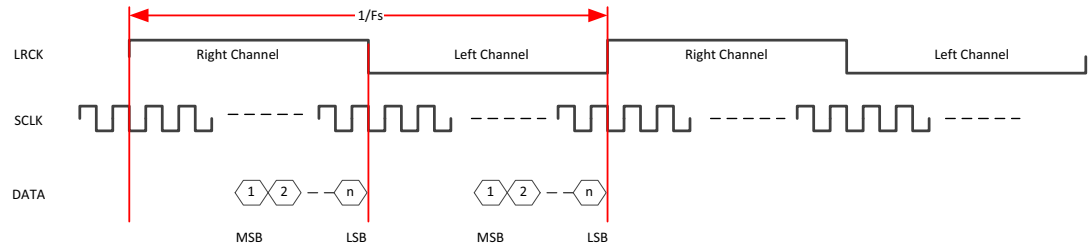
Figure 70: Basic I2S Mode



Right Justified (RJ) Mode

In RJ mode, data starts (r/2 – n) SCLKs after the LRCK edge (offset = r/2 – n, where r = number of SCLKs per LRCK, n = number of bits/sample).

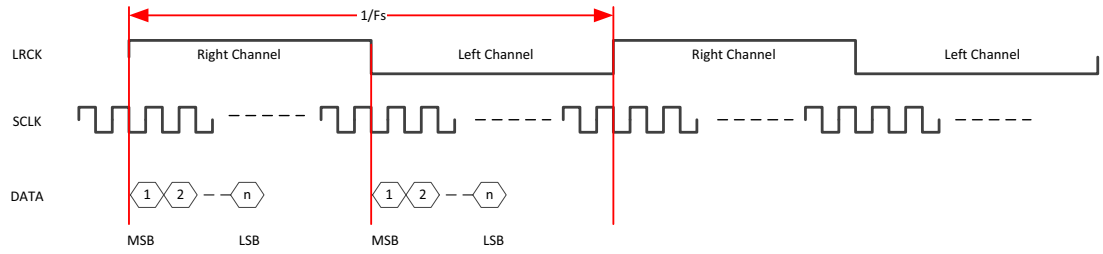
Figure 71: RJ Mode



Left Justified (LJ) Mode

In LJ mode, data starts 0 SCLKs after the LRCK edge (offset = 0).

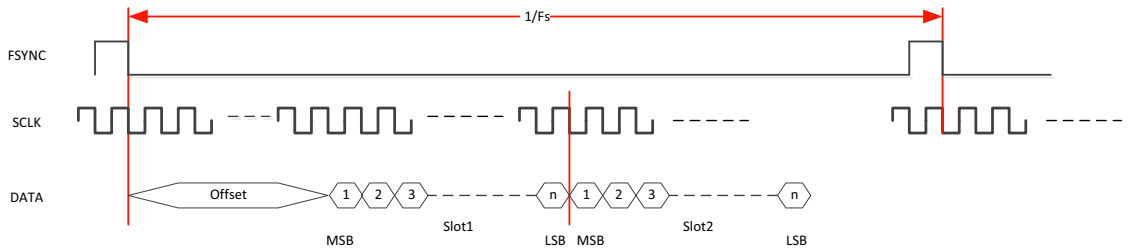
Figure 72: LJ Mode



FSYNC Modes

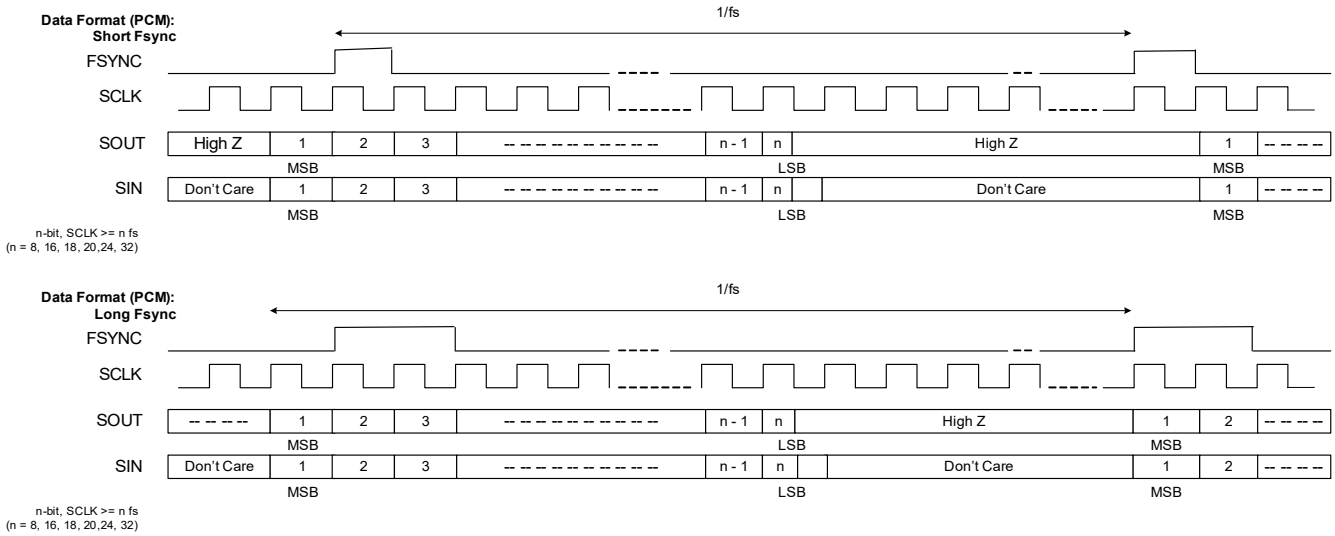
The width of the FSYNC, the offset value, number of slots and number of SCLKs per 1/Fs are all configurable. The slots are always contiguous.

Figure 73: FSync Mode

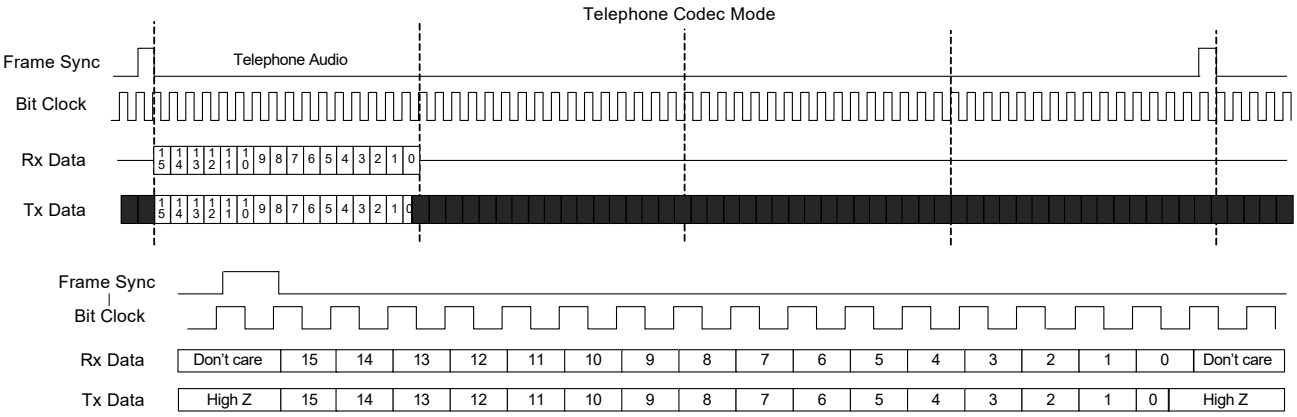


PCM Mode

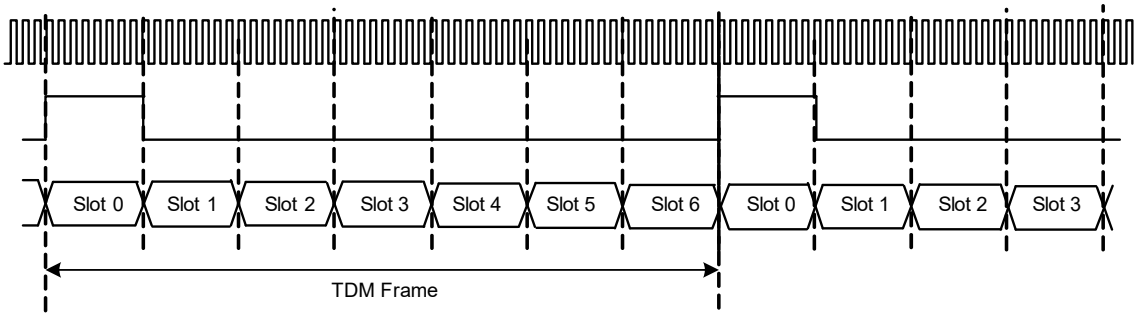
Figure 74: PCM Mode



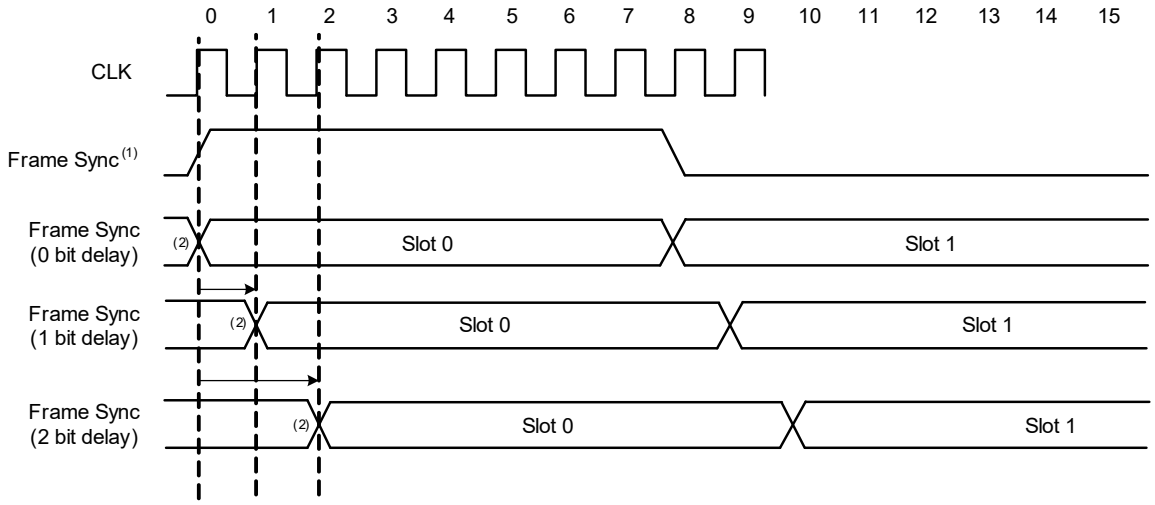
Data Formats in NW Mode



Data Format in TDM Mode



1. FS duration of a slot is shown. FS duration of a single bit is also supported.



1. FS duration of a slot is shown. FS duration of a single bit is also supported.
2. Last bit of the last slot of the previous frame. No gap is allowed between this bit and the first bit of slot 0.

23.1.2.3 Digital MIC Controller (DMIC)

The DMIC Controller is used to interface with PDM base input devices. The DMIC controller implements a converter to convert PDM (Pulse density modulation) signals to PCM (Pulse code modulation) signals.

DMIC Features

- Sample rate support: 8 kHz- 48 kHz
- Input PCM bit width: 16-24 bits
- Oversampling Ratio: 64, 128, 256

23.1.2.4 Serial Peripheral Device Interface (S/PDIF)

This interface is primarily intended to carry audio data coded other than as linear PCM coded audio samples. Provisions are also made to allow the interface to carry data related to computer software or signals coded using non-linear PCM. The format specification for these applications is not part of this standard.

S/PDIF Features

- Fully implements the IEC-958 standard interface
- Provides mono and stereo support for sampling frequencies 32 kHz, 44.1 kHz, and 48 kHz
- Supports the following data formats.
  - 16-bit

- 20-bit
- 24-bit
- Raw

- Supports “autolock” mode to automatically detect the “spdifin” sample rate and lock onto the data stream.
- Supports “override” mode to provide a manual control to sample the “spdifin” data stream.
- Provides a loopback mode to route the “spdifout” back to “spdifin” for self-testing.

23.1.2.5 Mixer

The Mixer is a key module in the audio architecture. Whether it is a smart phone/tablet environment or an automotive solution, mixing of different audio signals is an often used feature. Some examples are mixing system tones with voice calls, mixing two audio playbacks to create a transition effect, mixing Sat Nav announcements with audio playback etc.

Mixer Features

- Supports mixing up to 10 input streams of 7.1 channel audio each
- Supports 5 outputs each of which can be a mix of any combination of 10 input streams
- Time ramp-up/ramp-down volume control provided for each stream
- Fixed gain for each stream is also available
- A 32-bit sample counter is provided for each input stream to count the number of samples consumed
- A peak meter for each input stream is available. It can give peak values for non-overlapping frames of samples or can do continuous reset-on-read peak metering

23.1.2.6 Audio Multiplexer Block (AMX)

The Audio Multiplexer Block (AMX) can multiplex up to 4 input streams of up to 16 channels each and generate an output stream of up to 16 channels

A “byte RAM” helps to form an output frame by any combination of bytes from the 4 input frames

Two modes for data synchronization between input frames are available:

- Wait For All mode: At the beginning, wait for all enabled input streams to have data before forming the very first frame.
- Wait for Any mode: Start whenever data is available in any one of the enabled input streams.

In either mode, once the first output frame is sent out, AMX always waits for all active streams to have data available before forming and sending subsequent frames.

23.1.2.7 Demultiplexer Block (ADX)

The demultiplexer block (ADX) takes an input stream with up to 16 channels and demultiplexes it into four output streams of up to 16 channels each.

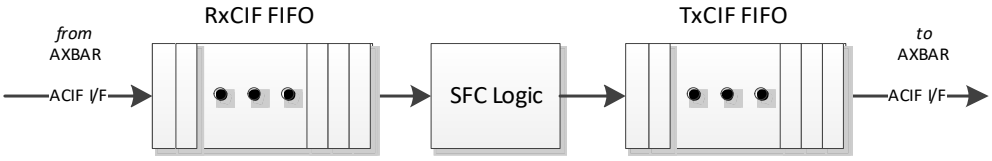
A “byte RAM” helps to form output frames by any combination of bytes from the input frame. Its design is identical to that of the byte RAM in the AMX except that the data flow direction is reversed.

23.1.2.8 Sampling Frequency Converter (SFC)

The sampling frequency converter (SFC) converts the sampling frequency of the input signal from one frequency to another.

The SFC is an AXBAR client and hence interacts with other AHUB modules using the Audio Client Interface (ACIF) protocol. Hence the SFC has a Receive CIF (RxCIF) and Transmit CIF (TxCIF), each with its own FIFO as shown below.

Figure 75: SFC's Receive and Transmit CIFs



SFC Features

- Supports sampling frequency conversion of streams of up to 2 channels (stereo)
- Has a very low latency with the maximum latency of < 125 µs
- Supports the following frequency conversions

FsIn\FsOut	8	11.025	16	22.05	24	32	44.1	48	88.2	96	176.4	192
8	Bypass	x	x	x	x	x	x	x	x	x		
11.025	x	Bypass	x	x	x	x	x	x	x	x		
16	x	x	Bypass	x	x	x	x	x	x	x	x	x
22.05	x	x	x	Bypass	x	x	x	x	x	x	x	x
24	x	x	x	x	Bypass	x	x	x	x	x	x	x
32	x	x	x	x	x	Bypass	x	x	x	x	x	x
44.1	x	x	x	x	x	x	Bypass	x	x	x	x	x
48	x	x	x	x	x	x	x	Bypass	x	x	x	x
88.2	x	x	x	x	x	x	x	x	Bypass	x	x	x
96	x	x	x	x	x	x	x	x	x	Bypass	x	x
176.4			x	x	x	x	x	x	x	x	Bypass	x
192			x	x	x	x	x	x	x	x	x	Bypass

23.1.2.9 Audio Flow Controller (AFC)

The audio flow controller (AFC) can control the flow of traffic between two I2S interfaces running at different clocks that are up to 100ppm apart.

The AFC implements high fidelity interpolation and decimation algorithms that compensate for clock differences.

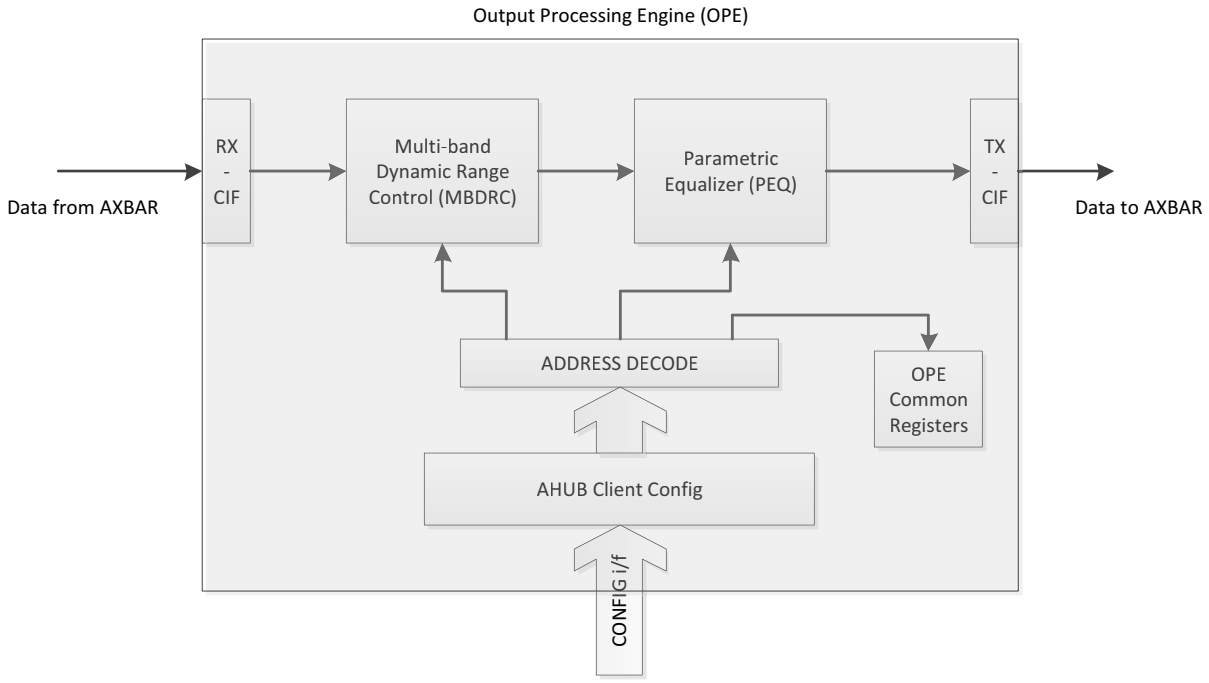
It can control traffic flow anywhere in the audio route, even to the inputs of AMX blocks.

The AFC can handle burst traffic from SFCs.

23.1.2.10 Output Processing Engine (OPE)

The Output Processing Engine (OPE) is one of the AHUB’s clients. The overall structure looks as shown below.

Figure 76: OPE Top-Level Block Diagram



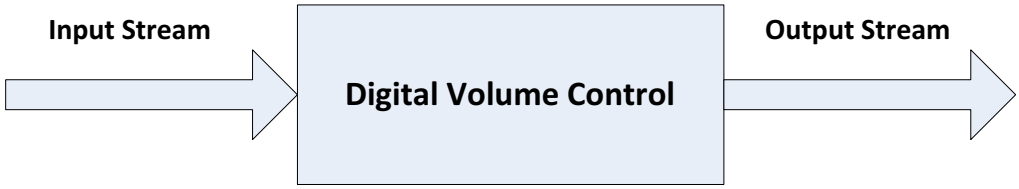
OPE Features

- Scalable Number of BiQuad Stages
- Supports stereo, 5p1 and 7p1 channels.
- Meets ultra-low power (ULP) audio requirements

23.1.2.11 Master Volume Control (MVC)

Digital volume control provides gain or attenuation to a digital signal path. The MVC digital volume control block can be used in input or output digital signal path. It can be used for per-stream volume control as well as master volume control. The following figure shows a simplified block diagram of digital volume control.

Figure 77: Simplified Digital Volume Control Block Diagram



The MVC block has one input and one output. The input digital stream can be mono- or multi-channel (up-to 7.1-channels) stream. The output digital stream has the same format as the input stream. Therefore, the sample rate, number of channels, number of bits per sample in the output stream are the same as those in the input stream. An independent mute/unmute control is also included in the MVC block. In addition, whenever the gain or mute setting is changed, the gain applied in digital volume control block is ramped up or down to the new setting. The parameters of the ramp, such as the duration and ramp-curve are programmable. In addition to linear ramp this design also provides hardware acceleration for the Windows audio curve type fade. The windows audio curve type fade is typically implemented using a programmable processor.

The MVC block also has an inbuilt peak meter detector. Peak meter detector is used as a feedback to the user. It is located after volume application and provides the peak output data for each channel. The duration used for the peak meter calculation is programmable

MVC Features

- Programmable range and steps for volume control
- Programmable Curve Ramp for volume control
- Independent mute/unmute controls
- Default gain values
- Peak meter detector

23.1.2.12 Audio Direct Memory Access (ADMA) Interface

The ADMA interface is a gateway in the AHUB for facilitating DMA transfers between memory and all of its clients. Basically it acts as a bridge to convert 32-bit full duplex AXI protocol to 1-bit DVS protocol with sufficient buffering for supporting seamless data transfers.

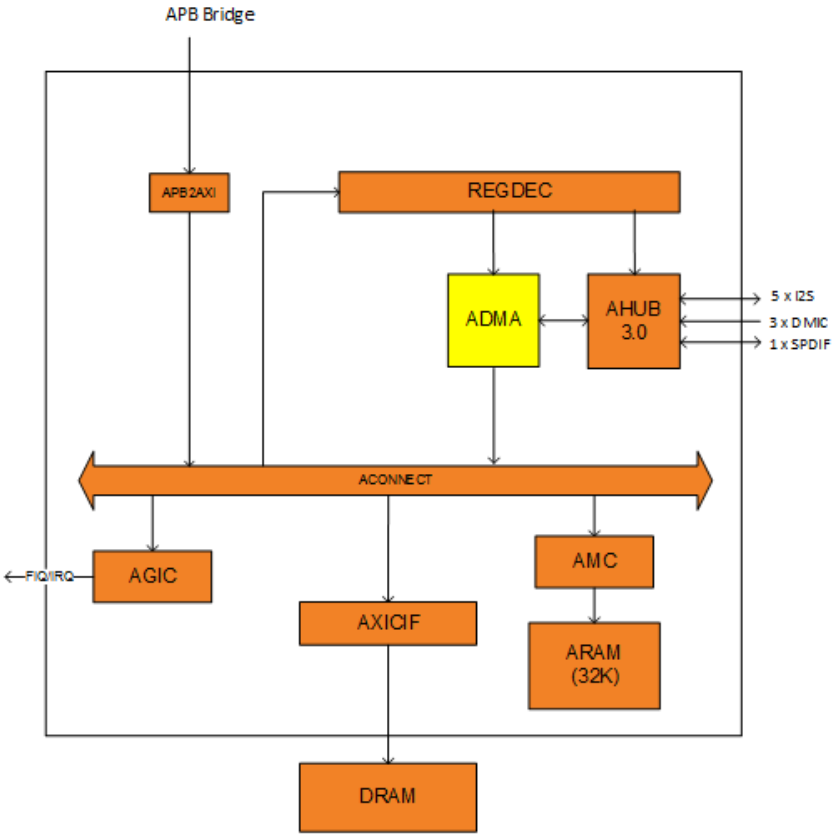
ADMA Interface Features

- 2 KB of buffering per direction for seamless DMA transfers.
- Dynamic or software configurable buffer allocation based on bandwidth and latency needs of each channel
- A maximum of 10 channels can be configured per direction for audio samples transfer between memory and AHUB clients.
- 32-bit full duplex AXI slave interface to communicate with ADMA for DMA transfers
- Up to 16 words of burst size
- APB slave interface for register programming
- 1-bit ACIF interface per channel to communicate with other AHUB clients through AXBAR
- Samples transfer through both DMA and register access (PIO mode)
- Supports packing (8 or 16 bits to 32 bits) in upstream direction and unpacking (32 bits to 8 or 16 bits) in downstream direction

23.1.3 ADMA

The ADMA caters the DMA needs of APE clients. It performs audio samples transfer among system memory, internal memory/ARAM, and AHUB through multiple unidirectional channels. A unidirectional channel is a point-to-point virtual connection for facilitating blocks of data movement with minimal CPU intervention. As depicted in the following figure, ADMA is plugged into the APE with the interfaces AXI interconnect for datapath, AHOST/REGDEC for programming interface, and AHUB for DMA requests originating from its internal clients.

Figure 78: The Sample Unit in the APE Block Diagram



23.1.3.1 ADMA Features

- Compliant with the industry standard AXI3 specifications for Data Path interface and internal standard HOST1X for programming interface.
- 22 channels where each channel can be configured for DMA transfer in any of 4 possible directions
  a. MEMORY-to-AHUB
  b. AHUB-to-MEMORY
  c. AHUB-to-AHUB
  d. MEMORY-to-MEMORY
- Flow controlled (Memory ←→ AHUB or AHUB ←→ AHUB) and non-flow controlled (Memory←→ Memory) DMA transfers

  DMA requests are made based on FIFO status of the requesters in case of flow controlled transfers
- Two AXI Master Interfaces.

  One of them is dedicated for transferring data to and from AHUB and the other one is hooked up to ACONNECT for the transfers to and from ARAM/DRAM
- Per channel pre-mask interrupt for indicating transfer completion to the AGIC. AGIC routes the post-mask interrupt to ADSP/CPU.
- 28-bit word aligned transfer size that can be configured up to 1 GB.
- 30-bit Word aligned source and target addresses
- Page or 4KB boundary alignment
- Per channel configurable burst size up to 16 words for all transfers

- Auto initialization of transfer size, source and target addresses on completion of programmed words transfer in continuous mode
- Scatter/Gather through Linked list for accessing non-contiguous memory regions

Software may use this feature in two scenarios:

1. When it requires to stream audio samples spread across the memory
2. When it requires less intervention from CPU. CPU need not attend the end of transfer interrupts from ADMA on a regular basis. It can occasionally write a bunch of descriptors into memory and attend other high priority tasks.

   Descriptor is a set of 4 registers (SOURCE_ADDR, TARGET_ADDR, TRANSFER_COUNT and NEXT_DESCRIPTOR_ADDR) located in consecutive 32-bit entries of DRAM/ARAM starting with SOURCE_ADDR.

   ADMA fetches next descriptor (SOURCE_ADDR, TARGET_ADDR, TRANSFER_COUNT and NEXT_DESCRIPTOR_ADDR) pointed to by the “NEXT_DESCRIPTOR_ADDR” of current descriptor for the next transfer while current transfer is in progress and these values are loaded at the end of the current transfer.

   Initially it is loaded by software while setting up the channel and then automatically loaded by hardware prior to end of each block transfer to enable seamless streaming. ADMA keeps fetching the descriptor from ARAM/DRAM pointed to by "NEXT_DESCRIPTOR_ADDR" until either software disables the channel or “NEXT_DESCRIPTOR_ADDR" register value of current descriptor is "0"

- Configurable address wrapping window in multiples of burst size for source and target in all modes
- Up to 8 buffers in all 3 transfer modes (linked list, once and continuous modes)
  - Source and target addresses are initialized on completion of all programmed buffers transfer and interrupt is generated on completion of every buffer transfer in continuous and linked list modes
  - Interrupt is generated on every buffer completion and channel would be disabled on completion of all buffers in once mode
- Up to 8 outstanding reads and writes
  - ADMA allows a maximum of 8 reads to source memory and that many writes to the target memory to be outstanding at any given point of time
  - ADMA issues read/write requests to ARAM/DRAM by mapping channel number to the “ARID/AWID” of AXI interface so that requests from different channels can pass each other and requests from same channel are handled in order or on first-come-first-serve basis en route to the target elements.
- Weighted Round Robin arbitration scheme for selecting read requests to AHUB and Memory
  - Each DMA channel can be programmed to a weight/request count so that it gets the grant for issuing that many requests back-to-back. This is applicable for all flow controlled (AHUB) and non-flow controlled transfers (ARAM/DRAM).
  - Separate WRR arbiters are used for AHUB and Memory Reads to enable un-interrupted full duplex transfer
- Configurable triggers for initiating DMA transfer.
  - Triggers for each channel are mapped to end of channel interrupt of all other DMA channels so that software can choose one of them to instruct the channel to initiate the transfer upon assertion of that particular interrupt
- Cut-through data transfers.
  - ADMA converts the returned data for the read requests issued to source element into write requests to the target element and forward them on AXI write channels in cut-through mode.

23.1.4 REGDEC

REGDEC provides the host interface for ADMA and AHUB in the APE. REGDEC provides only a direct register access path from ADSP/CPU to ADMA/AHUB. Command DMA and command synchronization features in AHOST are not supported by REGDEC.

REGDEC receives register requests targeted to ADMA and AHUB, decodes the requests, and forwards the requests to the corresponding REGDEC clients.

Features

- AXI3 interface to ACONNECT
- Host1x client interface to AHUB and ADMA
- Direct Register Access for AHUB and ADMA
- Frequency: 100MHz

23.1.5 ACONNECT

ACONNECT serves as the AXI interconnect backbone. There are AXI slave ports that connect to other engines, such as ADSP, ADMA, and AAS. AXI master ports connect to the ABRIDGE, AGIC and REGDEC. AXI to AMISC interface is APB.

The AXI receives memory read/write requests from the AXI masters and forwards to ABRIDGE/AMC/REGDEC/AMISC. It is responsible for transaction ordering, if any.

ACONNECT Features

- Frequency: 300 MHz
- Direct requests to slave target based on request address
- 64-bit AXI switch
- Compliant to transaction ordering defined in AXI3 and APB3 protocol specification. Transactions may be processed out-of-order by ACONNECT.

23.1.6 Audio Memory Controller (AMC)

Audio RAM provides a low latency local ARAM to DSP processor and other modules. Eight 32-bit EVP registers provide vector table at reset.

AMC Features

- AXI3 bus interface to ACONNECT
- 64-bit read and write data channels
- 64K ARAM
- Maximum Frequency: 300MHz
- 16 32-bit EVP registers

23.1.7 Audio Bridge (ABRIDGE)

ABRIDGE connects the internal AXI Interconnect/NIC (ACONNECT) to the Memory Controller via an AXICIF/MCCIF. ABRIDGE runs on the same first level clock as ACONNECT to reduce the number of clock crossings.

ABRIDGE Features

- AXI3
- MCCIF Version 2

23.1.8 APE Interrupt Controller (AGIC)

AGIC serves as the interrupt controller in the APE. It aggregates the interrupt lines from all the APE modules and distributes them to ADSP and the system. AGIC is an implementation of the ARM GIC-400 Generic Interrupt Controller, revision r0p1. Details of the GIC-400, including the technical reference manual, are available from ARM and may be downloaded from their website, http://arm.com.

GIC-400 supports 7 private peripheral interrupts (PPIs) per processor. For AGIC, PPIs are not used. GIC-400 supports lockable SPIs (LSPIs), AGIC does not use lockable SPIs feature. There are 56 SPI signals in AGIC. AGIC supports 2 SGIs for ADSP and

2 SGIs for CPU. SGIs are generated by writing to the Software Generated Interrupt Register, GICD_SGIR. ADSP can send 2 different interrupts to CPU and vice versa. AGIC has 2 CPU interfaces. CPU0 interface connects to system LIC which can then connect to the CPU. CPU1 interface connects to the ADSP.

23.1.8.1 Shared Peripheral Interrupts (SPI)

There are 2 interrupts line (FIQ/IRQ) per channel. Interrupts that are mapped to FIQ should use group 0. Interrupts that are mapped to IRQ should use group 1. Group 0 are recommended for higher priority interrupts.

Table 117: Interrupt Signals to GIC

Signal	ID	I/O	Edge/Level	Description
amisc_mbox_full[3:0]	32-35	I	Level	AMISC Mailbox Full Interrupt
amisc_mbox_empty[3:0]	36-39	I	Level	AMISC Mailbox Empty Interrupt
amisc_cpu_arb_sema[7:0]	40-47	I	Level	AMISC CPU Arbitrated Semaphore Interrupt
amisc_adsp_arb_sema[7:0]	48-55	I	Level	AMISC ADSP Arbitrated Semaphore Interrupt
adma_eot[21:0]	56-77	I	Level	ADMA Channel End of Transfer Interrupt
adsp_pmuirq	78	I	Level	ADSP/PTM Performance Monitoring Unit Interrupt
adsp_wdresetreq	79	I	Edge	ADSP Watchdog Timer Reset Request
adsp_l2ccintr	80	I	Level	ADSP L2 Cache Controller Interrupt
ahub_err	81	I	Level	AHUB Error Interrupt
amc_err	82	I	Level	AMC Error Interrupt
adma_err	83	I	Level	ADMA Error Interrupt
adsp_standbywfi	84	I	Level	ADSP Standby WFI. ADSP in idle mode. Waiting for Interrupt
adsp_standbywfe	85	I	Level	ADSP Standby WFE. ADSP in idle mode. Waiting for Event
adsp_ctiirq	86	I		
adsp_actmon	87	I	Level	Activity monitoring on ADSP. This interrupt is from AMISC
regdec_err (aas)	88	I	Level	This interrupt is from AAS

> ***Note:*** *Notice that ID assignment of SPI starts from 32. Asynchronous interrupt signals are synchronized in AGIC before sending to GIC-400. Signal adsp_wdresetreq is edge-triggered. The rest of APE interrupts are level-triggered.*

23.1.8.2 AGIC Features

- 32-bit AXI-4 compliant slave interface to ACONNECT
- Frequency: 300 MHz

23.1.8.3 Programming Sequence

Identifying the Supported Interrupts

This section discusses how to discover which the interrupts that are supported. Refer to Section 3.1.2 of GIC Architecture Specification.

1. Read GICD_TYPER. ITLinesNumber field identifies the number of implemented GICD_ISENABLERns.
2. Write to GICD_CTLR to disable forwarding of interrupts from distributor to the CPU interfaces
3. For each implemented GICD_ISENABLERn, starting with GICD_ISENABLER0:
   - Write 0xFFFFFFFF to the GICD_ISENABLERn.
   - Read the value of the GICD_ISENABLERn. Bits that read as 1 correspond to supported interrupt IDs.

Discovering permanently enabled interrupts

1. Write 0xFFFFFFFF to the GICD_ICENABLERn. This disables all interrupts that can be disabled.
2. Reads the value of the GICD_ICENABLERn. Bits that read as 1 correspond to interrupts that are permanently enabled.
3. Write 1 to any GICD_ISENABLERn bits corresponding to interrupts that must be re-enabled.

Routing an SPI interrupt to CPU/ADSP through FIQ using Group 1

1. Write 0xFFFFFFFF to the GICD_ICENABLERn. This disables all interrupts that can be disabled.
2. Enable Distributor Control Register

   Write 0x2 to Distributor Control Register (GICD_CTLR). Enable Grp1 interrupts.
3. Configure interrupt type (level or edge) by writing to Interrupt Configuration Registers, GICD_ICFGRn.
4. Write to interrupt group assignment by writing to the GICD_IGROUPR bit, if necessary. Set the intended interrupt to Group1.
5. Assign interrupt priority by writing to Interrupt Priority Registers, GICD_IPRIORITYRn, if necessary.
6. Write to GICD Priority Masked Interrupt GICD_PMR to set the interrupt mask level.
7. Write to Interrupt Processor Target Registers, GICD_ITARGETSRn to direct the interrupt to CPU.
8. Enable the interrupts by writing to Interrupt Set-Enable Register, GICD_ISENABLERn.
9. Enable CPU Interface Control Register (GICC_CTLR) of the destined CPU. AGIC is based on generic interrupt controller ARM IP GIC400. It serves as the APE interrupt controller, which detects, manages, and distributes interrupts. The GIC-400 complies to AMBA® AXI4 protocol and Version 2 of the ARM GIC Architecture Specification. The GIC-400 implements the GICv2 Security Extension. GIC does not support virtual extension. The feature is implemented in GIC-400 but will not be used or verified. Cortex-A9 doesn't support virtualization architecture.

   - FIQEn <= 1.

Routing an SPI interrupt to CPU/ADSP through FIQ using Group 0

1. Write 0xFFFFFFFF to the GICD_ICENABLERn. This disables all interrupts that can be disabled.
2. Enable Distributor Control Register

   - Write 0x1 to Distributor Control Register (GICD_CTLR). Enable Grp0 interrupts.
3. Configure interrupt type (level or edge) by writing to Interrupt Configuration Registers, GICD_ICFGRn.
4. Write to interrupt group assignment by writing to the GICD_IGROUPR bit, if necessary. Set the intended interrupt to Group0.
5. Assign interrupt priority by writing to Interrupt Priority Registers, GICD_IPRIORITYRn, if necessary.
6. Write to GICD Priority Masked Interrupt GICD_PMR to set the interrupt mask level.
7. Write to Interrupt Processor Target Registers, GICD_ITARGETSRn to direct the interrupt to CPU.
8. Enable the interrupts by writing to Interrupt Set-Enable Register, GICD_ISENABLERn.
9. Enable CPU Interface Control Register (GICC_CTLR) of the destined CPU. See ARM GIC Architecture Specification version 2, Tables 2-2 and 2-3 for IRQ and FIQ behavior.

   a. FIQEn <= 1.

   b. EnableGrp0 <= 1. Enable Group 0 interrupts using the FIQ signal. Group1 interrupts always using IRQ signal.

23.1.9 AMISC

This module contains ADSP configuration registers, synchronization registers, clock registers, and debug registers.

Features

- APB3 bus interface to ACONNECT

- 32-bit data width
- Frequency: 300MHz

23.1.10 APB-AXI Shim (AAS)

AAS is an APB2AXI shim which converts APB requests into AXI requests. The CPU accesses APE registers through the AAS over the APB bus. The AAS converts the requests to AXI and sends to ACONNECT which forwards the requests to the destination slaves.

The APE is not secured. It ignores the NS bit on the APB bus. Forward all requests to ACONNECT as secure.

23.1.10.1 Features

- Maximum Frequency: 300MHz
- Maximum of one outstanding APB request
- Support request
  - INCR 1: 32-bit read/write

23.2 Programming Guidelines

23.2.1 Common Programming Guidelines

23.2.1.1 System Level Programming

1. To start a use case: Enable modules from the tail end of the audio routing towards the source of the audio routing. For example, if the audio samples are fetched from memory, mixed with system tones in the mixer, and then played at the I2S, enable I2S first, followed by the mixer and then the ADMA Interface and ADMA.
2. To end a use case: Disable modules from the module nearest to the source towards the destination of the audio routing. In the use case example in point 1, disable ADMA first, followed by ADMA Interface, Mixer, and finally the I2S.
   a. The best practice while ending a use case is to disable a module using <module>_ENABLE register, wait for the <module>_STATUS_ENABLE_STATUS to become 0, and then move on to disabling the next module
   b. Alternatively, instead of polling for <module>_STATUS_ENABLE_STATUS to become 0, the software can choose to use the TX_DONE interrupt of every module. The “Using Interrupts” subsection explains this in detail.
   c. Besides the above options a. and b., for practical reasons, software can wait 20ms after getting a DMA TRANSFER_DONE interrupt (as DMA is the source in most audio routings), and then use the method described in option a. If a I2S/DMIC is the source of audio in AHUB, then software can wait 20ms after checking for I2S/DMIC ENABLE_STATUS to be 0 and then use the method described in option A.

23.2.1.2 Using Interrupts

All AHUB modules have RX_DONE and TX_DONE interrupts that can be used while ending a use case. The procedure to use these interrupts is:

1. Unmask the interrupt by writing 0 into <module>_XBAR_RX/TX_INT_MASK.
2. All the TX_DONE, RX_DONE interrupts are logically OR’ed and sent to the GIC as the ahub_err interrupt and hence the interrupt service routine for ahub_err interrupts needs to handle the TX_DONE/RX_DONE interrupts
   a. Check the fields of the AHUB_INTR_STATUS_0/1 register to find out which module(s) cause the ahub_err to be asserted
   b. In that module, check the fields of <module>_INT_STATUS register to find out which of the module’s interrupts was fired

23.2.1.3 Programming Module RAMs

Modules like SFC and Mixer have internal RAMs to contain filter coefficients, configurations, etc. The following are the programming guidelines for writing into and reading from the RAMs:

1. To write to a RAM location:
    a. In the <module>_AHUBRAMCTL_<module>_CTRL_x, write the address of the RAM entry to be written to into the RAM_ADDR field
    b. Write the data to be written into the RAM location in the <module>_AHUBRAMCTL_<module>_DATA_x register
    c. In the <module>_AHUBRAMCTL_<module>_CTRL_x, write 1 into the RW field
2. To write sequentially into a bunch of contiguous RAM locations:
    a. Write 1 into the <module>_AHUBRAMCTL_<module>_CTRL_x register field SEQ_ACCESS_EN
    b. In the <module>_AHUBRAMCTL_<module>_CTRL_x, write the address of the RAM entry to be written to into the RAM_ADDR field
    c. Write 1 into the <module>_AHUBRAMCTL_<module>_CTRL_x register field ADDRESS_INIT_EN
    d. Write the data to be written into the RAM location in the <module>_AHUBRAMCTL_<module>_DATA_x register
    e. In the <module>_AHUBRAMCTL_<module>_CTRL_x, write 1 into the RW field
    f. Repeat steps d and e for every word that needs to be written to the RAM (the address will increment automatically)
3. To read to a RAM location:
    a. In the <module>_AHUBRAMCTL_<module>_CTRL_x, write the address of the RAM entry to be read from into the RAM_ADDR field
    b. In the <module>_AHUBRAMCTL_<module>_CTRL_x, write 0 into the RW field
    c. Read the data from the <module>_AHUBRAMCTL_<module>_DATA_x register
4. To write sequentially into a bunch of contiguous RAM locations:
    a. Write 1 into the <module>_AHUBRAMCTL_<module>_CTRL_x register field SEQ_ACCESS_EN
    b. In the <module>_AHUBRAMCTL_<module>_CTRL_x, write the address of the RAM entry to be read from into the RAM_ADDR field
    c. Write 1 into the <module>_AHUBRAMCTL_<module>_CTRL_x register field ADDRESS_INIT_EN
    d. In the <module>_AHUBRAMCTL_<module>_CTRL_x, write 0 into the RW field
    e. Read the data from the <module>_AHUBRAMCTL_<module>_DATA_x register
    f. Repeat steps d and e for every word that needs to be read from the RAM (the address will increment automatically)

23.2.1.4 AHUB Sub-modules Soft Reset Sequence

AHUB sub-modules support software reset. Soft reset will reset FSM and state registers and flush the ACIF FIFOs. However, the effect of software reset on the sub-module interrupt status register is not consistent across all the sub-modules. Some modules clear the interrupt status register on soft reset but others do not. Following sequence can be used to ensure a consistent behavior.

AHUB sub-module soft reset programming sequence:

- Disable all interrupts of a sub-module
- Handle and clear all pending interrupts
- Issue soft reset to the sub-module

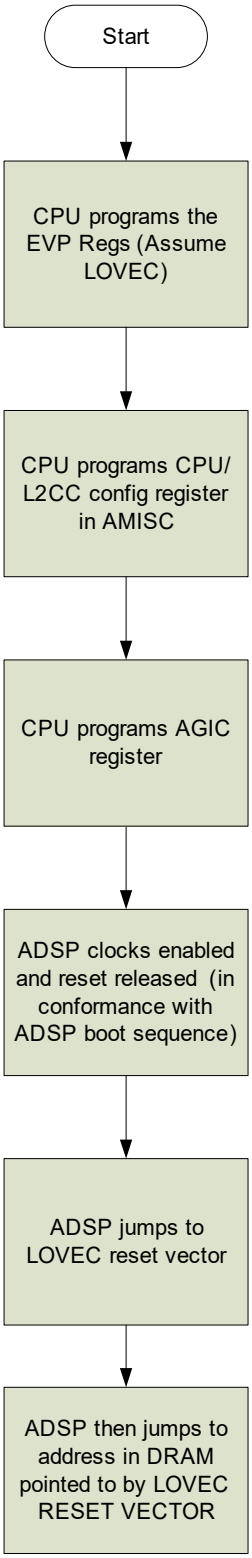
23.2.1.5 Boot Sequence

Cold Boot Sequence

The following steps are taken before bring ADSP out of reset:

- CPU enable clocks to APE through CAR module
- CPU programs CAR and de-asserts reset to ACONNECT, AAS, AMC, AGIC, AXIBRIDGE, AMISC, REGDEC, AHUB, ADMA
- CPU programs ACONNECT registers (if any) which configures ACONNECT
- CPU programs AGIC registers which sets the interrupt routing
- CPU configures AXIBRIDGE and AMC
- CPU configures ADSP and L2 cache controller through programming the configuration registers in AMISC
- CPU downloads the ADSP boot code to DRAM
- CPU programs EVP registers in AMC. Reset vector of EVP points to the start of the boot code.
- CPU de-asserts reset to the ADSP through the CAR module
- ADSP fetches the reset vector from the AMC and jumps to the boot code

Figure 79: ADSP Boot Flow



LP0/LP1 Entry

In LP0 state, DRAM is put in self-refresh mode and APE power rail (SOC) is off. In the LP1 state, DRAM is put in self-refresh mode and APE is power gated. There is no difference in the sequences to LP0 and LP1 states. Before entering LP0/LP1 state, APE states should be saved into DRAM. ADSP L1 and L2 are flushed.

LP0/LP1 Entry Sequence:

- CPU requests the ADSP to enter LP0. Request could come from mailbox.
- If the ADSP is not ready to enter LP0/LP1, it sends a “not ready” message to the CPU. Otherwise, continue.
- ADSP shuts off all activities in the AHUB and the ADMA. It makes sure there is no outstanding request in the ADMA. It is recommended that CPU does not access APE registers after asking the ADSP to enter LP0 and does not send more interrupts to the ADSP. It could unexpectedly interrupt the ADSP and divert it from the shut-down process.
- ADSP saves all states and restores information to DRAM
- ADSP flushes L1 and L2 caches
- ADSP disables interrupts to itself. It diverts interrupts to the CPU if appropriate.
- ADSP makes sure there are no outstanding activities.
- ADSP executes WFI/WFE. WFI is recommended because it makes sure there is no outstanding transaction in A9.
- CPU sees the interrupt from ADSP STANDBYWFI/STANDBYWFE signals. CPU reads the AGIC status register and makes sure STANDBYWFI or STANDBYWFE is asserted.
- CPU reads AMISC register to make sure PL310 CLKSTOPPED is asserted.
- CPU asserts reset and disables APE clocks through the CAR module.
- CPU clamps down and pulls down power to the APE.

LP0/LP1 Exit

LP0/LP1 exit boot sequence is the same as cold boot. To restore the ADSP context, the CPU sends a message to the ADSP, with pointers where the context information is saved.

- Execute ADSP cold boot sequence
- CPU sends restore commands, which have pointers to the saved data, to ADSP.

23.2.2 AAS Programming Guidelines

The AAS starts functioning right out of reset. No programming is needed.

When an error is asserted, read the INT_STATUS register to check for interrupt status. Write a ‘1’ to INT_STATUS_CLR to clear the corresponding interrupt status bit. When INT_STATUS is asserted, register ERROR_RESPONSE and ERROR_ADDRESS capture the information about the error status.

