NVIDIA

TECHNICAL REFERENCE MANUAL

NVIDIA Tegra X1 Mobile Processor

Abstract

The Technical Reference Manual focuses on the logical organization and control of Tegra X1 mobile processors. It provides information for those modules that interface to external devices, or those that control fundamental chip operations. The modules detailed in this document provide an overview, any necessary programming guidelines, and a register listing for that module. Internal functional units such as video and graphics hardware acceleration are controlled by NVIDIA provided software and not documented here. Refer to the software release notes for features supported in your product.

Revision History

Version	Date	Description
1.0p	NOV 09, 2015	Initial version.
1.1p	MAY 05, 2016	• Activity Monitor: BIF bit reserved. • Address Map: MIPI_BIF and NOR Flash marked "Reserved"; updated Client to Software name mapping table; added new section SMMU MC Client Address Ranges. • APB_DMA: BIF bit reserved. • Audio Processing Engine: Added paragraph to Section APE Interrupt Controller (AGIC); Added missing I2S_AXBAR registers. • Clock and Reset Controller: Added SW Default column to applicable register tables; added the following note to SDMMC4_CLK_DIVISOR, SDMMC2_CLK_DIVISOR register fields "Note: The divisor is ignored if the *_LJ options are chosen in corresponding _SRC fields"; added Clocking Sources diagram; updated Software Default values for CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL2_0; updated description for PLLE_PTS; updated Section Clock Generation Logic for SDMMC; CLK_RST_CONTROLLER_CLK_SOURCE_MIPIBIF_0 bits reserved. • Display Controller: Updated Features section, added note to Output Capabilities, updated DC_<D/T>_WIN_<DD/TD>_COLOR_DEPTH_0 register description. • Display Interfaces: • Added note to SOR_NV_PDISP_HEAD_STATE0_0 register • and updated SOR_NV_PDISP_SOR_STATE1_0 register descriptions. • I2C Controller: Several changes throughout the chapter. • Introduction: MIPIBIF removed from diavgram. • Memory Controller: Added Sections Latency Allowances, Timestamps, Deadlines, and Slacks and Arbitration Domain. • MIPI D-PHY Calibration for CSI and DSI: Updated register description for MIPI_CAL_MIPI_BIAS_PAD_CFG2_0. • Multi-Purpose I/O Pins and Pin Multiplexing (Pinmuxing): Removed UART boot section--not applicable; updated note in PINMUX_AUX_TOUCH_CLK_0 register; Updated DRV_TYPE[1:0] description in Table: Pinmux Register Format. • Power Management Controller: Updated Secure Registers section; updated register descriptions for APBDEV_PMC_SEC_DISABLE_0, APBDEV_PMC_PMC_SWRST_0, APBDEV_PMC_BLINK_TIMER_0, APBDEV_PMC_PWRGATE_TOGGLE_0, updated APBDEV_PMC_PWR_DET_VAL_0 register bit values; reserved BIF bit. • PWM Controller: Updated Functionality section pulse width bits. • SD/MMC Controller: Updated Section 32.7.5.5 DLL and Inbound Clock Trimmer Power Supply (VREG) programming; updated values for APB_MISC_GP_SDMMC3_PAD_CFGPADCTRL_0_CFG2TMC_SDMMC3_CLK_CFG_CAL_DRVUP_SLWF/_SLWR and APB_MISC_GP_SDMMC1_PAD_CFGPADCTRL_0_CFG2TMC_SDMMC1_PAD_CAL_DRVUP/_DRVDN. • USB Controller: Updated Section: Initial Role, under Section On-The-Go (OTG) support; added note regarding wake host capability; added PLLE_PTS register bit programming information.