23.2.3 ACIF Programming Guidelines

The following programming guidelines are common for the ACIF registers in all AHUB modules. The programming guidelines of the respective modules will refer to this subsection when it comes to programming the ACIF registers.

1. Set the XBAR_CHANNELS field to the number of channels in the input or output stream of a module, depending on whether the ACIF in question is an RxCIF or TxCIF, respectively
2. Set the CLIENT_CHANNELS field to the number of channels of the stream as dealt with inside the module. This setting is different from XBAR_CHANNELS only when a conversion of the number of channels of an audio stream is desired.
3. Similarly, set the XBAR_BITS and CLIENT_BITS fields.
4. If XBAR_BITS and CLIENT_BITS do not match, the EXPAND and TRUNCATE fields are used to determine how to transition from XBAR_BITS to CLIENT_BITS (in the case of a RxCIF) or from CLIENT_BITS to XBAR_BITS (in the case of an TxCIF). Expanding always results in the actual data being shifted to the MSB bits and the rest filled with zeros, ones, or some random bits from an LFSR. TRUNCATE can be set to chopping or rounding.
5. For the ADMA interface, Iif packing of data in the TxCIF is desired, use PACK8_ENABLE or PACK16_ENABLE. Similarly, If unpacking of data in the RxCIF is desired, use UNPACK8_ENABLE or UNPACK16_ENABLE.

6. If XBAR_CHANNELS and the CLIENT_CHANNELS are different, the STEREO_CONV field is used to determine how a stereo stream is converted to a mono stream, and the MONO_CONV field is used to determine how a mono stream is converted to a stereo stream.

23.2.4 I2S Controller Programming Guidelines

I2S transmit and receive directions can be independently enabled/disabled and controlled.

1. Ensure that the I2S TX/RX is in a disabled state (after being used in a previous use case):

   Check if I2S_AXBAR_RX/TX_STATUS_ENABLE_STATUS = 0

2. Configure the I2S TX/RX path

   - Configure CIF parameters (see “ACIF Programming Guidelines” for more details):

   Populate I2S_XBAR_TX/RX_CIF_CTRL

3. Configure the I2S to operate in the mode of choice

   - Refer to the “Programming I2S to Operate in Various Modes” section about programming I2S in different modes.
   - Select the sampling rate indirectly by setting the channel bit count. Use the “I2S Sampling Rate Selection” section to find the correct value for this register:

     Configure I2S_TIMING_CHANNEL_BIT_CNT

4. Enable the I2S TX/RX:

   - Set I2S_AXBAR_TX/RX_ENABLE to 1.
   - In the case of I2S RX, ensure the enabling is complete before sending data to this module:

   Set I2S_AXBAR_RX_STATUS_ENABLE_STATUS

5. After using the module, disable it:

   Set I2S_AXBAR_TX/RX_ENABLE to 0.

23.2.4.1 I2S Sampling Rate Selection

The channel_bit_cnt can be calculated using the equation:

channel_bit_cnt = (frequency of bit_clk) / (C * required sampling rate) -1

Where C is 2 for LRCK modes and 1 for FSYNC modes.

If this calculation returns a fractional value, use the non-symmetry feature of the controller to attain the required sampling rate. In that case, the channel_bit_cnt value should be programmed with an integer that is closest to the fraction, but less than the fraction.

The table below contains some examples for common sampling rates with CLK_SOURCE_I2S = 24 MHz:

Sampling Rate	I2S_NEW_TIMING[12:00] (mark-space ratio: Left_channel : Right_channel)				
	CLK_DIVISOR=0 BIT_CLK=24 MHz	CLK_DIVISOR=1 BIT_CLK=12 MHz	CLK_DIVISOR=3 BIT_CLK=6 MHz	CLK_DIVISOR=5 BIT_CLK=4 MHz	CLK_DIVISOR=7 BIT_CLK=3 MHz
8 KHz	0x05DB	0x02ED	0x0176	0x00F9	0x10BB
	(1500:1500)	(750:750)	(375:375)	(250:250)	(187:188)
32 KHz	0x0176	0x10BB	Not supported	0x103E	Not supported
	(375:375)	(187:188)		(62:63)	
44.1 KHz	0x010F	0x0087	0x0043	0x002C	0x0021
	(272:272)	(136:136)	(68:68)	(45:45)	(34:34)
48 KHz	0x00F9	0x007C	0x103E	Not supported	Not supported
	(250:250)	(125:125)	(62:63)		

Sampling Rate	I2S_NEW_TIMING[12:00] (mark-space ratio: Left_channel : Right_channel)				
	CLK_DIVISOR=0 BIT_CLK=24 MHz	CLK_DIVISOR=1 BIT_CLK=12 MHz	CLK_DIVISOR=3 BIT_CLK=6 MHz	CLK_DIVISOR=5 BIT_CLK=4 MHz	CLK_DIVISOR=7 BIT_CLK=3 MHz
96 KHz	0x007C	0x103E	0x101F	Not supported	Not supported
	(125:125)	(62:63)	(31:32)		

Notes:

- *Ideally, any sampling rate can be generated, either accurately or approximately with any clk_src selected for I2S, if the clk_divisor and the channel_bit_cnt are programmed accordingly.*
- *The NON_SYM.EN feature is meant to create the sampling rates approximately by realizing an odd bit rate with a non-50:50 mark/space ratio. However, if the bit rate (2*channel_bit_cnt) itself is a fraction, the resultant sampling rate will not be accurate. The entries shown as not supported in the above table are attributed to such a deviation.*
- *When the channel_bit_cnt is less than 32, the bit_size should be programmed to be less than channel_bit_cnt.*

Programming I2S to Operate in Various Modes

After the module initialization (reset and clock programming), program the corresponding bits of the following registers.

Table 118: I2S Programming for Various Modes

Register	Basic	LJM	RJM	DSP	PCM	NW	TDM
I2S_CTRL_FRAME_FORMAT	0	0	0	1	1	1	1
I2S_CTRL_LRCK_POLARITY	0	1	1	1	1	1	1
I2S_CTRL_CHANNEL_BIT_CNT	Number of bit clocks in left channel	Number of bit clocks in left channel	Number of bit clocks in left channel	Number of bits in left channel + right channel	Number of bit clocks per frame	Number of bit clocks per frame	Number of bit clocks per frame
TX_DATA_OFFSET	1	0	CHANNEL_BIT_CNT -BITS_PER_SAMPLE	1	1: Short Fsync 0: Long Fsync	1	0/1/2
RX_DATA_OFFSET	1	0	CHANNEL_BIT_CNT – BITS_PER_SAMPLE	1	1:short Fsync 0:Long Fsync	1	0/1/2
I2S_CTRL_FSYNC_WIDTH	Number of bit clocks in left channel	Number of bit clocks in left channel	Number of bit clocks in left channel	1	0: Short Fsync 1: Long Fsync	0	Bits per sample (slot size)
HIGHZ_CTRL	0	0	0	0	2	2	0/1/2
EDGE_CTRL	0	0	0	0	1	1	1
I2S_SLOT_CTRL_TOTAL_SLOTS	0	0	0	1	0	3	0,1,...7
SLOT_ENABLES	0x01	0x01	0x01	0x03	0x01	*	**
* In NW mode, there can only be one active slot. So 0x01, 0x02, 0x04, 0x08 are allowed values. ** In TDM mode, there is no restriction on what/how many slots are enabled.							

The only restriction on the programming sequence is that all other registers must be programmed first before the Tx/Rx channels are enabled (which is done by setting XFER_EN_TX/XFER_EN_RX).

Programming I2S to Work in Loopback Mode

1. Set the I2S_CTRL_LPBK to 1.

The rest of the programming is the same as if I2S is not in the loopback mode.

23.2.5 DMIC Programming Guidelines

23.2.5.1 Minimum Required Guidelines

1. Ensure that the DMIC is in a disabled state (after being used in a previous use case):

   Check if DMIC_STATUS_ENABLE_STATUS = 0

   a. Configure the DMIC:

   b. Configure TxCIF parameters: Populate DMIC_XBAR_TX_CIF_CTRL registers

   c. Configure the OSR: Populate DMIC_CTRL_OSR register

   d. Enable the DMIC module: Set DMIC_ENABLE to 1

   e. After using the module, disable the module: Set DMIC_ENABLE to 0.

23.2.5.2 Optional Guidelines

While configuring the DMIC controller (step 2 of the section above) one can choose to configure the following optional features:

1. Configure whether to receive the left channel data followed by right channel data or the other way around:

   Use the DMIC_CTRL_LRSEL_POLARITY register field.

   a. Configure whether to receive data in both left and right channels or just the left channel or the right channel:

   Use the DMIC_CTRL_CHANNEL_SELECT register field

2. The trimmer value can be chosen to align data and clock lines from the DMIC device to the DMIC controller:

   Use the DMIC_CTRL_TRIMMER register field

23.2.6 S/PDIF Programming Guidelines

23.2.6.1 16-□20-□24-bit Modes

During transmission, the audio data is taken from the TX data FIFO, the channel status bit is taken from the TX channel status page buffer, and the user status bit is from the TX user FIFO. The preamble bits are generated by the hardware. The Valid bit is always zero.

During reception, the audio data is stored in the RX data FIFO, the channel status bit is stored in the RX channel status page buffer and the user status bit is stored in the RX user FIFO.

In addition to storing the audio data, the RX data FIFO also stores the preamble bits, channel status bit, user status bit and the valid bit. The reception of the channel bits start after the B-preamble is detected.

The audio-data sample has 16, 20, or 24 bits of data. Firmware has to transmit 16-, 20-, or 24-bit data and read 16-, 20-, or 24-bit data.

23.2.6.2 Raw Mode

During transmission, the audio data, the preamble bits, channel status bits, the user bits, and the valid bits are transmitted from the RX data FIFO. The firmware has to provide the correct preamble bits for the receiving device to synchronize with the transmitter. The firmware has to provide preambles according to the following table:

Preceding State in the Parity Bit: 0/1

Table 119: Preamble Bits

Symbol	Preamble Code	Channel Coding	Description
“B” (or “Z”)	0001/0001	11101000/00010111	Start of a block.
“M” (or “X”)	0010/0010	11100010/00011101	Start of sub-frame 1.
“W” (or “Y”)	0011/0011	11100100/00011011	Start of sub-frame 2.

During reception, the audio-data, the preamble bits, channel status bits, the user bits and the valid bits are stored in the RX data FIFO. The user bit is also stored in the RX user FIFO. The channel bit is also stored in the RX channel status page buffer. But the channel status bits are stored in the RX channel status page buffer only after the B-preamble is detected.

23.2.6.3 Module Reset

The application may initialize or reset the S/PDIF module via the clock and reset (CAR) control’s RST_DEVICES_L_0 register.

23.2.6.4 Clock Source/Divider Control

The SPDIFOUT clock source/divider can be selected by programming CAR’s CLK_SOURCE_SPDIF register. Refer to the S/PDIF registers below for the needed input frequency for the desire output audio sample rate.

The SPDIFIN clock source/divider can be selected by programming CAR’s CLK_SOURCE_SPDIF register. Refer to the SPDIF registers below for the needed oversample frequency.

23.2.6.5 Clock Enable Control

The application may enable the S/PDIF clocks by programming the CAR’s CLK_OUT_ENB_L_0 register.

23.2.6.6 Detecting Incoming Sampling Rate

The SPDIFIN is capable of detecting and locking onto the ‘spdifin’ data stream regardless of the sample rate. It achieves this by using an oversampling technique.

In addition to reading the sampling rate from the channel status information, one can also read the PERIOD field in the STROBE_CTRL_0 register to estimate the incoming sample rate. The last two digits of PERIOD indicate the fractional clock period.

Sample rate ≈ (‘spdifin’ clock frequency * 1000) / (PERIOD * 128)

If using the PERIOD method, it is better to read this field toward the end of the song or just before turning off the SPDIFIN. Although the hardware can lock onto the SPDIFIN data stream in as little as 2 subframes of time, the hardware is actually constantly re-adjusting itself (due to jitter, synchronization loss, etc. in the data stream) to provide the strobe point to the center of the biphase data stream. Over time, the strobe point will vary less and less because the hardware has already adjusted to all the variations seen in the data stream.

23.2.6.7 S/PDIF Transmit Data Flow

Make sure that the TX_FIFO is filled before enabling the transmission by setting the TX_EN field of CTRL_0 register. Never allow the TX_FIFO to go empty at any time during transmission. The interrupt is generated when the Tx Data FIFO empty count is greater than the Tx DATA attention value (TX_ATN_LVL field of the DATA_FIFO_CSR_0 register) if the Tx interrupt enable is set.

23.2.6.8 S/PDIF Receive Data Flow

To enable the reception of RX_FIFO, set the RX_EN field of the CTRL_0 register. Never allow the RX_FIFO to become full at any time during reception. The interrupt is generated when the Rx Data FIFO data count is greater than the Rx DATA attention value (RX_ATN_LVL field of the DATA_FIFO_CSR register), if the Rx interrupt enable bit is set.

23.2.6.9 Method of Filling/Retrieve Data from TX/RX User/Data FIFO

Use the DMA method by programming the APB DMA and APBIF registers. With this method, the FIFO attention levels need to be set in the APBIF just like in method 2. But instead of enabling interrupts when the FIFO attention level is reached, one should program the APB DMA registers. Now, every time the attention level is reached, a DMA request will be generated by the APBIF to the APB DMA and the APB DMA will perform the data moving task from/to APBIF FIFOs to the AHB bus.

23.2.7 Mixer Programming Guidelines

23.2.7.1 Guidelines for Programming Mixer Inputs

In general, the Mixer's inputs are all independent of each other. The programming guidelines are given for configuring and using a generic input. The guidelines are applicable for any of the Mixer's inputs.

1. Configure the CIF parameters.

   Populate the register MIXER_AXBAR_RX<no>_CIF_CTRL.
2. Make gain application related configurations (see Section 23.2.7.3: Programming Gain Application)
3. Make peak value related configuration

   Configure the register MIXER_AXBAR_RX<no>_PEAK_CTRL

23.2.7.2 Guidelines for Programming Mixer Outputs

1. Ensure the output that is intended to be used is in a disabled state (After being used in the previous use case)

   Check if MIXER_AXBAR_TX<no>_STATUS_ENABLE_STATUS is 0
2. Configure the adder associated with this output by enabling which inputs to be used with this adder

   Populate the register MIXER_AXBAR_TX<no>_ADDER_CONFIG
3. Ensure that the Mixer module is in an enabled state

   Check if MIXER_STATUS_ENABLE_STATUS is 1

   a. If not, enable the Mixer module

      Set MIXER_ENABLE to 1
4. Ensure the module is done initializing

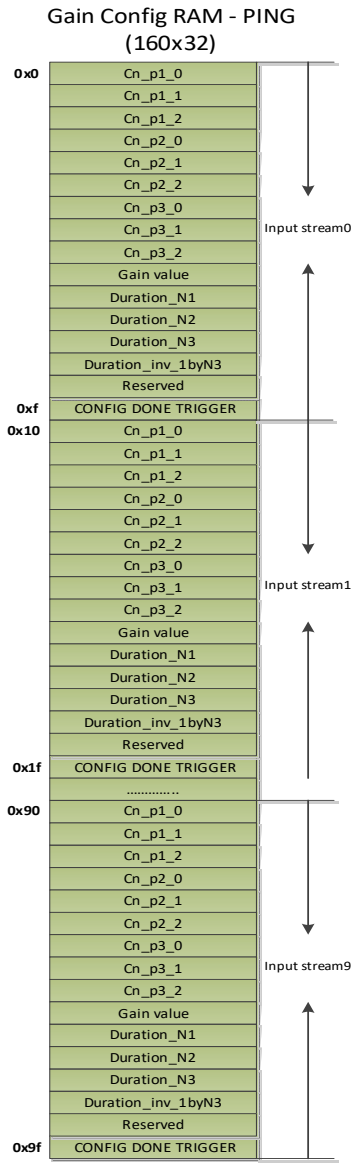
   Check if MIXER_STATUS_ENABLE_STATUS is 1
5. Enable the Mixer output

   Set MIXER_AXBAR_TX<no>_ENABLE to 1

23.2.7.3 Programming Gain Application

All gain-related configurations reside in a RAM as shown below.

Figure 80: Gain Configuration RAM



To write values into this RAM, one must use the AHUBRAMCTL_GAIN_CONFIG_RAM_CTRL, AHUBRAMCTL_GAIN_CONFIG_RAM_DATA. Refer to Section 23.2.1.3: Programming Module RAMs for programming guidelines on writing/reading RAM locations. The programming sequence for writing new gain parameters is:

1. Make sure the hardware is not in the middle of updating its internal variables with the old set of gain related parameters:

   Ensure MIXER_AXBAR_RX<no>_STATUS_CNFG_BUSY is 0

2. Program new gain value corresponding to other parameters if needed
3. Write to 0xf offset register to trigger the hardware to start using a new set of values.

   The ‘Duration_inv_1byN3’ should be calculated by software from the value of ‘Duration_N3’ (N3) as follows:

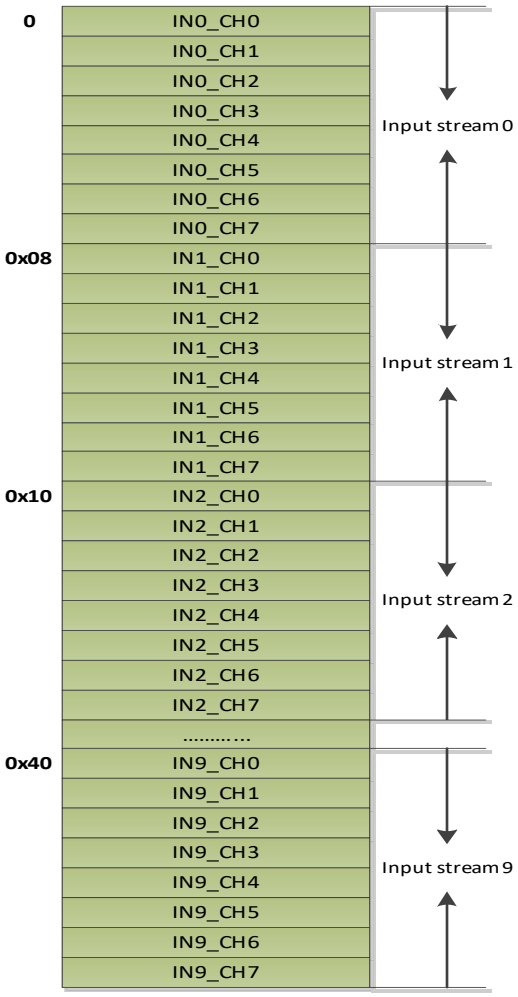
   Duration_inv_1byN3 = $\left(\frac{1}{N3}\right) * 2^{Prescalar} * 2^{31}$

   where, ‘Prescalar’ = 6.

23.2.7.4 Reading Peak Values

The peak value statuses are available in a RAM as shown below.

Figure 81: Peak Value RAM



To read a value from this RAM, one must use the registers AHUBRAMCTL_PEAKM_CTRL and AHUBRAMCTL_PEAKM_DATA. Refer to Section 23.2.1.3: Programming Module RAMs for programming guidelines on writing/reading RAM locations.

23.2.8 AMX Programming Guidelines

23.2.8.1 Mandatory Guidelines

1. Ensure that the AMX is in a disabled state (after being used in a previous use case)

   Check if AMX_STATUS_ENABLE_STATUS is 0

2. Configure the AMX

   a. Configure the RxCIF, TxCIF parameters (see Section 23.2.3: ACIF Programming Guidelines for more details)

      Populate AMX_XBAR_RX_CIF_CTRL0, AMX_XBAR_RX_CIF_CTRL1, AMX_XBAR_RX_CIF_CTRL2, AMX_XBAR_RX_CIF_CTRL3 and AMX_XBAR_TX_CIF_CTRL registers

   b. Enable the inputs that will be used for making the output frame:

      Use register fields AMX_CTRL_RX<no>_EN

3. Program the byte RAM map:

   Use AMX_AUDIORAMCTL_AMX_CTRL and AMX_AUDIORAMCTL_AMX_DATA registers. Refer to Section 23.2.1.3: Programming Module RAMs for programming guidelines on reading RAM locations.

4. Program the “wait-on” conditions for AMX:

   Configure the AMX_CTRL_RX_DEP, AMX_CTRL_MSTR_RX_NUM register fields

5. Configure which of the bytes in the output stream contain data

   Configure the AMX_OUT_BYTE_EN0 register for the LSB 32 bytes and the AMX_OUT_BYTE_EN1 register for the MSB 32 bytes

6. Enable the AMX module

   Set AMX_ENABLE to 1.

7. Ensure the module is done initializing before sending data to it

   Ensure AMX_STATUS_ENABLE_STATUS is 1

8. After using the module, disable the module

   Set AMX_ENABLE to 0.

23.2.8.2 Optional Guidelines

1. Configure AMX to stop accepting new input frames right after an input is disabled (otherwise AMX waits until all the continuous incoming frames are received and then disables)

   Set field(s) AMX_CTRL_RX<no>_DISABLE_MODE to FORCEFUL

   Note: Refer to the “Common Programming Guidelines” section for information on using some optional features in the AMX (and all other modules).

2. Configure Audio CIF control registers AMX_AUDIOCIF_CH0_CTRL, AMX_AUDIOCIF_CH1_CTRL, AMX_AUDIOCIF_CH2_CTRL, AMX_AUDIOCIF_CH3_CTRL, and AMX_AUDIOCIF_OUT_CTRL according to the guidelines given in Section 23.2.3: ACIF Programming Guidelines.

3. Configure the CH_DEP parameter field in the AMX_CTRL_0 register to determine whether to wait for all enabled channels to have data before transfer or start sending the data when any one of the input channels has data (WT_ON_ALL & WT_ON_ANY).

4. Configure the MSTR_CH_NUM register for designated master channel, so that if the data is available on a particular channel, the output can be sent.

5. Enable the AMX output by setting BYTE_EN in AMX_OUT_BYTE_EN0 and AMX_OUT_BYTE_EN1.

6. For Byte RAMCTL programming:

   - For programming RAM with the HW_ADR_EN bit cleared in the AMX_AUDIORAMCTL_AMX_CTRL register, set the RAM offset in the RAM_ADR field of the AMX_AUDIORAMCTL_AMX_CTRL register and set data in the DATA field in the AMX_AUDIORAMCTL_AMX_DATA register.
   - For programming RAM with the HW_ADR_EN bit set in the AMX_AUDIORAMCTL_AMX_CTRL register, set the RAM offset in the RAM_ADR field of the AMX_AUDIORAMCTL_AMX_CTRL register to 0 and set data in the DATA field in the AMX_AUDIORAMCTL_AMX_DATA register. Hardware auto-increments the RAM_ADR after each write.

23.2.9 ADX Programming Guidelines

23.2.9.1 Mandatory Guidelines

1. Ensure that the ADX is in a disabled state (after being used in a previous use case):

   Check if ADX_STATUS_ENABLE_STATUS is 0

2. Configure the ADX:

   a. Configure the RxCIF, TxCIF parameters (see Section 23.2.3: ACIF Programming Guidelines for more details)

Populate ADX_XBAR_TX_CIF_CTRL0, ADX_XBAR_TX_CIF_CTRL1, ADX_XBAR_TX_CIF_CTRL2, ADX_XBAR_TX_CIF_CTRL3 and ADX_XBAR_RX_CIF_CTRL registers

3. Enable the inputs that will be used for making the output frame:

   Use register fields ADX_CTRL_TX<no>_EN

4. Program the byte RAM map:

   Use ADX_AUDIORAMCTL_ADX_CTRL and ADX_AUDIORAMCTL_ADX_DATA registers. Refer to Section 23.2.1.3: Programming Module RAMs for programming guidelines on reading RAM locations.

5. Configure which of the bytes in the input stream contain data:

   Configure the ADX_IN_BYTE_EN0 register for the LSB 32 bytes and the ADX_IN_BYTE_EN1 register for the MSB 32 bytes

6. Enable the ADX module:

   Set ADX_ENABLE to 1

7. Ensure the module is done initializing.

   Ensure ADX_STATUS_ENABLE _STATUS is 1

8. After using the module, disable the module:

   Set ADX_ENABLE to 0.

23.2.9.2 Optional Guidelines

1. Configure ADX to stop generating new input frames right after an output is disabled (otherwise ADX waits until all the continuous incoming frames are received and then disables)

   Set field(s) ADX_CTRL_TX<no>_DISABLE_MODE to FORCEFUL

23.2.10 SFC Programming Guidelines

1. Ensure that the SFC is in a disabled state (after being used in a previous use case):

   Check if SFC_STATUS_ENABLE_STATUS = 0

2. Configure the SFC:

   a. Configure RxCIF, TxCIF parameters (see “ACIF Programming Guidelines” for more details):

      Populate SFC_AXBAR_RX_CIF_CTRL and SFC_AXBAR_TX_CIF_CTRL registers

   b. Configure input/output sampling frequencies:

      Populate SFC_AXBAR_RX_FREQ_FS_IN and SFC_AXBAR_TX_FREQ_FS_OUT registers

3. There are hardcoded coefficients for commonly used frequency conversions--see below. But for other frequency conversions, the software *must* program filter coefficients. Furthermore, optionally, even for the common use cases, the software may choose to program the filter coefficients. Note that the coefficients are in Q23 number format (1 sign bit and 23 fractional bits).

   a. Set SFC_COEF_RAM_0_COEF_RAM_EN to 1.

   b. Program the RAM via SFC_AHUBRAMCTL_SFC_CTRL_0 and SFC_AHUBRAMCTL_SFC_DATA_0. Refer to Section 23.2.1.3: Programming Module RAMs for how to program any RAM in an AHUB module.

4. Enable the SFC module:

   Set SFC_ENABLE to 1

5. Ensure the module initialization is done before sending data to SFC:

   Ensure SFC_STATUS_ENABLE_STATUS is 1

6. After using the module, disable the module:

   Set SFC_ENABLE to 0.

23.2.10.1 Commonly Used Frequency Conversions

- 8 KHz to 44.1 KHz
- 8 KHz to 48 KHz
- 16 KHz to 44.1 KHz
- 16 KHz to 48 KHz
- 44.1 KHz to 8 KHz
- 44.1 KHz to 16 KHz
- 48 KHz to 8 KHz
- 48 KHz to 16 KHz

23.2.11 AFC Programming Guidelines

1. Ensure that the AFC is in a disabled state (after being used in a previous use case):

   Check if AFC_STATUS_ENABLE_STATUS = 0

2. Configure the AFC:

   a. Configure RXCIF and TXCIF parameters (see Section 23.2.3: ACIF Programming Guidelines for more details)" Populate AFC_XBAR_RX_CIF_CTRL and AFC_XBAR_TX_CIF_CTRL registers

   b. Configure the maximum expected PPM difference between the two clock sources that AFC is used to control the flow between: Configure the AFC_CLK_PPM_DIFF register

   c. Configure the I2S FIFO thresholds and AFC TXCIF thresholds that are used by the AFC logic: Configure the AFC_CLK_PPM_DIFF register*

3. Enable the AFC module:

   Set AFC_ENABLE to 1

4. Ensure the module initialization is complete before sending data to AFC:

   Ensure AFC_STATUS_ENABLE_STATUS is 1

5. After using the module, disable the module:

   Set AFC_ENABLE to 0.

The following table shows the guidelines to follow for setting the threshold values under various conditions.

Note: *In the table, the numbers in parentheses are example values.*

Use Case	**AFC_THRESHOLDS_I2S_0**			**AFC_THRESHOLDS_AFC_0**			**Destination I2S FIFO Threshold (To be Programmed in I2S_AUDIOCIF_I2SRX_CTRL_0. FIFO_THRESHOLD)**
Actual Value (Typical Value)	HIGH_ THRESHOLD	START_ THRESHOLD	LOW_ THRESHOLD	HIGH_ THRESHOLD	START_ THRESHOLD	LOW_ THRESHOLD	
I2S → AFC → I2S	START_ THRESHOLD+ 1 (8)	START_ THRESHOLD (7)	START_ THRESHOLD - 1 (6)	START_ THRESHOLD+ 1 (8)	START_ THRESHOLD (7)	START_ THRESHOLD - 1 (6)	START_THRESHOLD + 1 (AFC_THRESHOLDS_ I2S_0) (8)
I2S → SFC → AFC → I2S	2*SRC-BURST + 1	1*SRC-BURST + 2	1*SRC-BURST	1*SRC-BURST + 1	1*SRC-BURST + 1	1*SRC-BURST + 1	START_THRESHOLD + 1 (AFC_THRESHOLDS_ I2S_0)

Use Case	AFC_THRESHOLDS_I2S_0			AFC_THRESHOLDS_AFC_0			Destination I2S FIFO Threshold (To be Programmed in I2S_AUDIOCIF_I2SRX_CTRL_0. FIFO_THRESHOLD)
I2S → AFC → AMX → I2S	START_THRESHOLD+1 (8)	START_THRESHOLD (7)	START_THRESHOLD - 1 (6)	START_THRESHOLD + 1 (8)	START_THRESHOLD (7)	START_THRESHOLD-1 (6)	Start Threshold + 1 (AFC_THRESHOLDS_I2S_0) (8)
I2S → SFC → AFC → AMX → I2S	2*SRC-BURST +1	1*SRC-BURST +2	1*SRC-BURST	2*SRC-BURST + 4	1*SRC-BURST + 4	(4)	START_THRESHOLD + 1 (AFC_THRESHOLDS_I2S_0)

23.2.12 OPE Programming Guidelines

1. Ensure that OPE is in a disabled state (after being used in a previous use case)

   Check if OPE_STATUS_ENABLE_STATUS = 0

2. Configure OPE:

   a. Configure RXCIF, TXCIF parameters (see Section 23.2.3: ACIF Programming Guidelines for more details)

      Populate OPE_XBAR_RX_CIF_CTRL and OPE_XBAR_TX_CIF_CTRL registers

3. Configure MBDRC and PEQ:
4. Enable OPE module:

   Set OPE_ENABLE to 1

5. Ensure the module initialization is complete before sending data to MBDRC:

   Ensure OPE_STATUS_ENABLE_STATUS is 1

6. After using the module, disable the module:

   Set OPE_ENABLE to 0.

If an output device is changing, or the coefficients and other settings need to be changed:

1. Disable OPE.
2. Wait for OPE_STATUS_ENABLE_STATUS = 0 (for datapath flushed out, or OPE_SOFT_RESET if immediate disable is needed)
3. Reprogram all coefficients and configuration registers as required.
4. Trigger OPE_SOFT_RESET.
5. Enable OPE as before.

Note: *Coefficient Data programmed takes care of the signs, i.e., hardware will always do add, so to implement a BiQuad operation b0*x[n] + b1*x[n-1] + b2*x[n-2] –a1*y[n-1] – a2*y[n-2], Software has to provide b0, b1, b2,-a1,-a2 as the coefficients.*

23.2.13 MVC Programming Guidelines

1. Ensure that the MVC is in a disabled state (after being used in a previous use case):

   Check if MVC_STATUS is 0

2. Configure the MVC

   a. Configure RXCIF and TXCIF parameters (see Section 23.2.3: ACIF Programming Guidelines for more details)

   b. Program MVC_CONFIG registers

   c. Program all Volume related settings (Target Volume, Duration, Polynomial Coefficients in Polynomial mode)

3. Enable MVC module:

   Set MVC_ENABLE to 1

4. Ensure the module initialization is complete before sending data to MVC:

   Ensure MVC_STATUS is 1

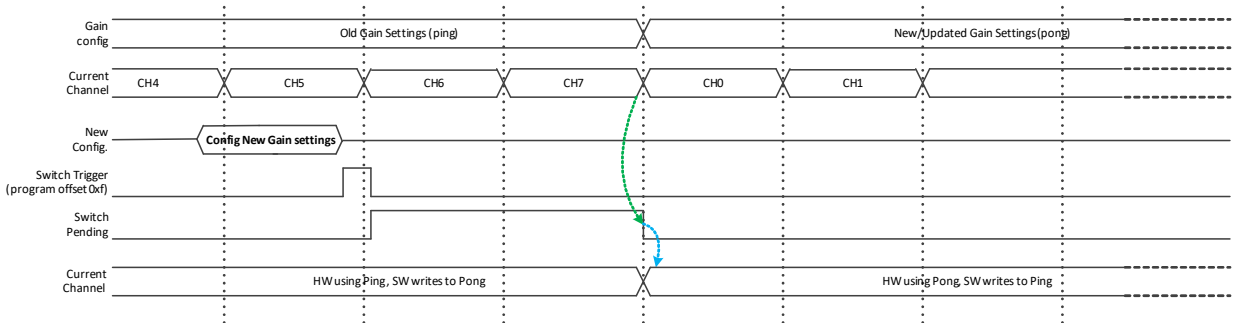
5. After using the module, disable the module:

   Set MVC_ENABLE to 0.

If software wants to change polynomial coefficients, duration parameters, or volume parameters (target volume and mute_unmute) on the fly while MVC is in enable state:

1. Check the status of switching: COEFF_SWITCH, DURATION_SWITCH and VOLUME_SWITCH
2. Program new parameters (For coefficient switching, hardware will handle whether that goes to Ping or Pong)
3. Set COEFF_SWITCH/DURATION_SWITCH/VOLUME_SWITCH to let hardware know new parameters are ready.

Figure 82: Programming Timeline for Updated Software Configuration



Note: *If software wants to program polynomial coefficients, duration parameters and volume parameters at the same time, then software should first program all the required fields for polynomial coefficients, duration parameters, and volume parameters, then set COEFF_SWITCH, DURATION_SWITCH, and VOLUME SWITCH together (they all belong to the same register).*

If an output device is changing, or the settings need to be changed:

1. Disable the MVC
2. Reprogram all registers
3. Trigger Soft Resets for MVC and CIFS
4. Enable – in same order above.

If the software is changing parameters while MVC is in disable state, following points should be kept in consideration:

1. If software wants to retain history between disable and enable stages, then when software disables the MVC, it should also set the INIT_VOL register to the last set Volume value by software. Examples:
   a. If software sets the volume to T1 and then disables the module, INIT_VOL should be set to T1.
   b. If software sets the volume to T1, then press Mute button and then disables the module, INIT_VOL should be set to T1
   c. If software sets the volume to T1 and then disables the module, INIT_VOL should be set to T1. Now if during the disable stage, if software changes the volume to T2, INIT_VOL should be set to T2.

      Exception: The only exception to the above case is if the last set volume was 0. If the last set volume was 0, then the INIT_VOL register should be set to the INIT_VOL during boot-up.
2. If software unmutes a channel while in the disabled stage, it needs to update the TARGET_VOL register to the last set volume value by software.

23.2.14 ADMA Programming Guidelines

1. Software should not attempt to write into registers of an active channel after the “TRANSFER_ENABLE” bit is set to “1”. The following register accesses are exceptions to this constraint.
   - “TRANSFER_PAUSE”
   - “SOFT_RESET”
2. ADMA channels to be involved in flow controlled transfers (AHUB-to-Memory and AHUB-to-AHUB) should be enabled prior to enabling the corresponding AHUB channels. For this, S/W should ensure “TRANSFER_ENABLED” status bit of ADMA channel is “high” before writing into “ENABLE_0_ENABLE” bit of corresponding AHUB channel.
3. Software should wait till “TRANSFER_ENABLED” status bit goes low and clear any pending interrupts for re-enabling a disabled channel.
4. “TRANSFER_COUNT” should be set to a non-zero value
5. Software should ensure “AHUB_FIFO_CTRL_0_TX_FIFO_SIZE” or “AHUB_FIFO_CTRL_0_RX_FIFO_SIZE” registers in an ADMA channel and “FIFO_CTRL_0_DMA_FIFO_SIZE” register of AHUB channel mapped to this ADMA channel programmed to a same value. ADMA and AHUB channel mapping is done through “CTRL_0_RX_REQUEST_SELECT” or “CTRL_0_TX_REQUEST_SELECT” registers in ADMA.
6. “TRANSFER_COUNT” status may not reflect the true value while transfer is in progress, so the channel should be “PAUSED” for getting the correct status.
7. Software may choose to terminate a transfer or disable a channel abruptly by clearing “TRANSFER_ENABLE” bit or wait until hardware disables it automatically up on normal completion of transfer.

23.3 Audio Processing Engine Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

23.3.1 Audio Crossbar (AXBAR) Registers

In the RX port registers, no more than one field can be 1 in a register because an RX port can receive from only one TX port.

23.3.1.1 AXBAR_PART_0_ADMAIF_RX*n*_0

There are 10 AXBAR_PART_0_ADMAIF_RX registers, one per RX port (*n* = 1 through 0xa).

Offset: 0x0 + ([*n* * 0x4] – 0x4) | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx00000xxxxxx0000000000)

Bit	Reset	Description
27	0x0	SFC4_TX1: 0 = DISABLE 1 = ENABLE
26	0x0	SFC3_TX1: 0 = DISABLE 1 = ENABLE
25	0x0	SFC2_TX1: 0 = DISABLE 1 = ENABLE
24	0x0	SFC1_TX1: 0 = DISABLE 1 = ENABLE
20	0x0	I2S5_TX1: 0 = DISABLE 1 = ENABLE
19	0x0	I2S4_TX1: 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
18	0x0	I2S3_TX1: 0 = DISABLE 1 = ENABLE
17	0x0	I2S2_TX1: 0 = DISABLE 1 = ENABLE
16	0x0	I2S1_TX1: 0 = DISABLE 1 = ENABLE
9	0x0	ADMAIF_TX10: 0 = DISABLE 1 = ENABLE
8	0x0	ADMAIF_TX9: 0 = DISABLE 1 = ENABLE
7	0x0	ADMAIF_TX8: 0 = DISABLE 1 = ENABLE
6	0x0	ADMAIF_TX7: 0 = DISABLE 1 = ENABLE
5	0x0	ADMAIF_TX6: 0 = DISABLE 1 = ENABLE
4	0x0	ADMAIF_TX5: 0 = DISABLE 1 = ENABLE
3	0x0	ADMAIF_TX4: 0 = DISABLE 1 = ENABLE
2	0x0	ADMAIF_TX3: 0 = DISABLE 1 = ENABLE
1	0x0	ADMAIF_TX2: 0 = DISABLE 1 = ENABLE
0	0x0	ADMAIF_TX1: 0 = DISABLE 1 = ENABLE

23.3.1.2 AXBAR_PART_0_I2S*i*_RX1_0

There are 5 AXBAR_PART_0_I2S_RX registers, five I2S channels per RX port (*i*= 1 through 5).

Offset: 0x40 + ([*i* * 0x4] – 0x4) | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx00000xxxxx0000000000)

Bit	Reset	Description
27	0x0	SFC4_TX1: 0 = DISABLE 1 = ENABLE
26	0x0	SFC3_TX1: 0 = DISABLE 1 = ENABLE
25	0x0	SFC2_TX1: 0 = DISABLE 1 = ENABLE
24	0x0	SFC1_TX1: 0 = DISABLE 1 = ENABLE
20	0x0	I2S5_TX1: 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
19	0x0	I2S4_TX1: 0 = DISABLE 1 = ENABLE
18	0x0	I2S3_TX1: 0 = DISABLE 1 = ENABLE
17	0x0	I2S2_TX1: 0 = DISABLE 1 = ENABLE
16	0x0	I2S1_TX1: 0 = DISABLE 1 = ENABLE
9	0x0	ADMAIF_TX10: 0 = DISABLE 1 = ENABLE
8	0x0	ADMAIF_TX9: 0 = DISABLE 1 = ENABLE
7	0x0	ADMAIF_TX8: 0 = DISABLE 1 = ENABLE
6	0x0	ADMAIF_TX7: 0 = DISABLE 1 = ENABLE
5	0x0	ADMAIF_TX6: 0 = DISABLE 1 = ENABLE
4	0x0	ADMAIF_TX5: 0 = DISABLE 1 = ENABLE
3	0x0	ADMAIF_TX4: 0 = DISABLE 1 = ENABLE
2	0x0	ADMAIF_TX3: 0 = DISABLE 1 = ENABLE
1	0x0	ADMAIF_TX2: 0 = DISABLE 1 = ENABLE
0	0x0	ADMAIF_TX1: 0 = DISABLE 1 = ENABLE

23.3.1.3 AXBAR_PART_0_SFC*i*_RX1_0

There are 4 AXBAR_PART_0_SFC_RX registers, four SFC channels per RX port (*i* = 1 through 4).

Offset: 0x60 + ([*i* * 0x4] – 0x4) | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx00000xxxxxx0000000000)

Bit	Reset	Description
27	0x0	SFC4_TX1: 0 = DISABLE 1 = ENABLE
26	0x0	SFC3_TX1: 0 = DISABLE 1 = ENABLE
25	0x0	SFC2_TX1: 0 = DISABLE 1 = ENABLE
24	0x0	SFC1_TX1: 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
20	0x0	I2S5_TX1: 0 = DISABLE 1 = ENABLE
19	0x0	I2S4_TX1: 0 = DISABLE 1 = ENABLE
18	0x0	I2S3_TX1: 0 = DISABLE 1 = ENABLE
17	0x0	I2S2_TX1: 0 = DISABLE 1 = ENABLE
16	0x0	I2S1_TX1: 0 = DISABLE 1 = ENABLE
9	0x0	ADMAIF_TX10: 0 = DISABLE 1 = ENABLE
8	0x0	ADMAIF_TX9: 0 = DISABLE 1 = ENABLE
7	0x0	ADMAIF_TX8: 0 = DISABLE 1 = ENABLE
6	0x0	ADMAIF_TX7: 0 = DISABLE 1 = ENABLE
5	0x0	ADMAIF_TX6: 0 = DISABLE 1 = ENABLE
4	0x0	ADMAIF_TX5: 0 = DISABLE 1 = ENABLE
3	0x0	ADMAIF_TX4: 0 = DISABLE 1 = ENABLE
2	0x0	ADMAIF_TX3: 0 = DISABLE 1 = ENABLE
1	0x0	ADMAIF_TX2: 0 = DISABLE 1 = ENABLE
0	0x0	ADMAIF_TX1: 0 = DISABLE 1 = ENABLE

23.3.1.4 AXBAR_PART_0_MIXER1_RX*n*_0

There are 10 AXBAR_PART_0_MIXER_RX registers, one per RX port (*n* = 1 through 0xa).

Offset: 0x80 + ([*n* * 0x4] – 0x4) | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx00000xxxxxx0000000000)

Bit	Reset	Description
27	0x0	SFC4_TX1: 0 = DISABLE 1 = ENABLE
26	0x0	SFC3_TX1: 0 = DISABLE 1 = ENABLE
25	0x0	SFC2_TX1: 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
24	0x0	SFC1_TX1: 0 = DISABLE 1 = ENABLE
20	0x0	I2S5_TX1: 0 = DISABLE 1 = ENABLE
19	0x0	I2S4_TX1: 0 = DISABLE 1 = ENABLE
18	0x0	I2S3_TX1: 0 = DISABLE 1 = ENABLE
17	0x0	I2S2_TX1: 0 = DISABLE 1 = ENABLE
16	0x0	I2S1_TX1: 0 = DISABLE 1 = ENABLE
9	0x0	ADMAIF_TX10: 0 = DISABLE 1 = ENABLE
8	0x0	ADMAIF_TX9: 0 = DISABLE 1 = ENABLE
7	0x0	ADMAIF_TX8: 0 = DISABLE 1 = ENABLE
6	0x0	ADMAIF_TX7: 0 = DISABLE 1 = ENABLE
5	0x0	ADMAIF_TX6: 0 = DISABLE 1 = ENABLE
4	0x0	ADMAIF_TX5: 0 = DISABLE 1 = ENABLE
3	0x0	ADMAIF_TX4: 0 = DISABLE 1 = ENABLE
2	0x0	ADMAIF_TX3: 0 = DISABLE 1 = ENABLE
1	0x0	ADMAIF_TX2: 0 = DISABLE 1 = ENABLE
0	0x0	ADMAIF_TX1: 0 = DISABLE 1 = ENABLE

23.3.1.5 AXBAR_PART_0_SPDIF1_RX*n*_0

There are 2 AXBAR_PART_0_SPDIF_RX registers, one per RX port (*n* = 1 through 2).

Offset: 0xc0 + ([*n* * 0x4] – 0x4) | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx00000xxxxxx0000000000)

Bit	Reset	Description
27	0x0	SFC4_TX1: 0 = DISABLE 1 = ENABLE
26	0x0	SFC3_TX1: 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
25	0x0	SFC2_TX1: 0 = DISABLE 1 = ENABLE
24	0x0	SFC1_TX1: 0 = DISABLE 1 = ENABLE
20	0x0	I2S5_TX1: 0 = DISABLE 1 = ENABLE
19	0x0	I2S4_TX1: 0 = DISABLE 1 = ENABLE
18	0x0	I2S3_TX1: 0 = DISABLE 1 = ENABLE
17	0x0	I2S2_TX1: 0 = DISABLE 1 = ENABLE
16	0x0	I2S1_TX1: 0 = DISABLE 1 = ENABLE
9	0x0	ADMAIF_TX10: 0 = DISABLE 1 = ENABLE
8	0x0	ADMAIF_TX9: 0 = DISABLE 1 = ENABLE
7	0x0	ADMAIF_TX8: 0 = DISABLE 1 = ENABLE
6	0x0	ADMAIF_TX7: 0 = DISABLE 1 = ENABLE
5	0x0	ADMAIF_TX6: 0 = DISABLE 1 = ENABLE
4	0x0	ADMAIF_TX5: 0 = DISABLE 1 = ENABLE
3	0x0	ADMAIF_TX4: 0 = DISABLE 1 = ENABLE
2	0x0	ADMAIF_TX3: 0 = DISABLE 1 = ENABLE
1	0x0	ADMAIF_TX2: 0 = DISABLE 1 = ENABLE
0	0x0	ADMAIF_TX1: 0 = DISABLE 1 = ENABLE

23.3.1.6 AXBAR_PART_0_AFC*i*_RX1_0

There are 6 AXBAR_PART_0_AFC_RX registers, with six AFC channels per RX port (*i* = 1 through 6).

Offset: 0xd0 + ([*i* * 0x4] – 0x4) | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx00000xxxxxx0000000000)

Bit	Reset	Description
27	0x0	SFC4_TX1: 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
26	0x0	SFC3_TX1: 0 = DISABLE 1 = ENABLE
25	0x0	SFC2_TX1: 0 = DISABLE 1 = ENABLE
24	0x0	SFC1_TX1: 0 = DISABLE 1 = ENABLE
20	0x0	I2S5_TX1: 0 = DISABLE 1 = ENABLE
19	0x0	I2S4_TX1: 0 = DISABLE 1 = ENABLE
18	0x0	I2S3_TX1: 0 = DISABLE 1 = ENABLE
17	0x0	I2S2_TX1: 0 = DISABLE 1 = ENABLE
16	0x0	I2S1_TX1: 0 = DISABLE 1 = ENABLE
9	0x0	ADMAIF_TX10: 0 = DISABLE 1 = ENABLE
8	0x0	ADMAIF_TX9: 0 = DISABLE 1 = ENABLE
7	0x0	ADMAIF_TX8: 0 = DISABLE 1 = ENABLE
6	0x0	ADMAIF_TX7: 0 = DISABLE 1 = ENABLE
5	0x0	ADMAIF_TX6: 0 = DISABLE 1 = ENABLE
4	0x0	ADMAIF_TX5: 0 = DISABLE 1 = ENABLE
3	0x0	ADMAIF_TX4: 0 = DISABLE 1 = ENABLE
2	0x0	ADMAIF_TX3: 0 = DISABLE 1 = ENABLE
1	0x0	ADMAIF_TX2: 0 = DISABLE 1 = ENABLE
0	0x0	ADMAIF_TX1: 0 = DISABLE 1 = ENABLE

23.3.1.7 AXBAR_PART_0_OPE*i*_RX1_0

There are 2 AXBAR_PART_0_OPE_RX registers, with two OPE channels per RX port (*i* = 1 through 2).