Version	Date	Description
1.2p	DEC 06, 2016	• APB Miscellaneous - Added register APB_MISC_GP_ASDBGREG_0. - Note added regarding programming CFG2TMC_RAM_SVOP_PDP. • Audio Processing Engine: - Marked IQC register fields as unused/reserved. - Removed duplicated AXBAR registers. • Boot and Power Management Processor-Lite: - Removed text associated with the MC/EMC frequency switch and DRAM temperature polling/ refresh adjustment. • Clock and Reset Controller - Updated Clocking Sources diagram. • CPU Complex - Added MSELECT_CONFIG register. • Design for Debugging: - Added “Managing CPU Power Down During Debug". • Display Interfaces: - Removed unsupported features (MST, DPU, and RNDGEN). - Removed TMDS Macro Configuration. - Added LC128 registers to “Enable Encryption”. - Removed DPAUX Scratch Registers. • Host Subsystem: - Added DPAUX1, TSEC1, and VII2C clients. • Interrupt Controller - Lines 75 and 76 updated in Table: Tertiary Interrupt Controller (TRI_ICTLR) Mapping. • Memory Controller - Added SWID_0/1 encoding to “Software Client-Groupings. • MIPI D-PHY Calibration for CSI and DSI: - Added Mapping of MIPI Calibration Control Registers with MIPI Pad diagram and text. - Updated register MIPI_CAL_MIPI_BIAS_PAD_CFG2_0. • Multi-Purpose I/O Pins and Pin-Multiplexing: - Updated GPIO Register Address Map table and the table in Section VGPIO Mapping. - Added note above Pad Control Groups Register Addresses. - Updated GPIO_DB_CTRL and GPIO_DB_CNT registers. - Added note to PINMUX_AUX_TOUCH_CLK_0. - Updated Pinmux setting E_OD. - Added Section on GPIOs in Loopback Mode. - Updated note in PINMUX_AUX_TOUCH_CLK_0 register. - Updated DRV_TYPE[1:0] Description in Table: Pinmux Register Format. • PCI Express Controller: - Added/revised root port registers to "NVIDIA Private Registers” at offsets 0xC10, 0xC14, 0xC18, 0xF0C, 0xF30, 0xF50, and 0xFF8. - Revised step 23a in “Root Port Initialization Sequence” • Power Management Controller: - Added content for APBDEV_PMC_NO_IOPOWER_0 register. • PWM Controller: - Added note to register PWM_CONTROLLER_PWM_CSR_0. • SD/MMC Controller: - Added “SDR50 Mode Workaround for Avoiding Read CRC Errors”. • Serial Peripheral Interface Controller: - Updated max SPI clock speed. - Added note to Section PIO Mode. - Updated Packed and Unpacked Modes Section.

Version	Date	Description
1.3p	April 23, 2019	• Clock Reset Controller: Updated registers. • CSI: Updated CSI-2 version number to v1.1. • Memory Controller: Updated bit field 15 of EMC_FBIO_CFG8_0 register. • Pixel Memory Format: Updated the Video Encode Path (NVENC) table. • SD/MMC Controller: Added Post-Tuning Procedure and updated DLL and Inbound Clock Trimmer Power Supply (VREG) Programming. • USB Complex: Updated to ensure clarity regarding isochronous endpoints are not supported.

CHAPTER 1: INTRODUCTION

The NVIDIA Tegra® X1 mobile processor is a complete applications and digital media system built around several powerful hardware elements:

- Graphics: NVIDIA® GeForce® Maxwell Graphics Processing Unit (GPU). The GPU fully supports DX11, Shader Model 4, and OpenGL4.5 as well as OpenGL ES 3.1. It supports Unified shaders and is GPU compute capable with 256 CUDA cores. The GPU supports all the same features as discrete NVIDIA GPUs, including PhysX, CUDA, OpenCL, and DX compute. It is highly power optimized for best performance in mobile and embedded use cases.
- CPU Complex: Quad ARM® Cortex®-A57 cores. The CPU cores support ARMv8, executing both 64-bit Aarch64 code, and 32-bit Aarch32 code including legacy ARMv7 applications. The Cortex-A57 processors each have 48 KB Instruction and 32 KB Data Level 1 caches; and have a 2 MB shared Level 2 unified cache.
- Memory Controller: 64-bit DRAM interface providing high bandwidth. LP-DDR4 DRAM type is supported.
- Video Decoder: The advanced video decoder supports full motion 60fps playback of 4K ultra-high-definition video with 10-bit pixels. It supports H.265, H.264, VP9, CP8 VC-1, MPEG-2, and MPEG-4 video standards and multiple audio standards with dedicated hardware.
- Video Encoder: A high performance H.265/H.264 capable hardware video encoder. This processor supports H.265 and H.264 BP/MP/HP/MVC and VP8 encoding.
- Audio Subsystem: A dedicated audio subsystem based on a Cortex-A9 processor and dedicated RAM. Full hardware support for multi-channel audio over multiple interfaces, and a broad and flexible range of audio I/O interfaces.
- Imaging: A high-quality hardware accelerated still-image and video capture path, with dual next-generation ISPs.
- Display: Dual display controllers with MIPI-DSI output, along with eDP support for LCD panels and HDMI 2.0 output for external display devices. Multiple line pixel storage allows more memory-efficient scaling operations and pixel fetching. Hardware display surface rotation is also provided for bandwidth reduction.