Offset: 0x100 + ([*i* * 0x4] – 0x4) | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx00000xxxxxx0000000000)

Bit	Reset	Description
27	0x0	SFC4_TX1: 0 = DISABLE 1 = ENABLE
26	0x0	SFC3_TX1: 0 = DISABLE 1 = ENABLE
25	0x0	SFC2_TX1: 0 = DISABLE 1 = ENABLE
24	0x0	SFC1_TX1: 0 = DISABLE 1 = ENABLE
20	0x0	I2S5_TX1: 0 = DISABLE 1 = ENABLE
19	0x0	I2S4_TX1: 0 = DISABLE 1 = ENABLE
18	0x0	I2S3_TX1: 0 = DISABLE 1 = ENABLE
17	0x0	I2S2_TX1: 0 = DISABLE 1 = ENABLE
16	0x0	I2S1_TX1: 0 = DISABLE 1 = ENABLE
9	0x0	ADMAIF_TX10: 0 = DISABLE 1 = ENABLE
8	0x0	ADMAIF_TX9: 0 = DISABLE 1 = ENABLE
7	0x0	ADMAIF_TX8: 0 = DISABLE 1 = ENABLE
6	0x0	ADMAIF_TX7: 0 = DISABLE 1 = ENABLE
5	0x0	ADMAIF_TX6: 0 = DISABLE 1 = ENABLE
4	0x0	ADMAIF_TX5: 0 = DISABLE 1 = ENABLE
3	0x0	ADMAIF_TX4: 0 = DISABLE 1 = ENABLE
2	0x0	ADMAIF_TX3: 0 = DISABLE 1 = ENABLE
1	0x0	ADMAIF_TX2: 0 = DISABLE 1 = ENABLE
0	0x0	ADMAIF_TX1: 0 = DISABLE 1 = ENABLE

23.3.1.8 AXBAR_PART_0_MVC*i*_RX1_0

There are 2 AXBAR_PART_0_MVC_RX registers, with two MVC channels per RX port (*i* = 1 through 2).

Offset: 0x120 + ([*i* * 0x4] – 0x4) | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx00000xxxxxx0000000000)

Bit	Reset	Description
27	0x0	SFC4_TX1: 0 = DISABLE 1 = ENABLE
26	0x0	SFC3_TX1: 0 = DISABLE 1 = ENABLE
25	0x0	SFC2_TX1: 0 = DISABLE 1 = ENABLE
24	0x0	SFC1_TX1: 0 = DISABLE 1 = ENABLE
20	0x0	I2S5_TX1: 0 = DISABLE 1 = ENABLE
19	0x0	I2S4_TX1: 0 = DISABLE 1 = ENABLE
18	0x0	I2S3_TX1: 0 = DISABLE 1 = ENABLE
17	0x0	I2S2_TX1: 0 = DISABLE 1 = ENABLE
16	0x0	I2S1_TX1: 0 = DISABLE 1 = ENABLE
9	0x0	ADMAIF_TX10: 0 = DISABLE 1 = ENABLE
8	0x0	ADMAIF_TX9: 0 = DISABLE 1 = ENABLE
7	0x0	ADMAIF_TX8: 0 = DISABLE 1 = ENABLE
6	0x0	ADMAIF_TX7: 0 = DISABLE 1 = ENABLE
5	0x0	ADMAIF_TX6: 0 = DISABLE 1 = ENABLE
4	0x0	ADMAIF_TX5: 0 = DISABLE 1 = ENABLE
3	0x0	ADMAIF_TX4: 0 = DISABLE 1 = ENABLE
2	0x0	ADMAIF_TX3: 0 = DISABLE 1 = ENABLE
1	0x0	ADMAIF_TX2: 0 = DISABLE 1 = ENABLE
0	0x0	ADMAIF_TX1: 0 = DISABLE 1 = ENABLE

23.3.1.9 AXBAR_PART_0_AMX1_RX*n*_0

There are 4 AXBAR_PART_0_AMX1_RX registers, one per RX port (*n* = 1 through 4).

Offset: 0x140 + ([*n* * 0x4] – 0x4) | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx00000xxxxxx0000000000)

Bit	Reset	Description
27	0x0	SFC4_TX1: 0 = DISABLE 1 = ENABLE
26	0x0	SFC3_TX1: 0 = DISABLE 1 = ENABLE
25	0x0	SFC2_TX1: 0 = DISABLE 1 = ENABLE
24	0x0	SFC1_TX1: 0 = DISABLE 1 = ENABLE
20	0x0	I2S5_TX1: 0 = DISABLE 1 = ENABLE
19	0x0	I2S4_TX1: 0 = DISABLE 1 = ENABLE
18	0x0	I2S3_TX1: 0 = DISABLE 1 = ENABLE
17	0x0	I2S2_TX1: 0 = DISABLE 1 = ENABLE
16	0x0	I2S1_TX1: 0 = DISABLE 1 = ENABLE

23.3.3 I2S Registers

The I^2S Controller is designed to transport streaming audio-data between the system memory and an audio codec. The controller supports I^2S format, Left Justified Mode format, Right Justified Mode format, and DSP mode format, as defined in the Philips inter-IC-sound (I^2S) bus specification.

The controller has one transmit and one receive interface. The controller can be configured to operate either as a master or a slave.

23.3.3.28 I2S_CTRL_0

The I2S control register is used to configure bit formats (I2S, LJM, RJM, DSP, PCM, NW, TDM), bit sizes (8, 16, 20, 24 and 32), FIFO formats, Master/slave selection, LR polarity, and error interrupt enables.

I2S Control Register

Offset: 0xa0 | Read/Write: R/W | Reset: 0x00000000 (0b00000000xxx00xxxx000x000xxxxx000)

Bit	Reset	Description
31:24	0x0	FSYNC_WIDTH: In number of bit clocks.
20	0x0	EDGE_CTRL: Indicates on which edge to drive data, and on which edge to sample data 0 = Drive data on negative edge and sample data on positive edge 1 = Drive data on positive edge and sample data on negative edge 0 = POS_EDGE 1 = NEG_EDGE
19	0x0	PIPE_MACRO_EN: Enable pipe macro stage (1 stage in Tx direction and 1 in Rx direction). 0 = DISABLE 1 = ENABLE
14:12	0x0	FRAME_FORMAT: Frame format. 0: BASIC, LJM, RJM modes 1: DSP, PCM, NW, TDM modes 0 = LRCK_MODE 1 = FSYNC_MODE
10	0x0	MASTER: Controller Master/Slave mode selection. 0: Do not drive LRCK and clock. 1: Drive LRCK and clock 0 = DISABLE 1 = ENABLE
9	0x0	LRCK_POLARITY: Left/Right Control Polarity. 0= Left channel when LRCK is low 1= Left channel when LRCK is high 0 = LOW 1 = HIGH
8	0x0	LPBK: Tx->Rx Loop Back Enable 0 = DISABLE 1 = ENABLE
2:0	0x0	BIT_SIZE: Bits per sample. 0 = BIT_SIZE_RSVD 1 = BIT_SIZE_8 2 = BIT_SIZE_12 3 = BIT_SIZE_16 4 = BIT_SIZE_20 5 = BIT_SIZE_24 6 = BIT_SIZE_28 7 = BIT_SIZE_32

23.3.3.29 I2S_TIMING_0

The NON_SYM.EN bit can be used to program the I2S Controller to output a non-50:50 mark-space ratio on to the I2S bus. When the NON_SYM.EN bit is enabled, the Controller sends out exactly the programmed number of clock cycles on the left channel and one bit clock greater on the right channel. This is used in Basic, LJM, and RJM modes.

When NON_SYM.EN is enabled, the channel-bit-count should be programmed with the number of bit clocks required in the left channel. This will ensure that the non-50:50 mark-space ratio is achieved with R_BCLK = L_BCLK + 1.

For PCM/NW/TDM modes, channel_bit_cnt can be calculated using the following equation:

```
Channel_bit_cnt = (frequency of bit_clk) / (2 * required sampling rate) - 1;
```

If this calculation returns a fractional value, the non-symmetry feature of the controller should be used to attain the required sampling rate.

I2S Timing Register

Offset: 0xa4 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxx0x00000011111)

Bit	Reset	Description
12	0x0	NON_SYM_EN: Enables non-symmetry mode. 0 = DISABLE 1 = ENABLE
10:0	0x1f	CHANNEL_BIT_CNT: I2S, LJM, RJM mode: Number of bit clocks in left or right channel. DSP mode: Number of bit clocks in LEFT+RIGHT channel TDM/NW/PCM mode: Number of bit clocks in the frame

23.3.3.30 I2S_SLOT_CTRL_0

Offset: 0xa8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	TOTAL_SLOTS: Number of slots when TDM mode is used.

23.3.3.31 I2S_CLK_TRIM_0

Offset: 0xac | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx00000xxx00000)

Bit	Reset	Description
12:8	0x0	SCLK_TRIM_SEL: Clock trimmer for master mode i2s clock output to pad
4:0	0x0	CORE_TRIM_SEL: Clock trimmer for core i2s clock segment

23.3.4 SPDIF Registers

The S/PDIF consists of the following two major modules:

- The SPDIFOUT sub-module, which sends data to the "spdifout" port in IEC 60958-3 biphase-mark code format.
- The SPDIFIN sub-module, which retrieves data to the "spdifin" port in IEC 60958-3 biphase-mark code format.

23.3.4.1 SPDIF_CTRL_0

SPDIF Control Register

Note: *Changing the state of TC_EN, TU_EN, LBK_EN, PACK, BIT_MODE while RX_EN and/or TX_EN and/or RX_BSY and/or TX_BSY is set can cause unexpected behavior and therefore shall not be attempted.*

23.3.4.19 SPDIF_FLOWCTL_CTRL_0

This register controls the flow control mechanism and is valid only with the TX mode. The flow control is only useful when the input stream to I2S/SPDIF is already real-time spaced such as a live stream from Baseband through another I2S_RX. If the input stream is from DMA directly, the flow control should be disabled.

Offset: 0x70 | Read/Write: R/W | Reset: 0x80000000 (0b10xxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
31	QUAD	FILTER: to use linear or quadratic filter. Tegra K1 devices support quadratic filter only. 0 = LINEAR 1 = QUAD
30	DISABLE	DUMMY_WR_EN: Insert a dummy frame when enabled 0 = DISABLE 1 = ENABLE
11:8	0x0	START_THRESHOLD: Flow control should wait for FIFO filled N-1, 0 means actual threshold 1
7:4	0x0	HIGH_THRESHOLD: High-threshold for HIGH state N-1, 0 means actual threshold 1
3:0	0x0	LOW_THRESHOLD: Low-threshold for LOW state N-1, 0 means actual threshold 1

23.3.4.20 SPDIF_TX_STEP_0

Offset: 0x74 | Read/Write: R/W | Reset: 0x00008000 (0bxxxxxxxxxxxxxxxx1000000000000000)

Bit	Reset	Description
15:0	0x8000	STEP_SIZE: This is a compensation value for the clock difference between input and output. To catch up the clock difference quickly, this value is supposed to be bigger than clock difference in terms of STEP_SIZE, but to avoid the sound quality degradation it should not be much greater than the clock difference. For example, the input frame sampling rate is 44.095 kHz, the output frame sampling rate is 44.100 kHz, and the clock error rate is (44100 - 44095) / 44100 = 0.00011.3 The step size used in the linear interpolation is 0x8000 (32768) step_size = 0.000113 * 32768 = 3.7. A threshold of 4 is recommended. If the value is less than 3 in the above example, the adjusted step size will not be able to catch up. The flow control FIFO will eventually become empty, leading to either NULL or replication of the last sample.

23.3.4.21 SPDIF_FLOW_STATUS_0

When the flow controller is used, the step size should be properly chosen depending on the clock frequency difference. The step size should be small enough not to degrade sound quality, but big enough to converge the FIFO depth. If the step size is not big enough, the FIFO depth will either increase or decrease, which will cause FIFO overflow/underflow eventually.

The flow controller monitor and counter can be used to fine-tune the step size. When the flow controller is enabled and a proper step size is chosen, the FIFO depth should be in [threshold -1 : threshold + 1].

When the flow controller monitor is enabled and the FIFO depth is deviated from the range, either FLOW_OVERFLOW or FLOW_UNDERFLOW will be set. Also, the interrupt signal will be asserted, if MONITOR_INT_EN is enabled. MONITOR_CLR clears the FLOW_OVERFLOW/UNDERFLOW as well as the interrupt signal to APBIF.

When the flow controller counter is enabled, it records how many samples are processed and how many times the step size is applied to either lower or raise the time step. In case of stereo samples, it counts as 1.

- FLOW_NORMAL - the total number of samples (only count left channel samples).
- FLOW_OVER - the number of samples with adding STEP_SIZE to the time step.
- FLOW_UNDER - the number of samples with subtracting STEP_SIZE from the time step.

Flow Controller Monitor/Counter

23.3.7.6 ABRIDGE_APE_MCCIF_FIFOCTRL_0

Memory Client Interface FIFO Control (where applicable) and Clock Gating Control Register

> ***Note:*** *The FIFO timing aspects of this register are no longer supported, but are retained for software compatibility*

The clock override/ovr_mode fields of this register control the second-level clock gating for the client and MC side of the MCCIF. All clock gating is enabled by default.

A '1' written to the rclk/wclk override field will result in one of the following:

- With wclk/rclk override mode = LEGACY, the clock reverts to legacy mode of operation, where the clock is on whenever the client clock is enabled.
- With wclk/rclk override mode = ON, the clock is always on inside MCCIF and PC.

A '1' written to the cclk override field keeps the client's clock always on inside the MCCIF.

Offset: 0x70 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000xxxxxxxxxxxx0000)

23.3.13.17 AFC_DEST_I2S_PARAMS_0

DEST_I2S_PARAMS Register

This register contains parameters concerning the destination I2S (AFC is plugged in somewhere in a path between a source I2S/DMIC and a destination I2S).

Offset: 0xa4 | Read/Write: R/W | Reset: 0x01190e0c (0bxxxxx001x0011001x0001110x0001100)

Bit	Reset	Description
26:24	I2S1	I2S_ID: The ID of the destination I2S (number from 1 to N, N being the last I2S ID for a given chip) 1 = I2S1 2 = I2S2 3 = I2S3 4 = I2S4 5 = I2S5
22:16	0x19	FIFO_HIGH_THRESHOLD: The RxCIF FIFO threshold of the destination I2S. If the number of samples in the FIFO goes above this threshold, the AFC starts decimation.
14:8	0xe	FIFO_START_THRESHOLD: The RxCIF FIFO threshold of the destination I2S. If this threshold is breached, the AFC will start its operations. Until then AFC will be a simple bypass.
6:0	0xc	FIFO_LOW_THRESHOLD: The RxCIF FIFO threshold of the destination I2S. If the number of samples in the FIFO goes below this threshold, the AFC starts interpolation.

23.3.13.18 AFC_TXCIF_FIFO_PARAMS_0

TXCIF_FIFO_PARAMS Register

This register contains parameters concerning AFC TxCIF FIFO.

Offset: 0xa8 | Read/Write: R/W | Reset: 0x00190e0c (0bxxxxxxxxxx0011001x0001110x0001100)

Bit	Reset	Description
22:16	0x19	FIFO_HIGH_THRESHOLD: The FIFO threshold of the destination I2S. If the number of samples in the FIFO goes above this threshold, the AFC starts decimation.
14:8	0xe	FIFO_START_THRESHOLD: The FIFO threshold of the destination I2S. If the threshold is breached, the AFC will start its operations. Until then AFC will be a simple bypass.
6:0	0xc	FIFO_LOW_THRESHOLD: The FIFO threshold of the destination I2S. If the number of samples in the FIFO goes below this threshold, the AFC starts interpolation.

23.3.13.19 AFC_CLK_PPM_DIFF_0

CLK_PPM_DIFF

This register is used to specify the maximum PPM difference between the source I2S/DMIC and the destination I2S clocks. For example, if the crystals/PLLs used to generate clocks for the source and the destination both have a specified maximum PPM of +/- 10ppm, then it is advisable to set this register to a value greater than 20.

Offset: 0xac | Read/Write: R/W | Reset: 0x0000001e (0bxxxxxxxxxxxxxxxx0000000000011110)

Bit	Reset	Description
15:0	0x1e	VALUE: Most codecs are expected to have +/- 10 ppm. So the maximum difference is 20 ppm. A value of 30 is chosen (greater than 20).

23.3.14 MVC Registers

1	X	TX_DONE: When the MVC is disabled, and all pipe data (RXCIF, MVC CORE and TXCIF) is flushed, TX_DONE is issued. 0 = CLEAR 1 = SET
0	X	RX_DONE: When the MVC is disabled, RXCIF stops receiving data from AXBAR. RX_DONE will be issued after all the data in the TXCIF FIFO is popped out. 0 = CLEAR 1 = SET

23.3.14.18 MVC_CTRL_0

Offset: 0xa8 | Read/Write: R/W | Reset: 0x40000001 (0b01xxxxxxxxxxxxxx00000000xxxxxx01)

Bit	Reset	Description
15:8	0x0	MUTE_UNMUTE: Mute/UnMute control bit. 8 bits for 8 channels. bit[8]->ch0, bit[9]->ch1... bit[15]->ch7. If PER_CHAN_CTRL_EN is DISABLE, all the channels use the same MUTE_UNMUTE control: ch0->MUTE_UNMUTE[0] If software programs this register, must be followed by VOLUME_SWITCH trigger to let hardware know new volume parameters are ready. Hardware will take the new target volume (mute value or previous unmute target volume) after finishing current frame. If software programs new target volume when system is under MUTE, this bit will be set to UNMUTE by hardware. Usually, this case is not allowed: Software programming both MUTE and new target volume at the same time. But if it is set by accident, the system will go to MUTE. 0 = UNMUTE 255 = MUTE

Bit	Reset	Description
1	0x0	CURVE_TYPE: Curve type. 0 = POLYNOMIAL Curve 1 = LINEAR RAMP curve Curve type switching cannot be done on the fly Software reset or disable/enable is needed to switch between two curves. 0 = POLYNOMIAL 1 = LINEAR_RAMP
0	UNBIASED	ROUNDING_TYPE: Rounding option. 1 = unbiased rounding (RNE) 0 = biased rounding 0 = BIASED 1 = UNBIASED

23.3.14.19 MVC_SWITCH_0

This register contains three switch bits (Volume, Coefficient, and Duration) for when software wants to do switching for all three parameters at the same time. Software just programs the three bits in this register, Hardware takes the new set of volume, duration, and coefficient simultaneously when processing new frame samples. There is interdependency between this and the coefficient switch, which means software cannot issue this switch until both coefficient switch and duration switch are cleared.

Offset: 0xac | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2	CLEAR	VOLUME_SWITCH: Software should write to this field to prompt the hardware to start using a new volume set for the volume related parameters (TARGET_VOL AND MUTE_UNMUTE), 1 bit for 8 channels. Hardware will detect which channel has a new target and do volume ramping. After software programs a new TARGET_VOL or changes MUTE_UNMUTE status, software needs to program this field to let hardware know a new volume is ready for using. Hardware does this switch as soon as it is done processing the current frame. This bit will remain 1 (SET) until the switch has happened, and is cleared to 0 by hardware as an ack that the configuration has been switched to the new one. During Write - The field does not matter, only a Write Access to this field to generate a trigger pulse. During Read - The field indicates whether polynomial coefficients switch clearing has happened or not 0 = CLEAR 1 = SET
1	CLEAR	COEFF_SWITCH: Software should write to this field - to prompt the hardware to start using a new configuration set for the polynomial coefficients. After software programs new polynomial coefficients, software needs to program this field to let hardware know new volume is ready for using. Hardware does this switch as soon as it is done processing the current frame. This bit will remain 1(SET) until the switch has happened, and is cleared to 0 by hardware as an ack that the configuration has been switched to the new one. During Write - The field does not matter, only a Write Access to this field to generate a trigger pulse. During Read - The field indicates whether polynomial coefficients switch clearing has happened or not there is interdependent between this and duration switch, which means software cannot issue this switch until both coefficient switch and duration switch are cleared 0 = CLEAR 1 = SET
0	CLEAR	DURATION_SWITCH: Software should write to this field to prompt the hardware to start using a new configuration set for the duration related parameters (DURATION, DURATION_INV, POLY_N1 AND POLY_N2). After software programs new duration parameters, software needs to program this field to let hardware know a new volume is ready for using. Hardware does this switch as soon as it is done processing the current frame. This bit will remain 1 (SET) until the switch has happened, and is cleared to 0 by hardware as an ack that the configuration has been switched to the new one. During Write - The field does not matter, only a Write Access to this field to generate a trigger pulse. During Read - The field indicates whether duration parameters switch clearing has happened or not. 0 = CLEAR 1 = SET

23.3.14.20 MVC_INIT_VOL_0

This is an array of 8 identical register entries; the register fields below apply to each entry.

Offset: 0xb0..0xcf | Read/Write: R/W | Reset: 0x00800000 (0b00000000100000000000000000000000)

Bit	Reset	Description
31:0	0x800000	INIT_VOL: 8 initial volumes for 8 channels. If PER_CHAN_CTRL_EN is DISABLE, all the channels use the same initial volume: ch0->INIT_VOL_0. This register is shared for Volume Initialization for two curve types: Polynomial: default curve type, all 32 bits of the registers are used. The volume is provided in linear and should be in signed Q8.24 format. Default: 0x80_0000 (0.5, Q8.24). Range: 0x0 ~ 0x6400_0000 (0 ~ 100 @Q8.24). Positive value only, cannot be set with negative number. Linear Ramp: For this curve type, only bottom 16 bits are used. The volume is provided in dB and should be in signed Q8.8 format. Default: 0xffff_fa00 (-6dB @Q8.8). Range: 0xffff_8800 ~ 0x2800 (-120dB ~ 40dB @Q8.8)

23.3.14.21 MVC_TARGET_VOL_0

This is an array of 8 identical register entries; the register fields below apply to each entry.

Offset: 0xd0..0xef | Read/Write: R/W | Reset: 0x00800000 (0b00000000100000000000000000000000)

Bit	Reset	Description
31:0	0x800000	TARGET_VOL: 8 target volumes for 8 channels. If PER_CHAN_CTRL_EN is DISABLE, all the channels use the same target volume: ch0->TARGET_VOL_0. This register is shared for Target Volume for two curve types: Polynomial: For this curve type, all 32 bits of the registers are used. The volume is provided in linear and should be in signed 8.24 format. Default: 0x80_0000 (0.5, Q8.24). Range: 0x0 ~ 0x6400_0000 (0 ~ 100 @Q8.24). Positive value only, cannot be set with negative number. Linear Ramp: For this curve type, only bottom 16 bits are used. The volume is provided in dB and should be in signed 8.8 format. Default: 0xffff_fa00 (-6dB @Q8.8). Range: 0xffff_8800 ~ 0x2800 (-120dB ~ 40dB @Q8.8) If software programs this register, must be followed by VOLUME_SWITCH trigger to let hardware know new volume parameters are ready. Hardware will take the new target volume after finishing current frame. Usually this case is not allowed: Software programming both MUTE and new target volume at the same time. But if it is by accident, the system will go to MUTE, ignore the target volume set it with RWTO, which hardware can update this register to a MUTE value when software is programming the mute flag

23.3.14.22 MVC_DURATION_0

Offset: 0xf0 | Read/Write: R/W | Reset: 0x000012c0 (0bxxxxxxxx00000000000001001011000000)

Bit	Reset	Description
23:0	0x12c0	DURATION: Number of samples to reach the target volume default:0x12C0 (100ms @ 48KHz). If software programs this register, it must be followed by a DURATION_SWITCH trigger to let hardware know new duration parameters are ready. Hardware will take the new duration parameter after finishing the current frame.

23.3.14.23 MVC_DURATION_INV_0

Offset: 0xf4 | Read/Write: R/W | Reset: 0x0006d3a0 (0b00000000000001101101001110100000)

Bit	Reset	Description
31:0	0x6d3a0	DURATION_INV: inverse ramp duration in samples. If software programs this register, it must be followed by a DURATION_SWITCH trigger to let hardware know new duration parameters are ready. Hardware will take the new inv_duration parameter after finishing the current frame.

23.3.14.24 MVC_POLY_N1_0

Offset: 0xf8 | Read/Write: R/W | Reset: 0x0000007d (0bxxxxxxxx00000000000000000001111101)

Bit	Reset	Description
23:0	0x7d	POLY_N1: The first splitting points for the three segments POLY_N1, POLY_N2, and DURATION programming should meet POLY_N1 <= POLY_N2 <=DURATION. For two segments case: POLY_N2 == DURATION. Programming coefficients for the first two segments: p1_0/1/2 and p2_0/1/2. For one segment case: POLY_N1 == POLY_N2 == DURATION. Programming coefficients for the first segment: p1_0/1/2. If software programs this register, it must be followed by DURATION_SWITCH trigger to let hardware know new duration parameters are ready. Hardware will take the new poly_n1 parameter after finishing current frame. Note: POLY_N1 cannot be changed without DURATION changing.

23.3.14.25 MVC_POLY_N2_0

Offset: 0xfc | Read/Write: R/W | Reset: 0x00000271 (0bxxxxxxxx00000000000000001001110001)

Bit	Reset	Description
23:0	0x271	POLY_N2: The second splitting points for the three segments POLY_N1, POLY_N2, and DURATION programming should meet POLY_N1 <= POLY_N2 <=DURATION. For two segments case: POLY_N2 == DURATION. Programming coefficients for the first two segments: p1_0/1/2 and p2_0/1/2 For one segment case: POLY_N1 == POLY_N2 == DURATION. Programming coefficients for the first segment: p1_0/1/2 If software programs this register, it must be followed by DURATION_SWITCH trigger to let hardware know new duration parameters are ready. Hardware will take the new poly_n2 parameter after finishing current frame. Note: POLY_N2 cannot be changed without DURATION changing.

23.3.14.26 MVC_PEAK_CTRL_0

Offset: 0x100 | Read/Write: R/W | Reset: 0x000012c0 (0b0xxxxxxx00000000000001001011000000)

Bit	Reset	Description
31	0x0	PEAK_TYPE: Peak metering type: 0 for window based (default), 1 for reset-on-read 0 = WINPEAK 1 = RORPEAK
23:0	0x12c0	PEAK_WIN: It is for Peak Metering window size, as the number of samples. Only available when peak metering type is window based peak metering. Default:0x12C0 (100ms @ 48KHz)

23.3.14.27 MVC_AHUBRAMCTL_CONFIG_RAM_CTRL_0

MVC Configuration RAM

1. The content in the RAM is shown below
2. Only one Configuration RAM

   0x00: poly_coeff_p1_0 // 0x01: poly_coeff_p1_1 |

   0x02: poly_coeff_p1_2 |

   0x03: poly_coeff_p2_0 \ PING

   0x04: poly_coeff_p2_1 /

   0x05: poly_coeff_p2_2 |

   0x06: poly_coeff_p3_0 |

   0x07: poly_coeff_p3_1 |

   0x08: poly_coeff_p3_2 /

0x09: poly_coeff_p1_0 // 0x0a: poly_coeff_p1_1 |

0x0b: poly_coeff_p1_2 |

0x0c: poly_coeff_p2_0 \ PONG

0x0d: poly_coeff_p2_1 /

0x0e: poly_coeff_p2_2 |

0x0f: poly_coeff_p3_0 |

0x10: poly_coeff_p3_1 |

0x11: poly_coeff_p3_2 /

3. PING/PONG scheme, 0x0~0x8 is PING, and 0x9~0x11 is PONG.

   PING-PONG scheme is taken care by hardware, which means software does not need to care which part (Ping or Pong) in the buffer to be programmed.

   Just set the base address to "0", and hardware will handle the PING-PONG scheme.

4. Before software programming, software needs to check COEFF_SWITCH status.

   If it is cleared, then software can start program new polynomial coefficients.

   After software finishes programming, it needs to write COEFF_SWITCH for hardware switching.

   Hardware will know the new configuration parameters are ready in the memory.

5. Poly coefficients usage:

   Ramp up:

   c[n] = p1_0*(n/N)^2 + p1_1*(n/N)^2 + p1_2 (n is in [0,POLY_N1))

   c[n] = p2_0*(n/N)^2 + p2_1*(n/N)^2 + p2_2 (n is in [POLY_N1,POLY_N2))

   c[n] = p3_0*(n/N)^2 + p3_1*(n/N)^2 + p3_2 (n is in [POLY_N2,DURATION))

   Ramp up:

   c[n] = p1_0*((N-n)/N)^2 + p1_1*((N-n)/N)^2 + p1_2 (n is in [0,POLY_N1))

   c[n] = p2_0*((N-n)/N)^2 + p2_1*((N-n)/N)^2 + p2_2 (n is in [POLY_N1,POLY_N2))

   c[n] = p3_0*((N-n)/N)^2 + p3_1*((N-n)/N)^2 + p3_2 (n is in [POLY_N2,DURATION))

6. For two segments case: only programming p1_0/1/2 and p2_0/1/2; POLY_N2==DURATION

7. For one segment case: only programming p1_0/1/2; POLY_N1==POLY_N2==DURATION

This is an array of 1 identical register entries; the register fields below apply to each entry.

Offset: 0x104..0x107 | Read/Write: R/W | Reset: 0xX0004000 (0bxxxxxxxx00000000x100xxx000000000)

Bit	Reset	Description
2	X	VOLUME_CONFIG_ERROR: Two sources: 1. Software programming target volume during Switching is set 2. Wrong programming: a. INIT_VOL > max volume, or INIT_VOL < min volume (refer to range of INIT_VOL) b. TARGET_VOL > max volume, or TARGET_VOL < min volume (refer to range of TARGET_VOL) 0 = FALSE 1 = TRUE
1	X	COEFF_CONFIG_ERROR: Software programming coefficient buffer during Switching is set 0 = FALSE 1 = TRUE
0	X	DURATION_CONFIG_ERROR: There are two sources for this error: 1. Software programming duration parameters (DURATION, DURATION_INV, POLY_N1 and POLY_N2) during Switching is SET 2. Wrong programming: a. POLY_N1 > POLY_N2 or POLY_N1 > DURATION or POLY_N2 > DURATION b. BOTH DURATION and DURATION_INV should be changed simultaneously. Only one of them changed will result in error config 0 = FALSE 1 = TRUE

23.3.15 DMA Registers

23.3.15.1 ADMA_CH<*n*>_CMD_0

There are 22 ADMA Command registers, one per channel (n = 1 through 22).

Offset: 0x0 + (n – 1) * 0x80 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	TRANSFER_ENABLE: Enables DMA transfer. This bit can be cleared by either software or hardware. Hardware clears this bit when the response/acknowledgment from the target device is received for the last write request of the transfer in once and linked list modes. Clearing this bit by software causes disabling the channel and all transfers initiated prior to it completed normally. Software should set this bit after configuring all other registers of this channel. 0 = FALSE 1 = TRUE

23.3.15.2 ADMA_CH<*n*>_SOFT_RESET_0

There are 22 ADMA Soft Reset registers, one per channel (n = 1 through 22).

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	ENABLE: Self clearing software initiated reset. 0 = FALSE 1 = TRUE

23.3.15.3 ADMA_CH<*n*>_STATUS_0

There are 22 ADMA Status registers, one per channel (n = 1 through 22).

Offset: 0xc | Read/Write: RO | Reset: 0x00XX000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
22:20	X	CURRENT_SOURCE_MEMORY_BUFFER: Indicates source memory buffer that is currently being read by ADMA. 0 = BUFFER_1 1 = BUFFER_2 2 = BUFFER_3 3 = BUFFER_4 4 = BUFFER_5 5 = BUFFER_6 6 = BUFFER_7 7 = BUFFER_8
18:16	X	CURRENT_TARGET_MEMORY_BUFFER: Indicates target memory buffer that is currently being written into by ADMA. 0 = BUFFER_1 1 = BUFFER_2 2 = BUFFER_3 3 = BUFFER_4 4 = BUFFER_5 5 = BUFFER_6 6 = BUFFER_7 7 = BUFFER_8
2	X	OUTSTANDING_TRANSFERS: Indicates if there is any DMA request pending to be completed. 0 = FALSE 1 = TRUE
1	X	TRANSFER_PAUSED: Asserts when "TRANSFER_PAUSE" bit is set by software and all previously issued DMA requests are completed. Software should attempt to access free running status bits like transfer count when this status bit goes high. 0 = FALSE 1 = TRUE
0	X	TRANSFER_ENABLED: This bit is set by hardware when software enabled the channel by setting TRANSFER_ENABLE control bit and is cleared when transfer is completed or when TRANSFER_ENABLE bit is cleared by software and all the previously issued requests are completed. 0 = FALSE 1 = TRUE

23.3.15.4 ADMA_CH<*n*>_INT_STATUS_0

There are 22 ADMA Interrupt Status registers, one per channel (n = 1 through 22).

Offset: 0x10 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	TRANSFER_DONE: Pre mask status of hardware or software initiated interrupt. Hardware generates an interrupt when it receives response/commit for last write request issued to the target. 0 = FALSE 1 = TRUE

23.3.15.5 ADMA_CH<*n*>_INT_SET_0

There are 22 ADMA Interrupt Set registers, one per channel (n = 1 through 22).

Offset: 0x18 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	TRANSFER_DONE: Software may choose to set this interrupt for debug/development purposes. 0 = FALSE 1 = TRUE

23.3.15.6 ADMA_CH<*n*>_INT_CLEAR_0

There are 22 ADMA Interrupt Clear registers, one per channel (n = 1 through 22).

Offset: 0x1c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	TRANSFER_DONE: Software should set this bit to clear this interrupt when it is serviced. 0 = FALSE 1 = TRUE

23.3.15.7 ADMA_CH<*n*>_CTRL_0

There are 22 ADMA Control registers, one per channel (n = 1 through 22).

Offset: 0x24 + (n – 1) * 0x80 | Read/Write: R/W | Reset: 0x11004102 (0b00010001xxx000000100x001xxxxx010)

Bit	Reset	Description
31:28	0x1	TX_REQUEST_SELECT: One of the AHUB transmit channels mapped as a target for DMA transfer by enabling "FLOWCTRL_ENABLE" bit. 1 = AHUB_CH1_REQUEST 2 = AHUB_CH2_REQUEST 3 = AHUB_CH3_REQUEST 4 = AHUB_CH4_REQUEST 5 = AHUB_CH5_REQUEST 6 = AHUB_CH6_REQUEST 7 = AHUB_CH7_REQUEST 8 = AHUB_CH8_REQUEST 9 = AHUB_CH9_REQUEST 10 = AHUB_CH10_REQUEST
27:24	0x1	RX_REQUEST_SELECT: One of the AHUB receive channels mapped as a source for DMA transfer by enabling the "FLOWCTRL_ENABLE" bit. 1 = AHUB_CH1_REQUEST 2 = AHUB_CH2_REQUEST 3 = AHUB_CH3_REQUEST 4 = AHUB_CH4_REQUEST 5 = AHUB_CH5_REQUEST 6 = AHUB_CH6_REQUEST 7 = AHUB_CH7_REQUEST 8 = AHUB_CH8_REQUEST 9 = AHUB_CH9_REQUEST 10 = AHUB_CH10_REQUEST

Bit	Reset	Description
20:16	0x0	TRIGGER_SELECT: One of the "TRANSFER_DONE" interrupts of other active channels to trigger the DMA transfer from this channel. This would be valid when the "TRIGGER_ENABLE" bit is set. 1 = CH1_TRANSFER_DONE 2 = CH2_TRANSFER_DONE 3 = CH3_TRANSFER_DONE 4 = CH4_TRANSFER_DONE 5 = CH5_TRANSFER_DONE 6 = CH6_TRANSFER_DONE 7 = CH7_TRANSFER_DONE 8 = CH8_TRANSFER_DONE 9 = CH9_TRANSFER_DONE 10 = CH10_TRANSFER_DONE 11 = CH11_TRANSFER_DONE 12 = CH12_TRANSFER_DONE 13 = CH13_TRANSFER_DONE 14 = CH14_TRANSFER_DONE 15 = CH15_TRANSFER_DONE 16 = CH16_TRANSFER_DONE 17 = CH17_TRANSFER_DONE 18 = CH18_TRANSFER_DONE 19 = CH19_TRANSFER_DONE 20 = CH20_TRANSFER_DONE 21 = CH21_TRANSFER_DONE 22 = CH22_TRANSFER_DONE
15:12	0x4	TRANSFER_DIRECTION: Indicates the source and destination of the DMA transfer. Possible transfer directions are Memory-to-Memory, AHUB-to-AHUB. Memory <--> AHUB. Memory element could be ARAM or DRAM or any other element hooked up to ACONNECT. It should be configured Memory-to-Memory direction if both source and target are connected ADMA through ACONNECT. 1 = MEMORY_TO_MEMORY 2 = AHUB_TO_MEMORY 4 = MEMORY_TO_AHUB 8 = AHUB_TO_AHUB
10:8	0x1	TRANSFER_MODE: ADMA can be configured to operate in 3 modes 1) ONCE: Enables single transfer that spans single or multiple buffers. Hardware generates an interrupt and clears the "TRANSFER_ENABLE" bit on completion of transfer 2) CONTINUOUS Enables repetitive transfers that spans single or multiple buffers. Hardware reloads SOURCE Address and TARGET Address after completing the number of block transfers indicated by the register field "SOURCE_MEMORY_BUFFERS or TARGET_MEMORY_BUFFERS" and reloads Transfer Count at the end of each block transfer for next transfer. This will be continued till software clears "TRANSFER_ENABLE" bit. 3) Linked List: Enables to operate in Linked list mode using chain of descriptors stored in external/ internal memory for loading SOURCE address, TARGET address, Transfer count and next descriptor address at the end of current block transfer till the descriptors are exhausted or software disables transfers by clearing the "TRANSFER_ENABLE" bit. Hardware fetches the descriptor at the beginning of the current transfer if the next descriptor field is set to a non-zero value or at end of the current transfer if it is found to be "0" in the beginning. 1 = ONCE 2 = CONTINUOUS 4 = LINKED_LIST
2	0x0	TRIGGER_ENABLE: Enables wait on one of the DMA channels interrupts listed in "TRIGGER_SELECT" field to occur for starting the data transfer. 0 = FALSE 1 = TRUE
1	0x1	FLOWCTRL_ENABLE: Enables flow controlled transfers to and/or from the FIFO(s) of AHUB channels specified in "TX_REQUEST_SELECT and RX_REQUEST_SELECT". It is the responsibility of ADMA to ensure enough buffer space is available for transmitting the samples or enough samples are available to read from the channel FIFOs in ADMAIF (AHUB). Source and/or target for DMA transfer should be from AHUB when this bit is set. 0 = FALSE 1 = TRUE
0	0x0	TRANSFER_PAUSE: Stops issuing the new requests and waits for all previously issued DMA requests are completed normally for moving into paused state. Clearing this bit causes resuming the DMA transfer 0 = FALSE 1 = TRUE

23.3.15.8 ADMA_CH<*n*>_CONFIG_0

There are 22 ADMA Configuration registers, one per channel (n = 1 through 22).

Offset: 0x28 + (n – 1) * 0x80 | Read/Write: R/W | Reset: 0x00500001 (0bx000x000x10100000000xxxxxxxx0001)

Bit	Reset	Description
30:28	0x0	SOURCE_MEMORY_BUFFERS: Up to 8 logically partitioned and consecutively located buffers/chunks of ARAM/DRAM of size equal to "TRANSFER_COUNT". Hardware generates an interrupt on completion of every buffer. Software can choose to program more than one block/buffer in all three modes "ONCE, CONTINUOUS and LINKED_LIST". In "CONTINUOUS" mode, all these buffers are read in a circular fashion (0-1-2-3...0-1-2-3) continuously until software clears the "TRANSFER_ENABLE" bit. Transfer terminates in ONCE mode when last buffer is drained and SOURCE ADDR, TARGET ADDR, and TC would be re initialized with the descriptor fields in case of Linked list mode. 0 = BUFFER_1 1 = BUFFERS_2 2 = BUFFERS_3 3 = BUFFERS_4 4 = BUFFERS_5 5 = BUFFERS_6 6 = BUFFERS_7 7 = BUFFERS_8
26:24	0x0	TARGET_MEMORY_BUFFERS: Up to 8 logically partitioned and consecutively located buffers/chunks of ARAM/DRAM of size equal to "TRANSFER_COUNT". Hardwaregenerates an interrupt on completion of every buffer. Software can choose to program more than one block/buffer in all three modes "ONCE, CONTINUOUS and LINKED_LIST". In "CONTINUOUS" mode, all these buffers are written into in a circular fashion (0-1-2-3...0-1-2-3) continuously until software clears the "TRANSFER_ENABLE" bit. Transfer terminates in ONCE mode when last buffer is drained and SOURCE ADDR, TARGET ADDR and TC would be re initialized with the descriptor fields in case of Linked list mode. 0 = BUFFER_1 1 = BUFFERS_2 2 = BUFFERS_3 3 = BUFFERS_4 4 = BUFFERS_5 5 = BUFFERS_6 6 = BUFFERS_7 7 = BUFFERS_8
22:20	0x5	BURST_SIZE: Software initializes this field to an appropriate value based on the type of transfer and bandwidth needs of the client and overall DMA needs of the system. This field is applicable for both reads from Source and writes to Target. ADMA does not support different burst sizes for source and target. 1 = WORD_1 2 = WORDS_2 3 = WORDS_4 4 = WORDS_8 5 = WORDS_16
19:16	0x0	SOURCE_ADDR_WRAP: Address wrap around window for source client. AHUB transfers should wrap on single word. 0 = NO_WRAP 1 = WRAP_ON_1_WORD 2 = WRAP_ON_2_WORDS 3 = WRAP_ON_4_WORDS 4 = WRAP_ON_8_WORDS 5 = WRAP_ON_16_WORDS 6 = WRAP_ON_32_WORDS 7 = WRAP_ON_64_WORDS 8 = WRAP_ON_128_WORDS 9 = WRAP_ON_256_WORDS 10 = WRAP_ON_512_WORDS 11 = WRAP_ON_1K_WORDS
15:12	0x0	TARGET_ADDR_WRAP: Address wrap around window for destination client. AHUB transfers should wrap on single word. 0 = NO_WRAP 1 = WRAP_ON_1_WORD 2 = WRAP_ON_2_WORDS 3 = WRAP_ON_4_WORDS 4 = WRAP_ON_8_WORDS 5 = WRAP_ON_16_WORDS 6 = WRAP_ON_32_WORDS 7 = WRAP_ON_64_WORDS 8 = WRAP_ON_128_WORDS 9 = WRAP_ON_256_WORDS 10 = WRAP_ON_512_WORDS 11 = WRAP_ON_1K_WORDS

Bit	Reset	Description
3:0	0x1	WEIGHT_FOR_WRR: Weight of this channel for weighted round robin arbitration. When this channel get its turn, WRR arbiter selects these many requests from this channel prior to switching to the other channels. Arbiter switches by default to other active channels if this channel has no requests to schedule for arbitration.

23.3.15.9 ADMA_CH<*n*>_AHUB_FIFO_CTRL_0

There are 22 ADMA FIFO Control registers, one per channel (n = 1 through 22).

For n = 1 through 4: Offset: 0x2c + (n – 1) * 0x80 | Read/Write: R/W | Reset: 0x01010303 (0b0xx00001xxx00001xxx00011xxx00011)
For n = 5 through 19: Offset: 0x22c + (n – 5) * 0x80 | Read/Write: R/W | Reset: 0x00000202 (0b0xx00000xxx00000xxx00010xxx00010)
For n = 20 through 22: Offset: 0x9ac + (n – 20) * 0x80 | Read/Write: R/W | Reset: 0x00000000 (0b0xx00000xxx00000xxx00000xxx00000)

Bit	Reset	Description
31	0x0	FETCHING_POLICY: 0: DMA requests are scheduled for arbitration as and when a burst of space is available to load into TX FIFO or a burst of samples are ready to be read from Rx FIFO 1: DMA requests are scheduled for arbitration based on "OVERFLOW and STARVATION" thresholds to let DRAM get into IDLE state for longer durations 0 = BURST_BASED 1 = THRESHOLD_BASED
28:24	0x1	OVERFLOW_THRESHOLD: Burst of Transfers starts when FIFO status reaches this threshold and continues until it becomes empty. Transfer resumes again after FIFO status reaches this threshold. It is applicable only when the FETCHING_POLICY field is set to 1. It must be set to a value in multiples of 16 words.
20:16	0x1	STARVATION_THRESHOLD: Burst of Transfers starts when FIFO count goes below this threshold and continues until it becomes full. Transfer resumes again after FIFO count goes below this threshold. It is applicable only when the FETCHING_POLICY field is set to 1, and It must be set to a value in multiples of 16 words.
12:8	0x3	TX_FIFO_SIZE: TX FIFO size of AHUB channel indicated by the TX_REQUEST_SELECT field in multiples of 16 words/64 bytes. This field is valid only when the FLOWCTRL_ENABLE bit is set and TRANSFER_DIRECTION is either memory-to-AHUB or AHUB-to-AHUB.
4:0	0x3	RX_FIFO_SIZE: RX FIFO size of AHUB channel indicated by the RX_REQUEST_SELECT field in multiples of 16 words/64 bytes. This field is valid only when the FLOWCTRL_ENABLE bit is set and TRANSFER_DIRECTION is either AHUB-to-memory or AHUB-to-AHUB.

23.3.15.10 ADMA_CH<*n*>_TC_STATUS_0

There are 22 ADMA Transfer Count Status registers, one per channel (n = 1 through 22).

Offset: 0x30 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
29:2	X	CURRENT_TRANSFER_COUNT: Remaining number of words to be transferred

23.3.15.11 ADMA_CH<*n*>_LOWER_SOURCE_ADDR_0

There are 22 ADMA Lower Source Address registers, one per channel (n = 1 through 22).

Offset: 0x34 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000xx)

Bit	Reset	Description
31:2	0x0	BASE_ADDR: Word aligned lower 32 bits of source address. Next location is reserved for future enhancements to the address width.

23.3.15.12 ADMA_CH<*n*>_LOWER_TARGET_ADDR_0

There are 22 ADMA Lower Target Address registers, one per channel (n = 1 through 22).

Offset: 0x3c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000xx)

Bit	Reset	Description
31:2	0x0	BASE_ADDR: Word aligned lower 32 bits of target address. Next location is reserved for future enhancements to the address width.

23.3.15.13 ADMA_CH<*n*>_TC_0

There are 22 ADMA Transfer Count registers, one per channel (n = 1 through 22).

Offset: 0x44 | Read/Write: R/W | Reset: 0x00000000 (0bxx00000000000000000000000000xx)

Bit	Reset	Description
29:2	0x0	TRANSFER_COUNT: Word aligned transfer size.