In addition to these major elements, Tegra X1 mobile processors have a broad range of peripheral interfaces to enable communication with wireless baseband, other communications peripherals, audio codecs, power management, and mass storage. When combined with baseband and PMIC chips, the Tegra X1 mobile processor provides the functionality needed to build a range of both low-power mobile or high-performance embedded devices. Dedicated high-performance mass storage controllers, with their own DMA engines, free the CPU Complex from routine data management tasks.

Selected SKUs also contain a companion set of quad ARM Cortex-A53 cores in a switched configuration with the A57 core complex. The Cortex-A53 processors each have 32 KB Instruction and 32 KB Data Level 1 caches; and have a 512 KB shared Level 2 unified cache.Tegra X1 Technical Reference Manual

1.1 The Role of the Technical Reference Manual

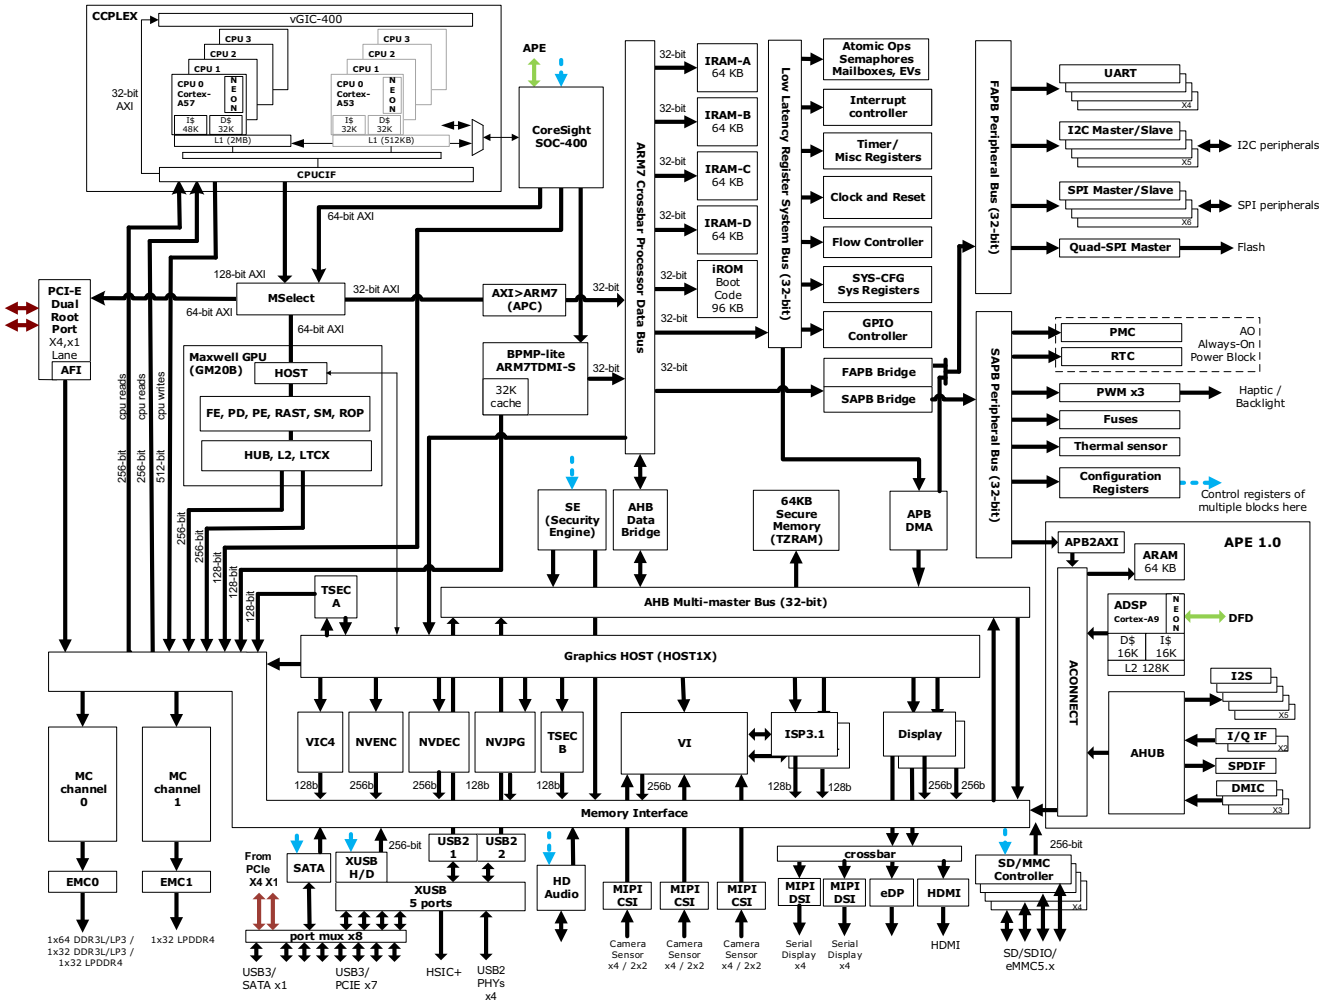
This document is intended to provide guidance to programmers writing code for Tegra X1 devices. It describes the register interfaces and hardware functionality, with the goal to aid anyone in understanding and potentially modifying the NVIDIA provided code.