23.3.15.14 ADMA_CH<*n*>_LOWER_DESC_ADDR_0

There are 22 ADMA Lower Descriptor registers, one per channel (n = 1 through 22).

Offset: 0x48 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000xx)

Bit	Reset	Description
31:2	0x0	NEXT_DESCRIPTOR_ADDR: Initially it is loaded by software while setting up the channel and then automatically loaded by hardware prior to end of each block transfer. This is valid only when Linked list mode is enabled. ADMA keeps fetching the descriptor from ARAM/DRAM pointed to by "NEXT_DESCRIPTOR_ADDR" until either software disables the channel or received "NEXT_DESCRIPTOR_ADDR" value is "0". Descriptor is a set of 4 registers (SOURCE_ADDR, TARGET_ADDR, TRANSFER_COUNT and NEXT_DESCRIPTOR_ADDR) located in consecutive 32-bit entries of DRAM/ARAM starting with SOURCE_ADDR.

23.3.15.15 ADMA_CH<*n*>_TRANSFER_STATUS_0

There are 22 ADMA Transfer Status registers, one per channel (n = 1 through 22).

Offset: 0x54 | Read/Write: RO | Reset: 0x0000XXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
15:0	X	TRANSFER_DONE_COUNT: Indicates the number of block/buffer transfers completed since the channel was enabled. In other words the count increments every time the TRANSFER_DONE interrupt is asserted.

23.3.15.16 ADMA_GLOBAL_CMD_0

Offset: 0xc00 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	GLOBAL_ENABLE: This bit must be set to "1" for enabling the DMA transfers from channels 0 = FALSE 1 = TRUE

23.3.15.17 ADMA_GLOBAL_SOFT_RESET_0

Offset: 0xc04 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	ENABLE: Self clearing soft reset 0 = FALSE 1 = TRUE

23.3.15.18 ADMA_GLOBAL_CG_0

Offset: 0xc08 | Read/Write: R/W | Reset: 0x00000007 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx111)

Bit	Reset	Description
2	0x1	CFG_SLCG_ENABLE: Second level clock gating enable for the clock driving the registers 0 = FALSE 1 = TRUE
1	0x1	CHANNEL_SLCG_ENABLE: Second level clock gating enable for the clock driving the channel controllers except of first 4 channels 0 = FALSE 1 = TRUE
0	0x1	GLOBAL_SLCG_ENABLE: Second level clock gating enable for the clock driving first 4 channel controllers and remaining modules 0 = FALSE 1 = TRUE

23.3.15.19 ADMA_GLOBAL_STATUS_0

Offset: 0xc10 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
4	X	TRANSFER_PAUSED: Transfers from ALL channels can be paused by setting this bit and can be resumed by clearing it 0 = FALSE 1 = TRUE
3	X	CFG_CLK_ENABLED: Indicates whether Registers clock is enabled or disable 0 = FALSE 1 = TRUE
2	X	CHANNEL_CLK_ENABLED: Indicates whether the clock driving channel controllers is enabled or disabled 0 = FALSE 1 = TRUE
1	X	GLOBAL_CLK_ENABLED: Indicates whether the clock driving common modules is enabled or disabled 0 = FALSE 1 = TRUE
0	X	TRANSFER_ENABLED: Asserts when any of the channels is enabled for DMA transfer 0 = FALSE 1 = TRUE

23.3.15.20 ADMA_GLOBAL_INT_STATUS_0

Offset: 0xc14 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	GLOBAL_TRANSFER_ERROR: Pre mask error interrupt "STATUS" 0 = FALSE 1 = TRUE

23.3.15.21 ADMA_GLOBAL_INT_MASK_0

Offset: 0xc18 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	0x1	GLOBAL_TRANSFER_ERROR: Mask for hardware or software triggered error interrupt 0 = FALSE 1 = TRUE

23.3.15.22 ADMA_GLOBAL_INT_SET_0

Offset: 0xc1c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	GLOBAL_TRANSFER_ERROR: Self clearing error interrupt "SET" from software. This bit always read back 0 0 = FALSE 1 = TRUE

23.3.15.23 ADMA_GLOBAL_INT_CLEAR_0

Offset: 0xc20 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	GLOBAL_TRANSFER_ERROR: Self clearing error interrupt "CLEAR". This bit always read back 0 0 = FALSE 1 = TRUE

23.3.15.24 ADMA_GLOBAL_CTRL_0

Offset: 0xc24 | Read/Write: R/W | Reset: 0x00080800 (0bxxxxxxxxxxxx1000xxxx1000xxxxxxx0)

Bit	Reset	Description
19:16	0x8	OUTSTANDING_MEM_WRITES: Supports a max of 8 outstanding memory reads to ARAM/DRAM
11:8	0x8	OUTSTANDING_MEM_READS: Supports a max of 8 outstanding memory writes to ARAM/DRAM.
0	0x0	TRANSFER_PAUSE: Software may choose to PASUE Transfers from all channels by setting this bit to "1". Clearing it resume all transfers. 0 = DISABLE 1 = ENABLE

23.3.15.25 ADMA_GLOBAL_CH_INT_STATUS_0

Offset: 0xc28 | Read/Write: RO | Reset: 0x00XXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
21	X	CH22_TRANSFER_DONE: Pre mask end of transfer or transfer done interrupt from all channels 0 = FALSE 1 = TRUE
20	X	CH21_TRANSFER_DONE: 0 = FALSE 1 = TRUE
19	X	CH20_TRANSFER_DONE: 0 = FALSE 1 = TRUE

TX10: Offset: 0x568 | Read/Write: R/W | Reset: 0x0180021d (0b0x0000011000xxxxxxx00010xxx11101)

Bit	Reset	Description
31	Depends on TX<n>. See reset values above this table.	TRANSFER_MODE: 0 = DMA 1 = PIO
29:20		DMA_FIFO_THRESHOLD
12:8		DMA_FIFO_SIZE
4:0		DMA_FIFO_START_ADDR

23.3.16.20 ADMAIF_AXBAR_TX<n>_FIFO_WRITE_0

There are 10 ADMAIF AXBAR TX FIFO Write registers, one for each TX channel (n=1 to 10).

Offset: 0x32c + (n – 1) * 0x40 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	DATA

23.3.16.21 ADMAIF_GLOBAL_ENABLE_0

Offset: 0x700 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	ENABLE: 0 = FALSE 1 = TRUE

23.3.16.22 ADMAIF_GLOBAL_SOFT_RESET_0

Self-clearing software-initiated global reset. It clears all channels' enable bits, DMA/CIF FIFOs, state machines, and any pipelines.

Offset: 0x704 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	SOFT_RESET: 0 = FALSE 1 = TRUE

23.3.16.23 ADMAIF_GLOBAL_CG_0

Offset: 0x708 | Read/Write: R/W | Reset: 0x00000003 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx11)

Bit	Reset	Description
1	0x1	CHANNEL_SLCG_ENABLE: Second level clock gating enable, for remaining channels specific logic portions. 0 = FALSE 1 = TRUE
0	0x1	GLOBAL_SLCG_ENABLE: Second level clock gating enable for first 2 channels and global/common logic. 0 = FALSE 1 = TRUE

23.3.16.24 ADMAIF_GLOBAL_STATUS_0

Offset: 0x710 | Read/Write: RO | Reset: 0x00000X0X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
9	X	CHANNEL_CLK_ENABLE: Channel clock Enable 0 = FALSE 1 = TRUE
8	X	GLOBAL_CLK_ENABLE: Global clock Enable 0 = FALSE 1 = TRUE
0	X	TRANSFER_ENABLED: Set when at least one of the channels is enabled by software 0 = FALSE 1 = TRUE

23.3.16.25 ADMAIF_GLOBAL_RX_ENABLE_STATUS_0

Offset: 0x720 | Read/Write: RO | Reset: 0x00000XXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
9	X	CH10_TRANSFER_ENABLED: 0 = FALSE 1 = TRUE
8	X	CH9_TRANSFER_ENABLED: 0 = FALSE 1 = TRUE

Bit	Reset	Description
31:0	X	GICD_SGIR: Software Generated Interrupt Register

23.3.17.17 AGIC_DISTRIBUTOR_GICD_CPENDSGIR<n>_0

There are 4 GICD SGI Clear-Pending registers, where n = 0 to 3.

Offset: 0x1f10 + (n * 0x4) | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICD_CPENDSGIR<n>: SGI Clear-Pending Registers

23.3.17.18 AGIC_DISTRIBUTOR_GICD_SPENDSGIR<n>_0

There are 4 GICD SGI Set-Pending registers, where n = 0 to 3.

Offset: 0x1f20 + (n * 0x4) | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICD_SPENDSGIR<n>: SGI Set-Pending Registers

23.3.17.19 AGIC_DISTRIBUTOR_GICD_PIDR<n>_0

There are 8 GICD Peripheral ID registers, where n = 0 to 7. Note that ID5 through ID7 register offsets precede those offsets of registers ID0 through ID4.

ID0-ID4: Offset: 0x1fe0 + (n * 0x4) | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)
ID5-ID7: Offset: 0x1fd0 + (n-5) * 0x4 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICD_PIDR<n>: Peripheral ID<n> Register

23.3.17.20 AGIC_DISTRIBUTOR_GICD_CIDR<n>_0

There are 4 GICD Component ID registers, where n = 0 to 3.

Offset: 0x1ff0 + (n * 0x4) | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICD_CIDR<n>: Component ID<n> Register

23.3.17.21 AGIC_CPUIF_GICC_CTLR_0

Offset: 0x2000 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_CTLR: CPU Interface Control Register

23.3.17.22 AGIC_CPUIF_GICC_PMR_0

Offset: 0x2004 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_PMR: Interrupt Priority Mask Register

23.3.17.23 AGIC_CPUIF_GICC_BPR_0

Offset: 0x2008 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_BPR: Binary Point Register

23.3.17.24 AGIC_CPUIF_GICC_IAR_0

Offset: 0x200c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_IAR: Interrupt Acknowledge Register

23.3.17.25 AGIC_CPUIF_GICC_EOIR_0

Offset: 0x2010 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_EOIR: End of Interrupt Register

23.3.17.26 AGIC_CPUIF_GICC_RPR_0

Offset: 0x2014 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_RPR: Running Priority Register

23.3.17.27 AGIC_CPUIF_GICC_HPPIR_0

Offset: 0x2018 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_HPPIR: Highest Priority Pending Interrupt Register

23.3.17.28 AGIC_CPUIF_GICC_ABPR_0

Offset: 0x201c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_ABPR: Aliased Binary Point Register

23.3.17.29 AGIC_CPUIF_GICC_AIAR_0

Offset: 0x2020 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_AIAR: Aliased Interrupt Acknowledge Register

23.3.17.30 AGIC_CPUIF_GICC_AEOIR_0

Offset: 0x2024 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_AEOIR: Aliased End of Interrupt Register

23.3.17.31 AGIC_CPUIF_GICC_AHPPIR_0

Offset: 0x2028 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_AHPPIR: Aliased Highest Priority Pending Interrupt Register

23.3.17.32 AGIC_CPUIF_GICC_APR0_0

Offset: 0x20d0 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_APR0: Active Priority Register

23.3.17.33 AGIC_CPUIF_GICC_NSAPR0_0

Offset: 0x20e0 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_NSAPR0: Non-Secure Active Priority Register

23.3.17.34 AGIC_CPUIF_GICC_IIDR_0

Offset: 0x20fc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_IIDR: CPU Interface Identification Register

23.3.17.35 AGIC_CPUIF_GICC_DIR_0

Offset: 0x3000 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GICC_DIR: Deactivate Interrupt Register

23.3.18 Mixer Registers

23.3.18.1 MIXER_AXBAR_RX<n>_SOFT_RESET_0

There are 10 RX Soft Reset registers, where n = 1 through 10.

Offset: 0x4 + (n-1) * 0x40 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	FALSE	SOFT_RESET: 0 = FALSE 1 = TRUE

23.3.18.2 MIXER_AXBAR_RX<n>_STATUS_0

There are 10 RX Status registers, where n = 1 through 10.

Offset: 0x10 + (n-1) * 0x40 | Read/Write: RO | Reset: 0xX0000X0X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
8	X	CONFIG_BUSY: 0 = FALSE 1 = TRUE

23.3.18.5 MIXER_AXBAR_RX<n>_PEAK_CTRL_0

There are 10 RX Peak Control registers, where n = 1 through 10.

Offset: 0x2c + (n-1) * 0x40 | Read/Write: R/W | Reset: 0x000012c0 (0b00000000000000000001001011000000)

Bit	Reset	Description
31	WINDOW_BASED	PEAK_TYPE: 0 = WINDOW_BASED 1 = RESET_ON_READ
30:0	0x12c0	PEAK_WIN

23.3.18.6 MIXER_AXBAR_RX<n>_SAMPLE_COUNT_0

There are 10 RX Sample Count registers, where n = 1 through 10.

Offset: 0x30 + (n-1) * 0x40 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	SAMPLE_CNT

23.3.18.7 MIXER_AXBAR_TX<n>_ENABLE_0

There are 5 TX Enable registers, where n = 1 through 5.

Offset: 0x280 + (n-1) * 0x40 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	FALSE	ENABLE: 0 = FALSE 1 = TRUE

23.3.18.8 MIXER_AXBAR_TX<n>_SOFT_RESET_0

There are 5 TX Soft Reset registers, where n = 1 through 5.

Offset: 0x284 + (n-1) * 0x40 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	FALSE	SOFT_RESET: 0 = FALSE 1 = TRUE

23.3.18.9 MIXER_AXBAR_TX<n>_STATUS_0

There are 5 TX Status registers, where n = 1 through 5.

Offset: 0x290 + (n-1) * 0x40 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
2	X	ACIF_FIFO_FULL: 0 = FALSE 1 = TRUE
1	X	ACIF_FIFO_EMPTY: 0 = FALSE 1 = TRUE
0	X	ENABLE_STATUS: 0 = FALSE 1 = TRUE

23.3.18.10 MIXER_AXBAR_TX<n>_INT_STATUS_0

There are 5 TX Interrupt Status registers, where n = 1 through 5.

Offset: 0x294 + (n-1) * 0x40 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	TX_DONE: 0 = CLEAR 1 = SET

23.3.18.11 MIXER_AXBAR_TX<n>_INT_MASK_0

There are 5 TX Interrupt Mask registers, where n = 1 through 5.

Offset: 0x298 + (n-1) * 0x40 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	MASK	TX_DONE: 0 = UNMASK 1 = MASK

23.3.18.12 MIXER_AXBAR_TX<n>_INT_SET_0

There are 5 TX Interrupt Set registers, where n = 1 through 5.

Offset: 0x29c + (n-1) * 0x40 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	CLEAR	TX_DONE: 0 = CLEAR 1 = SET

23.3.18.13 MIXER_AXBAR_TX<n>_INT_CLEAR_0

There are 5 TX Interrupt Clear registers, where n = 1 through 5.

Offset: 0x2a0 + (n-1) * 0x40 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

0	DISABLE	RX1_INPUT_ENABLE: 0 = DISABLE 1 = ENABLE

23.3.18.16 MIXER_ENABLE_0

Offset: 0x400 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	FALSE	ENABLE: MIXER global enable bit, When disabled, the MIXER does not disable until all the data in the datapipe has been processed and sent out. The "datapipe" here includes the mixer core block and TXCIF, but not the RXCIF. The MIXER core will finish the current frame and go bank to IDLE. It will not pop data from the RXCIF any more, even if there are still some data in the RXCIF FIFO. Read back of the register will also give module enable status. 0 = FALSE 1 = TRUE

23.3.18.17 MIXER_SOFT_RESET_0

Offset: 0x404 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	FALSE	SOFT_RESET: Soft Reset is a self-clearing bit. Soft Reset resets all FSM, flushes flow control FIFO, and resets the state registers. It also brings the module back to the disabled state (without flushing data in the pipe) 0 = FALSE 1 = TRUE

23.3.18.18 MIXER_CG_0

Offset: 0x408 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	TRUE	SLCG_EN: Second level clock gating enable 0 = FALSE 1 = TRUE

23.3.18.19 MIXER_STATUS_0

Offset: 0x410 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
1	X	SLCG_CLKEN: 0 = FALSE 1 = TRUE
0	X	ENABLE_STATUS: 0 = FALSE 1 = TRUE

23.3.18.20 MIXER_INT_STATUS_0

Offset: 0x414 | Read/Write: RO | Reset: 0x00XX000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
20	X	TX5_DONE: 0 = CLEAR 1 = SET
19	X	TX4_DONE: 0 = CLEAR 1 = SET
18	X	TX3_DONE: 0 = CLEAR 1 = SET
17	X	TX2_DONE: 0 = CLEAR 1 = SET
16	X	TX1_DONE: 0 = CLEAR 1 = SET
0	X	MIXER_TX_DONE: 0 = CLEAR 1 = SET

23.3.18.21 MIXER_AHUBRAMCTL_GAIN_CONFIG_RAM_CTRL_0

Mixer Configuration RAM

1. The content in the RAM is shown below
2. The order is input stream 0 settings, input stream 1 settings, input stream 9 settings.

Input Stream 0:

0x00: cn_p1_0

0x01: cn_p1_1

0x02: cn_p1_2

0x03: cn_p2_0

0x04: cn_p2_1

0x05: cn_p2_2

0x06: cn_p3_0

0x07: cn_p3_1

0x08: cn_p3_2

0x09: gain_value

0x0a: duration_n1

0x0b: duration_n2

0x0c: duration_n3

0x0d: duration_inv_n3

0x0e: Reserved

0x0f: CONFIG_DONE_TRIGGER

3. For each time of programming, after software programs part or all the parameters which are needed for each stream, software must write CONFIG_DONE_TRIGGER, which offset is 0xf (the last address for each stream). Hardware will trigger the switching after CONFIG_DONE_TRIGGER was programmed. Software can program any value for this register.
4. Software needs to check configuration busy flag before programming this configuration RAM. It can program only if it is not "busy". A Configure Error interrupt will be generated if software programs when it is "busy".
5. Software needs to program the right address for different input streams; that is, 0x0 for input stream0, 0x10 for input stream 1, and 0x90 for input stream 9.
6. Gain_value:
   a. Software can program the settings only if the gain value needs change.
   b. Q16.16 format, 0x10000 means unity gain.

   Hardware running with unity gain as default. Software does not need to program anything if applying unity gain to input stream.
7. This RAM cannot be read by software during the runtime (MIXER is enabling), read port is occupied by hardware
8. Duration_n3:
   a. ==1: doing gain transition (from old gain to new gain) instantaneously.
   b. Should be greater than 64.
9. Duration parameters setting: duration_n1<=duration_n2<=duration_n3.
10. It is meaningless to read RAM for each input stream with offset equal to 0x0e and 0x0f. Hardware may return an unexpected value for these two entries access.

This is an array of 1 identical register entries; the register fields below apply to each entry.

Offset: 0x42c..0x42f | Read/Write: R/W | Reset: 0xX0004000 (0bxxxxxxxx00000000x100xxx000000000)

Bit	R/W	Reset	Description
31	RO	X	READ_BUSY: 0 = DONE 1 = BUSY
23:16	RW	0x0	SEQ_READ_COUNT
14	RW	WRITE	RW: 0 = READ 1 = WRITE
13	RW	DISABLE	ADDR_INIT_EN: 0 = DISABLE 1 = ENABLE
12	RW	DISABLE	SEQ_ACCESS_EN: 0 = DISABLE 1 = ENABLE
8:0	RW	0x0	RAM_ADDR

23.3.18.22 MIXER_AHUBRAMCTL_GAIN_CONFIG_RAM_DATA_0

This is an array of 1 identical register entries; the register fields below apply to each entry.

Offset: 0x430..0x433 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	DATA

23.3.18.23 MIXER_AHUBRAMCTL_PEAKM_RAM_CTRL_0

Peak Metering RAM

1. For Peak value storing
2. The content order is as follows:
   - 0x00: in0_ch0 input stream 0, channel 0
   - 0x01: in0_ch1
   - 0x02: in0_ch2
   - 0x03: in0_ch3
   - 0x04: in0_ch4
   - 0x05: in0_ch5
   - 0x06: in0_ch6
   - 0x07: in0_ch7
   - 0x4e: in9_ch6
   - 0x4f: in9_ch7
3. Peak Metering RAM is read-only for software.
4. Peak Metering RAM supports sequential reads. Software needs to program CTRL.SEQ_READ_COUNT to indicate the number of sequential reads from initial address, that is, if software wants to sequentially read peak values for 8 channels, SEQ_READ_COUNT should be set with 8. SEQ_READ_COUNT is only valid in sequential access mode (SEQ_ACCESS_EN == 1).
5. CTRL.SEQ_READ_COUNT is 8 bits, which means the maximum number of sequential read entries is 255. For more than 255 sequential read entries, software needs to reload this field, which means programming CTRL registers again.

This is an array of 1 identical register entries; the register fields below apply to each entry.

Offset: 0x434..0x437 | Read/Write: R/W | Reset: 0xX0004000 (0bxxxxxxxx00000000x100xxx000000000)

Bit	Reset	Description
13	ALL_PASS_TREE	FILTER_STRUC: Selects between a custom Butterfly Structure with fixed BiQuad stages (ALL_PASS_TREE) 0 = ALL_PASS_TREE: or a programmable structure where per band biquads can be programmed (FLEX) 1 = FLEX
12:8	0x1e	SHIFT_CTRL: Shift Control for each BiQuad Stage - this depends on the format of coefficient programmed Default to 30 - current coefficients are all with 2.30 format. Software can only change it when the format of coefficients is changed. Otherwise, always keep 30.
7:4	N32	FRAME_SIZE: Number of Samples per "frame" that will be used to compute the sidechain calculation 0 = N1: Has to be a power of 2 1 = N2: Maximum Frame size that hardware can support is 64 (FRAME_SIZE=6) 2 = N4: It will result in incorrect output if it is set bigger than 6 3 = N8 4 = N16 5 = N32 6 = N64
1:0	FULLBAND	MBDRC_MODE: MBDRC Mode of Operation Filtering - LowPass, BandPass and HighPass, SideChain, and Gain Application for the three bands 0 = BYPASS: Bypass - No Filtering, No Side Chain, No Gain Application (DISABLE) 1 = FULLBAND: Full Band - No Filtering, But SideChain and Gain Application - for a single Band 2 = DUALBAND: Filtering - LowPass and HighPass, SideChain and Gain Application for the two Band 3 = MULTIBAND

23.3.19.4 MBDRC_CHAN_MASK_0

Offset: 0x2c | Read/Write: R/W | Reset: 0x00000003 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx00000011)

Bit	Reset	Description
7:0	0x3	CHAN_MASK_EN: An N bit field - a "1" on field, indicates perform DRC on that channel a "0" on field, indicates DRC will not be done on that channel, i.e., no SideChain Calculation, and Unity Gain will be applied Bit(N-1)-0 = Masks for Channels(N-1)-0

23.3.19.5 MBDRC_MASTER_VOLUME_0

Offset: 0x30 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	MASTER_VOLUME: Feedback of Volume Control to MBDRC (if Volume Control is placed before MBDRC) (Signed Q9.23 format) (Default is 0 dB)

23.3.19.6 MBDRC_FAST_FACTOR_0

Offset: 0x34 | Read/Write: R/W | Reset: 0x30000800 (0b00110000000000000000100000000000)

Bit	Reset	Description
31:16	0x3000	FR_FACTOR: Gain Smoothing: FastRelease is applied if CurrentGain/PreviousGain < FRFactor default: 12288 (0.375) (Q1.15 format) positive value only. Defining them as negative values will result in incorrect results.
15:0	0x800	FA_FACTOR: Gain Smoothing: FastAttack is applied if PreviousLevel/CurrentLevel < FAFactor default: 2048 (0.0625) (Q1.15 format) positive value only. Defining them as negative values will result in incorrect results

23.3.19.7 MBDRC_IIR_CONFIG_0

The following registers that are indexed by the MAX_BANDS (0,1,2) correspond to low/mid/high as follows:

- Band_0 = Low Band
- Band_1 = Mid Band
- Band_2 = High Band

This is an array of 3 identical register entries; the register fields below apply to each entry.

Offset: 0x38..0x43 | Read/Write: R/W | Reset: 0x00000005 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0101)

Bit	Reset	Description
3:0	0x5	NUM_STAGES: Number of Stages - Maximum of 6,8,6 - only applicable in ALL_PALL_TREE mode - Here number is actually N-1, for max 6 - this number should be 5

23.3.19.8 MBDRC_INATTACK_0

This is an array of 3 identical register entries; the register fields below apply to each entry.

Offset: 0x44..0x4f | Read/Write: R/W | Reset: 0x3e48590c (0b00111110010010000101100100001100)

Bit	Reset	Description
31:0	0x3e48590c	IN_ATTACK_TC: Attack Time Constant for Input envelope detection (different for each band) (1 - exp((-1.0 * BufferSize) / (Fs * INattackTC))) default: 1044928780 (0.001sec @ 48KHz with 32 BufferSize) positive value only. Defining them as negative values will result in incorrect results

23.3.19.9 MBDRC_INRELEASE_0

This is an array of 3 identical register entries; the register fields below apply to each entry.

Defining them as negative values will result in incorrect results

23.3.19.23 MBDRC_AHUBRAMCTL_MBDRC_CTRL_0

COEFFICIENT RAM control for all bands

1. There is one Coefficient RAM for each Band
   - FULLBAND -> No need to program the coefficient RAM, since there is no Biquad Filtering
   - DUALBAND -> First two bands' coefficient RAM need to be programmed.

- MULTIBAND -> Three bands' coefficient RAMs needs to be programmed.

2. The coefficients inside each RAM are organized in the following order:
   - 'd00: Biquad1-b0
   - 'd01: Biquad1-b1
   - 'd02: Biquad1-b2 > Biquad 1
   - 'd03: Biquad1-a1
   - 'd04: Biquad1-a2
   - 'd05: Biquad2-b0
   - 'd06: Biquad2-b1
   - 'd07: Biquad2-b2 > Biquad 2
   - 'd08: Biquad2-a1
   - 'd09: Biquad2-a2
   - 'd35: Biquad8-b0
   - 'd36: Biquad8-b1
   - 'd37: Biquad8-b2 > Biquad 8
   - 'd38: Biquad8-a1
   - 'd39: Biquad8-a2
3. The order of coefficients is b0,b1,b2,a1,a2 (5 set)
4. y(n) = b0*x(n) + s1(n)

   s1(n) = b1*x(n) - a1*y(n) + s2(n)

   s2(n) = b2*x(n) - a2*y(n)
5. For MULTIBAND mode in the ALL_PASS_TREE structure, for the third band, the coefficient starting address should be 'd15 (the fourth biquad), since hardware only maintains one read pointer which is used for all the coefficient RAMs
6. Current format is 2.30. If the format changed, the SHIFT_CTRL value should be updated correspondingly.

This is an array of 3 identical register entries; the register fields below apply to each entry.

Bit	Reset	Description
7:0	0x0	SHRD_SMP_STA_CLR: Writing bit i to 1 clears corresponding semaphore bit.

23.3.21.11 AMISC_CPU_ARBGNT_STATUS_0

Arbitration semaphores provide a mechanism by which the two processors can arbitrate for the use of various resources. These semaphores provide a hardware locking mechanism, so that when a processor is already using a resource, the second processor is not granted that resource. There are 32 bits of Arbitration semaphores provided in the system. The hardware does not enforce any resource association to these bits. It is left to the firmware to assign and use these bits.

The setup/usage of the Arbitration Semaphores is described in Chapter 4: Semaphores.

The Arbitration Semaphores can also generate an interrupt when a hardware resource becomes available. The registers in this module configure these interrupts. When a 1 is set in the corresponding bit position of the Arbitration Semaphore Interrupt Source Register (CPU_enable or DSP_enable), an interrupt will be generated when the processor achieves Grant Status for that resource.

The current Grant status can be viewed in the CPU_STATUS or DSP_STATUS registers.

Semaphore Granted Status Register

Offset: 0x28 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	ARBGNT_STATUS: A one in any bit indicates that the processor reading this register as granted status for that bit. A zero indicates semaphore not granted.

23.3.21.12 AMISC_CPU_ARBGNT_GET_0

Request Arbitration Semaphore Register

Offset: 0x2c | Read/Write: R/W | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	ARBGNT_GET: Writing a one in any bit is a request for that semaphore bit by the processor performing the register write.

23.3.21.13 AMISC_CPU_ARBGNT_PUT_0

Arbitration Semaphore Put Request Register

Offset: 0x30 | Read/Write: R/W | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	ARBGNT_PUT: Writing a one in any bit will clear the corresponding semaphore bit by the processor performing the register write.

23.3.21.14 AMISC_ADSP_ARBGNT_STATUS_0

Semaphore Granted Status Register

Offset: 0x34 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	ARBGNT_STATUS: A one in any bit indicates that the processor reading this register as granted status for that bit. A zero indicates semaphore not granted.

23.3.21.15 AMISC_ADSP_ARBGNT_GET_0

Request Arbitration Semaphore Register

Offset: 0x38 | Read/Write: R/W | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	ARBGNT_GET: Writing a one in any bit is a request for that semaphore bit by the processor performing the register write.

23.3.21.16 AMISC_ADSP_ARBGNT_PUT_0

Arbitration Semaphore Put Request Register

Offset: 0x3c | Read/Write: R/W | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	ARBGNT_PUT: Writing a one in any bit will clear the corresponding semaphore bit by the processor performing the register write.

23.3.21.17 AMISC_ADSP_ARBGNT_REQ_STATUS_0

Arbitration Request Pending Status (1=PENDING) Register

Offset: 0x40 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	REQ_STATUS: A one in any bit indicates a request pending status from the AMISC_ADSP_ARBGNT_GET_0 register. The corresponding bits are set when the request for the individual resource is pending.

23.3.21.18 AMISC_CPU_ARBGNT_REQ_STATUS_0

Arbitration Request Pending Status (1=PENDING) Register

Offset: 0x44 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	REQ_STATUS: REQ_STATUS: A one in any bit indicates a request pending status from the AMISC_CPU_ARBGNT_GET_0 register. The corresponding bits are set when the request for the individual resource is pending.

23.3.21.19 AMISC_TSC_0

The TSC register contains the MSB 32 bits of the TSC signal on the first read. On the 2nd read, it contains the bottom 32 bits of the TSC signal. The TSC signal is zero-extended from 56 bits to 64 bits.

Offset: 0x48 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	TSC

23.3.21.20 AMISC_AMISC_DEBUG_0

Offset: 0x4c | Read/Write: RO | Reset: 0xX0000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	TSC_SET: If 1, indicates that lower 32 bits will be read from TSC register. If 0, indicates that upper 32 bits will be read from the TSC register.

23.3.21.21 AMISC_IDLE_0

Offset: 0x50 | Read/Write: R/W | Reset: 0x80000000 (0b1xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description

CHAPTER 24: DISPLAY CONTROLLER

The Tegra® X1 architecture has two entirely independent display controllers. They can support two independent display devices, typically a local display panel and an external HDMI TV or DP monitor. Other configurations are possible such as two local panels. Each display controller can run at a different clock rate and drive a different resolution panel.

Refer to Chapter 27: Display Interfaces: HDMI and DisplayPort for information on DisplayPort, eDP, HDMI, and HDCP. Refer to the “Color Decompression Engine” section for information on CDE.

24.1 Features

Key features include:

- Serial output resource (SOR) supports DisplayPort (DP) or eDP concurrently with HDMI or MIPI-DSI
- Three full function display windows, A, B and C, supporting scaling and blending
- Two additional windows (collectively known as “Simple Windows”):
  - Window D: Fourth general-purpose window
  - Window T: TrustZone® Secure display
- Color Decompression Engine (CDE) support
- Display Stream Compression (DSC) support
- Enhanced PRISM2 display with run per frame on VPULSE2 and smooth K0
- Maximum panel resolution:
  - Internal panel
    - DSI

    Dual link 3200 x 2000 @ 60Hz (2D – portrait/landscape)

    Single link 2560 x 1440 @ 60Hz (2D – portrait/landscape)
    - eDP

    3840 x 2160 @ 60 Hz (2D – portrait/landscape)
  - External panel
    - HDMI 4096 x 2160 @ 60 Hz (2D – landscape)
    - HDMI 1920 x 1080 @ 60 Hz (3D – frame packed mode)
- Use of line buffering to avoid re-fetching data from memory on subsequent lines
- Line buffer free dithering: temporal dithering
- HDMI 1080i and some HDMI YUV output formats are supported (BT.601, BT.709)
- Efficient fetch for scaling (select windows)
- Improved handling of display buffer underflow (select windows)
- Supports high-quality scaling/filtering (select windows)
- Supports up to Quad Full HD resolution (3840 x 2160)
- Support for Image Rotation in hardware
- Supports semi-planar YUV (input surface format)

- Extending the cursor size to 256x256 with full color and alpha-blending
- Display Color Management unit (based on a LUT and CSC in the output path)
- Layered blending among all windows
- Independent cursor update/activate control

24.1.1 Output Capabilities

- 1 or 2 internal panels
  - MIPI-DSI on two 4-lane DSI channels, operating either independently for one or two panels, or ganged together as 2x4 for a single panel
    - Maximum panel size of 3840 x 1920 @ 60 Hz using 2x4-lane ganged DSI channels
    - Independent resolution and pixel clock when not ganged
  - eDP supports 18/24 bpp, 1/2/4 data lanes, RBR/HBR/HBR2 up to 3840x2160 @ 60Hz
  - DSC supported by MIPI-DSI
    - Maximum panel size of 4096 x 2304 @ 60 Hz
  - 1 external display
  - On HDMI. Maximum 1920x1080p @ 60 Hz (3D) or 4096x2160 @ 60Hz (2D)
  - DisplayPort or HDMI 4096x2160 @ 60 Hz (2D)
  - With HDCP and multi-channel audio (HDMI 2.0 and DHCP 2.2)

Note: *The display controller only outputs RGB444 or YUV444 format to the output interface controllers (DSI, SOR). Refer to the chip output formats in the individual interface sections.*

24.1.2 Color Management Unit (CMU)

- Gamma (tone curve) conversion
- Color gamut conversion
- Allow conversion of sRGB content for a non-sRGB panel, for predictable colors (color matching)
- Enhanced PRISM2 display for these panels, as the PRISM2 algorithm assumes sRGB gamma
- Enable TCON and panels with non sRGB response
- Allows color calibrated displays, and enables end-to-end Camera / ISP -> Display color quality

24.1.3 Windows A/B/C

- Data Formats include (see Section 24.3.5: Surface Formats for a complete list):
  - B4G4R4A4
  - B5G5R5A, AB5G5R5, B5G6R5
  - B8G8R8A8, R8G8B8A8
  - YCbCr420P, YCbCr422P, YCbCr422RP (planar format)
  - YCbCr422 (packed format)
  - YCrCb420SP, YCrCb422SP (semiplanar format)
  - Palletized format limited to 8-bit mode
- Three 256x8-bit RAMs (color palette) used for gamma correction

- Horizontal and Vertical Flip
- Horizontal and Vertical Scaling
  - Horizontal scale-down by up to 4x, subject to clock speed limitations
  - Vertical scale-down by up to 4x for 2 bytes per pixel or 2x for 4 bytes per pixel, again subject to clock speed limitations
  - Scale-up by up to 4000x (from 1 pixel to 4000 pixels)
- Filtering (Windows A/B/C)
  - 6-tap, 16-phase programmable H filter
  - 2-tap, 16-phase programmable V filter
- YCbCr to RGB color space converter (Windows A/B/C)
- Digital Vibrance (8-level)

The table below describes a breakdown of features for a Tegra X1 Display on a window basis. Note that rotation is supported up to 2560x1600. Also note that system bandwidth, power, and other constraints might limit what combinations of resolution and features are achievable.

Table 120: Window Feature Summary

Head	Maximum Window Resolution @ 60 fps	Window	Planar Rotation	Packed Rotation	Compressed Surfaces (32 bpp RGBA)
A Without Rotation	4096x4096	A, B, C	-	-	Y
	4096x4096	D, T	-	-	N
	256x256	Cursor	-	-	N
A With Rotation	4096x2304	A	Y	Y	Y
	4096x4096		N	Y	Y
	4096x4096	B	N	Y	Y
		C	N	Y	Y
B Without Rotation	4096x4096	A	-	-	Y
		B	-	-	Y
		C	-	-	Y
	256x256	Cursor	-	-	N

24.1.4 Windows D/T (Simple Windows)

Windows D and T are similar, generic windows with limited features for supporting status bars, soft buttons, and similar use cases. Window T has additional TrustZone semantics and limitations.

Windows D/T, collectively known as “simple windows”, support a subset of the registers used by the full-featured windows A/B/C.

The following table summarizes the differences among the two windows.

Table 121: Windows D/T Summary

Feature	Window D	Window T
32/16 bpp RGBA	Y	Y
Syncpt	Y	N
STATE_CONTROL shadow	Y	N
TrustZone Secure mode	N	Y
Indirect access (DISPLAY_WINDOW_HEADER)	Y	N

Table 121: Windows D/T Summary

Feature	Window D	Window T
Class (Host1x command) access	Y	N [secure mode]

24.1.4.1 Feature Limitations

Windows D/T have similar window datapath features. Unlike window T, window D has syncpt increment and state control similar to windows A/B/C. Limitations of windows D/T relative to A/B/C include:

- Color depth is limited to a subset of RGB/RGBA single-plane formats. YCbCr/YUV/palette formats are not supported. The following formats are supported:
  - T_R8G8B8A8 – Tegra 4-style RGBA cursor uses
  - T_A8R8G8B8 – Tegra 3/Tegra 4 common 32-bit format
  - T_A8B8G8R8 – Tegra 3/Tegra 4 common 32-bit format
  - T_R5G6B5 – Best quality 16bpp format
  - T_A4R4G4B4 – 16bpp format with 4-bit alpha
  - T_A1R5G5B5 – 16bpp with 1-bit alpha format, better quality
- No scaling or filtering (DDA_INCREMENT, H/V_FILTER_ENABLE)
- Blending is limited to per-pixel alpha (ALPHA_WEIGHT and PREMULT_WEIGHT) and fixed alpha (FIX_WEIGHT). No color key or dependent weight (i.e., no dependence on non-secure pixels)
- The following features are not supported:
  - Block linear
  - H_DIRECTION, V_DIRECTION
  - Rotation (SCAN_COLUMN)
  - DV (digital vibrance)
  - BYTE_SWAP
  - TILE_MODE
  - H/V_INITIAL_DDA
  - DDA_INCREMENT (no scaling)

Window T has some additional feature limitations:

- No syncpt increment
- No indirect access using DISPLAY_WINDOW_HEADER – only window direct space is supported
- No class writes in secure mode. Class writes are always non-secure and therefore cannot be used in secure mode.
- Register activation and shadow control do not use STATE_CONTROL/STATE_ACCESS/REG_ACT_CONTROL. Separate registers are used.

24.1.4.2 Blending

Window D/T supports a subset of window blending registers. Because color key is not supported, only MATCH case exists.

24.1.4.3 Window T TrustZone Support

The display controller supports the ability to display TrustZone secured content in window T. Registers and memory interface in window T are separate from the other windows.

The display controller can be configured at boot time between Secure and non-Secure modes. In Secure mode, window T is composited on top of 4 non-secure windows, and the cursor is disabled. The Non-secure OS can continue to run as normal, but

its windows maybe obscured. All other semantics for the non-Secure OS are unchanged, including register reads, sync points, and interrupts.

TZ_SECURE is not intended for digital media DRM; the Video Protection Region is intended for that. The TZ_SECURE window T also does not have sufficient features for video use cases. TrustZone and VPR are orthogonal. TZ_SECURE does not require a VPR region, and VPR region access does not require TZ_SECURE.

Only displayA (internal display) has window T. But, both display A and displayB (external display) have TrustZone Secure host interfaces and implement the SECURE_CONTROL register. This allows the Secure OS to control the displayB output to DSI.

The display controller allows window T to use an alternate MC address-space ID (ASID) so that secure and non-secure address translation and attributes can be different. Window T is hardcoded to a different SWID (via the swid signal) from all other windows. Software can either program the two SWIDs to different ASIDs or to the same ASID.

The display controller allows disabling CRC in Secure mode, so that non-secure software cannot gain information about trusted display by examining the CRC.

Secure Mode Limitations

The TrustZone Secure OS mode has these limitations:

- No hardware cursor. The cursor could be used to spoof secure window.
- No use of display syncpt increment, interrupt or raise. The single interrupt line is shared by the whole head (all windows).
- DISPLAY_WINDOW_HEADER should not be used by TrustZone. TrustZone must use “window direct” address range only.
- Only direct Host1x writes can support TZ_SECURE accesses; indirect and CDMA/class writes might not.
- The Host1x channel should not be shared with non-TZ OS. If unavoidable, only Host1x direct read/write should be done. In particular, non-atomic Host1x sequences, such as indirect register writes, should be avoided.
- STATE_CONTROL, STATE_ACCESS, and REG_ACT_CONTROL must not be used by TrustZone. SECURE_STATE_CONTROL and WIN_T_STATE_ACCESS should be used instead.
- Display CRC includes the Secure Window which could confuse the non-Secure OS, if the latter uses CRC. This applies to functions like NvDPS.
- Secure window affects PRISM2 and thus backlight brightness. It might interact poorly with SD_WINDOW* region, for example.
- Bandwidth used by window T must be accounted for in DVFS, IMP, etc.

24.1.4.4 DVFS Support

Windows D/T are also responsible for generating DVFS readiness signals similar to those generated by MEMFETCH windows. The requirements for generating ready_for_latency_event for windows D/T DVFS are the same as for full featured windows.

24.2 Block Diagrams

Figure 83: Display Controller Front End Block Diagram

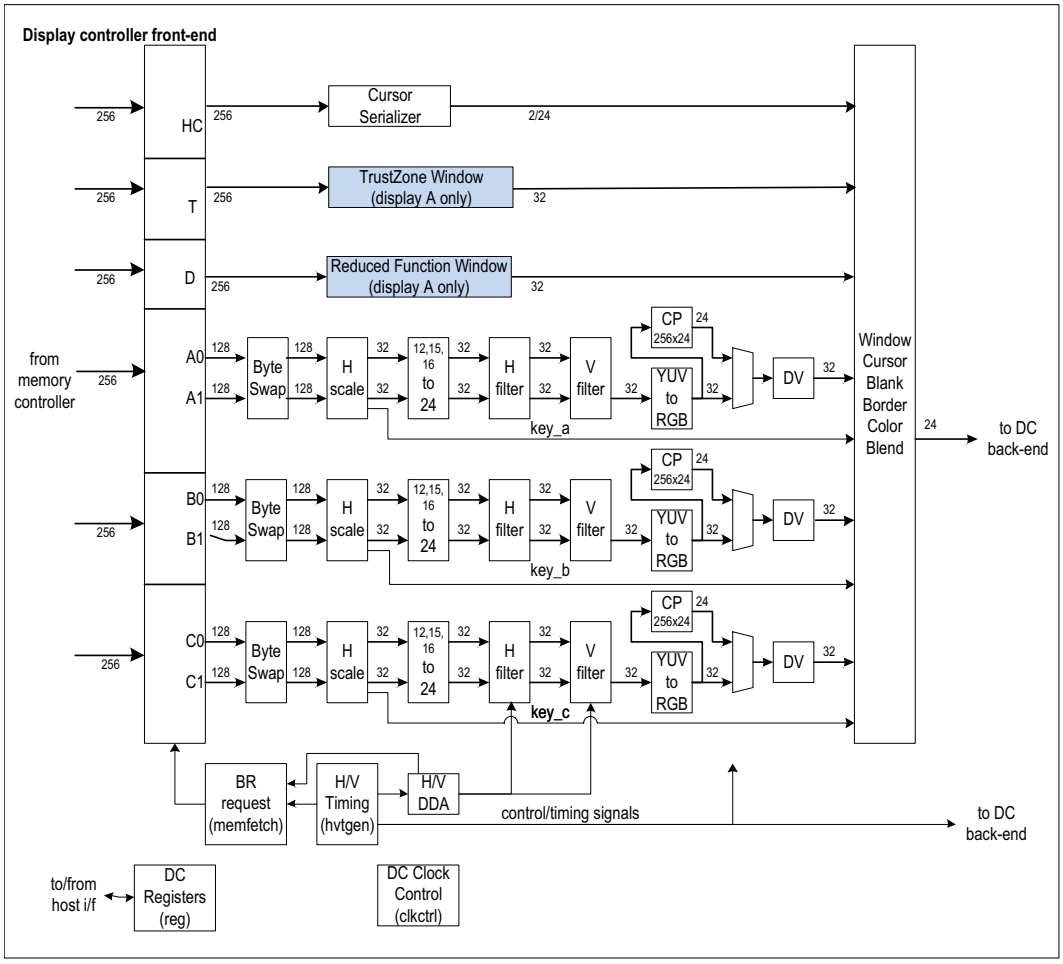

Figure 84: Display Controller Back End Block Diagram

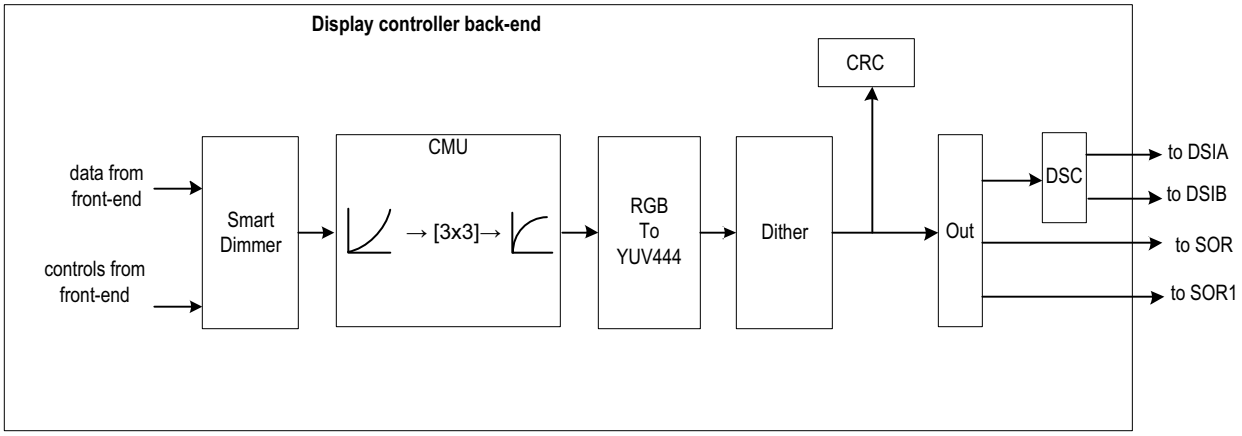


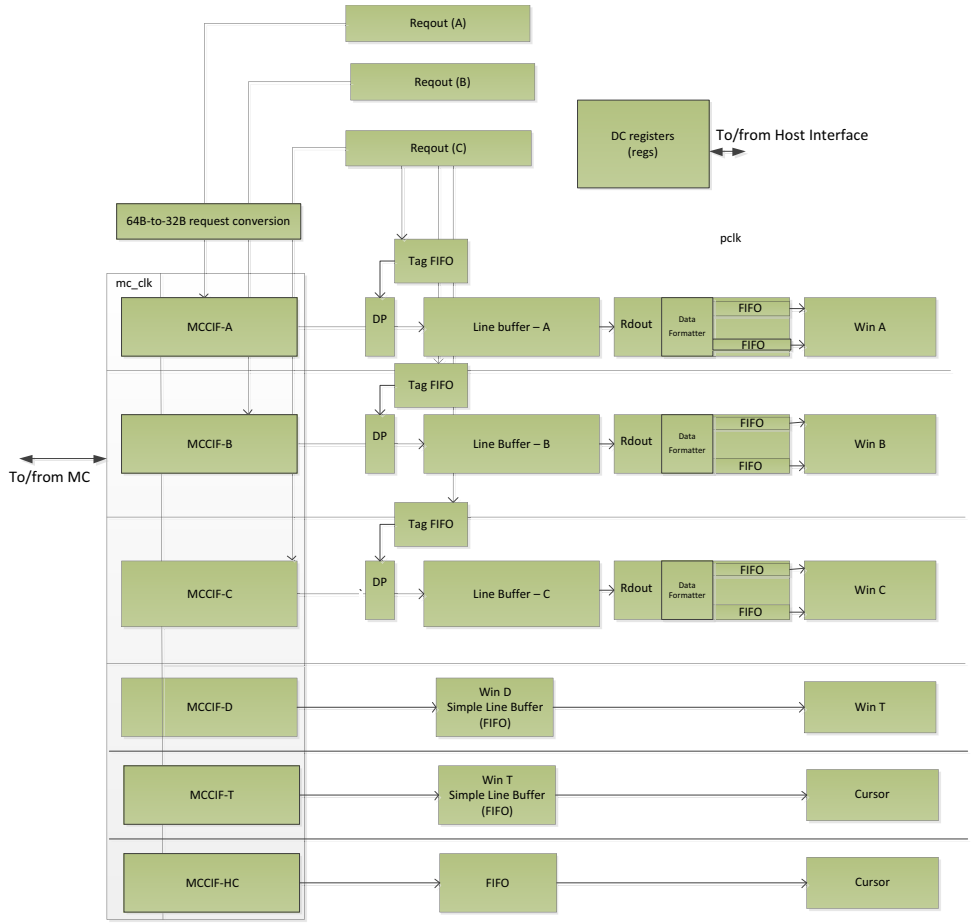
24.3 Display Controller Description

24.3.1 MEMFETCH

The following figure shows the top-level block diagram of the display memory interface for Tegra X1 devices. The diagram shows the memory fetch engines associated with the three full-featured windows and two simple windows in the display controller. Each window memory fetch engine has a line buffer and MCCIF. In addition to the windows, display also uses a memfetch for cursor.

Requests are issued to the memory and data is returned via MCCIF to the window line buffer. Data from the line buffer is subsequently read out, unpacked and passed to the window scaler and filter units. Windows D/T and the cursor fetch engines do not contain line buffers.

Figure 85: Memfetch Block Diagram



24.3.1.1 Request Engine

The request engine is responsible for fetching the window image from memory. Logic to translate the X, Y coordinates to a linear memory address is used to make requests to memory.

A pulse signal is sent to the request engine from the display timing generator at the beginning of the vertical blanking period to alert the request engine to start requesting the image data. Tagged requests are sent to the MCCIF. The thread ID specifying the line location of the return data is passed to the tag FIFO between the request and response engines. The thread ID is read by the data packer block when the return data is received and the data is steered to the appropriate line(s) in the line buffer.

The request engine must handle the following surface formats:

- Pitched linear surface

- Block linear surface
  - 16B x 2 lines – subset of 32B x 2 lines (rotation disabled)
  - 16B x 2 lines – subset of 16B x 4 lines (rotation enabled or CDE enabled)

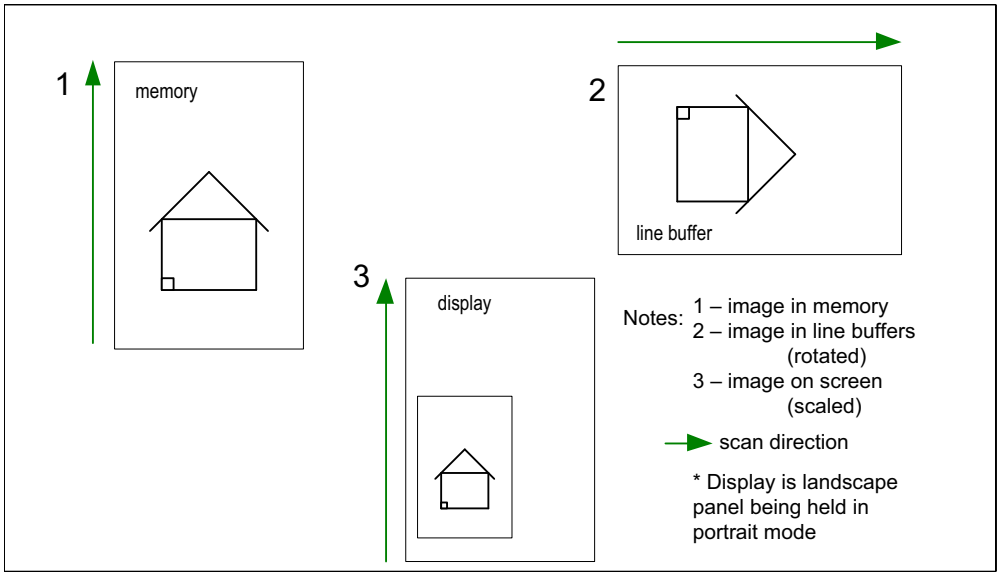
Requests are only stalled by:

- Backpressure from MCCIF
  - Occurs when MCCIF reorder buffer allocation is full
  - MCCIF reorder buffer size is 6KB
- Tag FIFO full
  - Each tag represents 64-byte line buffer entry
  - Current tag FIFO depth sized at 119 entries
  - Allows for slightly over 7KB requests
  - Tag FIFO depth should be slightly greater than possible MCCIF outstanding requests

Rotation Support

The display supports 0°, 90°□180°, or 270° rotation or image flip. To support rotation, the memfetch unit rotates the data at the input to the line buffers. That is, memfetch walks the Y axis and stores these columns in memory as rows to the display. The figure below illustrates the image orientation and shape at different stages in the pipeline for rotation.

Figure 86: Example Rotation Use Case



Memfetch only supports rotation in block linear mode. This is due to the amount of horizontal pixel data read in pitched linear versus block linear format. For pitched linear, 32B of horizontal data is fetched compared to block linear format where only 16B of horizontal data is fetched using the 16B x 4 line block linear mode. Since rotation switches rows and columns, the 4 horizontal pixels become 4 rows in the line buffer. Therefore the minimum number of lines when rotation is enabled is 4. The number of lines grows to 5 when scaling is enabled.

The request for 16Bx4 format must be communicated to the MCCIF via addressing bits 6 and 7. Memfetch will increment the Y instead of X coordinate for subsequent accesses and after reaching maximum Y will reset the coordinates to (X+16B, 0) for the next fetch of columns from memory. Selection of 32Bx2 or 16Bx4 is based on B_SCAN_COLUMN used to indicate rotation

The B_SCAN_COLUMN bit indicates if the image needs to be scanned out row by row or column by column. When this bit is enabled, the display needs to scan out lines column by column. This will provide the required 90°/270° rotated images. To achieve 90° or 270° rotation, software must use a combination of H_DIR, V_DIR, and SCAN_COLUMN as shown in the table

below. It illustrates how the image is scanned in to display by the memfetch unit for each combination of (SCAN_COLUMN, H_DIR, V_DIR).

Table 122: Rotation Cases

SCAN_COLUMN	H_DIR	V_DIR	Orientation
0	0	0	0 degrees
0	0	1	N/A – vertical flip
0	1	0	N/A – horizontal flip
0	1	1	180 degrees
1	0	0	N/A – vertical flip followed by rotation
1	0	1	90 degrees
1	1	0	270 degrees
1	1	1	N/A – horizontal flip followed by rotation

The window dimension registers can be confusing when rotation is introduced. Therefore it is important to note which registers apply to pre-rotation and which to post rotation.

The following registers apply to pre-rotation:

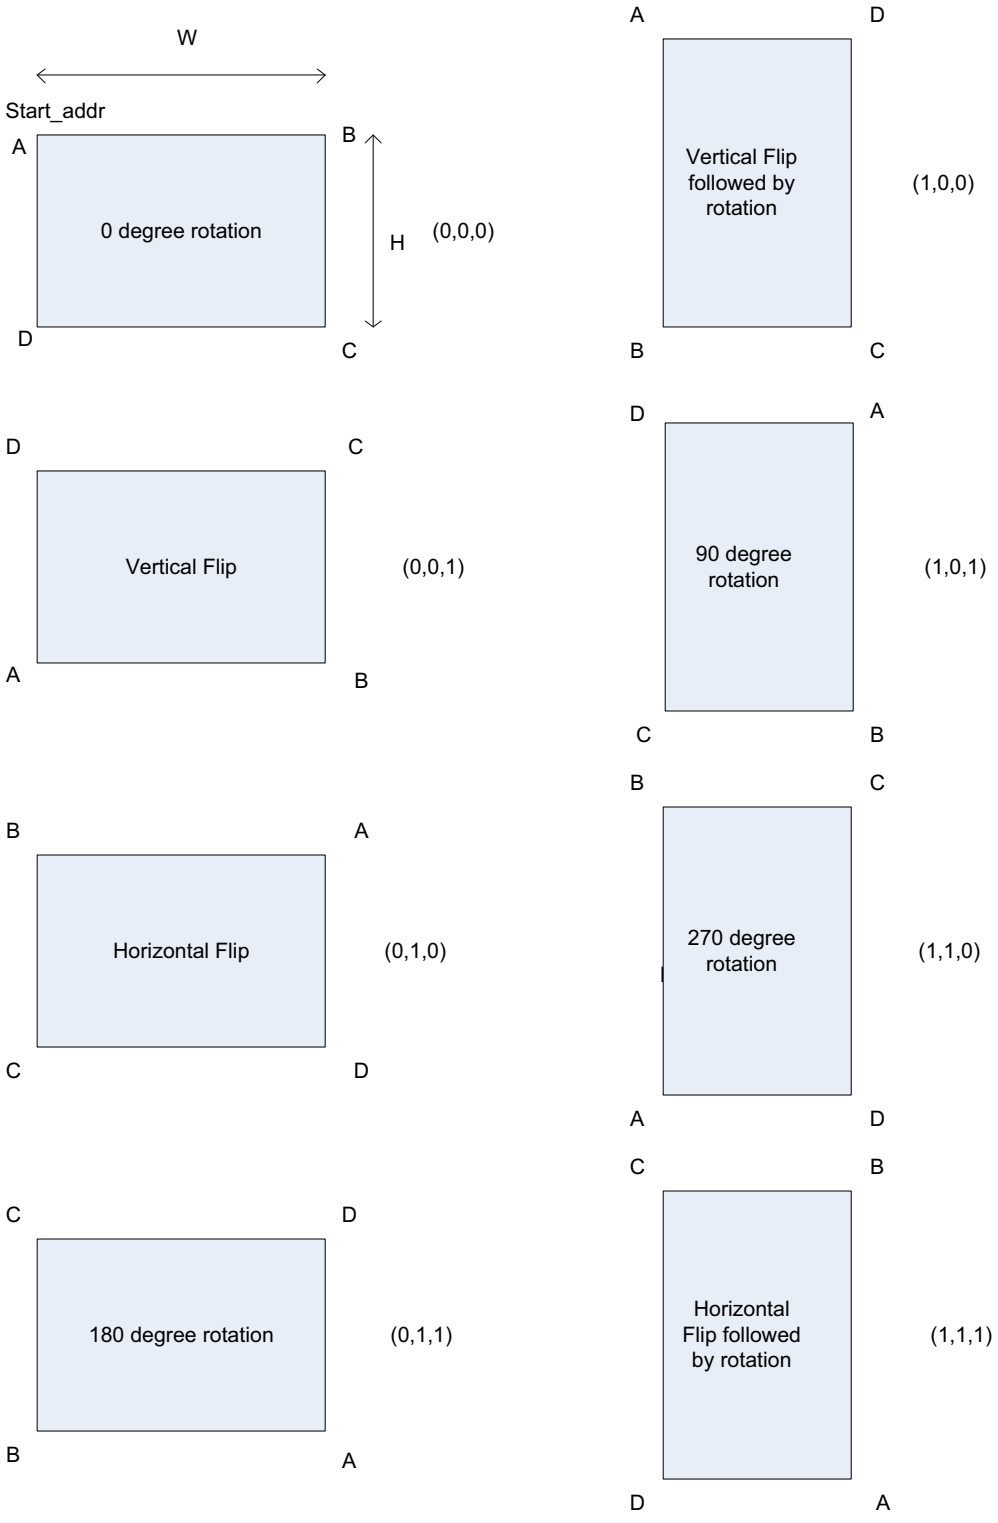
- B_WIN_OPTIONS
  - H_DIR
  - V_DIR
  - SCAN_COLUMN (“column” refers to surface pre-rotated columns)
- B_LINE_STRIDE
- B*_BUF_STRIDE
- B_START_ADDR_*
- B_ ADDR_H_OFFSET_*
- B_ ADDR_V_OFFSET_*

The following registers apply to post rotation:

- B_WIN_OPTIONS
  - H_FILTER*
  - V_FILTER*
- B_PRESCALED_SIZE
- B_SIZE
- B*_INITIAL_DDA
- B_DDA_INCREMENT

Because the memfetch unit is essentially walking the Y axis in memory, the majority of the window registers and associated logic remain unchanged. Therefore except for B_ADDR_H/V_OFFSET horizontal and vertical directions are with respect to post rotation.

Figure 87: Rotation Combinations



24.3.1.2 Line Buffer

The memfetch line buffer allows the display controller to retain one or more scan lines of window data locally so that no further reading of the scan line is required from memory. The scenarios where this is required are:

- Vertical scaling and filtering
  - Requires 3 scan lines of data for non-rotated memory fetches

    - Requires 5 scan lines of data for non-rotated memory fetches of packed data when compression is enabled
    - Requires 5 scan lines of data for rotated memory fetches of packed data
- Reading block linear data
    - Data is sent in 2 scan lines for non-rotated memory fetches
    - Data is sent in 4 scan lines for non-rotated memory fetches with compression enabled
    - Data is sent in 4 scan lines for rotated memory fetches

Data is received from the memory interface and steered to the proper location in the line buffer based on the thread ID in the tag FIFO. Data is read out of the line buffer and unpacked based on the pixel format. These pixels are placed in an output FIFO of memfetch to be sent to the window scaler logic in the display pipe.

In the vertical scaling and filtering scenario, up to five scan lines of data are required for the vertical scaler engine for it to generate the proper scaled output. In the block linear mode scenario, only a single scan line is output but the 32B returned data contains portions of two scan lines. To ensure adequate storage of RGB packed data format and steady bandwidth consumption to the display controller, line buffers are deep enough to hold up to five lines of maximum width of packed pixel data based on the maximum use-case supported by the given window.

Support for YUV planar rotation when reading data in BL 16Bx4 format requires a larger amount of data storage. Each plane of data will return 16B per color component. Due to scaling, it is required to keep a scan line of data in the buffer when fetching the next block of 16. This will require an additional byte of data. Therefore the buffer requirements for YUV planar are:

- Number of bytes per plane = 17 bytes
    - Minimum data fetch size = 16 bytes
    - Scaling requires additional scan-line remain
    - Pixel component depth per plane = 1 byte
- Number of planes = 3
- Line buffer width = Maximum width + 64 bytes
- Line buffer size = 17 bytes/plane* 3 planes/pixel * (maximum width+64) pixels per line
- Line buffer size for Y plane = (17 bytes/plane * 3 planes/pixel + 1 extra Y plane) * (maximum width+64) pixels per line

Since the line buffer storage requirement for YUV planar is close to three times (3X) the RGB packed format, the Tegra X1 display only supports buffering support for YUV planar rotation on 1 window. This restriction applies to YUV422 packed data as well due to the implementation of expanding the data to YUV444 in the line buffer. The other two windows will contain buffering to support non YUV planar rotation.

Below are the equations used to calculate buffer requirements for a given rotated video image.

- YUV444 (packed):
    - Scaling – 5 lines * (4Bpp*width + 64 bytes)
    - No scaling – 4 lines * (4Bpp*width + 64 bytes)
- YUV422 (packed):
    - Scaling – 9 lines*4Bpp (as data is expanded)* width + 9*64 bytes
    - No scaling – 8 *4Bpp(as data is expanded)*width + 8*64 bytes
- YUV Planer:
    - Scaling: (3 (number of surfaces)*17+1) * (width+ 64 bytes)
    - No scaling: 3 (number of surfaces)* 16 * (width + 64 bytes)

The line buffer helps to prevent refetching of data from memory. The line buffer must also account for invalid bytes fetched within a line due to address offset. This adds 64 bytes per line per plane (after aligning the line width in bytes to a multiple of 64).

The line buffer size requirement to prevent refetch depends on the use case. Based on the use case and method of packing/unpacking pixels stored in the line buffer, there will be an inherent pixel latency associated with the buffer. The memory controller can take advantage of this latency to temporarily stop sending pixel data to the display for cases such as changing the memory clock frequency.

Note that the line buffer can be written or read either with single or multiple lines per clock. For rotation use cases, line buffers load up to 16 lines at a time based on pixel format. Line buffers are read one or two lines at a time based on vertical scaling. The following tables and figures illustrate the line buffer size as well as inherent latency for various use cases for packed ARGB formats (4Bpp). For rotation use cases only block linear formats are supported. Remember that for rotation, block linear format is 16Bx4 lines.

Table 123: Non-Rotation Use Cases

Scenario	Vertical Scaling Enabled	Data Format	Line buffer size required to avoid refetch	Latency Tolerance Guaranteed by Line Buffer
A	NO	Pitched Linear	0	0 lines
B	NO	Block Linear	1 line	0 lines
C	YES	Pitched Linear	1 line	0 lines
D	YES	Block Linear	3 lines	0 lines
E	YES	Block Linear	5 lines (for compression enabled)	0 lines

Table 124: Rotation Use Cases

Scenario	Vertical Scaling Enabled	Data Format	Line buffer size required to avoid re-fetch	Latency Tolerance Guaranteed by Line Buffer
A	NO	Block Linear	4 line	1 line
B	YES	Block Linear	5 lines	0 lines
C	NO	YUV Planer	16 line	1 line
D	YES	YUV Planer	17 lines	0 lines

The latency tolerance refers to the number of lines available in the line buffer when the line buffer is full between when a given pixel is written to and read from the line buffer. For some of these use cases, there is a relatively long period of time after a pixel is written to the buffer before it is needed in the scan line. However, note that in every case where a scan line or more of data exists, the scan lines are being written at a rate of ½ or ¼ of the pixel clock rate since either 2 or 4 scan lines are being read at once from memory at a rate of 1 pixel per clock.

The fixed sizes of the Tegra X1 display buffers is given below. Each buffer size has a corresponding “maximum use-case” scenario from those listed above. For those scenarios that are not “maximum use-case”, the portion of the line buffer beyond what the scenario required can be used as latency buffering. Even the “maximum use-case” scenario can use a portion of the pixel latency as latency buffering.

Table 125: Window Class Line Buffer Sizes

Windows	Line Buffer Size (KB)	Maximum Use-Case	Maximum Surface Size
DisplayA WinAD	150	Rotation/Vertical Scaling/Block Linear/Planar	4096x2304
		Rotation/Vertical Scaling/Block Linear/Packed/Compression	4096x4096
DisplayA WinB/C	108	Rotation/Vertical Scaling/Block Linear/Packed/Compression	4096x4096
		Non-rotation/Vertical Scaling/Block Linear/Packed/Compression	4096x4096
DisplayB Win A/B/C	108	Non-rotation/Vertical Scaling/Block Linear/Compression	4096x4096
Window D/T	18	No scaling/non-rotation/non-block-linear/non-compression/RGBA only	4096x4096

To take advantage of the portion of the line buffer dedicated for handling latency MEMFETCH will send flags to the MC indicating when a programmable threshold is crossed. For each scenario, software must calculate the portion of the line buffer that can be used for latency buffering and set the threshold accordingly. Below is a list of the flags MEMFETCH will generate:

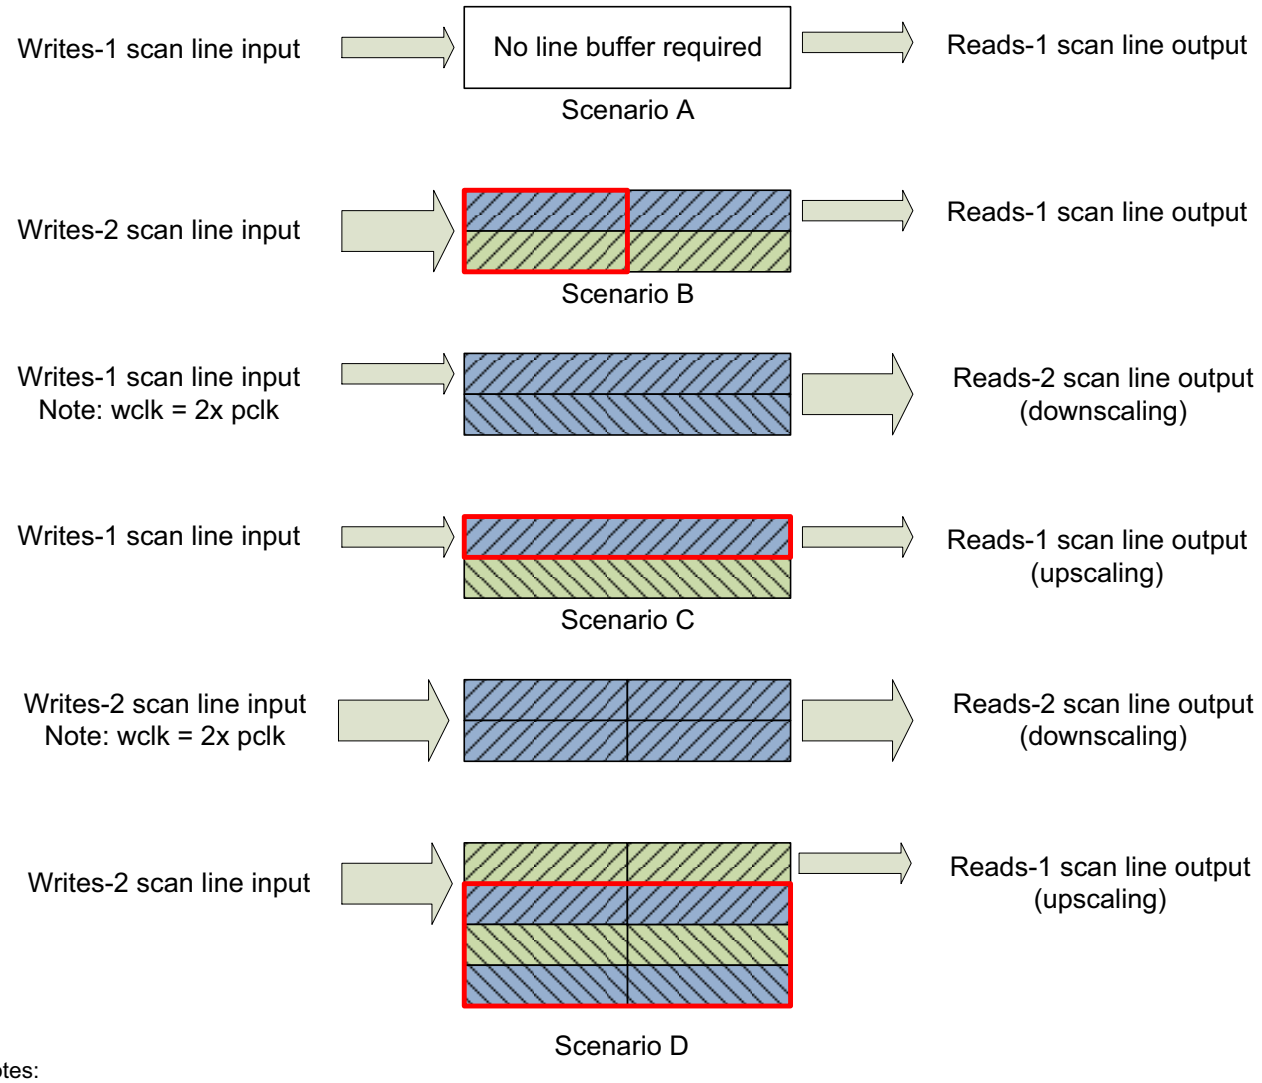
- SPOOLUP
  - Signal name: csr_display0a2mc_spool_up
  - Active from when data is requested during Vblank until active space
  - Active space starts with 1st pixel of window sent to display pipe
- DVFS readiness flag
  - Requires HWM threshold
  - Signal name: csr_display0a2mc_ready_for_latency_event
  - Active when:
  - Buffer exceeds HWM threshold
  - Window is disabled
- From the time all data is read for current frame until data is requested for subsequent frame
  - Deactivated with occurrence of underflow for the remainder of the frame
- LATENCY ALLOWANCE SCALE FACTOR buffering
  - Requires HWM/LWM thresholds
  - Signal names:
  - csr_display0a2mc_la_th_above_hi = level > HWM
    - deactivate with occurrence of underflow for remainder of frame
    - activate when window is disabled
  - csr_display0a2mc_la_th_below_lo = level < LWM
    - activate with occurrence of underflow for remainder of frame
    - deactivate when window is disabled

The programmable threshold will simply keep a running count of the number of bytes in the buffer and compare that value against the one in the threshold register.

Line buffering for planer YUV requires separate storage per plane. Each line is read by sending 1KB of Y requests followed by 1KB of U then 1KB of V requests. This is maintained until the entire line of YUV is read. Subsequent line requests are not issued for any component until all component requests have been issued for the current line. MEMFETCH does allow for changing the weights of the given requests per plane to help control the behavior of the requests per plane.

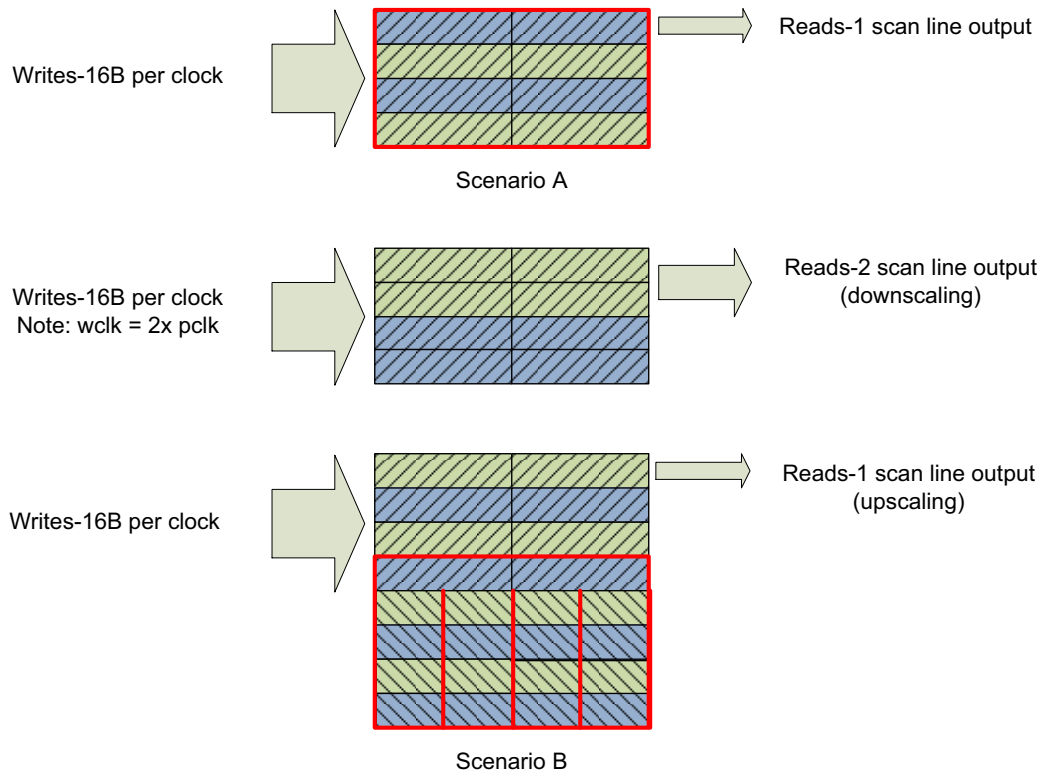
For non-rotated YUV planer use cases, the size of the line buffer is less than that of 4B ARGB since the pixel format is only 1.5B/pixel. However rotated planer YUV requires storage of 16B for each line per plane. Contact your NVIDIA AE should you need further support on this.

Figure 88: Non-Rotation Line Buffer Use Cases



Notes:
- Diagonal Lines represent the order in which data is written to the buffer (Two rows that have the same line pattern are written in parallel)
- Color represents the order in which data is read from the buffer (the same color indicates the rows are read in parallel)
- Red box indicates the line buffer size required to avoid refetch

Figure 89: Rotation Line Buffer Use Cases



Note:
- Diagonal lines Indicate the order in which data is written to the buffer.
  If the two rows have same line pattern, they are written in parallel.
- Color indicates read pattern
- Red boxes indicate line buffer size needed to avoid refetch
- Red lines indicate progress of filling line buffer as scan lines are read

24.3.1.3 Handling of Underflow

Display is an isochronous client that requires a steady bandwidth allocation. If data is not returned at a fairly constant rate and the line buffers run dry then data will not appear on the screen at the proper time. Eventually when data does start to flow to the display controller the image will appear shifted and there is no way for the image data to catch up to where it should be on the screen. This undesirable lack of guaranteed data is called underflow and it can happen in 2 forms:

- Short term underflow – pixels worth of missing data
- Long term underflow – scan-lines worth of missing data

For short term underflow it is possible for the display controller to catch up to the correct pixel by the start of the next scan-line by reading pixels during the horizontal blanking period. Short term underflow is being managed by Tegra display controller in this manner. For long term underflow it would be impossible for the display controller to throw out that much data. Short term underflow may arise when the memory controller is over-taxed based on a momentary surge in memory client requests. Long term underflow may happen when memory controller frequency changes are being made.

Tegra X1 display windows will address short term underflow similar to what is done in Tegra 3. Long term underflow is also handled in a manner similar to Tegra 3 during the active frame portion. Below is a description of Tegra X1 Underflow recovery improvements:

- Underflow recovery within a frame
  - Start counter of underflow pixels when underflow occurs
  - Last valid pixel is held at the beginning at the display pipeline for duration of the underflow

- Underflow pixels that eventually return to display are stored in line buffer and immediately read/discarded
- Operation continues (even during HBlank) until all underflow pixels have been discarded
- Once valid pixel is present at display pipe input memfetch operations return to normal mode
- Limit requests issued at the end of a frame if window is in underflow using the following method:

For cases when underflow continues to the end of the frame

- Add threshold counter (B_UFLOW_THRESHOLD)
- Track prescaled scanout
- Stop issuing frame requests when
  - prescaled scanout + threshold is > prescaled size

- Underflow recovery between frames
  - Add a frame bit to the tag FIFO to allow DP logic to determine which of the responses that are coming back are for the previous frame
  - Drop pixels from previous frame at 64B/pclk rate
  - Within display pipe, reset the underflowed pixel counters
  - Limit requests issued at the end of a frame if window is in underflow using method described above
  - Last pixel of previous frame is displayed

The Tegra X1 display handles cursor underflow in the following manner:

- Interface between memfetch and display pipeline senses when underflow occurs.
- For simple windows, the display pipe drives the last valid pixel for the duration of the underflow.
- When underflow occurs display pipeline drives a cursor alpha value of 0 for the remainder of the underflow period. This could be until the end of 1 or more scan lines.
- Memfetch will not drive valid to the display pipeline until the start of the scan line when data is available.
- Display pipeline will not assert ready to memfetch until the beginning of the scan line when data is available and memfetch is driving valid.
- Memfetch keeps track of number of clocks of missing data and when data does appear it reads out the data until the end of the scan line is reached.

It is important to highlight underflows for debug purposes. Current display units raise an interrupt to indicate that underflow has occurred. The Tegra X1 display continues to drive an interrupt when an underflow is detected. To further assist with highlighting underflows, memfetch drives a solid color from the window that experiences an underflow if the associated enable bit is active.

24.3.2 Display Stream Compression (DSC)

The DSC compression block takes pixel/control signals from the display and outputs compressed data to the DSI. The DSC block is compliant with VESA Display Stream Compression (DSC) Standard v1.1.

24.3.3 Color Decompression Engine (CDE)

The Color Decompression Engine (CDE) resides on the VIC and Display memory read interfaces. It transparently converts regular requests sent by the VIC or display unit to compressed requests, and decompresses data in the read responses on-the-fly before sending it back to the client. Compressed surfaces are created by the GPU. Refer to Chapter 25: Color Decompression Engine in this TRM for more information.

24.3.4 Interlaced Fields

To support set top boxes, the Tegra X1 display supports interlaced format, which is still prevalent in many television displays and broadcast networks. Interlaced format requires half the bandwidth of progressive and alternates sending fields containing odd and even lines of the original video frame.

The CEA Standard (CEA-861-E) defines these interlaced fields as FIELD1 and FIELD2. FIELD1 contains the even lines (line 0, 2, 4, etc.). FIELD2 contains the odd lines (line 1, 3, 5, etc.). From a consumer electronic display perspective, FIELD1 contains the top lines, and FIELD2 contains the bottom lines.

Memfetch contains start (base) addresses for both fields and when interlaced mode is enabled it will toggle between these base addresses every frame. Memfetch will continue to toggle between FIELD1 and FIELD2 fields until interlace mode is disabled. When interlace mode is disabled, memfetch only uses the normal (FIELD1) registers.

IMPORTANT: The first field that is fetched when interlace mode is based on HVTGEN field1/field2 field status. It is up to software to ensure that proper field being fetched is ready when activating interlace mode in memfetch.

No parameter other than start address and offset can change between fields such as size and stride.

To support double buffering of interlaced fields, software is required to update field1/field2 base addresses on a frame (not a field) boundary. Because the display is treating each field as a frame, software should make sure that updates only occur after an even number of frame SYNCPTS are received. It is strongly suggested that both field1 and field2 fields are ready in memory when performing the buffer swap to avoid coordinating field updates based on current field scanout.

24.3.5 Surface Formats

The following table lists the surface formats supported by the Tegra X1 device. The 32-bit RGBA formats that support compression are bolded.

Name (MSB..LSB)	Legacy Name (LSB..MSB)
T_P8	P8
T_A4R4G4B4	B4G4R4A4
T_A1R5G5B5	B5G5R5A
T_R5G6B5	B5G6R5
T_R5G5B5A1	AB5G5R5
T_A8R8G8B8	B8G8R8A8
T_A8B8G8R8	R8G8B8A8
T_U8_Y8__V8_Y8	CbYCrY422 YCbCr422
T_U8_Y8__V8_Y8_TRUE	UYVY422 YUV422
T_Y8___U8___V8_N420	YCbCr420P
T_Y8___U8___V8_N420_TRUE	YUV420P
T_Y8___U8___V8_N422	YCbCr422P
T_Y8___U8___V8_N422_TRUE	YUV422P
T_Y8___U8___V8_N422R	YCbCr422RP YCbCr422R
T_Y8___U8___V8_N422R_TRUE	YUV422RP YUV422R
T_A4B4G4R4	R4G4B4A4
T_A1B5G5R5	R5G5B5A
T_B5G5R5A1	AR5G5B5
T_X1R5G5B5	B5G5R5X1
T_R5G5B5X1	X1B5G5R5
T_X1B5G5R5	R5G5B5X1
T_B5G5R5X1	X1R5G5B5
T_B5G6R5	R5G6B5

Name (MSB..LSB)	Legacy Name (LSB..MSB)
T_X8R8G8B8	B8G8R8X8
T_X8B8G8R8	R8G8B8X8

T_Y8___V8U8_N444_TRUE	YUV444SP

24.3.6 Horizontal Filter

Memfetch and scaler provide 6 adjacent pixels per clock, along with DDA fraction indicating filter kernel phase. Fraction selects among 16 sets of coefficients for filter kernel.

Note: *When scaling RGBA values, the alpha channel is never filtered, so the output is a point-sampled result.*

24.3.7 Vertical Filter

When enabled, memfetch provides 2 adjacent lines in parallel, which are independently horizontally filtered before being sent to vertical filter. The fractional DDA from vertical scaler (indicating filter phase) selects among 16 filter kernel coefficients. For coefficient entry N, the weights are N and 1-N.

Note: *When scaling RGBA values, the alpha channel is never filtered, so the output is a point-sampled result.*

24.3.8 Color Space Converter

The full-featured memfetch windows A/B/C support color space conversion. The color space converter converts YCbCr and YUV to RGB. It can also do limited RGB to RGB conversions. This feature is different from the CMU CSC, which is post-blending.

24.3.9 Color Palette/LUT

To support gamma adjustment and palletized formats, each window A/B/C has a color palette look-up table (CP LUT) with three 256x8-bit tables, one each for red, green, and blue. The three tables are independent and can represent arbitrary functions. For 4-bit palette modes, only the bottom 16 entries are used.

Note that the LUTs, and subsequent display pipeline, do not have the resolution needed for linear RGB. Thus the CP LUTs cannot really be used to “un-gamma” input data. They can be used for minor adjustments to the tone curve.

24.3.10 Digital Vibrance

Using the same algorithm as NVIDIA GeForce GPUs, digital vibrance can increase the saturation of colors.

24.3.11 Cursor

The cursor supports two pixel formats:

- Legacy 2-bit-per-pixel, where the four values are background color, foreground color, transparent, and invert. Foreground and background color are programmable via registers with 24-bit RGB values. Transparent means cursor is invisible and desktop shows through. Invert means desktop RGB is inverted (red’ = 255 – red, etc.). Pixels are packed 4 per byte, and each line has 16 bytes pitch, regardless of whether it is 32 or 64 pixels wide.
  - Cursor sizes of 32x32 or 64x64
- 32-bpp RGBA pitch linear
  - Full color with alpha
  - Cursor sizes of:
    - 32x32
    - 64x64
    - 128x128
    - 256x256

The blending required for the alpha cursor will occur near the end of the blending pipeline (on top of windows A/B/C/D).

Note: *Legacy cursor does not support per-pixel or global alpha.*

The cursor can be clipped to either the display, or window A, B, or C. Thus the cursor active region for blending must be computed according to that mode. In regions where cursor is clipped, or outside the cursor entirely, blending behaves as if cursor is disabled (i.e., previous blend stage passes through.)

Note: *The Tegra X1 display cursor supports partial clipping but does not support trivial reject of cursor when the cursor is completely outside of the window region. It is the responsibility of software to ensure that the cursor is at least partially visible.*

24.3.11.1 Legacy Support for Blending

The Tegra X1 display controller supports cursor modes used in previous generations of the Tegra display. Legacy cursor blending uses 2 bits per pixel and programming for this mode will remain unchanged.

24.3.11.2 32-bpp RGBA Cursor Mode

In 32-bpp RGBA cursor mode, legacy adaption is disabled. Cursor RGBA is blended with the last stage of the window blending unit. Cursor alpha value controls this blending.

24.3.11.3 Interlaced Cursor Support

To support interlaced output, the cursor performs a progressive-to-interlaced format conversion of the cursor image in memory. Since the cursor is static, no low pass filtering is necessary. The display cursor reads every other line from the square cursor thus reading only half of the lines. Based on the cursor destination Y position and the field, the Tegra X1 display starts reading line 0 or 1 from memory. The decision on whether to start on cursor line 0 or 1 for the first or second field is left to software,

giving more flexibility to manipulate the cursor image and set the offset for a given field. An interlace sequence example for cursor is shown below:

1. Program CURSOR_INTERLACE_ENABLE=1
2. Program CURSOR_INTERLACE_START =1
3. The cursor reads every other line from memory starting at line 1 and stores it to sequential panel lines
4. On the next “frame”, the cursor toggles the line start to 0

   CURSOR_INTERLACE_STATUS = 0
5. The cursor reads every other line from memory starting at line 0 and stores it to sequential panel lines

Repeat steps 2 through 5 in the above sequence when the cursor position is updated and set the cursor start line appropriately.

The cursor interlace control register is shown below. When the CURSOR _INTERLACE_START bit is written, hardware should update the corresponding CURSOR_INTERLACE_STATUS bit to this value. This allows the start line to track updates to the cursor position. The CURSOR_INTERLACE_FIELD1/2_VOFF_INCR bits determine if V_CURSOR_POSITION is incremented by one for that field. The field status is tracked by the hardware cursor logic using HVTGEN interlace field status information.

Table 126: Cursor Interlace Control Register

Field Name	Setting
CURSOR_INTERLACE_ENABLE	Interlace Enable 0=disable 1=enable
CURSOR_INTERLACE_FIELD1_VOFF_INCR	Field1 v position Incr Enable 0=disable 1=enable
CURSOR_INTERLACE_FIELD2_VOFF_INCR	Field2 v position Incr Enable 0=disable 1=enable
CURSOR _INTERLACE_START	Starting line. 0=line 0, 1=line 1
CURSOR_INTERLACE_STATUS	Current line start. Read only. 0=line 0, 1=line 1

There are two possibilities for cursor vertical position in a progressive frame – odd or even line. When breaking a progressive frame into interlaced fields, it is important to know what cursor line number to start on per field when the cursor vertical position starts on an odd progressive line and when it is on an even progressive line. Consider the following examples:

Example 1 cursor starts on line 10:

- V_CURSOR_POSITION = 5
- First line of cursor is at progressive line offset 10

  Corresponds to FIELD1 line 5
- Second line of cursor is at progressive line offset 11

  Corresponds to FIELD2 line 5

Example 2 cursor starts on line 1:

- V_CURSOR_POSITION = 0
- First line of cursor is at progressive line offset 1

  Corresponds to FIELD2 line 0
- Second line of cursor is at progressive line offset 2

  Corresponds to FIELD1 line 1

  Requires setting CURSOR_INTERLACE_FIELD1_VOFF_INCR=1

The following table describes programming mechanism for line start based on progressive frame vertical cursor offset for interlaced fields FIELD1 and FIELD2.

Interlace field	Progressive frame cursor Y offset	
	Odd	**Even**
First field (FIELD1)	CURSOR_INTERLACE_START = Line 1 V_CURSOR_POSITION = INT(Progressive_cursor_y/2) + 1	CURSOR_INTERLACE_START = Line 0 V_CURSOR_POSITION = INT(Progressive_cursor_y/2)
Second field (FIELD2)	CURSOR_INTERLACE_START = Line 0 V_CURSOR_POSITION = INT(Progressive_cursor_y/2)	CURSOR_INTERLACE_START = Line 1 V_CURSOR_POSITION = INT(Progressive_cursor_y/2)

Note: *Programming of CURSOR_INTERLACE registers listed above must line up with the interlaced field in the table. Therefore the register should be written (armed) on the previous field for it to activate on the appropriate field.*

24.3.12 Blending

The Tegra X1 display uses weighted blending between windows. Legacy cursor blending must be disabled when full-color alpha-blended cursor is in use.

In Tegra X1 devices, the display blender has six sequential blending stages. Each window is assigned a depth value. The windows are sorted by depth and assigned to a blend stage. The cursor is the last (top) stage. Each stage combines its pixels with the previous stage according to programmed equations.

Figure 90: Tegra X1 Blender Window Stages

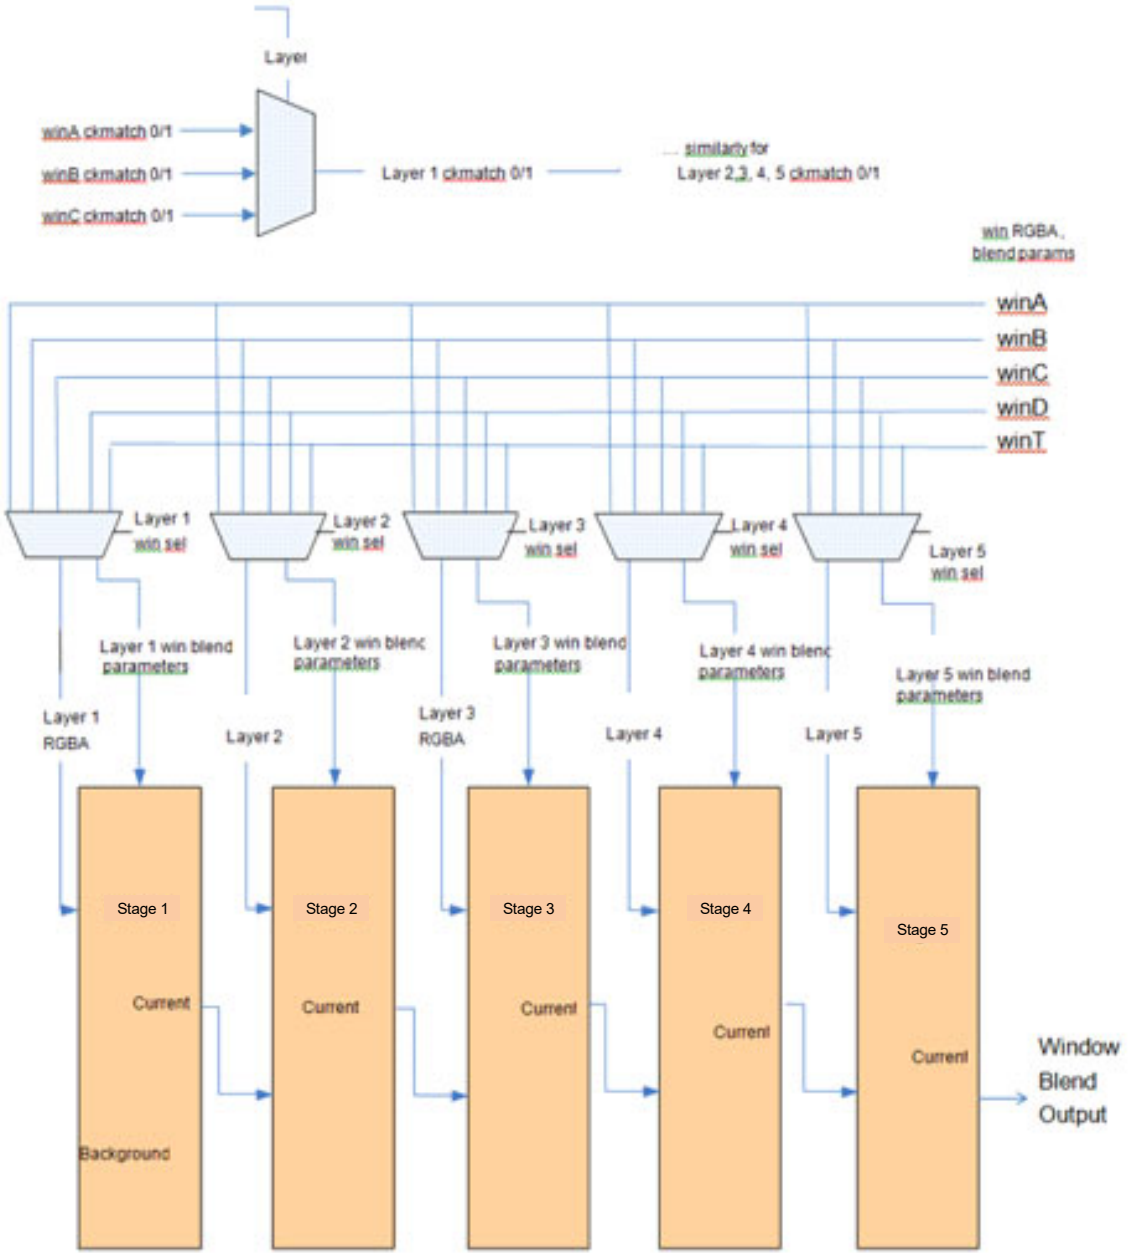

Figure 91: Tegra X1 Blender Cursor Stages

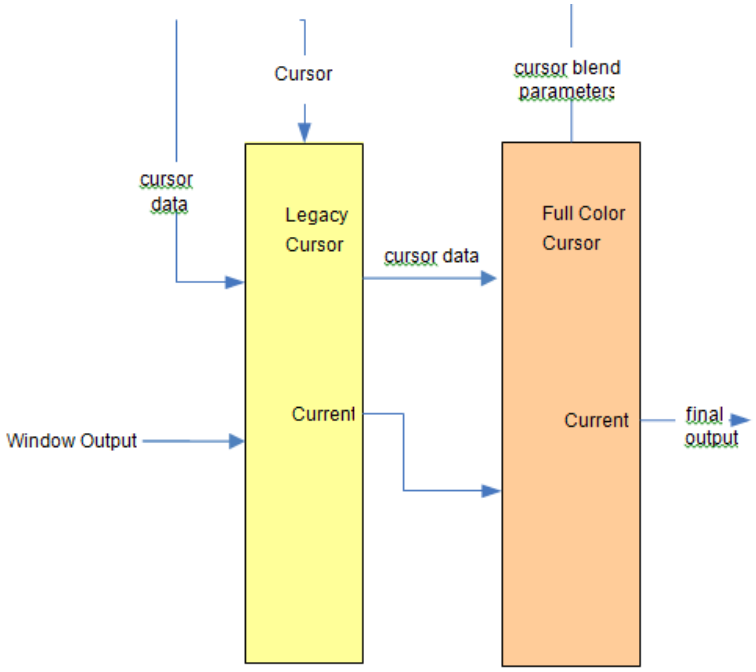


24.3.12.1 Blend Algorithm

Each blending stage requires:

- The current color from the previous stage (often called “Destination”)
- The surface color from the assigned window (often called “Source”)
- Window enable (that is, whether windows cover the current pixel)
- Blend parameters from the per-window registers

Each window has the following registers (where x is A, B, C, D, or T). The cursor settings are also described below.

```
windowx.Z  - an 8 bit z value
windowx.K1 - an 8 bit constant alpha value
windowx.K2 - an 8 bit constant alpha value
windowx.blend_bypass - a boolean

windowx.srcFactC_Match_Select - an enum with the following options:
            K1                      windowx.K1
            K1_TIMES_DST            windowx.K1*currentA
            NEG_K1_TIMES_DST        1 - (windowx.K1*currentA)
            K1_TIMES_SRC            windowx.K1*layerxA
            ZERO                    0

windowx.dstFactC_Match_Select - an enum with the following options:
            K1                      windowx.K1
            K2                      windowx.K2
            K1_TIMES_DST            windowx.K1*currentA
            NEG_K1_TIMES_DST        1 - (windowx.K1*currentA)
            NEG_K1_TIMES_SRC        1 - (windowx.K1*layerxA)
            ZERO                    0
```

```
            ONE                     1.0 (0xff)

windowx.srcFactA_Match_Select - an enum with the following options:
            K1                      windowx.K2
            K2                      windowx.K2
            ZERO                    0

windowx.dstFactA_Match_Select - an enum with the following options:
            K2                      windowx.K2
            ZERO                    0
            NEG_K1_TIMES_SRC        1 - (windowx.K1*layerxA)
            ONE                     1.0 (0xff)
```

Tegra X1 devices support color key; however, color key is not described in this document. The “Match” blend registers above apply to cases where color key is disabled as well as to cases where color key is enabled but the key color does not match. There is an additional set of “NoMatch” registers for the color key enabled but not matching cases.