It may also describe hardware functions not currently supported by NVIDIA drivers; thus the description of a capability in this document does not necessarily imply software support for that function.

1.2 Block Diagram

This diagram provides an overview of a Tegra X1 mobile processor.

Figure 1: Tegra X1 Processor Block Diagram



1.3 Memory Controller and Internal Bus Architecture

The Tegra X1 mobile processor has a highly optimized 64-bit memory controller, supporting low latency access for the CPU, optimized high bandwidth access for the graphics and video devices, and controlled latency for real time devices such as display.

There is a three-level hierarchy of memory clients:

1. Memory controller clients: The memory controller directly arbitrates between various requesters using a complex algorithm optimizing DRAM efficiency. The highest bandwidth clients all fall into this class, and they communicate directly with the memory controller using a proprietary high-speed bus.
2. AHB devices: These generally have a built-in DMA engine, and share a single memory client using the AHB bus protocol.
3. APB devices: All APB devices are slaves, and are serviced by a shared multi-channel APB DMA controller which is also an APB device.

Special provisions are made for the CPU to bypass parts of the memory controller arbitration to help achieve a lower latency.

1.4 Reading Register Tables

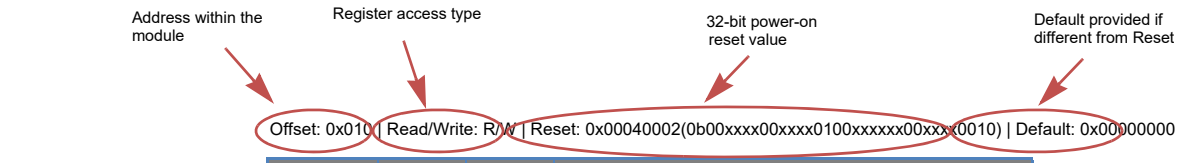
Every register table has an address line followed by a table containing the bit descriptions for that register. The address line contains:

- **Offset:** the address of the register within the specific module. Refer to the system memory map for the start address of the module, and apply the offset at the top of the table to get the register address.
- **Read/Write:** the register access type. When a register table contains the R/W column, individual bits within the register will have different R/W properties. When there is no R/W column, all bits in that register have the same R/W property. Values are RO (read only), R/W (read/write), WO (write only, and RWC (read/write clear).
- **Reset:** gives the power-on reset value in 32-bit binary. A value of x implies that the register bit has an undefined value at reset. A hexadecimal value is listed for convenience, where appropriate.
- **Default:** only displayed if the default setting is different from the Reset value.

Unspecified bits may not appear in tables (see example below). Unspecified bits should be written with their Reset values, while reads return an unknown value.

Note: *At times, a SW Default column may be present. SW Default settings are the default values that software is expected to program.*

Figure 2: Register Table Example



Unspecified bits in this example register: 31:26, 23:20, 15:10, 7:4

In the Reset field above the table, most unspecified bits are shown as 'x' in binary format. In hex format, unspecified bits within nibbles are shown as 0 in the Reset field above the table.

At power-on reset, write only the provided reset value to unspecified bits for proper operation. For example, in the Reset field above the table, bits [31:30], which are not specified in the table, must be written as 0s.

Bit	R/W	Reset	Description
25:24	RW	N1	EMEM_NUMDEV 0 = N1 1 = N2
19:16	RO	D64MB	EMEM_DEVSIZE 0 = D4 MB 1 = D8 MB 2 = D16 MB 3 = D32 MB 4 = D64 MB 5 = D128 MB 6 = D256 MB 7 = D512 MB
9:8	RW	W2	EMEM_BANKWIDTH 1 = W1 2 = W2 3 = W3
3:0	RO	W9	EMEM_COLWIDTH 0 = W7 1 = W8 2 = W9 3 = W10 4 = W11

1.5 Glossary

This glossary is intended to cover the Tegra specific acronyms used in this document; along with some others related to the ARM SOC world. Many acronyms in this document are in broad engineering use and are not documented here; we assume you already know what USB and CPU are, for example.