The windows are sorted according to Z (Depth) value and assigned to blending stages 1 to 5. Cursor is layer 6. Each layerx (where x is 1 ..6) operates as follows:

Inputs

```
layerxRGBA - the RGBA color from the corresponding window pipeline
windowx.* - window registers from window associated with this layer
currentxRGBA - output from the preceding layer_blendx unit
```

Layer0 only needs the BackgroundColorRGBA (also known as Border Color) as input

Layer 6 (cursor) gets layerxRGBA from the cursor surface and gets windowx.* from special cursor.* registers as follows:

```
windowx.key_Select = NONE
windowx.K1 = cursor.K1
windowx.K2 = cursor.K2
windowx.dstFactC_Match_Select = cursor.dstFactC_Select
windowx.srcFactC_Match_Select = cursor.srcFactC_Select
```

The following are “don’t cares” but can be set as shown:

```
windowx.dstFactA_Match_Select   = K2
windowx.srcFactA_Match_Select   = K2
```

Outputs

```
outputRGBA – 32-bit blended RGBA color
```

Local State

```
match - boolean
dstFactC_Select - enum
srcFactC_Select - enum
dstFactA_Select - enum
srcFactA_Select - enum
dstFactC - 8 bit alpha value
srcFactC - 8 bit alpha value
dstFactA - 8 bit alpha value
srcFactA - 8 bit alpha value
```

Operation

At each pixel of the output raster, the blending is performed. Only a subset of windows touch (cover) each pixel, because windows have an arbitrary size and position on the “desktop” raster.

layer_blend0 is trivial:

```
outputRGBA = BackgroundColorRGBA
```

layer_blendx (where x is 1 through 5) does the following:

```
    - calculate fact??_Select:
if [match] then
        srcFactC_Select = windowx.srcFactC_Match_Select
        dstFactC_Select = windowx.dstFactC_Match_Select
        srcFactA_Select = windowx.srcFactA_Match_Select
        dstFactA_Select = windowx.dstFactA_Match_Select
else
        srcFactC_Select = windowx.srcFactC_NoMatch_Select
        dstFactC_Select = windowx.dstFactC_NoMatch_Select
        srcFactA_Select = windowx.srcFactA_NoMatch_Select
        dstFactA_Select = windowx.dstFactA_NoMatch_Select

    - calculate srcFactC:
        switch (srcFactC_Select) {
            case K1:                    srcFactC = windowx.K1
            case K1_TIMES_SRC:          srcFactC = windowx.K1*layerxA
            case K1_TIMES_DST:          srcFactC = windowx.K1*currentA
            case NEG_K1_TIMES_DST:      srcFactC = 1 - (windowx.K1*currentA)
            case ZERO:                  srcFactC = 0
            case ONE:                   srcFactC = 1
        }

    - calculate dstFactC:
        switch (dstFactC_Select) {
            case K1:                    dstFactC = windowx.K1
            case K2:                    dstFactC = windowx.K2
            case ZERO:                  dstFactC = 0
            case ONE:                   dstFactC = 1
            case K1_TIMES_DST:          dstFactC = windowx.K1*currentA
            case NEG_K1_TIMES_SRC:      dstFactC = 1 - (windowx.K1*layerxA)
            case NEG_K1_TIMES_DST:      dstFactC = 1 - (windowx.K1*currentA)
            case NEG_K1:                dstFactC = 1 - windowx.K1
        }

    - calculate srcFactA:
        switch (srcFactA_Select) {
            case K1:                    srcFactA = windowx.K1
            case K2:                    srcFactA = windowx.K2
            case ZERO:                  srcFactA = 0
        }
```

```
- calculate dstFactA:
    switch (dstFactA_Select) {
        case K2:                    dstFactA = windowx.K2
        case ZERO:                  dstFactA = 0
        case ONE:                   dstFactA = 1
        case NEG_K1_TIMES_SRC:      dstFactA = 1 - (windowx.K1*layerxA)
    }
```

If the window or cursor for this layer does NOT touch this pixel, then:

```
        outputRGBA = currentRGBA
    else if windowx.blend_bypass is TRUE then
        outputRGBA = layerxRGBA
    else
        outputR = (srcFactC * layerxR) + (dstFactC * currentR)
        outputG = (srcFactC * layerxG) + (dstFactC * currentG)
        outputB = (srcFactC * layerxB) + (dstFactC * currentB)
        outputA = (srcFactA * layerxA) + (dstFactA * currentA)
```

Note: windowx.blend_bypass allows bypassing the entire blend operation and is intended to save power.

For the cursor layer, there is no need to calculate the following:

```
    outputA - not needed
    dstFactA - not needed
    srcFactA - not needed
```

Final Result

The outputRGB from layer_blend6 is the pixel value sent to the display.

24.3.12.2 Example Use Cases

The examples below assume 3 windows, not 5, for simplicity.

```
                Eye is looking down from here
                           i
                           ^
layer 4                 -----              cursor
layer 3              -------               windowC
layer 2                   ----------       windowB
layer 1           ----------------------    windowA
layer 0           ----------------------    background
```

Common Settings

If not mentioned in a use case, assume registers have the following values:

```
BackgroundColorRGBA = background color

key0.MinRGBA = (don't care)
key0.MaxRGBA = (don't care)

key1.MinRGBA = (don't care)
key1.MaxRGBA = (don't care)

windowA.Z  = 3
```

```
windowB.Z  = 2
windowC.Z  = 1

window*.K1 = 0
window*.K2 = 0
window*.key_Select = NONE
window*.dstFactC_Match_Select = K1
window*.srcFactC_Match_Select = K1
window*.dstFactC_NoMatch_Select = K1
window*.srcFactC_NoMatch_Select = K1
window*.dstFactA_Match_Select = K2
window*.srcFactA_Match_Select = K2
window*.dstFactA_NoMatch_Select = K2
window*.srcFactA_NoMatch_Select = K2
```

If the cursor uses non-premultiplied alpha with fade factor F:

```
cursor.K1 = F
cursor.dstFactC_Select = NEG_K1_TIMES_SRC
cursor.srcFactC_Select = K1_TIMES_SRC

result = ((1.0-(F*cursorA)) * layer3RGB) + (F*cursorA * cursorRGB)
```

If the cursor uses premultiplied alpha with fade factor F:

```
cursor.K1 = F
cursor.dstFactC_Select = NEG_K1_TIMES_SRC
cursor.srcFactC_Select = K1

result = ((1.0-(F*cursorA)) * layer3RGB) + (F         * cursorRGB)
```

Below "use for fade" indicates that the value of windowx.K1 can be used to fade the window from invisible (transparent) at windowx.K1=0x00 to fully visible at windowx.K1=0xff.

Alpha Blend

```
layer 4                -----              cursor
layer 3            ccccccc                windowC non-premul
layer 2                 bbbbbbbbbb        windowB premul
layer 1         aaaaaaaaaaaaaaaaaaaaa     windowA no alpha
layer 0        gggggggggggggggggggggggg   background

result         gaaaccccccccbbbbbbbbbaaaag
                     ^    ^ ^
                     |    | |
                     |    | +---- b blended with a
                     |    +------ c blended with (b blended with a)
                     +---------- c blended with a
```

Window A has RGB (alpha not used)

Window B has premultiplied alpha RGBA for blending with A

Window C has non-premultiplied alpha RGBA for blending with A and B

Blend Equations

```
layer0RGBA = BackgroundColorRGBA
layer1RGB  = windowA color
layer1A    = don't care
layer2RGB  =             windowB.RGB  +  (1.0 - windowB.A) * layer1RGB
layer2A    = don't care
layer3RGB  = windowC.A * windowC.RGB  +  (1.0 - windowC.A) * layer2RGB
layer3A    = don't care
layer4RGB  = blend with cursor
```

Register Settings

```
windowA.K1 = 0xff  (use for fade)
windowA.key_Select = NONE
windowA.srcFactC_Match_Select = K1
windowA.dstFactC_Match_Select = ZERO

windowB.K1 = 0xff  (use for fade)
windowB.key_Select = NONE
windowB.srcFactC_Match_Select = K1  (K1_TIMES_SRC for non-premul)
windowB.dstFactC_Match_Select = NEG_K1_TIMES_SRC

windowC.K1 = 0xff  (use for fade)
windowC.key_Select = NONE
windowC.srcFactC_Match_Select = K1_TIMES_SRC    (K1 for premul)
windowC.dstFactC_Match_Select = NEG_K1_TIMES_SRC
```

Note: *Window B and window C can each be either premul or non-premul.*
Use windowx.K1 to fade the window (0=transparent, 0xff=opaque).

Opaque Layer with Fade

```
layer 4                -----              cursor
layer 3            ccccccc                windowC non-premul
layer 2                 bbbbbbbbbb        windowB no alpha
layer 1         aaaaaaaaaaaaaaaaaaaaa     windowA no alpha
layer 0        gggggggggggggggggggggggg   background

result         gaaaccccccbbbbbbbbaaaag
                     ^   ^ ^
                     |   | |
                     |   | +---- b blended with a using L
                     |   +------ c blended with (b blended with a using L)
                     +---------- c blended with a
```

Same as case 1, but window B (or A or C or any combination) contains no alpha values (or garbage alpha values). There is a constant L which is used to fade the window.

Blend Equations

Note: *"..." means "same as the last use case"*

```
...
layer2RGB  = L * windowB.RGB  +  (1.0 - L) * layer1RGB
layer2A    = don't care
...
```

Register Settings

```
...
windowB.K1 = L
windowB.K2 = 1.0 - L
windowB.srcFactC_Match_Select = K1
windowB.dstFactC_Match_Select = K2
...
```

Window B's Alpha is in Window A

```
layer 4                -----              cursor
layer 3            ccccccc                windowC premul
layer 2                 bbbbbbbbbb        windowB no alpha
layer 1         aaaaaaaaaaaaaaaaaaaaa     windowA alpha for blend w/ b
layer 0        gggggggggggggggggggggggg   background

result         gaaaccccccccbbbbbbbbbaaaag
                     ^   ^ ^
                     |   | |
                     |   | +---- b blended with a using alpha from a
                     |   +------ c blended with (")
                     +---------- c blended with a
```

Same as case 1, but window B contains no alpha values (or garbage alpha values), and the alpha is needed for use from window A to blend window B with window A.

Blend Equations

```
layer0RGBA = BackgroundColorRGBA
layer1RGB  = windowA color
layer1A    = windowA alpha
layer2RGB  = windowA.A * windowB.RGB + (1.0 - windowA.A) * layer1RGB
layer2A    = don't care
layer3RGB  = windowC.RGB + (1.0 - windowC.A) * layer2RGB
layer3A    = don't care
layer4RGB  = blend with cursor
```

Register Settings

```
windowA.K1 = 0xff  (use for fade)
windowA.K2 = 0xff
windowA.key_Select = NONE
windowA.srcFactC_Match_Select = K1
windowA.dstFactC_Match_Select = ZERO
windowA.srcFactA_Match_Select = K2
windowA.dstFactA_Match_Select = ZERO

windowB.K1 = 0xff  (use for fade)
windowB.key_Select = NONE
```

```
windowB.srcFactC_Match_Select = NEG_K1_TIMES_DST
windowB.dstFactC_Match_Select = K1_TIMES_DST

windowC.K1 = 0xff  (use for fade)
windowC.key_Select = NONE
windowC.srcFactC_Match_Select = K1  (K1_TIMES_SRC for non-premul)
windowC.dstFactC_Match_Select = NEG_K1_TIMES_SRC
```

There is no way to do this for B and C at the same time (unless they are known to not overlap).

If windowA.A is the opacity of window C, then use the following blend equation and register settings:

Blend Equation (windowA.A is the opacity of window C)

```
layer2RGB  = (1.0 - windowA.A) * windowB.RGB  +  windowA.A * layer1RGB
```

Register Settings (windowA.A is the opacity of window C)

```
windowB.srcFactC_Match_Select = NEG_K1_TIMES_DST
windowB.dstFactC_Match_Select = K1_TIMES_DST
```

If windowA.A is the transparency of window C, then use the following blend equation and register settings:

Blend Equation (windowA.A is the transparency of window C)

```
layer2RGB  = windowA.A * windowB.RGB  +  (1.0 - windowA.A) * layer1RGB
```

Register Settings (windowA.A is the transparency of window C)

```
windowB.srcFactC_Match_Select = K1_TIMES_DST
windowB.dstFactC_Match_Select = NEG_K1_TIMES_DST
```

The above assumes non-premul alpha. Premul alpha would not make sense in this case.

Window C's Alpha is in Window A

```
layer 4                -----              cursor
layer 3           ccccccc                 windowC no alpha
layer 2                bbbbbbbbbb         windowB premul alpha
layer 1         aaaaaaaaaaaaaaaaaaaaa     windowA alpha for blend w/ c
layer 0        gggggggggggggggggggggggg   background

result         gaaaccccccccbbbbbbbbbaaaag
                     ^   ^ ^
                     |   | |
                     |   | +---- b blended with a
                     |   +------ c blended with (") using alpha from a
                     +---------- c blended with a using alpha from a
```

Same as case 1, but window C contains no alpha values (or garbage alpha values), and the alpha is needed for use from window A to blend window C with window A and window B.

Blend Equations

```
layer0RGBA = BackgroundColorRGBA
layer1RGB  = windowA color
layer1A    = windowA alpha
layer2RGB  = windowB.RGB              +  (1.0 - windowB.A) * layer1RGB
layer2A    = don't care
layer3RGB  = windowA.A * windowC.RGB  +  (1.0 - windowA.A) * layer2RGB
```

```
layer3A    = don't care
layer4RGB  = blend with cursor
```

Register Settings

```
windowA.K1 = 0xff  (use for fade)
windowA.K2 = 0xff
windowA.key_Select = NONE
windowA.srcFactC_Match_Select = K1
windowA.dstFactC_Match_Select = ZERO
windowA.srcFactA_Match_Select = K2
windowA.dstFactA_Match_Select = ZERO

windowB.K1 = 0xff  (use for fade)
windowA.K2 = 0xff
windowB.key_Select = NONE
windowB.srcFactC_Match_Select = K1   (K1_TIMES_SRC for non-premul)
windowB.dstFactC_Match_Select = NEG_K1_TIMES_SRC
windowB.srcFactA_Match_Select = ZERO
windowB.dstFactA_Match_Select = K2

windowC.K1 = 0xff  (use for fade)
windowC.key_Select = NONE
windowC.srcFactC_Match_Select = NEG_K1_TIMES_DST
windowC.dstFactC_Match_Select = K1_TIMES_DST
```

24.3.13 PRISM2

This section describes the enhancements to PRISM2. The PRISM function was formerly known as Smart Dimmer, and so the abbreviation SD is commonly used in register names for PRISM2.

Key features include:

- Programmable statistics window
- Separate crush/adaptation
- Programmable soft clipping
- Increased pixel count limits
- Run per-frame on VPULSE2
- Enhanced phase-in (smooth K0)

24.3.13.1 CMU

The CMU impacts PRISM2 by allowing SD to run in sRGB-style gamma space, which is more suitable than the arbitrary tone curve of the display device.

24.3.13.2 Programmable Statistics Window

This feature allows statistics to be gathered over a subset of the active display. It is useful when part of the display is not interesting for PRISM2 statistics purposes, such as letterbox or border around a video. Without this feature, the border would influence the histogram and therefore the brightness, giving suboptimal results for the video.

The programming interface is a control bit SD_WINDOW_ENABLE in SD_CONTROL register to enable the feature, and two registers containing position and size of the window. When SD_CONTROL == DISABLE (the default), the position/size registers are ignored, and the entire active display region is used, like in Tegra 3.

The coordinate system is relative to display active area – (0,0) is upper left corner of display active. The active region will have upper left corner (H_POSITION, V_POSITION), and lower right corner (H_POSITION + SD_WIN_H_SIZE – 1, V_POSITION + V_SIZE – 1) inclusive. Note this display coordinate system does not take into account surface rotation or device rotation. It is the same coordinate system use by window position (e.g., B_H_POSITION, B_V_POSITION).

The limitation on minimum pixel count of 2^16 must be obeyed.

The programmable window has no direct effect on enhancement – every pixel of display active area is enhanced.

24.3.13.3 Separate Crush/Adaptation

As in earlier Tegra devices, the AGGRESSIVENESS register controlled both the maximum crushed pixel percentage, and the lowest K (maximum gain). This feature separates them and allows software to separately control lowest K (maximum gain). AGRESSIVENESS continues to control the maximum crushed pixel percentage.

The programming interface is a control bit K_LIMIT_ENABLE, and a register SD_K_LIMIT.

As in earlier Tegra devices, the initial K (as determined by accumulating histogram bins until maximum crush pixel percentage is reached). When K_LIMIT_ENABLE=ENABLE, the initial K is clamped to SD_K_LIMIT rather than default “lowest_K”. When K_LIMIT_ENABLE = DISABLE (the default), SD_K_LIMIT register is ignored and the default “lowest_L” are used based on AGGRESSIVENESS.

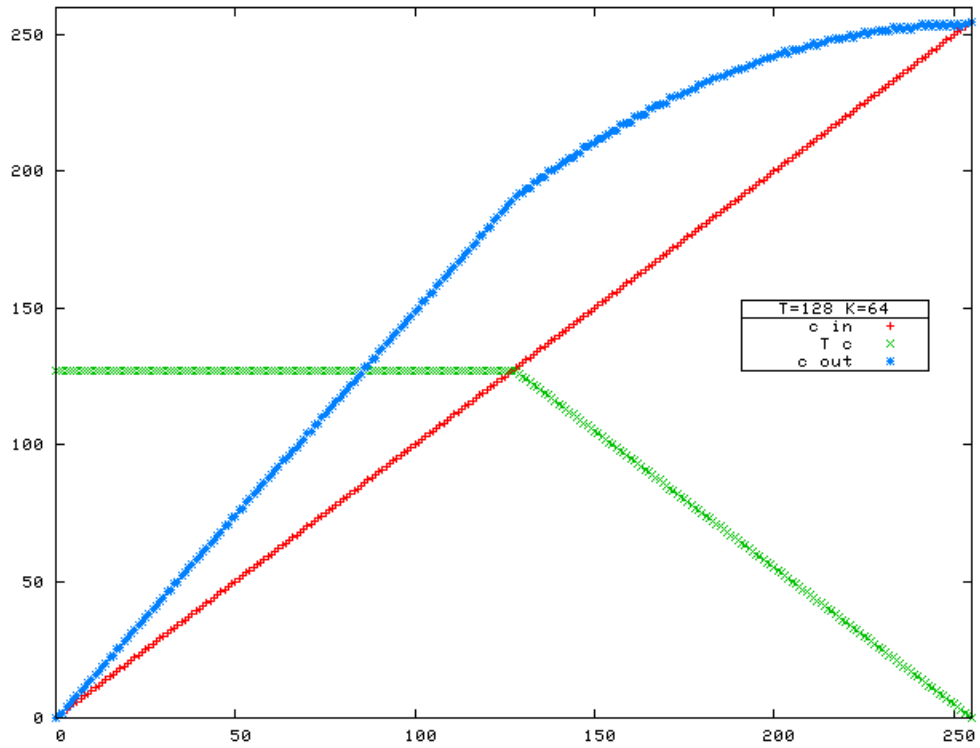
24.3.13.4 Programmable Soft Clipping

Soft clipping is employed to avoid harsh clipping of amplified high-value pixels, and resulting loss of detail in bright areas. The gain applied to high-valued pixels is reduced gradually from 1/K to 1.0, for pixels above a threshold of 128. The threshold is fixed at 128, and soft clipping is always enabled. This feature gives more software control.

Since soft clipping is performed after statistics, and it affects the brightness of the image, the statistics and therefore the backlight brightness will be incorrect. This can somewhat compensated for in the backlight transfer-function and/or enhancement value lookup tables.

The Tegra X1 transfer function is shown here, for K=1.5. The T_c plot is the weight applied to fractional portion of K, and goes from 127 to 0, representing 1 to 0.

Figure 92: Default Threshold=128 at K=1.5



With programmable thresholds, other curves are possible. For example, Figure 93 and Figure 94 show more gradual curves using threshold=64 and 0 respectively.

Figure 93: Threshold=64 at K=1.5

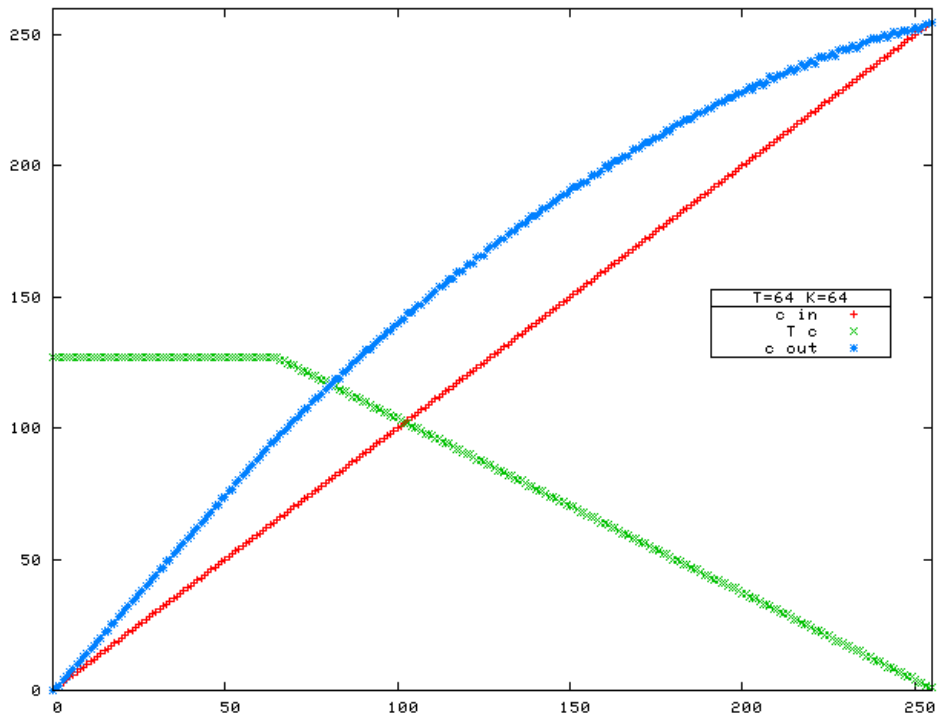


Figure 94: Threshold 0 at K=1.5

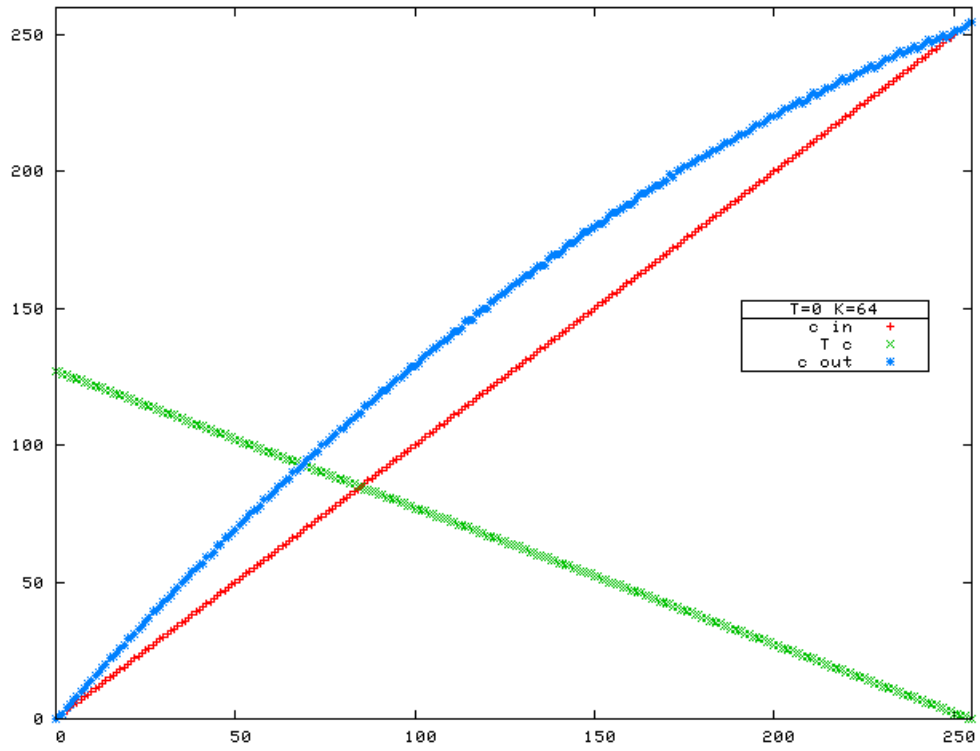

Thresholds too high are not usable, because the soft clipping does not kick in early enough to prevent clipping as K grows; note in Figure 95 (threshold 170 at K=1.5) the value of c_out rises about 255. The curve is also not monotonically increasing. Software would need to reduce maximum K to 1.25 or so for such a threshold. The following figure shows threshold of 170 with K = 1.25.

Figure 95: Overflowing at Threshold=170 at K=1.5

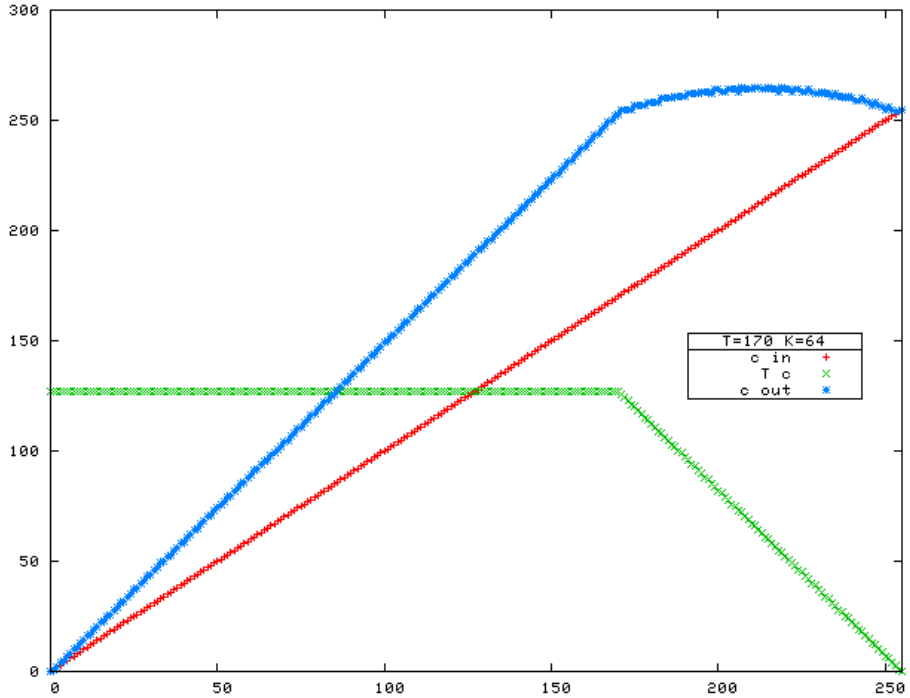

Figure 96: Threshold 170 at K=1.25

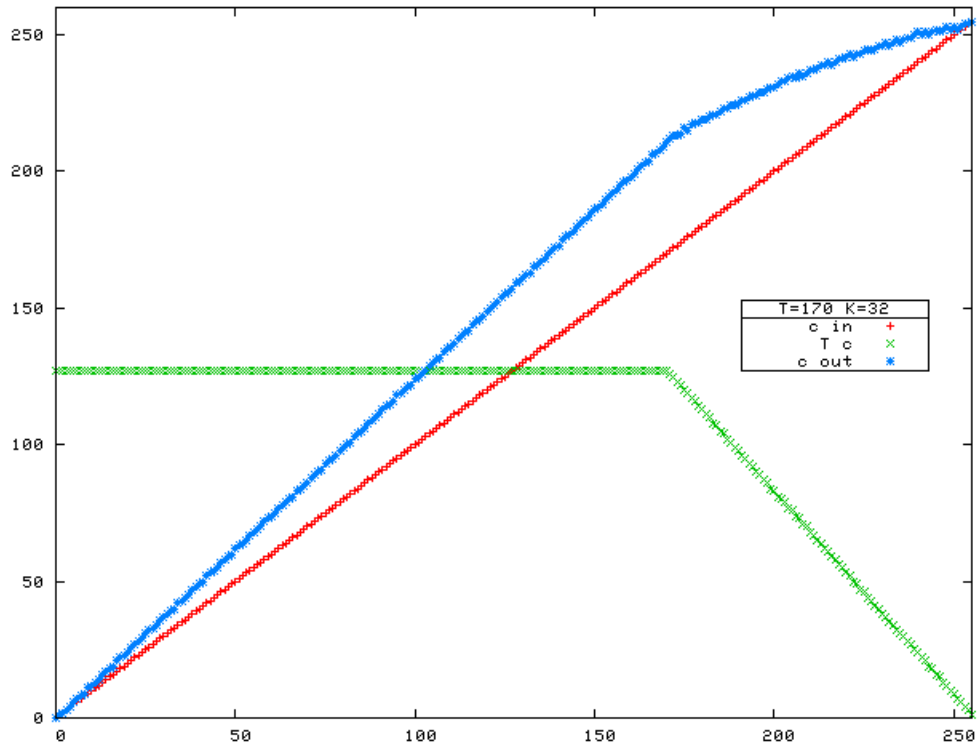


The programming interface consists of a control bit SOFT_CLIPPING_ENABLE and one register SD_SOFT_CLIPPING. The latter contains both the threshold and a software-computed reciprocal of inverse threshold. The software-computed reciprocal avoids the need to perform division in hardware. RECIP is computed as 64*1024 * 1.0 / (256 – threshold), truncated to 16-bit unsigned integer. Internally, the hardware may use fewer than 16 bits as described below.

When SOFT_CLIPPING_ENABLE=DISABLE, then SD_SOFT_CLIPPING is ignored and no clipping is done.

When SOFT_CLIPPING_ENABLE=ENABLE, SD_SOFT_CLIPPING is used. At the default values of SD_SOFT_CLIPPING, it behaves like Tegra 3.

The soft clipping equation performed in hardware, per component, is

```
If SD_CONTROL.SOFT_CLIPPING_ENABLE==ENABLE and c_in >= threshold:
T_c = 0x7f - (((c_in - threshold) * (recip >> 2)) >> 7);
Else
T_c = 0x7f
```

Where recip is the programmed SOFT_CLIPPING_RECIP; it is shifted right 2 bits to yield a 14-bit value. T_c is a 7-bit weight. The shift by 7 represents discarding 6 bits from recip plus one to give a 7-bit rather than 8-bit result. As before, T_c is used to scale the fractional portion of K:

```
c_k_limited = (K_c * T_c) >> 7;
```

and then apply the fractional gain to the component:

```
c_mul = (c_in * c_k_limited) >> 7;
```

and finally add the integer portion of gain (which is always 1, i.e., 1 * c_in = c_in):

```
c_out = c_in + c_mul
```

24.3.13.5 Increased Pixel Count Limits

With displays trending to 2560x1600 and larger panels, PRISM2 supports at least 2^{23} pixels. For simplification, the minimum screen size of 2^{16} is retained. Therefore the pixel count dynamic range increases from 32:1 to 128:1. The total_pixels and

histogram accumulator counters must support that range. Also, the histogram normalization must support an expanded range of exponents and shifting (0-7 rather than 0-5).

The SD_HISTOGRAM bins need not expand because they contain normalized pixel percentages, not raw counts.

SD_PIXEL_COUNT accommodates this range.

24.3.13.6 Run per-Frame on VPULSE2

For Tegra 3 devices and earlier, Smart Dimmer histogram processing was done on VSYNC, which is at the beginning of the frame. Thus a new BRIGHTNESS, based on the previous frame's histogram, was not available until the beginning of the next frame. In non-continuous (display self-refresh) mode, there can be a long delay. In Tegra 4 and later devices, PRISM2 can be configured to run on V_PULSE2 instead. This can be programmed to occur at the end of a frame, so that software can get the results in a timely manner, and decide whether to change brightness, re-transmit the frame with a new enhancement value, or neither.

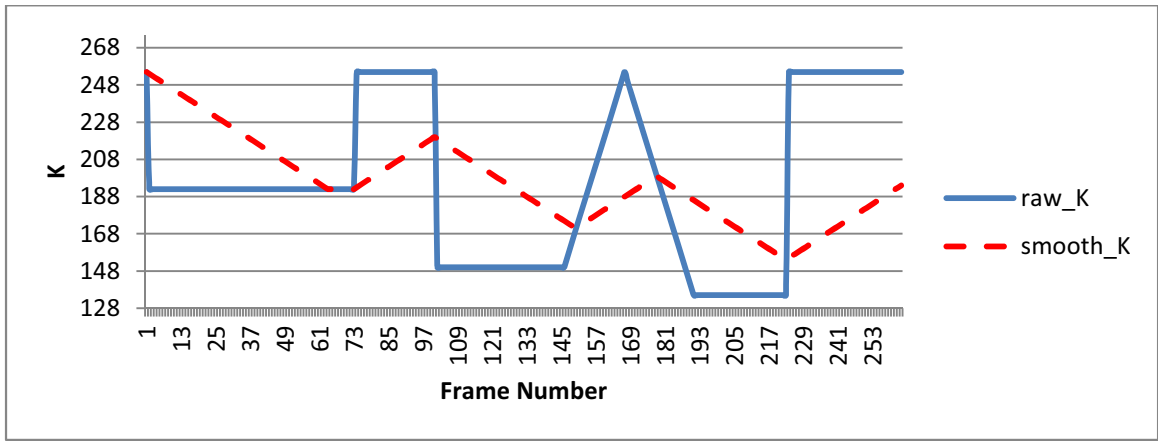
24.3.13.7 Programmable Smooth Transitions

Sudden changes in PRISM2 enhancement K and backlight can be noticeable and objectionable. While the soft-clipping compensation algorithm in Section 24.3.13.4: Programmable Soft Clipping above can help, it might not be enough. To improve the user experience, this feature allows changes to be automatically phased in (smoothed) over time.

When enabled, the hardware-generated raw K is the target value. It is not used directly for enhancement or backlight brightness. Rather, a "smooth_K" is used. Each frame, the current smooth_K is incremented or decremented if different than the target raw K. The smooth_K and increment value have four additional fraction bits. The minimum SMOOTH_K_INCR value of 0x1 changes smooth_K by 1/16 per frame. For a maximum raw_K change of 128, the maximum phase-in time is 128*16 = 2048 frames, or about 34 seconds.

The following figure illustrates the smooth_k function; SMOOTH_K_INCR = 64 which changes smooth_K by at most 1.0 per frame.

Figure 97: Smooth K



Software can compute SMOOTH_K_INCR as follows.

- Assume a maximum desired brightness change rate of R L* / second = SMOOTH_K_INCR K/frame.
- Assume L* is roughly linear with respect to K (L* = K/2).
- R L* / second = SMOOTH_K_INCR K/frame

Solving for SMOOTH_K_INCR. R L* / second = R L* / (60 frames) = R K / (2*60 frames) = R/120 K/frame.

So SMOOTH_K_INCR = R/120. Because the register is encoded as 8.6 fixed-point, encode as round (R/120 * 64).

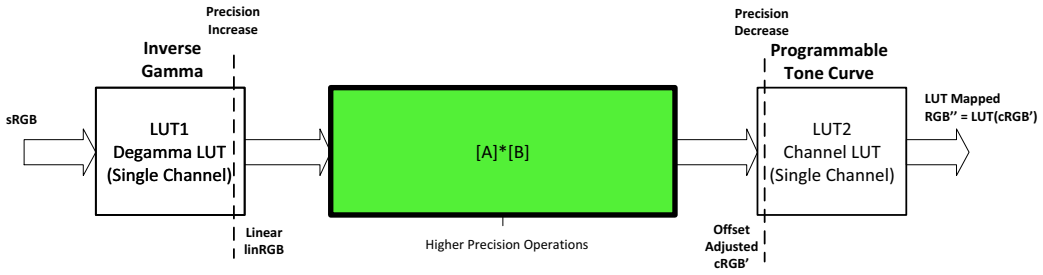
24.3.14 Display Color Management Unit (LUT/CSC)

This unit has an additional LUT -> CSC -> LUT after the PRISM2 unit to enable gamma and color gamut change. While this feature is independent from PRISM2, and more generally useful, it helps PRISM2 accommodate non-standard (non-sRGB) panels. It also helps convert from the display's native gamma and gamut (de facto of sRGB) into panels.

- First stage – LUT1 – is an 8-bit to 12-bit RAM-based look-up table (LUT) to convert gamma from sRGB 2.2 to linear (1.0). The output is 8.4 unsigned fixed-point format. A single LUT may be used for all 3 channels.
- Second stage – CSC – is 3x3 matrix multiply, to convert color gamut / whitepoint. 12 bits unsigned in, and 12 bits unsigned out. Its nine coefficients are 10-bit (S1.8 signed).
- Third stage – LUT2 – is a 12-bit to 8-bit LUT to convert from linear gamma to sRGB or similar gamma (for example, 1 / 2.2). A single LUT may be used for all 3 channels.

Note: *The window datapaths have subunits called LUT (CP) and CSC already, but they are for different purposes. The CP is for converting linear frame-buffer data into sRGB, or for color index modes, or for applying aesthetic changes like contrast. CSC is for converting YCbCr into RGB. They are for normalizing all surfaces into a common format, nominally sRGB, for blending.*

Figure 98: Color Management Unit



24.3.14.1 CMU LUT1

LUT1 maps 8-bit gamma-corrected input to 12-bit linear output. A single LUT may be used for all 3 RGB channels – per-channel control is not required.

```
R' = LUT1[R]
G' = LUT1[G]
B' = LUT1[B]
```

24.3.14.2 CSC Matrix

The CSC equation is:

$$\begin{bmatrix} KRR & KGR & KBR \\ KRG & KGG & KBG \\ KRB & KGB & KBB \end{bmatrix} * \begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} R' \\ G' \\ B' \end{bmatrix}$$

24.3.14.3 CMU LUT2

LUT2 maps 12-bit linear input to 8-bit gamma corrected output. A single LUT may be used for all 3 RGB channels – per-channel control is not required. LUT2 is only 960 rows deep, and divided unevenly so that precision is variable; greater precision (more entries) are allocated to darker values. The first 512 entries 0..511, representing range [0.0, 32.0), are darker values, and are mapped with full 9-bit precision (5.4). The top 448 entries are for lower-precision brighter range [32, 256); they are reduced from 8.4 to 8.1 and offset so that values [32,256) map to 512..959 rather than 576..1023.

```
R' = LUT2[zone_select(R)]
```

```
G' = LUT2[zone_select(G)]
B' = LUT2[zone_select(B)]
```

The zone_select function maps a 12-bit component value to 10-bit RAM index, with variable precision:

```
If C >= THRESHOLD:
        C' = (C >> PRECISION_DIFF) + THRESHOLD – OVERLAP
Else:
        C' = C[9:0]
```

Where THRESHOLD=2^9 = 512, PRECISION_DIFF = 12 – 9 = 3, and OVERLAP = THRESHOLD >> PRECISION_DIFF = 512 >> 3 = 64.

Software would use an inverse_zone_select to initialize the LUT2.

24.3.14.4 Programming Interface

The CMU LUTs and CSC registers are single-buffered; shadow update and activation have no effect. However, the CMU_ENABLE bit is double-buffered, so it can be enabled/disabled at frame boundaries.

Host interface writes and reads take precedence over the datapath and may result in visible glitches. Software is responsible for ensuring the datapath is idle before writing or reading. An interrupt will be raised upon a conflict. The LUTs are guaranteed to be idle during blanking and when CMU_ENABLE=DISABLE. Software must explicitly enable reading, and reading is only performed for debugging reasons.

Note: *When reading LUTs: due to internal RAM latency, after changing read-enable or read address, data is not available until two clocks later. Best way to ensure this is to issue two back-to-back writes of same read address, as shown in read sequence.*

Software initialization sequence:

```
Ensure CMU_ENABLE=DISABLE or display idle
For C = 0 .. 255:
        C' = ungamma_function(C/255) * 4095
        CMU_LUT1.LUT1_ADDR = C
        CMU_LUT1.LUT1_DATA = C'
        Write CMU_LUT1
For C = 0 .. 1023: # assume 10-bit
        C' = gamma_function(inverse_zone_select(C)/4095) * 255
        CMU_LUT2.LUT1_ADDR = C
        CMU_LUT2.LUT1_DATA = C'
        Write CMU_LUT2
Write DISP_COLOR_CONTROL.CMU_ENABLE = ENABLE
Use GENERAL_ACT_REQ
```

Where typically functions are: ungamma_function(x) = $x^{2.2}$, and gamma_function(x) = $x^{1/2.2}$.

LUT read sequence:

```
Ensure CMU_ENABLE=DISABLE or display idle
For C = 0 .. 255:
        CMU_LUT1_READ.LUT1_READ_EN = 1
        CMU_LUT1_READ.LUT1_READ_ADDR = C
        Write CMU_LUT1_READ
        Write CMU_LUT1_READ # ensure one cycle delay
        Read CMU_LUT1.LUT1_DATA
```

```
Write CMU_LUT1_READ.LUT1_READ_EN = 0
```

24.3.14.5 LUT Conflict Interrupt

To help debug conflicts caused by accessing LUTs while datapath is using them, CMU_LUT_CONFLICT interrupt is raised if:

- host write during scanout (pixel read when cmu_enable=1)
- host read during scanout
- host write during host read (i.e; LUT1_READ_EN=1)

24.3.15 Dither

Temporal dither is used in place of error diffusion and does not use line buffers.

24.3.16 Output RGB-to-YUV444 CSC

The Tegra X1 display outputs one of three color spaces:

- Red, Green, Blue color primaries.
- YCbCr 4:4:4 Luminance and color difference signals as defined by ITU-R BT.601
- YCbCr 4:4:4 Luminance and color difference signals as defined by ITU-R BT.709

YCbCr color space operates only on limited RGB color space of RGB[16, 235]. HDMI requires YCbCr support of limited color space and optionally extended color space. HDMI also allows for direct RGB limited color space input (that is, RGB[16, 235]). The Tegra X1 Display allows limitation of RGB color space automatically by placing hardcoded full to limited color space scaler unit prior to CSC. This allows for support of the following output formats to HDMI:

- RGB[0, 255]
- RGB[16, 235]
- BT.601 YCbCr 4:4:4 (converted from RGB[16, 235])
- BT.709 YCbCr 4:4:4 (converted from RGB[16, 235])

24.4 Programming Model

24.4.1 Software Alignment Requirements

For Tegra X1 devices, the pixel data alignment restriction is 64B boundaries. The table below describes what registers are affected.

Parameter	Register name	Pitch (packed) 1/ 2/4 Bpp	Pitch (Planar) 1 Bpp per surface	Tiled (packed) 1/2/4 Bpp	Tiled (planar) 1 Bpp per surface
line_stride	B_LINE_STRIDE	64	64	64	64
h_prescale_size	B_H_PRESCALED_SIZE	Bpp	Even	Bpp	Even
v_prescale_size	B_V_PRESCALED_SIZE	NA	Even for 420	NA	Even for 420
h_offset	B_ADDR_H_OFFSET	Bpp	Even	Bpp	Even
v_offset	B_ADDR_V_OFFSET	NA	Even for 420	NA	Even for 420
Startaddr	B_START_ADDR	64	64	256	256

24.4.2 DSC Programming Sequence

The Display Stream Compression (DSC) block is programmed only once on mode change, after that hardware just keeps running. There is no use case to change DSC configuration on the fly, and no hardware-software interaction needed when hardware is running.

Anytime software wants to change the mode, it has to stop the entire display pipeline. For DSC, either dsc auto_reset is enabled OR a 1 is written to soft_reset at frame end. On error (buffer over/underflow, timeout), software needs to reset the DSC module by writing 1 to soft_reset.

Table 127: Picture Parameter Set

	Register/(Field)	Value
dsc_version_major	NA	1
dsc_version_minor	NA	0
pps_identifier	NA	identifier that can be used to differentiate between different PPS tables
bits_per_component	NA	8
linebuf_depth	DC_COM_DSC_UNIT_SET_0 (DSC_LINEBUF_DEPTH)	Line buffer bit depth used to generate the stream, 8 or 9
block_pred_enable	DC_COM_DSC_COMMON_CTL_0 (DSC_BLOCK_PRED_ENABLE)	0 or 1
convert_rgb	NA	1
enable_422	NA	0
vbr_enable	NA	0
bits_per_pixel	DC_COM_DSC_COMMON_CTL_0 (DSC_BITS_PER_PIXEL)	bpp<<4, bpp is 8 , 12, or 16
pic_height	DSC_PIC_INFO Picture_height (V_DISP_ACTIVE)	Active picture height in lines
pic_width	DSC_PIC_INFO Picture_width (H_DISP_ACTIVE)	Active picture width in pixels
slice_height	DC_COM_DSC_SLICE_INFO_0 (DSC_SLICE_HEIGHT)	Slice height in pixel. When the whole picture is one slice, the slice height should equal to picture height.
slice_width	DC_COM_DSC_SLICE_INFO_0 (DSC_SLICE_WIDTH)	Slice width in pixel. When the whole picture is one slice, the slice width should equal to picture width.
chunk_size	DC_COM_DSC_COMMON_CTL_0 (DSC_CHUNK_SIZE)	ceil(bpp * slice_width / 8)
initial_xmit_delay	DC_COM_DSC_RC_DELAY_INFO_0 (DSC_INITIAL_XMIT_DELAY)	Int(4096/bpp)
initial_dec_delay	DC_COM_DSC_RC_DELAY_INFO_0 (DSC_INITIAL_DEC_DELAY)	minRateBufferSize = rc_model_size - initial_offset + ceil(initial_xmit_delay * bpp) + groupsPerLine * first_line_bpg_offset hrdDelay = ceil(minRateBufferSize /bpp) initial_dec_delay = hrdDelay - initial_xmit_delay
initial_scale_value	DC_COM_DSC_RC_SCALE_INFO_0 (DSC_INITIAL_SCALE_VALUE)	8*rc_model_size / (rc_model_size – initial_offset)

scale_increment_interval	DC_COM_DSC_RC_SCALE_INFO_2_0 (DSC_SCALE_INCR_INTERVAL)	final_scale= rc_model_size / (rc_model_size – final_offset)
		
		if (final_scale <= 9)
		scale_increment_interval = 0;
		else
		scale_increment_interval = groupsPerLine / (final_scale-9);

scale_decrement_interval	DC_COM_DSC_RC_SCALE_INFO_0 (DSC_SCALE_DECR_INTERVAL)	groupsPerLine / (initial_scale_value – 8)
first_line_bpg_offset	DC_COM_DSC_RC_FLATNESS_INFO_0 (DSC_FIRST_LINE_BPG_OFFS)	Suggested value:12 for 8bpp; 15 for 12bpp
nfl_bpg_offset	DC_COM_DSC_RC_BPGOFF_INFO_0 (DSC_NFL_BPG_OFFSET)	ceil((double)(first_line_bpg_ofs << 11) / (slice_height - 1));

Table 127: Picture Parameter Set

	Register/(Field)	Value
slice_bpg_offset	DC_COM_DSC_RC_BPGOFF_INFO_0 (DSC_SLICE_BPG_OFFSET)	ceil((double)(1<<11) * (rc_model_size - initial_offset + numExtraMuxBits)/ (groups_total)) numExtraMuxBits = 198 + ((chunk_size*slice_height*8-246)%48)
initial_offset	DC_COM_DSC_RC_OFFSET_INFO_0 (DSC_INITIAL_OFFSET)	Recommended value: 6144 for 8bpp; 2048 for 12bpp
final_offset	DC_COM_DSC_RC_OFFSET_INFO_0 (DSC_FINAL_OFFSET)	rc_model_size –initial_xmit_delay * bpp + numExtraMuxBits
flatness_min_qp	DC_COM_DSC_RC_FLATNESS_INFO_0 (DSC_FLATNESS_MIN_QP)	Recommended value: 3
flatness_max_qp	DC_COM_DSC_RC_FLATNESS_INFO_0 (DSC_FLATNESS_MAX_QP)	Recommended value:12
rc_model_size	DC_COM_DSC_RC_BUF_THRESH0_0 (DSC_RC_MODEL_SIZE)	Recommended value: 8192
rc_edge_factor	DC_COM_DSC_RC_PARAM_SET_0 (DSC_RC_EDGE_FACTOR)	Recommended value: 6
rc_quant_incr_limit0	DC_COM_DSC_RC_PARAM_SET_0 (DSC_RC_QUANT_INCR_LIMIT0)	Recommended value: 11
rc_quant_incr_limit1	DC_COM_DSC_RC_PARAM_SET_0 (DSC_RC_QUANT_INCR_LIMIT1)	Recommended value: 11
rc_tgt_offset_hi	DC_COM_DSC_RC_PARAM_SET_0 (DSC_RC_TGT_OFFSET_HI)	Recommended value: 3
rc_tgt_offset_lo	DC_COM_DSC_RC_PARAM_SET_0 /Rc_tgt_offset_lo	Recommended value: 3
rc_buf_thresh[14]	DC_COM_DSC_RC_BUF_THRESH[0~3]_0	Recommended value: 896, 1792, 2688, 3584, 4480, 5376, 6272, 6720, 7168,7616, 7744, 7872, 8000, 8064(the top most three thresh need change to 7808, 7872, 7936 for rc overflow solution 3)
rc_range_parameters[15]	DC_COM_DSC_RC_RANGE_CFG[0~7]_0	Recommended value: see spec table 16-2
Other info:		
output_delay	DC_COM_DSC_DELAY_0 (DSC_OUTPUT_DELAY)	delay_in_slice = (0x17f*8*3+bpp-1)/bpp + slice_width+ initial_xmit_delay+18 (delay_in_slice/slice_width)*(pic_width+hBlank) + (delay_in_slice%slice_width)
timeout_counter	DC_COM_DSC_TOP_CTL_0 (DSC_TIMEOUT_COUNTER)	It can be set to slightly larger than HBLANK 0 means disable
intr_mask	DSC_INTR /intr_mask (INT_MASK.DSC_*_INT_MASK registers)	1: mask, 0: not mask
hblank_cycles	Reuse display	Hblank cycles
Slice_num_minus1_in_line	DC_COM_DSC_UNIT_SET_0 (DSC_SLICE_NUM_MINUS1_IN_LINE)	0, 1 or 3
Soft_reset	DC_COM_DSC_TOP_CTL_0 (DSC_SOFT_RESET)	0: disable, 1: enable
Auto_reset	DC_COM_DSC_TOP_CTL_0 (DSC_AUTO_RESET)	0: disable, 1:enable
Slcg_override	DC_COM_DSC_TOP_CTL_0 (DSC_SLCG_OVERRIDE)	0:disable, 1:enable

Table 127: Picture Parameter Set

	Register/(Field)	Value
rc_solution_mode	DC_DISP_DISPLAY_SPARE0_0 (rc_solution_mode)	Select RC solution for overflow issue: 0 disable 1: solution 2 2: solution 3
check_flatness2	DC_DISP_DISPLAY_SPARE0_0 (check_flatness2)	Enable flatness check step 2 for overflow solution
flatness_fix_en	DC_DISP_DISPLAY_SPARE0_0 (flatness_fix_en)	Enable flatness fix for overflow solutions
rc_overflow_thresh	DC_DISP_DISPLAY_SPARE0_0 (rc_overflow_thresh)	RC threshold for overflow solution 2, range can be -512~512

24.5 Display Controller Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers. The display memory map is shown below.

24.5.1 Address Map

Space Name	Offset	Notes
DC_CMD	0x0	Non-shadowed command/sync registers
DC_D_WIN	0x80	Window D instance of DC_WIN
DC_D_WINBUF	0xc0	Window D instance of DC_WINBUF
DC_T_WIN	0x100	Window T instance of DC_WIN
DC_T_WINBUF	0x140	Window T instance of DC_WINBUF
DC_H_WIN	0x180	Window H instance of DC_WIN (RESERVED)
DC_H_WINBUF	0x1c0	Window H instance of DC_WINBUF (RESERVED)
DC_COM	0x300	Non-shadowed non-window registers
DC_DISP	0x400	Shadowed non-window registers
DC_WINC	0x500	Non-shadowed indirect window registers: indirect alias; windows A/B/C; use DISPLAY_WINDOW_HEADER(1)
DC_WIN	0x700	Shadowed indirect window register: indirect alias; windows A/B/C/D; use DISPLAY_WINDOW_HEADER(1)
DC_WINBUF	0x800	Triple-buffered indirect window registers: indirect alias; windows A/B/C/D; use DISPLAY_WINDOW_HEADER(1)
DC_A_WINC	0xa00	Window A instance for DC_WINC
DC_A_WIN	0xb80	Window A instance for DC_WIN
DC_A_WINBUF	0xbc0	Window A instance for DC_WINBUF
DC_B_WINC	0xc00	Window B instance for DC_WINC
DC_B_WIN	0xd80	Window B instance for DC_WIN
DC_B_WINBUF	0xdc0	Window B instance for DC_WINBUF
DC_C_WINC	0xe00	Window C instance for DC_WINC
DC_C_WIN	0xf80	Window C instance for DC_WIN
DC_C_WINBUF	0xfc0	Window C instance for DC_WINBUF
DC_D_WINC	0x1000	Window D instance of DC_WINC (RESERVED)
DC_T_WINC	0x1200	Window T instance of DC_WINC (RESERVED)
DC_H_WINC	0x1400	Window H instance of DC_WINC (RESERVED)
Note the indirect ranges have been deprecated but are listed for legacy purposes.		

24.5.2 New Registers for Tegra X1 Devices

The following registers or register fields are new or changed for Tegra X1 devices.

- DISP_WIN_OPTIONS. SOR1_ENABLE – similar to SOR_ENABLE. Enables output of pixels from this controller to SOR1. Note that SOR1 has a separate input selector register.
- SECURE_CONTROL. SECURE_SOR1_PROTECT - In TrustZone mode, this allows TrustZone code to disable the output to SOR1.
- Windows A/B/C CDE registers
- DSC registers and register fields

24.5.3 Display Controller Register Definition

Each display supports three windows: Window A, Window B, Window C

The windows may have different features, as described above; however, the register interfaces are the same.

Color Palette

These appear as three instances of 256 32-bit registers with each register consisting of one RGB pixel so not all 32 bits in the registers are used. One instance is used for window A, another instance is used for window B, and the third instance is used for window C. In reality, each instance is implemented as triple 256-word dual-port register files (2P RF) with one read port and one write port (1R1W) and with each word consisting of 1 red/green/blue component. Read port of the color palettes are used for the corresponding window A, window B, or window C and write port of the color palettes are used for host write.

Note that the host cannot read these color palettes, so it must cache this color palette somewhere else to be able to read them. This is done to reduce area.

24.5.4 Display Shadow Registers

Display registers have three shadow types:

1. Not Shadowed

   Writes to these registers take effect immediately.

2. Double Buffered

   Each register has two copies: ASSEMBLY and ACTIVE. ACTIVE is the working copy.

   These two copies share the same address/offset.

   WRITE_MUX can be programmed to choose which copy the subsequent register writes goes to:

   - When set to ACTIVE, both ACTIVE and ASSEMBLY copies will be written
   - When set to ASSEMBLY, only ASSEMBLY copy will be written

   READ_MUX can be programmed to choose which copy the subsequent register reads comes from.

   If display is in STOP mode, ASSEMBLY copy is latched into ACTIVE copy immediately after

   (GENERAL/WIN_A/WIN_B/WIN_C)_ACT_REQ is programmed. In other modes the latching happens on the next frame boundary after (GENERAL/WIN_A/WIN_B/WIN_C)_ACT_REQ is programmed.

3. Triple Buffered

   Each register has three copies: ASSEMBLY, ARM, and ACTIVE. ACTIVE is the working copy.

   ASSEMBLY and ACTIVE copies share the same address/offset, the ARM copy is located at the address/offset one bigger than the ASSEMBLY/ACTIVE copy.

   WRITE_MUX can be programmed to choose which copy the subsequent register writes goes to:

   - When set to ACTIVE, all three copies will be written
   - When set to ASSEMBLY, only ASSEMBLY copy will be written

READ_MUX can be programmed to choose which copy the subsequent register reads comes from.

- To read back ASSEMBLY or ACTIVE copy, set READ_MUX correctly before register reads.

These two copies share the same address.

- To read back ARM copy, do not set READ_MUX, but read back the register/register-field with "_NS" in their names, the offset of which is 1 bigger than its ASSEMBLY/ACTIVE counterpart.

ASSEMBLY copy is latched into ARM copy immediately after GENERAL/WIN_A/WIN_B/WIN_C)_UPDATE is programmed.

If display is in STOP mode, ARM copy is latched into ACTIVE copy immediately after (GENERAL/WIN_A/WIN_B/WIN_C)_ACT_REQ is programmed. In other modes the latching happens on the next frame boundary after (GENERAL/WIN_A/WIN_B/WIN_C)_ACT_REQ is programmed.

24.5.5 Display Control Modes

The DISPLAY_COMMAND is used to set display control mode (**CONTINUOUS**, **ONE-SHOT**, or **STOP**).

Display switches mode when CONTROL_MODE is programmed to shadow register and then activated.

Display enters a mode when the register activation happens, either on frame boundary when entering **STOP** mode, or immediately when exiting **STOP** mode.

In **STOP** mode, display is in idle. Pixel clock is not running.

In **CONTINUOUS** mode, display keeps refreshing the output frame by frame. This mode is mostly used for the panels without internal frame buffer.

In **ONE-SHOT** mode, also known as non-continuous mode, display waits for a trigger before refreshing each frame. Between those frames, display is in idle. This mode is usually for the panels with internal frame buffer.

In ONE-SHOT mode, there are different types of triggers as follows:

- Input triggers

  Input trigger is to notify DISPLAY that a new memory surface is ready to be displayed.

  - Host Trigger

  Host trigger is requested when NC_HOST_TRIG_ENABLE is programmed. This register field is in the same register as shadow registers UPDATE/ACT_REQ so that the trigger can happen atomically with register updates for the new frame. When host trigger is requested within a frame, the requested frame will start immediately after the end of the current frame.

- Output Triggers

  Output trigger is to notify DISPLAY that a panel is ready to receive data from DISPLAY.

  - Tear Effect Signal Triggers

  When MSF/SSF register field is set to ENABLE, DISPLAY holds off a frame requested by input triggers until DISPLAY receives a "ready" from the pins that connect to the tearing effect signals from the panel, then sends a new frame to panel. However, if no input trigger has been requested, DISPLAY does not send a new frame.

In CONTINUOUS mode, the meaning of the triggers is different.

- Input Triggers

  Since in CONTINUOUS mode trigger happen automatically and repeatedly, trigger here only affects the buffer address change on a window.

  - Host Trigger

    Host can change the buffer address and then write WIN_A/B/C_ACT_REQ to request the buffer address change. Note that for syncpt logic, it cannot tell if a WIN_A/B/C register activation indicates the change of address, so it always behaves like a change of address happens on any register activation requested by WIN_A/B/C_ACT_REQ. As the result, RD_DONE/OP_DONE is returned.

- Output triggers

  These triggers are not applicable in CONTINUOUS mode. MSF/SSF_ENABLE should never be set in CONTINUOUS mode.

24.5.6 Sync Points

DISPLAY has 4 syncpt clients:

- GENERAL

  Conditions

  - 0: IMMEDIATE return INDX immediately
  - 1: OP_DONE not meaningful, same as IMMEDIATE
  - 2: RD_DONE not meaningful, same as IMMEDIATE
  - 3: REG_WR_SAFE returns INDX whenever it is safe to program GENERAL shadow registers (when all previous GENERAL activation has happened)
  - 4: HSPI returns INDX whenever it is safe to send HSPI data (when all HSPI_*** registers are safe to be programmed)
  - 5: FRAME_DONE returns INDX on the next frame end
  - 6: VPULSE3 returns INDX on the next vpulse3 leading edge (for timing sensitive operations if needed)
  - 7: FRAME_START returns INDX on the next frame start (currently for hardware testing, but can be used if needed)

- WIN_A

  Conditions

  - 0: IMMEDIATE return INDX immediately
  - 1: OP_DONE same as RD_DONE
  - 2: RD_DONE returns INDX when all WIN_A reads for frames activated before the INCR_SYNCPT are complete. In ONE-SHOT mode with TVO disabled, this happens after the last row of window A display. In CONTINUOUS mode, or in ONE-SHOT mode with TVO enabled, this happens on the last row of window A or on frame end (depending if the INCR_SYNCPT is issued before or after the window A last row).
  - 3: REG_WR_SAFE returns INDX whenever it is safe to program WIN_A shadow registers (when all previous WIN_A activation has happened)
  - 4: LINE_FLIPPED returns INDX whenever the activation has happened and the previous surface has been completely read out. This is particularly useful for line flip case, when s/w could use the syncpt to free up the previously read surface. As hardware moves on to the new surface.

- WIN_B

  Similar to WIN_A

- WIN_C

  Similar to WIN_A

- DISPLAY Continuous syncpt

  VSYNC: When enabled, return syncpt whenever a vblank start happens.

24.5.7 Raise Actions (Legacy)

The Raise action is used to check the state of the display's command execution. The Raise action can be enabled by itself or with other actions.

The raise value is returned to the host controller if the current and all previous commands have completed execution. If the command is executed with the delayed mode, the raise is not returned till that command is executed at the end of the frame.

If there is no pending command when the Raise is issued, the raise value is returned immediately. The raise value is a 4-bit number included in the command.

Context switch acknowledge, register reads, and raises are returned to the host through a read FIFO. However, because there may be more than one raise, read, or acknowledge available for writing to the FIFO in a certain cycle, there must be a priority encoder. Here is the priority:

1. Context switch
2. Register read
3. SIGNAL_RAISE
4. SIGNAL_RAISE1
5. SIGNAL_RAISE2
6. SIGNAL_RAISE3
7. DISP_COMMAND_RAISE
8. HSPI_RAISE
9. Refcount

These packets are for verification; they have no relevance to software. The RAISE packet should include the intended return channel. This channel should be passed back to the host so the RAISE will be reflected in the correct channel.

24.6 Display CMD Registers

24.6.1 DC_CMD_GENERAL_INCR_SYNCPT_0

Offset: 0x0 | Byte Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:8	0x0	GENERAL_COND: Condition mapped from raise/wait 0 = IMMEDIATE 1 = OP_DONE 2 = RD_DONE 3 = REG_WR_SAFE 4 = HSPI 5 = FRAME_DONE 6 = VPULSE3 7 = FRAME_START 8 = COND_8 9 = COND_9 10 = COND_10 11 = COND_11 12 = COND_12 13 = COND_13 14 = COND_14 15 = COND_15 16 = COND_16 17 = COND_17 18 = COND_18 19 = COND_19 20 = COND_20 21 = COND_21 22 = COND_22 23 = COND_23 24 = COND_24 25 = COND_25 26 = COND_26 27 = COND_27 28 = COND_28 29 = COND_29 30 = COND_30 31 = COND_31
7:0	0x0	GENERAL_INDX: syncpt index value

24.6.2 DC_CMD_GENERAL_INCR_SYNCPT_CNTRL_0

Offset: 0x1 | Byte Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxxx0)

Bit	Reset	Description
8	0x0	GENERAL_INCR_SYNCPT_NO_STALL: If NO_STALL is 1, then when FIFOs are full, INCR_SYNCPT methods will be dropped and the INCR_SYNCPT_ERROR[COND] bit will be set. If NO_STALL is 0, then when FIFOs are full, the client host interface will be stalled.
0	0x0	GENERAL_INCR_SYNCPT_SOFT_RESET: If SOFT_RESET is set, then all internal state of the client syncpt block will be reset. To do a soft reset, first set SOFT_RESET of all Host1x clients affected, then clear all SOFT_RESETs.

24.6.3 DC_CMD_GENERAL_INCR_SYNCPT_ERROR_0

Offset: 0x2 | Byte Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GENERAL_COND_STATUS: COND_STATUS[COND] is set if the FIFO for COND overflows. This bit is sticky and will remain set until cleared. Cleared by writing 1.

24.6.4 DC_CMD_WIN_A_INCR_SYNCPT_0

Offset: 0x8 | Byte Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:8	0x0	WIN_A_COND: Condition mapped from raise/wait 0 = IMMEDIATE 1 = OP_DONE 2 = RD_DONE 3 = REG_WR_SAFE 4 = LINE_FLIPPED 5 = COND_5 6 = COND_6 7 = COND_7 8 = COND_8 9 = COND_9 10 = COND_10 11 = COND_11 12 = COND_12 13 = COND_13 14 = COND_14 15 = COND_15 16 = COND_16 17 = COND_17 18 = COND_18 19 = COND_19 20 = COND_20 21 = COND_21 22 = COND_22 23 = COND_23 24 = COND_24 25 = COND_25 26 = COND_26 27 = COND_27 28 = COND_28 29 = COND_29 30 = COND_30 31 = COND_31
7:0	0x0	WIN_A_INDX: syncpt index value

24.6.5 DC_CMD_WIN_A_INCR_SYNCPT_CNTRL_0

Offset: 0x9 | Byte Offset: 0x24 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxxx0)

Bit	Reset	Description
8	0x0	WIN_A_INCR_SYNCPT_NO_STALL: If NO_STALL is 1, then when FIFOs are full, INCR_SYNCPT methods will be dropped and the INCR_SYNCPT_ERROR[COND] bit will be set. If NO_STALL is 0, then when FIFOs are full, the client host interface will be stalled.
0	0x0	WIN_A_INCR_SYNCPT_SOFT_RESET: If SOFT_RESET is set, then all internal states of the client syncpt block will be reset. To do a soft reset, first set SOFT_RESET of all Host1x clients affected, then clear all SOFT_RESETs.

24.6.6 DC_CMD_WIN_A_INCR_SYNCPT_ERROR_0

Offset: 0xa | Byte Offset: 0x28 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	WIN_A_COND_STATUS: COND_STATUS[COND] is set if the FIFO for COND overflows. This bit is sticky and will remain set until cleared. Cleared by writing 1.

24.6.7 DC_CMD_WIN_B_INCR_SYNCPT_0

Offset: 0x10 | Byte Offset: 0x40 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description

7:0	0x0	WIN_C_INDX: syncpt index value

24.6.11 DC_CMD_WIN_C_INCR_SYNCPT_CNTRL_0

Offset: 0x19 | Byte Offset: 0x64 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxx0)

Bit	Reset	Description
8	0x0	WIN_C_INCR_SYNCPT_NO_STALL: If NO_STALL is 1, then when FIFOs are full, INCR_SYNCPT methods will be dropped and the INCR_SYNCPT_ERROR[COND] bit will be set. If NO_STALL is 0, then when FIFOs are full, the client host interface will be stalled.
0	0x0	WIN_C_INCR_SYNCPT_SOFT_RESET: If SOFT_RESET is set, then all internal states of the client syncpt block will be reset. To do a soft reset, first set SOFT_RESET of all Host1x clients affected, then clear all SOFT_RESETs.

24.6.12 DC_CMD_WIN_C_INCR_SYNCPT_ERROR_0

Offset: 0x1a | Byte Offset: 0x68 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	WIN_C_COND_STATUS: COND_STATUS[COND] is set if the FIFO for COND overflows. This bit is sticky and will remain set until cleared. Cleared by writing 1.

24.6.13 DC_CMD_CONT_SYNCPT_VSYNC_0

Offset: 0x28 | Byte Offset: 0xa0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxx0xxxxxxxx)

Bit	Reset	Description
8	0x0	VSYNC_EN: On host read bus every time VSYNC (V-blank leading edge) happens and VSYNC_EN is set 0 = DISABLE 1 = ENABLE
7:0	X	VSYNC_INDX: Return INDX (set HOST_CLRD packet TYPE field to SYNCPT)

24.6.14 DC_CMD_CTXSW_0

Context switch registers for class and channel

Should be common to all modules. Includes the current channel/class (writable by software) and the next channel/class (which the hardware sets when it receives a context switch).

Context switch works like this:

Any context switch request triggers an interrupt to the host and causes the new channel/class to be stored in NEXT_CHANNEL/NEXT_CLASS (see vmod/chexample). Software sees that there is a context switch interrupt and does the necessary operations to make the module ready to receive traffic from the new context. It clears the context switch interrupt and writes CURR_CHANNEL/CLASS to the same value as NEXT_CHANNEL/CLASS, which causes a context switch acknowledge packet to be sent to the host. This completes the context switch and allows the host to continue sending data to the module.

Context switches can also be pre-loaded. If CURR_CLASS/CHANNEL are written and updated to the next CLASS/CHANNEL before the context switch request occurs, an acknowledge will be generated by the module and no interrupt will be triggered. This is one way for software to avoid dealing with context switch interrupts.

Another way to avoid context switch interrupts is to set the AUTO_ACK bit.

This bit tells the module to automatically acknowledge any incoming context switch requests without triggering an interrupt. CURR_* and NEXT_* will be updated by the module so they will always be current.

Offset: 0x30 | Byte Offset: 0xc0 | Read/Write: R/W | Reset: 0xf000f800 (0bxxxxxxxxxxxxxxxx11111x0000000000)

Bit	R/W	Reset	Description
31:28	RO	X	NEXT_CHANNEL: Next requested channel
25:16	RO	X	NEXT_CLASS: Next requested class
15:12	RW	0xf	CURR_CHANNEL: Current working channel, reset to 'invalid'
11	RW	0x1	AUTO_ACK: Automatically acknowledge any incoming context switch requests 0 = MANUAL 1 = AUTOACK
9:0	RW	0x0	CURR_CLASS: Current working class

24.6.15 DC_CMD_DISPLAY_COMMAND_OPTION0_0

Display Controller Option 0. This register is not effective until DISPLAY_COMMAND is written.

Class: Display Command

Offset: 0x31 | Byte Offset: 0xc4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxx000xxxxxxx00000000)

Bit	Reset	Description
18	0x0	WINDOW_C_NC_DISPLAY: Window C Non-Continuous Display. This is effective only in Non-Continuous Display mode when window C buffer switching is not controlled by host. If this bit is enabled, a frame is sent whenever Window C buffer is switched. 0 = DISABLE 1 = ENABLE
17	0x0	WINDOW_B_NC_DISPLAY: Window B Non-Continuous Display. This is effective only in Non-Continuous Display mode when window B buffer switching is not controlled by host. If this bit is enabled, a frame is sent whenever Window B buffer is switched. 0 = DISABLE 1 = ENABLE
16	0x0	WINDOW_A_NC_DISPLAY: Window A Non-Continuous Display. This is effective only in Non-Continuous Display mode when window A buffer switching is not controlled by host. If this bit is enabled, a frame is sent whenever Window A buffer is switched. 0 = DISABLE 1 = ENABLE
7:6	0x0	SSF_SOURCE: Source pin for the SSF input. Controls which pin will be used as the source for the trigger input when MSF mode is enabled. Note that although the same pins are available for both MSF and SSF, the order in the enum and hence the values differ between the pins. This is to maintain backwards compatibility with previous chips, which had a fixed mapping. The init value and the first value in the enum reflect this historical mapping. 0= LCD_DC pin (legacy default) 1= LCD_SPI pin 2= LCD_SDI pin 3= RESERVED for future use. 0 = SSF_LDC 1 = SSF_LSPI 2 = SSF_LSDI
5	0x0	SSF_ENABLE: Sub-Display Stop Frame (SSF) input. This is effective only in Non-Continuous Display mode. When enabled, SSF signal can be input through LDC pin. When SSF is enabled a trigger to send a frame in Non-Continuous Display mode will be delayed until SSF is active. 0 = DISABLE 1 = ENABLE
4	0x0	SSF_POLARITY: Sub-Display Stop Frame (SSF) Polarity 0= Active high 1= Active low
3:2	0x0	MSF_SOURCE: Source pin for the MSF input. Controls which pin will be used as the source for the trigger input when MSF mode is enabled. Note that although the same pins are available for both MSF and SSF, the order in the enum and hence the values differ between the pins. This is to maintain backwards compatibility with previous chips, which had a fixed mapping. The init value and the first value in the enum reflects this historical mapping. 0= LCD_SPI pin (legacy default) 1= LCD_DC pin 2= LCD_SDI pin 3= RESERVED for future use. 0 = MSF_LSPI 1 = MSF_LDC 2 = MSF_LSDI
1	0x0	MSF_ENABLE: Main-Display Stop Frame (MSF) input This is effective only in Non-Continuous Display mode. When enabled, the MSF signal can be input through the LSPI pin. When MSF is enabled, a trigger to send a frame in Non-Continuous Display mode will be delayed until MSF is active. 0 = DISABLE 1 = ENABLE
0	0x0	MSF_POLARITY: Main-Display Stop Frame (MSF) Polarity 0= Active high 1= Active low

24.6.16 DC_CMD_DISPLAY_COMMAND_0

Display Command

Offset: 0x32 | Byte Offset: 0xc8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx00xxxx0)

Bit	Reset	Description
30:27	X	DISP_COMMAND_RAISE_CHANNEL_ID: Display Command Channel ID
26:22	X	DISP_COMMAND_RAISE_VECTOR: Display Command Raise Vector. This raise vector is at the next line or frame boundary, depending on GENERAL_ACT_CNTR_SEL

Bit	Reset	Description
6:5	0x0	DISPLAY_CTRL_MODE: Display Controller Mode 0= Stop Display, this can be used to stop sending frame at the next frame boundary. This is automatically generated in Non-Continuous Display after sending one frame. If this is issued when display controller is already stopped then there is no frame sent. Raise vector (if raise is enabled) is also returned immediately. This command can also be used in non-continuous display mode to stop accepting non-host trigger conditions from other clients. 1= Continuous Display, the display controller will continuously send frame. Continuous display mode can be stopped by switching to Non-Continuous Display or by issuing Stop Display. 2= Non-Continuous Display, the display controller is forced to send one frame of each active display and then wait for the next time this command is issued or for other (non-host) trigger conditions to send frame. The sending of frames may be delayed by MSF or SSF input signals from the display device. If a Stop Display is issued while in non-continuous display mode then non-host trigger conditions will no longer be accepted until the next time Non-Continuous Display is issued 0 = STOP 1 = C_DISPLAY 2 = NC_DISPLAY
0	0x0	DISP_COMMAND_RAISE: Display Command Raise. Raise vector will be returned at the end of command completion 0 = DISABLE 1 = ENABLE

24.6.17 DC_CMD_SIGNAL_RAISE_0

When written, the next occurrence of the selected SIGNAL will cause a RAISE to be sent to the host. Software must not write this register if a previous request (from previous write) is still outstanding. Added SIGNAL_RAISE_TYPE option so that multiple raises can be returned without software intervention. SIGNAL_RAISE1, SIGNAL_RAISE2, or SIGNAL_RAISE3 can be used if more than one source signal is needed.

Offset: 0x33 | Byte Offset: 0xcc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx0xxxxxxxxxxx)

Bit	Reset	Description
19:16	X	SIGNAL_RAISE_CHANNEL_ID: Signal Raise Channel ID
12	0x0	SIGNAL_RAISE_TYPE: 0= One-shot, single raise returned. 1= Continuous, raise is returned persistently whenever raise event is true until this register is reprogrammed such that SIGNAL_RAISE_SELECT=NONE or SIGNAL_RAISE_TYPE=ONESHOT 0 = ONESHOT 1 = CONT
10:8	X	SIGNAL_RAISE_SELECT: which signal to raise on 0= none, no raise sent back 1= Frame End signal 2= V Blank signal 3= V Pulse 3 signal 4= Rising edge of V Blank signal 5= Falling edge of V Blank signal 6= Rising edge of V Pulse 3 signal 7= Falling edge of V Pulse 3 signal 0 = NONE 1 = FRAME_END 2 = VBLANK 3 = VPULSE3 4 = VBLANK_START 5 = VBLANK_END 6 = VPULSE3_START 7 = VPULSE3_END
4:0	X	SIGNAL_RAISE_VECTOR: bit number to raise

24.6.18 DC_CMD_DISPLAY_POWER_CONTROL_0

PW0, PW1, PW2, and PW3 are tied internally to the same value corresponding to PW3.

Software is required to program all these register fields to ENABLE - PW0 to PW3 simultaneously, in the same register write access.

The power sequencing provided by PW0 - PW3 was LCD output specific, which is not applicable because LCD has been removed.

Display Power Control

Offset: 0x36 | Byte Offset: 0xd8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxx00xxxxx0x0xxxxxxx0x0x0x0x0)

Bit	Reset	Description
25	0x0	HSPI_ENABLE: Host SPI write cycle enable. SPI_ENABLE must be enabled also for this bit to be effective. 0 = DISABLE 1 = ENABLE
24	0x0	SPI_ENABLE: SPI interface enable. This enables clock to SPI interface logic for Host SPI, IS SPI, and LCD SPI. 0 = DISABLE 1 = ENABLE
18	0x0	PM1_ENABLE: PM1 signal enable 0 = DISABLE 1 = ENABLE
16	0x0	PM0_ENABLE: PM0 signal enable 0 = DISABLE 1 = ENABLE
8	0x0	PW4_ENABLE: PW4 signal enable. This signal can be output at the pad for display power sequencing. 0 = DISABLE 1 = ENABLE
6	0x0	PW3_ENABLE: PW3 signal enable. This signal can be output at the pad for display power sequencing. 0 = DISABLE 1 = ENABLE
4	0x0	PW2_ENABLE: PW2 signal enable. This signal controls pixel data processing. It should be enabled during V blank time. This signal also controls the time when pin polarity takes effect at the pad. This signal can be output at the pad for display power sequencing. 0 = DISABLE 1 = ENABLE
2	0x0	PW1_ENABLE: PW1 signal enable. This signal can be output at the pad for display power sequencing. 0 = DISABLE 1 = ENABLE
0	0x0	PW0_ENABLE: PW0 signal enable. This signal controls the display H and V counters. It must be enabled first and disabled last during display power sequencing. This signal can be output at the pad for display power sequencing. 0 = DISABLE 1 = ENABLE

24.6.19 DC_CMD_INT_STATUS_0

This reflects status of all pending interrupts which is valid as long as the interrupt is not cleared even if the interrupt is masked. A pending interrupt can be cleared by writing a '1' to this the corresponding interrupt status bit in this register.

Display Interrupt and Status

Offset: 0x37 | Byte Offset: 0xdc | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
29	X	DSC_TO_UF_INT: DSC TO Underflow Interrupt Status. 1 = Interrupt pending 0 = Interrupt not pending
28	X	DSC_BBUF_UF_INT: DSC BBUF Underflow Interrupt Status. 1 = Interrupt pending 0 = Interrupt not pending

Bit	Reset	Description
27	X	DSC_RBUF_UF_INT: DSC RBUF Underflow Interrupt Status. 1 = Interrupt pending 0 = Interrupt not pending
26	X	DSC_OBUF_UF_INT: DSC OBUF Underflow Interrupt Status. 1 = Interrupt pending 0 = Interrupt not pending
25	X	WIN_T_UF_INT: Window T Underflow Interrupt Status 0= interrupt not pending 1= interrupt pending

3	X	H_BLANK_INT: Horizontal Blank Interrupt 0= interrupt not pending 1= interrupt pending
2	X	V_BLANK_INT: Vertical Blank Interrupt 0= interrupt not pending 1= interrupt pending

Bit	Reset	Description
1	X	FRAME_END_INT: Frame End Interrupt 0= interrupt not pending 1= interrupt pending
0	X	CTXSW_INT: Context Switch Interrupt Status (this is cleared on write) 0= interrupt not pending 1= interrupt pending

24.6.20 DC_CMD_INT_MASK_0

Setting bits in this register masks the corresponding interrupt but neither clears a pending interrupt nor prevents a pending interrupt from being generated. Masking an interrupt also does not clear a pending interrupt status and does not prevent a pending interrupt status from being generated.

Interrupt Mask

Offset: 0x38 | Byte Offset: 0xe0 | Read/Write: R/W | Reset: 0x00000000 (0bxx00000000xxxxx00000x0000x000000)

Bit	Reset	Description
29	0x0	DSC_TO_UF_INT_MASK: DSC TO Underflow Interrupt Mask 0 = MASKED 1 = NOTMASKED

0	0x0	CTXSW_INT_MASK: Context Switch Interrupt Mask 0 = MASKED 1 = NOTMASKED

24.6.21 DC_CMD_INT_ENABLE_0

Setting bits in this register enable the corresponding interrupt event to generate a pending interrupt. Interrupt output signal will be activated only if the corresponding interrupt is not masked.

Disabling an interrupt will not clear a corresponding pending interrupt - it only prevents a new interrupt event to generate a pending interrupt.

Interrupt Enable

Offset: 0x39 | Byte Offset: 0xe4 | Read/Write: R/W | Reset: 0x00000001 (0bxx00000000xxxxx00000x0000x000001)

Bit	Reset	Description

24.6.22 DC_CMD_INT_TYPE_0

Two interrupt types are available:

- Edge interrupt - transition on input signal/event generates pending interrupt
- Level interrupt - active level on input signal/event generates pending interrupt

Interrupt Type

Offset: 0x3a | Byte Offset: 0xe8 | Read/Write: R/W | Reset: 0x00000000 (0bxx00000000xxxxx00000x0000x00000x)

Bit	Reset	Description
29	0x0	DSC_TO_UF_INT_TYPE: DSC TO Underflow Interrupt Type. 1 = Level Interrupt 0 = Edge Interrupt 0 = EDGE 1 = LEVEL

24.6.23 DC_CMD_INT_POLARITY_0

For edge interrupts, these bits specify whether a pending interrupt is generated on the falling edge or on the rising edge of the corresponding input signal/event. For level interrupts, these bits specify whether a pending interrupt is generated on the low level or on the high level of the corresponding input signal/event.

Interrupt Polarity

Offset: 0x3b | Byte Offset: 0xec | Read/Write: R/W | Reset: 0x00400000 (0bxx00000001xxxxx00000x0000x00000x)

2	0x0	WIN_A_ACT_CNTR_SEL: Select which counter to use for window A activation 0= vertical counter 1= horizontal counter 0 = VCOUNTER 1 = HCOUNTER
0	0x0	GENERAL_ACT_CNTR_SEL: Select which counter to use for general activation 0= vertical counter 1= horizontal counter 0 = VCOUNTER 1 = HCOUNTER

24.6.31 DC_CMD_WIN_T_STATE_CONTROL_0

WIN_T State control register for activating/arming new register state

Restrictions:

- ACT_REQ cannot be programmed at the same time the corresponding "UPDATE" is programmed. If so desired, it should be split into two consecutive writes to this register.
- When SECURE_CONTROL.SECURE_ENABLE=1, this register is only accessible when HOST1X secure bit is set.
- If SECURE_CONTROL.SECURE_ENABLE is zero, this register is accessible regardless of HOST1X secure bit level.

Offset: 0x44 | Byte Offset: 0x110 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxxx0)

Bit	Reset	Description
8	0x0	WIN_T_UPDATE: Trigger for the arming state (from assembly to armed state) for the win T subset of the triple buffered registers. This register is also known as "Update Register" 0 = DISABLE 1 = ENABLE
0	0x0	WIN_T_ACT_REQ: 0= no request pending/request completed 0 = DISABLE 1 = ENABLE

24.6.32 DC_CMD_SECURE_CONTROL_0

Secure control register for enabling secure mode and controlling host1x register loads and reads

Restrictions:

- This register is only accessible when the HOST1X secure bit is set. If the HOST1X secure bit is zero writes to this register are ignored and reads return 0.

Offset: 0x45 | Byte Offset: 0x114 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxx0000x00xxxxx000)

Bit	Reset	Description
14	DISABLE	SECURE_SOR1_PROTECT: If ENABLE, blanks the display output to SOR1 when SECURE_ENABLE is true. 0 = DISABLE 1 = ENABLE
13	DISABLE	SECURE_SOR_PROTECT: if ENABLE, blanks the display output to SOR when SECURE_ENABLE is true. 0 = DISABLE 1 = ENABLE
12	DISABLE	SECURE_DSIB_PROTECT: if ENABLE, blanks the display output to DSIB when SECURE_ENABLE is true. 0 = DISABLE 1 = ENABLE
11	DISABLE	SECURE_DSIA_PROTECT: If ENABLE, blanks the display output to DSIA when SECURE_ENABLE is true. 0 = DISABLE 1 = ENABLE
9	ASSEMBLY	SECURE_READ_MUX: Controls which of the double-buffered window registers are read in TrustZone Secure mode (host1x secure bit set). Similar to STATE_ACCESS.READ_MUX 0 = ASSEMBLY 1 = ACTIVE
8	ASSEMBLY	SECURE_WRITE_MUX: Controls which of the double-buffered window registers are written in TrustZone Secure mode (host1x secure bit set). Similar to STATE_ACCESS.WRITE_MUX 0 = ASSEMBLY 1 = ACTIVE
2	DISABLE	SECURE_CRC_PROTECT: If ENABLE, and SECURE_ENABLE=ENABLE, CRC computation is disabled. 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
1	DISABLE	SECURE_CMU_PROTECT: If ENABLE, and SECURE_ENABLE=ENABLE, CMU registers are only accessible in TrustZone Secure mode. 0 = DISABLE 1 = ENABLE
0	DISABLE	SECURE_ENABLE: Double-buffered: Active state changed at next frame boundary, or immediately in STOP mode. Read returns active state. Changes window T to and from Secure mode 0 = DISABLE 1 = ENABLE

24.6.33 DC_CMD_WIN_D_INCR_SYNCPT_0

Offset: 0x4c | Byte Offset: 0x130 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:8	0x0	WIN_D_COND: Condition mapped from raise/wait 0 = IMMEDIATE 1 = OP_DONE 2 = RD_DONE 3 = REG_WR_SAFE 4 = LINE_FLIPPED 5 = COND_5 6 = COND_6 7 = COND_7 8 = COND_8 9 = COND_9 10 = COND_10 11 = COND_11 12 = COND_12 13 = COND_13 14 = COND_14 15 = COND_15 16 = COND_16 17 = COND_17 18 = COND_18 19 = COND_19 20 = COND_20 21 = COND_21 22 = COND_22 23 = COND_23 24 = COND_24 25 = COND_25 26 = COND_26 27 = COND_27 28 = COND_28 29 = COND_29 30 = COND_30 31 = COND_31
7:0	0x0	WIN_D_INDX: syncpt index value

24.6.34 DC_CMD_WIN_D_INCR_SYNCPT_CNTRL_0

Offset: 0x4d | Byte Offset: 0x134 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxx0)

Bit	Reset	Description
8	0x0	WIN_D_INCR_SYNCPT_NO_STALL: If NO_STALL is 1, then when FIFOs are full, INCR_SYNCPT methods will be dropped and the INCR_SYNCPT_ERROR[COND] bit will be set. If NO_STALL is 0, then when FIFOs are full, the client host interface will be stalled.
0	0x0	WIN_D_INCR_SYNCPT_SOFT_RESET: If SOFT_RESET is set, then all internal states of the client syncpt block will be reset. To do a soft reset, first set SOFT_RESET of all Host1x clients affected, then clear all SOFT_RESETs.

24.6.35 DC_CMD_WIN_D_INCR_SYNCPT_ERROR_0

Offset: 0x4e | Byte Offset: 0x138 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	WIN_D_COND_STATUS: COND_STATUS[COND] is set if the FIFO for COND overflows. This bit is sticky and will remain set until cleared. Cleared by writing 1.

24.7 Display COM Registers

24.7.1 DC_COM_CRC_CONTROL_0

CRC Control

CRC is provided for at speed testing and diagnostic. When CRC is enabled, the CRC logic waits for the next VSync pulse or the one after that (depending on CRC_WAIT) and then it captures one frame of data at the end of display pipeline and computes the CRC value.

After one frame of data is captured, the CRC logic will stop capturing data.

When CRC_INPUT_DATA = FULL_FRAME, DISPLAY_COMMAND.DISPLAY_CTRL_MODE should be programmed to C_DISPLAY so that CRC works properly.

When CRC_INPUT_DATA = ACTIVE_DATA, it can work on both NC_DISPLAY and C_DISPLAY modes, and can work for multiple frames if CRC is checked, disabled, and re-enabled after the end of frame v-active area and before next VSYNC.

CRC logic takes 8 bits of control signals and 24-bit RGB pixel after dither and after display color (R and B) swap option.

Input [31:0] into CRC depends on CRC_INPUT_DATA. If programmed as FULL_FRAME, input data is {LVP1, LPV0, LHP2, LHP1, LHP0, VSYNC, HSYNC, ACTIVE, R[7:0], G[7:0], B[7:0]} and CRC runs over the entire frame (including blank). If programmed as ACTIVE_DATA, input data is {R[7:0], G[7:0], B[7:0]} and CRC runs only during active display area.

Offset: 0x300 | Byte Offset: 0xc00 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3	0x0	CRC_ALWAYS: CRC always: calculates CRC for every following frame. Must use with CRC_INPUT_DATA = ACTIVE_DATA. If enabled, CRC_WAIT field is ignored. 0 = DISABLE 1 = ENABLE
2	0x0	CRC_INPUT_DATA: CRC input data 0= Full frame (RGB data and control) 1= Active display (Only RGB data) 0 = FULL_FRAME 1 = ACTIVE_DATA
1	0x0	CRC_WAIT: CRC Wait 0= 1 Vsync 1= 2 Vsyncs
0	0x0	CRC_ENABLE: CRC Enable 0 = DISABLE 1 = ENABLE

24.7.2 DC_COM_CRC_CHECKSUM_0

CRC Checksum

This register can be read by host after CRC logic stops capturing data.

Offset: 0x301 | Byte Offset: 0xc04 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	0x0	CRC_CHECKSUM: CRC Checksum

24.7.3 DC_COM_PIN_MISC_CONTROL_0

Pin Miscellaneous Control

Pin Miscellaneous Control

Offset: 0x31b | Byte Offset: 0xc6c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0xx)

Bit	Reset	Description
2	0x0	DISP_CLOCK_OUTPUT: Display Clock (DCLK) Enable. 0= disable. 1= enable display clock to be output on LCD_DE pin (LCD_DE output select must be appropriately programmed for this to be effective) 0 = DISABLE 1 = ENABLE

24.7.4 DC_COM_PM0_CONTROL_0

PM0 Signal Control

Class: Pulse Width Modulation

PM0 signal is programmable pulse width modulation signal that can be output on several pins. The control register should be initialized once before PM0 is enabled.

Note: *The period is expressed as multiples of 4 times the divider value.*
The actual period - in clock cycles - is given by:
*period = (1 + PM0_CLOCK_DIVIDER) * ((PM0_PERIOD + 1) * 4)*

Offset: 0x31c | Byte Offset: 0xc70 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
23:18	X	PM0_PERIOD: PM0 Period (4, 8, ... , 256 clock cycles)
17:4	X	PM0_CLOCK_DIVIDER: PM0 Clock Divider (1 to 16384)
1:0	X	PM0_CLOCK_SELECT: PM0 Clock Select. 0= output of shift clock divider 1= pixel clock 2= line clock 3= frame clock Notes: 1) Pixel clock, line clock, and frame clock are running only when the PW0 signal is enabled. 2) In non-continuous mode, shift clock and pixel clock run continuously, but line clock and frame clock only run while a frame is being sent.