Term	Definition
ACPI	Advanced Configuration and Power Interface

Term	Definition
ADX	Audio Demultiplexer Block, part of the Audio Hub used to demultiplex multiple audio streams.
AHB	AMBA High-Speed Bus, a multi-master high-speed (relative to APB) bus supporting arbitration and split transactions, defined as part of AMBA 2.
AHBSLVMEM	The AHB slave used for the main memory interface. Acts as an AHB slave and provides a path from there to main memory. Refer to the AHB chapter.
AMBA	Advanced Microcontroller Bus Architecture, a set of standard buses defined by ARM.
AMX	Audio Multiplexer Block, part of the Audio Hub used to multiplex multiple audio streams together.
AO	Always ON
APB	AMBA Peripheral Bus, a simple 32-bit single master bus for peripheral devices.
APBDMA	A multi-channel DMA controller for devices on the APB bus, performing DMA between APB and AHB.
APE	Audio Processing Engine
ARM	Advanced RISC Machines, a company that licenses CPU IP to Tegra. Also: Architecture Reference Manual, so the ARM defines the CPU architecture.
AXI	AMBA Advanced eXtensible Interface, a more advanced bus than AHB defined as part of AMBA 3.
BPMP	Boot and Power Management Processor. ARM7 coprocessor used for power management related tasks at runtime.
BSEA	Bit Stream Engine for Audio applications
CAR	Clock and Reset module allows controlling clocks and resets to all the modules and subsystems in the Tegra processor.
CDE	Color Decompression Engine
CEC	Consumer Electronics Control, a part of the HDMI interface specification used for sending device control commands, often from a remote control.
COP	CO-Processor, an obsolete name for BPMP-Lite still present in legacy documentation and registers.
CSI	MIPI Camera Serial Interface, a standard high-speed serial interface for connecting cameras to the Tegra processor.
CUDA	Compute Unified Device Architecture
DMIC	Digital microphone interface, supporting direct attach of PDM microphones.
DSI	MIPI Display Serial Interface, a standard high-speed serial interface for connecting displays to the Tegra processor.
DVC	Dynamic Voltage Controller module
eDP	Embedded Display Port
EMC	External Memory Controller, a module that interfaces with external DDR/LPDDR devices.
GART	Graphic Address Relocation Table, a now obsolete mechanism for mapping from virtual to physical addresses for devices. Remains in Tegra only as an aperture to memory that may be mapped though the SMMU, the replacement for the GART.
GPIO	General Purpose Input/Output, an I/O signal uncommitted to a specific role and controlled by software.
HDMI	High-Definition Multimedia Interface, a digital connection carrying uncompressed video and audio at high speed over a single connector.
IDE	Integrated Drive Electronics (or Integrated Device Electronics)
ISP	Image Signal Processor, a hardware engine that is part of the camera processing pipeline.
MC	Memory Controller module handles requests from internal clients and arbitrates among them to allocate memory bandwidth.
MCCIF or MC-CIF	Memory Controller Client InterFace, the standard interface block between the memory controller sub-system fabric and the client device. Note that some modules may have multiple client interfaces.
MIPI	The Mobile Industry Processor Interface and industry alliance promoting a number of standard interfaces for mobile devices.

Term	Definition
MPCORE	Multi-processor CPU core, a generic term for a CPU capable of operating as part of an SMP group.
MPE	An older name for the Video Encoder in the Tegra processor capable of encoding raw video stream into MPEG. Now referred to as MSENC.
NVENC	NVIDIA Video Encoder engine.
OGL	Open Graphics Library, also known as OpenGL. An API supported on Tegra devices and accelerated in hardware by dedicated 3D and 2D engines.
PCIe	Peripheral Component Interconnect Express, a high-speed interface for external devices connected to the Tegra SOC.
PMC	Power Management Controller module controls the various power management features in the system.
POR	Power On Reset
PPSB	PortalPlayer System Bus, a proprietary register bus used for some blocks. Similar to APB. PortalPlayer is a company that was acquired by NVIDIA, and from where parts of Tegra are derived including this bus.
PWFM	Pulse Width Frequency Modulation module generates programmed pulse widths typically used to control backlight in display panels.
PVT	Process, Voltage, & Temperature
RISC	Reduced Instruction Set Computer, the CPU architecture used by ARM CPUs.
SATA	Serial Advanced Technology Attachment (ATA)
SDMMC	SD and MMC controller. An I/O controller supporting
SLINK	Serial Link, a legacy and now obsolete name for the SPI controller
SMMU	System Memory Management Unit, a block within the memory controller used to map from a virtual address space to physical addresses for device DMA.
SMP	Symmetric Multi-Processing
SOC	