24.7.5 DC_COM_PM0_DUTY_CYCLE_0

PM0 Duty Cycle

A counter repeatedly counts up from 0 to ((PM0_PERIOD << 2) + 3) pre-scaled cycles.

The period always starts with the output value == 1. After DUTY_CYCLE number of pre-scaled cycles, the output value is cleared for the remainder of the period. In order to output constant 0, simply set the DUTY_CYCLE to 0. To output a constant 1, set DUTY_CYCLE to be any value greater than ((PM0_PERIOD << 2) + 3).

Offset: 0x31d | Byte Offset: 0xc74 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
8:0	X	PM0_DUTY_CYCLE: PM0 Duty Cycle (or D) From 1/P to D/P pulse high time where P is the period.

24.7.6 DC_COM_SCRATCH_REGISTER_A_0

Scratch Register A

Class: Software Scratch Registers

Offset: 0x325 | Byte Offset: 0xc94 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SCRATCH_REGISTER_A: Scratch Register A

24.7.7 DC_COM_SCRATCH_REGISTER_B_0

Scratch Register B

Offset: 0x326 | Byte Offset: 0xc98 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SCRATCH_REGISTER_B: Scratch Register B

24.7.8 DC_COM_CRC_CHECKSUM_LATCHED_0

CRC Checksum latched

This register is a latched version of CRC_CHECKSUM. Latching happens at frame end.

Note: *CRC_INPUT_DATA needs to be set to ACTIVE_DATA if this register is used. In full frame mode, CRC is frozen two cycles after frame end due to pipelining, so only in active area mode, CRC is consistent and independent of display control mode, and can be checked continuously frame by frame.*

Offset: 0x329 | Byte Offset: 0xca4 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	0x0	CRC_CHECKSUM_LATCHED: CRC Checksum latched

24.7.9 DC_COM_CMU_CSC_KRR_0

CMU Color Space Conversion Matrix

- R' = sat(KRR * R + KGR * G + KBR * B)
- G' = sat(KRG * R + KGG * G + KBG * B)
- B' = sat(KRB * R + KGB * G + KBB * B)

Coefficients are signed 1.8 fixed point, for a range of approximately [-2.0, +1.996]

24.8.2 DC_DISP_DISP_WIN_OPTIONS_0

Display Window Options

Offset: 0x402 | Byte Offset: 0x1008 | Read/Write: R/W | Reset: 0x00000000 (0bxx0x000xxxxxxxx0xxxxxxxxxxxxxxxx)

Bit	Reset	Description
29	0x0	DSI_ENABLE: MIPI Display Serial Interface Enable. The DSI unit must also be separately enabled in its own register space in order to use DSI functionality. 0 = DISABLE 1 = ENABLE
27	DP	SOR1_TIMING_CYA: HDMI expects a delayed vsync and preamble compared to DP 0 = DP 1 = HDMI

Bit	Reset	Description
26	0x0	SOR1_ENABLE: SOR1 interface - DP/HDMI 0 = disable 1 = enable The SOR1 unit must also be separately enabled in its own register space in order to use SOR1 functionality. 0 = DISABLE 1 = ENABLE
25	0x0	SOR_ENABLE: SOR interface - eDP The SOR unit must also be separately enabled in its own register space in order to use SOR functionality. 0 = DISABLE 1 = ENABLE
16	0x0	CURSOR_ENABLE: Cursor Enable 0 = DISABLE 1 = ENABLE

24.8.3 DC_DISP_DISP_TIMING_OPTIONS_0

Display Timing Options

Class: Display Standard Timings

Programming of display timing registers must meet these restrictions:

- Constraint 1: H_REF_TO_SYNC + H_SYNC_WIDTH + H_BACK_PORCH > 20.
- Constraint 2: V_REF_TO_SYNC + V_SYNC_WIDTH + V_BACK_PORCH > 1.
- Constraint 3: V_FRONT_PORCH + V_SYNC_WIDTH + V_BACK_PORCH > 1 (vertical blank).
- Constraint 4: V_SYNC_WIDTH >= 1

  H_SYNC_WIDTH >= 1
- Constraint 5: V_REF_TO_SYNC >= 1

  H_REF_TO_SYNC >= 0
- Constraint 6: V_FRONT_PORCH >= (V_REF_TO_SYNC + 1)

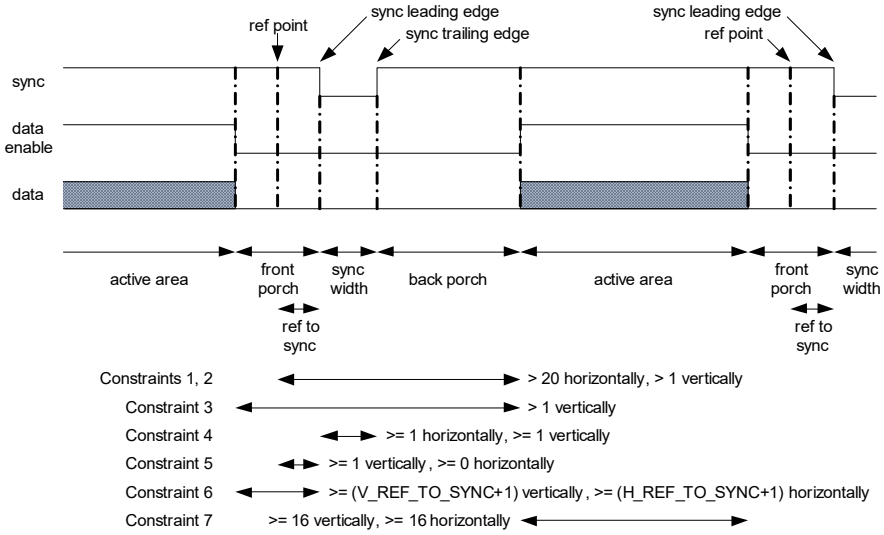
  H_FRONT_PORCH >= (H_REF_TO_SYNC + 1)
- Constraint 7: H_DISP_ACTIVE >= 16

  V_DISP_ACTIVE >= 16

Timing Diagram

- This diagram applies to both vertical and horizontal timing
- The back porch is the only parameter that can be negative

Figure 99: Display Timing Options Timing Diagram



This register specifies display timing options for HSYNC and VSYNC.

Offset: 0x405 | Byte Offset: 0x1014 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx0000000000000)

Bit	Reset	Description
12:0	0x0	VSYNC_H_POSITION: VSYNC Horizontal Position. This parameter specifies the position where VSYNC can toggle with respect to H reference point.

24.8.4 DC_DISP_REF_TO_SYNC_0

H/V Reference to Sync

This register specifies the start position of HSYNC and VSYNC with respect to H and V reference point (line and frame start) correspondingly. The H and V reference points correspond to the time when H and V display timing counter is re-initialized to zero correspondingly. Check DC_DISP_DISP_TIMING_OPTIONS_0, the Display Timing Options register, for programming restrictions for REF_TO_SYNC.

The H reference point also determines the point where V display timing counter is incremented so this points the horizontal relationship between HSYNC and VSYNC.

Note: *VSYNC's rising/falling edge is fixed at H reference point zero.*

Offset: 0x406 | Byte Offset: 0x1018 | Read/Write: R/W | Reset: 0x00000000 (0bxxx0000000000000xxx0000000000000)

Bit	Reset	Description
28:16	0x0	V_REF_TO_SYNC: V reference to VSYNC (minimum 1 line clock)
12:0	0x0	H_REF_TO_SYNC: H reference to HSYNC (minimum 0 pixel clock)

24.8.5 DC_DISP_SYNC_WIDTH_0

H/V SYNC Pulse Width

This register specifies the width of HSYNC and VSYNC pulses. Check DC_DISP_DISP_TIMING_OPTIONS_0, the Display Timing Options register, for programming restrictions for SYNC_WIDTH.

Offset: 0x407 | Byte Offset: 0x101c | Read/Write: R/W | Reset: 0x00000000 (0bxxx0000000000000xxx0000000000000)

Bit	Reset	Description
28:16	0x0	V_SYNC_WIDTH: VSYNC pulse width (minimum 1 line clock)
12:0	0x0	H_SYNC_WIDTH: HSYNC pulse width (minimum 1 pixel clock)

24.8.6 DC_DISP_BACK_PORCH_0

H/V Back Porch

This register specifies the distance between H/V SYNC trailing edge to beginning of display active area. This is a 2's complement value, and a negative value indicates that H/V SYNC overlaps with the corresponding display active area. Check DC_DISP_DISP_TIMING_OPTIONS_0, the Display Timing Options register, for programming restrictions for BACK_PORCH.

Offset: 0x408 │ Byte Offset: 0x1020 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxx0000000000000xxx0000000000000)

Bit	Reset	Description
28:16	0x0	V_BACK_PORCH: V back porch
12:0	0x0	H_BACK_PORCH: H back porch

24.8.7 DC_DISP_DISP_ACTIVE_0

H/V Display Active Width

This register specifies the width of the H/V display active area. Check DC_DISP_DISP_TIMING_OPTIONS_0, the Display Timing Options register, for programming restrictions for DISP_ACTIVE.

Offset: 0x409 │ Byte Offset: 0x1024 │ Read/Write: R/W │ Reset: 0x00030003 (0bxxx0000000000011xxx0000000000011)

Bit	Reset	Description
28:16	0x3	V_DISP_ACTIVE: V display active width (minimum 16 lines)
12:0	0x3	H_DISP_ACTIVE: H display active width (minimum 16 pixels)

24.8.8 DC_DISP_FRONT_PORCH_0

H/V Front Porch

This register specifies the distance between end of H/V display active area to the leading edge of the corresponding H/V SYNC.

Design Note: H/V active end plus the H/V front porch value minus the H/V reference to H/VSYNC determines the H/V total (final H/V count value for the H/V display counter). Check DC_DISP_DISP_TIMING_OPTIONS_0, the Display Timing Options register, for programming restrictions for FRONT_PORCH.

Offset: 0x40a │ Byte Offset: 0x1028 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxx0000000000000xxx0000000000000)

Bit	Reset	Description
28:16	0x0	V_FRONT_PORCH: VSYNC front porch (minimum -=PS_=-V_REF_TO_SYNC + 1)
12:0	0x0	H_FRONT_PORCH: HSYNC front porch (minimum -=PS_=-H_REF_TO_SYNC + 1)

24.8.9 DC_DISP_H_PULSE0_CONTROL_0

H Pulse 0 Control

Class: Display Extended Timings

Horizontal pulse 0 is programmable pulse that repeats every line.

In NORMAL mode, this signal can have several pulses (A to D) per line with programmable width as defined by the pairs of start and end positions. The pulses must not overlap and must occur in sequence: pulse A, then pulse B, etc. In this case, the Enable field must be set to one of the End position. If the Enable field is set to one of the Start position then the pulse generator will stop

as if the Enable field is set to the previous End position. If the Enable field is set to the Start A position, then no pulse is generated.

In ONE_CLOCK mode, this signal can have up to twice the number of pulses per line with each pulse having a width of 1 pixel clock. In this mode, the position of the one-clock pulses corresponds to the enabled Start and End positions.

Regardless of the mode, the pulse generator processes the pairs of start and end position sequentially in the order of: Start A, End A, Start B, End B, etc.

So these start/end positions should be programmed in increasing order. If any of the positions are programmed in non-increasing order (has invalid value) then the pulse generator will stop at the last valid position.

Polarity adjustment is made prior to V display qualification. This register specifies options for Horizontal pulse 0.

Offset: 0x40b │ Byte Offset: 0x102c │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

24.8.32 DC_DISP_V_PULSE2_CONTROL_0

V Pulse 2 Control

Vertical pulse 2 is a programmable pulse that repeats every frame.

This signal can have one pulse (A) per frame with programmable width as defined by the pair of start and end positions.

In this case, the Enable field must be set to one of the End position. If the Enable field is set to one of the Start position then the pulse generator will stop as if the Enable field is set to the previous End position. If the Enable field is set to the Start A position, then no pulse is generated.

So these start/end positions should be programmed in increasing order. If any of the positions are programmed in non-increasing order (has invalid value) then the pulse generator will stop at the last valid position.

This register specifies options for Vertical pulse 2.

24.8.36 DC_DISP_DISP_CLOCK_CONTROL_0

Display Clock Control

The shift clock divider is used to divide root clock for display controller module to generate internal shift clock for shifting data to the display. Output of this divider is typically used to generate the external shift clock which is sent to the display (SC0 and/or SC1) except for 1-pixel/1-clock parallel display.

The output of this divider is also used to generate Programmable Pulse (PP) signal. For 1-pixel/1-clock parallel display, SC0 and SC1 are generated using the output of pixel clock divider which can be set to 1, 2, or 4 for 1-pixel/1-clock parallel display.

The reason pixel clock divider 2 and 4 are allowed for 1-pixel/1-clock parallel display interface is so that the clock that generates PP can be generated with 2x or 4x higher frequency than pixel clock and therefore can produce higher resolution PP pulse positions. For all cases of parallel display, SC0 and SC1 can be further divided by 1, 2, or 4.

Class: Display Interface Settings

This register controls generation of shift clock to the display and internal pixel clock. Internal display pipeline runs with pixel clock and processes 1 pixel per clock.

Offset: 0x42e │ Byte Offset: 0x10b8 │ Read/Write: R/W │ Reset: 0x00000006 (0bxxxxxxxxxxxxxxxxxxxxx000000000110)

Bit	Reset	SW Default	Description

Bit	Reset	SW Default	Description
7:0	0x6	NONE	SHIFT_CLK_DIVIDER: Shift Clock Divider. 0 = divide by 1 1 = divide by 1.5 2 = divide by 2 3 = divide by 2.5 4 = divide by 3 : : : : 254 = divide by 128 255 = divide by 128.5 Pixel clock divider is used to divide output of internal shift clock divider to generate internal pixel clock which is used to clock the internal horizontal and vertical counters. This divider also determines the output format for parallel interface, serial interface, and LCD SPI interface in conjunction with Display Data Format parameter. For 1-pixel/1-clock parallel display interface, valid settings are PCD1, PCD2, and PCD4. Note that the main reason to use PCD2 and PCD4 is to get higher frequency PP clock because the PP clock is always generated from the output of shift clock divider. For non 1-pixel/1-clock parallel display interface, valid settings are, PCD1H (2-pixel/3-clock), PCD2 (1-pixel/2-clock), and PCD3 (1-pixel/3-clock). For 1-channel serial display interface, valid settings are PCD3 (3-bpp 1-ch), PCD4 (3-bpp 1-ch), PCD6 (6-bpp 1-ch), PCD9 (9-bpp 1-ch), PCD12 (12-bpp 1-ch), PCD16 (16-bpp 1-ch), PCD18 (18-bpp 1-ch). For 2-channel serial display interface, valid settings are PCD2 (3-bpp 2-ch), PCD3 (6-bpp 2-ch), PCD6 (12-bpp 2-ch), PCD8 (16-bpp 2-ch), PCD9 (18-bpp 2-ch). For 3-channel serial display interface, valid settings are PCD1 (3-bpp 3-ch), PCD2 (6-bpp 3-ch), PCD3 (9-bpp 3-ch), PCD4 (12-bpp 3-ch), PCD6 (18-bpp 3-ch). For LCD SPI interface, valid settings are PCD12 (B4G4R4), PCD16 (B5G6R5), PCD18 (B6G6R6), PCD24 (B8G8R8), PCD8 (B5G6R5 with data/command bit), PCD6 (B5G6R5 with data/command start byte - depending on data/command bit), PCD4 (P8 for spi8), PCD9 (B5G6R5 with chip select deassertion at 8-bit boundary, spi16x2), PCD3 (P8 for spidc), PCD2 (B5G6R5 with data/command bit and chip select deassertion at 9-bit boundary, spi16x2dc), and PCD13 (spi12p2, no chip select deassertion between pairs of pixels).

24.8.37 DC_DISP_DISP_INTERFACE_CONTROL_0

Display Interface Control

This register specifies display interface options.

Note: *Only the PCD1 setting is allowed. Only default settings are allowed.*

24.8.43 DC_DISP_CURSOR_FOREGROUND_0

Cursor Foreground color

Class: Hardware Cursor

Hardware cursor is supported for 32x32 or for 64x64 2-bpp cursor.

Cursor start address is aligned to 1 KB boundary. All cursor registers except for cursor foreground and background colors are triple buffered.

GENERAL_UPDATE controls ASSEMBLY->ARM latching, GENERAL_ACT_REQ controls ARM->ACTIVE latching.

Cursor scaling and flipping are not implemented so this must be done by software if needed. Cursor H/V positions are signed number with respect to one of the display windows or with respect to upper left position of display active area as specified by cursor clipping parameter which also determines cursor clipping boundary. If cursor position is with respect to one of the display window and the corresponding display window is disabled then cursor will also be disabled.

In legacy cursor mode, only 32x32 and 64x64 are supported

24.8.47 DC_DISP_DC_MCCIF_FIFOCTRL_0

Memory Client Interface FIFO Control Register (where applicable) and Clock Gating Control

Note: *The FIFO timing aspects of this register are no longer supported, but are retained for software compatibility. The clock override/ovr_mode fields of this register control the second level clock gating for the client and MC side of the MCCIF. All clock gating is enabled by default.*

A '1' written to the rclk/wclk override filed will result in one of the following:

- With wclk/rclk override mode = LEGACY, the clock reverts to the legacy mode of operation (where the clock is on whenever the client clock is enabled.
- With wclk/rclk override mode = ON, the clock is always on inside the MCCIF and PC.

A '1' written to the cclk override field keeps the client's clock always on inside the MCCIF.

24.8.51 DC_DISP_DISP_MISC_CONTROL_0

Miscellaneous Controls

Offset: 0x4c1 | Byte Offset: 0x1304 | Read/Write: R/W | Reset: 0x00000002 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx10)

Bit	Reset	Description
1	0x1	UF_LINE_FLUSH: Enable underflow line flush as opposed to end-of-frame flush. underflow line flush 0 = DISABLE; 1 = ENABLE

Bit	Reset	Description
0	0x0	PHASE_SHIFT_2P1C18B: Enable phase shift for 2P1C format phase shift SC0/SC1 will be delayed for one pixel clock cycle. In 2P1C format, data will hold for 2 pixel clocks, so either choice should work 0 = DISABLE 1 = ENABLE

24.8.52 DC_DISP_SD_CONTROL_0

The Smart Dimmer (PRISM2) function takes advantage of the fact that a perceived pixel brightness in an LCD depends on both the pixel brightness value and the backlight intensity to reduce the backlight intensity to save power. Statistics are gathered on the current video frame and an "enhancement" is applied to subsequent frames that increases the pixel brightness value and reduces the backlight brightness to give an overall image intensity that is mostly the same as before.

PRISM2 Control

Offset: 0x4c2 | Byte Offset: 0x1308 | Read/Write: R/W | Reset: 0x00004000 (0bx000xxxxxxxxxxx0100000000000000)

Bit	Reset	Description
30:29	BIAS0	K_INIT_BIAS: BIAS of the initial K bias MSB of count 0 = BIAS0: bias 0 1 = BIAS1: bias 1.0 2 = BIAS_HALF: bias 0.5 3 = BIAS_MSB
28	VSYNC	SD_FRAME_PROC_CONTROL: when to run per-frame processing. VSYNC is legacy behavior. 0 = VSYNC 1 = VPULSE2
15	DISABLE	SMOOTH_K_ENABLE: When enable, maximum raw K change per frame is limited to SMOOTH_K_INCR 0 = DISABLE 1 = ENABLE
14	ENABLE	SOFT_CLIPPING_ENABLE: When enabled, enhancement gain (K) is reduced for pixels above SOFT_CLIPPING_THRESHOLD level to avoid saturation (clipping). 0 = DISABLE 1 = ENABLE
13	DISABLE	SD_WINDOW_ENABLE: When enabled, constrain histogram (and therefore backlight) to a rectangular subset of display. The rectangle has upper/left corner described by SD_WINDOW_POSITION, and width/height by SD_WINDOW_SIZE. Useful for when display has regions that should not influence SD, such as letterbox borders, etc. Enhancement is always performed on whole display, regardless. DISABLE: SD histogram done over whole display ENABLE: SD histogram done over rectangular subset given by SD_WINDOW* registers 0 = DISABLE 1 = ENABLE
12	DISABLE	K_LIMIT_ENABLE: When enabled, Max. K is taken from K_LIMIT register rather than computed from AGGRESSIVENESS. DISABLE: K is limited by AGGRESSIVENESS ENABLE: K is limited by K_LIMIT register. 0 = DISABLE 1 = ENABLE
11	0x0	SD_CORRECTION_MODE: Determines which K values are used to modify the pixel values. MANUAL: The K values in the SD_MAN_K_VALUES register are used to modify pixel values. 0 = AUTO_CORRECT: AUTO_CORRECT: SD Hardware computed K values are used to 1 = MANUAL
10	0x0	SD_ONE_SHOT: Enables the PRISM2 function for one frame only. on which the SD statistics are gathered. NOTE: The SD_ENABLE field (see above) must be set to ONE_SHOT in order to use this function. 0 = DISABLE: Automatically cleared to DISABLE at the end of the frame 1 = ENABLE

Bit	Reset	Description
9:8	0x0	HW_UPDATE_DLY: Determines the delay - in video frames - of the update of the hardware enhancement value that is applied to the pixels. This is useful for allowing the software some time to update the backlight control, when the control must be sent via side-band control packets or by some other means of control that incurs a sizeable delay. Being able to delay the hardware update ensures that the modification of the pixels occurs as nearly simultaneously with the update of the backlight as possible. Value Description 0 No delay - pixels modified immediately 1 New enhancement value delayed by 1 frame. 2 New enhancement value delayed by 2 frames. 3 New enhancement value delayed by 3 frames.
7:5	0x0	AGGRESSIVENESS: The "aggressiveness" level of the PRISM2 algorithm. Higher aggressiveness levels result in higher power savings at the potential expense of image quality. The number programmed determines how many highlight pixels will be allowed to exceed the maximum representable brightness value and be clipped to that value. It also determines the maximum allowed enhancement value (k) applied to the pixel brightness. AGGRESSIVENESS Description Max pixels crushed (%) Max. k value 0 Essentially off 0% 1.00 1 Highest quality < 5% 1.10 2 Higher quality < 10% 1.15 3 Balanced < 15% 1.20 4 Higher battery life < 20% 1.25 5 Highest battery life < 25% 1.50
4:3	0x0	BIN_WIDTH: Width of the Histogram bins, in quantization levels. EIGHT = 8 levels per bin. Bins span range from 0 to 255 0 = ONE: ONE = 1 level per bin. Bins span range from 224 to 255 1 = TWO: TWO = 2 levels per bin. Bins span range from 192 to 255 2 = FOUR: FOUR = 4 levels per bin. Bins span range from 128 to 255 3 = EIGHT
2	0x0	USE_VID_LUMA: Use Video Luminance control of luminance: Luminance = MAX(R, G, B) ENABLE = use "video" luminance, which is determined by the coefficients in the SD_CSC_COEFFS register See the SD_CSC_COEFFS register for details. 0 = DISABLE: DISABLE = use Hue Saturation Value (HSV) version 1 = ENABLE
1:0	0x0	SD_ENABLE: Enables the PRISM2 Function. 0 = DISABLE: DISABLE = SD function disabled. 1 = ENABLE: ENABLE = SD function enabled and operational. 2 = ONE_SHOT = SD function enabled, but statistics gathering limited to the next frame only.

24.8.53 DC_DISP_SD_CSC_COEFF_0

Luminance calculation coefficients used to convert the red, green, and blue color components into a luminance value. The conversion is performed according to the following equation: Luminance = (R * R_COEFF + G * G_COEFF + B * B_COEFF) >> 4 It is suggested that the values of the coefficients be programmed as shown below, though user-defined color spaces are also accommodated. Color Space R_COEFF G_COEFF B_COEFF ITU-R Bt601 5 9 2 ITU-R Bt709 3 12 1. The coefficients do not have to be particularly accurate, hence their low precision, and the coefficients used are open to experimentation to obtain the best results.

Offset: 0x4c3 │ Byte Offset: 0x130c │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxx0000xxxx0000xxxx0000xxxx)

Bit	Reset	Description
23:20	0x0	B_COEFF: Blue coefficient for luminance calculation
15:12	0x0	G_COEFF: Green coefficient for luminance calculation
7:4	0x0	R_COEFF: Red coefficient for luminance calculation

24.8.54 DC_DISP_SD_LUT_0

Enhancement value (k) Look Up Table. Each LUT entry contains the value of k for each of the three color components. Since the value of k for the color components must be the reciprocal of the hardware-computed value of k, and the hardware value is guaranteed to be less than or equal to 1, the values in the LUT represent the fractional part of k, with an implied 1 to the left of the decimal place. For example, if the programmed value of R_LUT was 64 (01000000 in binary), then the actual value of k

generated would be 1.01000000 in binary or 1.25 in decimal. To program a default, linear response into the LUT, use the following code as a guide: for (i = 0; i < 9; i++) { t = (4096 / (8 + i)) - 256; if (t > 255) t = 255; R_LUT[i] = t; G_LUT[i] = t; B_LUT[i] = t; } For other non-linear response curves (for example, to take display gamma into consideration), this code will have to be modified.
This is an array of 9 identical register entries; the register fields below apply to each entry.

Offset: 0x4c4..0x4cc | Byte Offset: 0x1310..0x1330 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000000000000000000000)

Bit	Reset	Description
23:16	0x0	B_LUT: Blue Enhancement value (k) Look Up Table
15:8	0x0	G_LUT: Green Enhancement value (k) Look Up Table
7:0	0x0	R_LUT: Red Enhancement value (k) Look Up Table

24.8.55 DC_DISP_SD_FLICKER_CONTROL_0

Flicker Reduction Control Register

The flicker control prevents rapid and frequent changes in the enhancement value.

Offset: 0x4cd | Byte Offset: 0x1334 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:8	0x0	THRESHOLD: The amount by which the currently calculated enhancement value must deviate from the currently active enhancement value for it to increment the TIME_LIMIT counter.
7:0	0x0	TIME_LIMIT: Length of time - in frames - that the enhancement value must deviate from the current value by more than THRESHOLD, before the enhancement value changes.

24.8.56 DC_DISP_SD_PIXEL_COUNT_0

Status / debug register showing the total number of active pixels

Offset: 0x4ce | Byte Offset: 0x1338 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
15:0	X	NUM_PIXELS: in the preceding output frame. Expressed as a quantity of 256 pixels. In other words, a 640 x 480 image has 307200 pixels. The value in this register would be 307200 / 256 = 1200

24.8.57 DC_DISP_SD_HISTOGRAM_0

Status/debug registers showing the gathered histogram data. Each register contains 4 histogram bins, for a total of 8 x 4 = 32 bins. Each bin has been approximately scaled to the number of pixels in the image so that a single quantization step in a bin represents a fraction of between 1/256 and 1/128 of the total number of pixels in the image.

This is an array of 8 identical register entries; the register fields below apply to each entry.

Offset: 0x4cf..0x4d6 | Byte Offset: 0x133c..0x1358 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:24	**X**	**BIN_3**
23:16	X	BIN_2
15:8	X	BIN_1
7:0	X	BIN_0

24.8.58 DC_DISP_SD_BL_PARAMETERS_0

Backlight response parameters. Defines the parameters for the backlight temporal response model.

Offset: 0x4d7 | Byte Offset: 0x135c | Read/Write: R/W | Reset: 0x00000400 (0bxxxxxxxx00000000xxxxx10000000000) | Default: 0x00ff0000

Bit	Reset	SW Default	Description
23:16	0x0	0xff	STEP: Determines the instantaneous portion of the target value of enhancement that is applied. 0 = 0%: response is entirely exponential and determined by TIME_CONSTANT 128 = 50%: response will instantly step up by 50% and will then be exponential. 255 = 100%: response is entirely instantaneous. TIME_CONSTANT has no effect.
10:0	0x400	NONE	TIME_CONSTANT: The time constant for the response curve. This value represents the fraction by which the value of enhancement value approaches the target value each frame. Example values are shown below: 0: The value will never reach the target (infinite TC) 512: The next value will be halfway between the current value and the target value. 1024: The next value will be 100% of the target value. In other words - an instantaneous response.

24.8.59 DC_DISP_SD_BL_TF_0

Backlight Transfer Function

Each register contains 4 points on the Transfer Function curve that defines how the backlight output changes with respect to the control input. Each point defines a value at the vertex of a 16 segment line. The 17th point is defined to be the maximum value (it is assumed 100% control == 100% light output).

This is an array of 4 identical register entries; the register fields below apply to each entry.

Offset: 0x4d8..0x4db | Byte Offset: 0x1360..0x136c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:24	X	POINT_3
23:16	X	POINT_2
15:8	X	POINT_1
7:0	X	POINT_0

24.8.60 DC_DISP_SD_BL_CONTROL_0

Backlight Control Register

Offset: 0x4dc | Byte Offset: 0x1370 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	R/W	Reset	Description
15:8	RO	X	BRIGHTNESS: Backlight brightness modification value. This value is determined by the hardware according to all the other control registers and the image content. The amount by which the backlight should be modified is given as a fraction with 0 representing that the backlight should be off and 255 representing no change in the backlight intensity. Other values vary linearly between these two extremes. New BL control = (Old BL control * BRIGHTNESS) / 255

Bit	R/W	Reset	Description
1:0	RW	0x0	BL_MODE: Control Mode: and adjust the backlight brightness itself. PWM_AUTO: Hardware will adjust the backlight PWM control signal directly using the value in BRIGHTNESS. * OTHER VALUES ARE RESERVED FOR FUTURE USE * 0 = MANUAL: MANUAL: Hardware makes no BL corrections. Software must read the BRIGHTNESS field 1 = PWM_AUTO

24.8.61 DC_DISP_SD_HW_K_VALUES_0

Hardware-computed values of K for each color component. These values are used to modify the pixel values when CORRECTION_MODE in the SD_CONTROL register is set to AUTO_CORRECT. The numerical format is a fractional 10-bit number. Since we only ever want to make the pixel values bigger, there is an implied integer "1" not present in the register value. Only the fractional part is returned. Also in Tegra X1 devices, only the top 7 bits of the 10-bit K word have any meaning. The bottom 3 bits are always 0 and are reserved for future expansion. This register is read only.

Offset: 0x4dd │ Byte Offset: 0x1374 │ Read/Write: RO │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
29:20	X	HW_K_BLUE: Value of K for blue pixels.
19:10	X	HW_K_GREEN: Value of K for green pixels.
9:0	X	HW_K_RED: Value of K for red pixels.

24.8.62 DC_DISP_SD_MAN_K_VALUES_0

Manual values of K for each color component. These values are used to modify the pixel values when CORRECTION_MODE in the SD_CONTROL register is set to MANUAL. The numerical format is a fractional 10-bit number. Since we only ever want to make the pixel values bigger, there is an implied integer "1" not present in the register value. Only the fractional part can be programmed. Therefore, K values can only be programmed from 1.0 to slightly less than 2.0.Also note that only the top 7 bits of the 10-bit K word have any effect in the hardware. The bottom 3 bits are reserved for future expansion.

Offset: 0x4de │ Byte Offset: 0x1378 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
29:20	X	MAN_K_BLUE: Value of K for blue pixels.
19:10	X	MAN_K_GREEN: Value of K for green pixels.
9:0	X	MAN_K_RED: Value of K for red pixels.

24.8.63 DC_DISP_SD_K_LIMIT_0

Offset: 0x4df │ Byte Offset: 0x137c │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
9:0	X	K_LIMIT: When K_LIMIT_ENABLE=ENABLE, limits raw K independently of AGGRESSIVENESS. Currently, only the bottom 8 bits are effective. The upper 2 are reserved for future expansion.

24.8.64 DC_DISP_SD_WINDOW_POSITION_0

SD Window Position

Offset: 0x4e0 │ Byte Offset: 0x1380 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
28:16	X	SD_WIN_V_POSITION: SD window vertical position. This is specified with respect to the top edge of active display area.

Bit	Reset	Description
12:0	X	SD_WIN_H_POSITION: SD window horizontal position (pixels). This is specified with respect to the left edge of active display area.

24.8.65 DC_DISP_SD_WINDOW_SIZE_0

SD Window Size

Offset: 0x4e1 | Byte Offset: 0x1384 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
28:16	X	SD_WIN_V_SIZE: SD window vertical height (lines).
12:0	X	SD_WIN_H_SIZE: SD window horizontal width (pixels).

24.8.66 DC_DISP_SD_SOFT_CLIPPING_0

SD soft clipping parameters. Software programs both threshold and a reciprocal thereof.

Offset: 0x4e2 | Byte Offset: 0x1388 | Read/Write: R/W | Reset: 0x02000080 (0b00000010000000000xxxxxxx10000000)

Bit	Reset	Description
31:16	0x200	SOFT_CLIPPING_RECIP: Reciprocal of inverse threshold. Compute as RECIP = int(64*1024 * 1.0 / (256 - THRESHOLD)). For example, for THRESHOLD=128, RECIP = int(64*1024 * 1.0 / (256 - 128)) = 512.
7:0	0x80	SOFT_CLIPPING_THRESHOLD: Threshold at which pixel enhancement gain is reduced.

24.8.67 DC_DISP_SD_SMOOTH_K_0

Offset: 0x4e3 | Byte Offset: 0x138c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
13:0	X	SMOOTH_K_INCR: When SMOOTH_K_ENABLE=1, the raw K is changed at most by SMOOTH_K_INCR per frame. 8.6 fixed-point fraction, with resolution 1/64. Currently, only the top 12 bits are effective. The bottom 2 are reserved for future expansion, so the effective resolution is 1/16.

24.8.68 DC_DISP_BLEND_BACKGROUND_COLOR_0

Offset: 0x4e4 | Byte Offset: 0x1390 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:24	0x0	BKGND_ALPHA
23:16	0x0	BKGND_BLUE
15:8	0x0	BKGND_GREEN
7:0	0x0	BKGND_RED

24.8.69 DC_DISP_INTERLACE_CONTROL_0

1080i Related Register

This register controls whether interlacing is enabled or disabled. When interlacing is enabled, the data is fetched from memory at 1080i (interlaced) and all fields are passed directly to the panel. A set of even (normal) and odd (new for interlacing) registers define the field base addresses and timings.

If interlacing is disabled, the following interlacing related registers will have NO effect.

Offset: 0x4e5 | Byte Offset: 0x1394 | Read/Write: R/W | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	R/W	Reset	Description
2	RO	X	INTERLACE_STATUS: 0 = field1 1 = field2 0 = FIELD1 1 = FIELD2
1	RW	0x0	INTERLACE_START: 0 = field1 1 = field2 0 = FIELD1 1 = FIELD2
0	RW	0x0	INTERLACE_ENABLE: 0 = DISABLE 1 = ENABLE

24.8.70 DC_DISP_INTERLACE_FIELD2_REF_TO_SYNC_0

1080i Related Register

This register controls the ref to sync offset for H sync and V sync for FIELD2.

Offset: 0x4e6 | Byte Offset: 0x1398 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
28:16	X	FIELD2_V_REF_TO_SYNC: V reference to VSYNC for FIELD2. IMP - Units are in pixel clocks. Generally, for the non-interlaced timing, the units are in line clocks; however, for interlaced V sync must be generated at a pixel granularity with respect to V ref.
12:0	X	FIELD2_H_REF_TO_SYNC: H reference to HSYNC for FIELD2. Units are in pixel clocks.

24.8.71 DC_DISP_INTERLACE_FIELD2_SYNC_WIDTH_0

1080i Related Register

This register controls the H and V sync widths for FIELD2.

Offset: 0x4e7 | Byte Offset: 0x139c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
28:16	X	FIELD2_V_SYNC_WIDTH: This field controls the V sync widths for FIELD2. Units are in line clocks.
12:0	X	FIELD2_H_SYNC_WIDTH: This field controls the H sync widths for FIELD2. Units are in pixel clocks.

24.8.72 DC_DISP_INTERLACE_FIELD2_BACK_PORCH_0

1080i Related Register

This register controls the H and V back porch widths for FIELD2.

Offset: 0x4e8 | Byte Offset: 0x13a0 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
28:16	X	FIELD2_V_BACK_PORCH: V back porch. Units are in line clocks.
12:0	X	FIELD2_H_BACK_PORCH: H back porch. Units are in pixel clocks.

24.8.73 DC_DISP_INTERLACE_FIELD2_FRONT_PORCH_0

1080i Related Register

This register controls the H and V front porch widths for FIELD2.

Offset: 0x4e9 | Byte Offset: 0x13a4 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
28:16	X	FIELD2_V_FRONT_PORCH: V front porch. Units are in line clocks.
12:0	X	FIELD2_H_FRONT_PORCH: H front porch. Units are in pixel clocks.

24.8.74 DC_DISP_INTERLACE_FIELD2_DISP_ACTIVE_0

1080i Related Register

This register controls the H and V active widths for FIELD2.

Offset: 0x4ea | Byte Offset: 0x13a8 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
28:16	X	FIELD2_V_DISP_ACTIVE: V active width. Units are in line clocks.
12:0	X	FIELD2_H_DISP_ACTIVE: H active width. Units are in pixel clocks.

24.8.75 DC_DISP_CURSOR_UNDERFLOW_CTRL_0

24.9 WINC_AD/BD/CD Registers

These registers control windows A, B and C parameters.

Notes:

- *There are three copies of these registers for windows A, B, and C. Windows D and T have subsets of these registers.*
- *In the register and field names, <AD/BD/CD> indicates window A, B, or C depending on the window selection. Window selection is determined by which Window Direct address range is used.*

24.9.1 DC_<A/B/C>_WINC_<AD/BD/CD>_COLOR_PALETTE_0

This is used for palletized data format (color depth of 8 bpp or less) or for gamma correction for non-palletized data formats (color depth of more than 8-bpp).

Each window has its own color palette which consists of three 256x8 tables which can be written by the host and indexed (read) by the window.

For palletized data formats less than 8 bpp, the pixel data is aligned to least significant bits of the palette index (address), and the remaining upper bits are filled with the corresponding bits of the Palette Color Extension. For example, for 4-bpp mode, the pixel data occupies bits 3:0 of the palette index, and bits 7:4 of the palette index are set to bits 7:4 of the Palette Color Extension.

Note that a host read is assumed to be not needed - software can cache the color palette in system memory.

This is an array of 256 identical register entries; the register fields below apply to each entry.

Window AD/BD/CD Color Palette

7:1	X	<AD/BD/CD>_PALETTE_COLOR_EXT: Window A/B/C Palette Color Extension. Bits 7:1 are used for 1-bpp mode, bits 7:2 are used for 2-bpp mode, and bits 7:4 are used for 4-bpp mode

24.9.3 DC_<A/B/C>_WINC_<AD/BD/CD>_H_FILTER_P00_0

Horizontal Scaling Filter Coefficients

Horizontal scaling filter is a 6-tap filter with 4-bit positional phase.

- Coefficients 0 and 5 are 3-bit signed values ranging from -4 to 3.
- Coefficients 1 and 4 are 5-bit signed values ranging from -16 to 15.
- Coefficients 2 and 3 are 8-bit unsigned values ranging from 0 to 128.
- Coefficient 0 is the multiplier for the earliest pixel (P0) in the group of 6 pixels and
- Coefficient 5 is the multiplier for the latest pixel (P5) in the group. The output pixel positional phase is defined as centered in P2 if the positional phase is 0 or proportionally in between P2 and P3 if the positional phase is larger than 0.

The sum of all coefficients for each phase should be 128 typically, and software should never program the sum of all coefficients for a phase to be more than 128.

For each horizontal positional phase, the 6 filter coefficients require 32 register bits.

Note that color value ranges from 0 to 255 for Y, R, G, B, and -128 to 127 for U and V.

Color Space Conversion Coefficients

The CSC can be used for YUV to RGB conversion with brightness and hue/saturation control. The CSC can only be enabled for window AD/BD/CD controlled by CSC_ENABLE register bits.

For Y color, the Y offset is applied first and saturation (clipping) is performed immediately after the Y offset is applied.

R = sat(KYRGB * sat(Y + YOF) + KUR * U + KVR * V)

G = sat(KYRGB * sat(Y + YOF) + KUG * U + KVG * V)

B = sat(KYRGB * sat(Y + YOF) + KUB * U + KVB * V)

Saturation and rounding is performed in the range of 0 to 255 for the above equations.

Typical values are:

YOF = -16.000, KYRGB = 1.1644

KUR = 0.0000, KVR = 1.5960

KUG = -0.3918, KVG = -0.8130

KUB = 2.0172, KVB = 0.0000

KUR and KVB are typically 0.0000 but they may be programmed non-zero for hue rotation.

The CSC can also take RGB input, in which case YOF, KVB, KUG, and KUR should be programmed to 0, and KYRGB will be forced to 0 by the hardware for generating R and B. KYRGB will not be forced to 0 for generating G. KVR, KYRGB, and KUB can be programmed to 1.0 or used as gain control for R, G, B, correspondingly.

Note that color value ranges from 0 to 255 for Y, R, G, B, and -128 to 127 for U and V.

Vertical Scaling Filter Coefficients

The vertical scaling filter is a 2-tap filter with 4-bit positional phase. Coefficients 0 and 1 are 8-bit unsigned values ranging from 0 to 128.

Coefficient 0 is the multiplier for the earlier pixel (P0) in the group of 2 pixels, and coefficient 1 is the multiplier for the later pixel (P1) in the group. The output pixel positional phase is defined as centered in P0 if the positional phase is 0 or proportionally in between P0 and P1 if the positional phase is larger than 0.

The sum of all coefficients for each phase should be 128 typically. Therefore coefficient 1 can be calculated from (1 - coefficient 0) and only coefficient 0 is programmed. For each vertical positional phase, the filter coefficient requires 8 register bits. Note that color value ranges from 0 to 255 for Y, R, G, B, and -128 to 127 for U and V.

Bit	Reset	Description
31	0x0	<AD/BD/CD>_H_FILTER_MODE: Horizontal filter mode. 0 = With previous Tegra horizontal coefficients widths. 0,5 - signed 5 bits 1,4 - signed 9 bits 2,3 - unsigned 9 bits 1 = New mode. With the expanded horizontal filter coefficients widths. 0,5- signed 5 bits 1,4- signed 7 bits 2,3- unsigned 9 bits 0 = OLD 1 = NEW
30	0x0	<AD/BD/CD>_WIN_ENABLE: Window AD/BD/CD Window enable 0 = DISABLE 1 = ENABLE
23	0x0	<AD/BD/CD>_INTERLACE_ENABLE: Window AD/BD/CD Interlace enable. This controls the fetch unit toggle between odd and even (normal) base addresses at the start of each field. Base address select between odd/even field is determined by HVTGEN field status. 0 = DISABLE 1 = ENABLE
22	0x0	<AD/BD/CD>_YUV_RANGE_EXPAND: Window AD/BD/CD Enable range expansion in the cases where RANGEREDFRM is 1 from mpd. Formula: Y = clip((Y-128)*2 + 128); Cb = clip((Cb-128)*2 + 128); Cr = clip((Cr-128)*2 + 128); where clip() function clips between 0 and 255. 0 = DISABLE 1 = ENABLE
20	0x0	<AD/BD/CD>_DV_ENABLE: Window AD/BD/CD Digital Vibrance Enable 0 = DISABLE 1 = ENABLE
18	0x0	<AD/BD/CD>_CSC_ENABLE: Window AD/BD/CD Color Space Conversion Enable. This controls the color space conversion and should be enabled for YCbCr/YUV color modes for conversion to B8G8R8 and for hue and saturation control. This can also be used for gain control for RGB color modes. 0 = DISABLE 1 = ENABLE
16	0x0	<AD/BD/CD>_CP_ENABLE: Window AD/BD/CD Color Palette Enable. This controls the color palette and should be enabled for palletized color modes. For non-palletized color modes, the color palette can be enabled for gamma correction. 0 = DISABLE 1 = ENABLE
14	0x0	<AD/BD/CD>_V_FILTER_UV_ALIGN: Window AD/BD/CD V Filter UV Alignment. This is effective only when vertical scaling filter is enabled and only on these formats YCbCr420P, YUV420P, YCbCr422R, YUV422R, YCbCr422RA YUV422RA. When UV alignment is enabled, the chroma components are aligned to the even number of luma component lines. When disabled the chroma components are aligned to half a pixel below the corresponding even number of luma component lines. It is usually disabled unless the incoming video stream specifically indicates otherwise. 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
10	0x0	<AD/BD/CD>_V_FILTER_ENABLE: Window AD/BD/CD V Filter Enable. This controls V scaling filter and is effective only for non-palletized color modes. If V filter is disabled, only one line is read from memory for each output line. NOTE: This feature is not supported,. This bit is ignored and is a don't care. 0 = DISABLE 1 = ENABLE
8	0x0	<AD/BD/CD>_H_FILTER_ENABLE: Window AD/BD/CD H Filter Enable. This controls H scaling filter and is effective only for non-palletized color modes. 0 = DISABLE 1 = ENABLE
6	0x0	<AD/BD/CD>_COLOR_EXPAND: Window AD/BD/CD 12/15/16/18-to-24 bpp color expansion. This bit should be enabled only for 12-bpp B4G4R4A4, 15-bpp B5G5R5A, 16-bpp B5G6R5, 18-bpp B6G6R6 color modes. If enabled the color conversion is performed prior to horizontal scaling. 0 = DISABLE 1 = ENABLE
4	0x0	<AD/BD/CD>_SCAN_COLUMN: Window AD/BD/CD Scanning direction 0= Scan in horizontal direction (for 0 or 180 degrees) 1= Scan in vertical direction (for 90 or 270 degrees) 0 = DISABLE 1 = ENABLE
2	0x0	<AD/BD/CD>_V_DIRECTION: Window AD/BD/CD Vertical (Y) drawing Direction 0 = INCREMENT 1 = DECREMENT
0	0x0	<AD/BD/CD>_H_DIRECTION: Window AD/BD/CD Horizontal (X) drawing Direction 0 = INCREMENT 1 = DECREMENT

24.10.2 DC_<A/B/C>_WIN_<AD/BD/CD>_BYTE_SWAP_0

Window AD/BD/CD Byte Swap

CD: Offset: 0xf81 │ Byte Offset: 0x3e04 │ Read/Write: R/W │ Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
2:0	NOSWAP	<AD/BD/CD>_BYTE_SWAP: Window AD/BD/CD Byte Swap. This controls byte swap of frame data read from memory prior to any data processing in the display module. 00= no byte swap (3 2 1 0) 001= byte swap for each 2-byte word (2 3 0 1) 010= byte swap for each 4-byte word (0 1 2 3) 011= word swap for each 4-byte word (1 0 3 2) 100= byte0 swapped with byte2 (3 0 1 2) 101= left shift every byte (2 1 0 3) 0 = NOSWAP 1 = SWAP2 2 = SWAP4 3 = SWAP4HW 4 = SWAP02 5 = SWAPLEFT

24.10.3 DC_<A/B/C>_WIN_<AD/BD/CD>_COLOR_DEPTH_0

Window AD/BD/CD Color Depth

This register describes the Window AD/BD/CD color surface format. Windows have different capabilities and support subsets of these formats.

Windows AD/BD/CD can use BYTE_SWAP to support additional formats.

Windows D/T do not support BYTE_SWAP. They support only the following formats:
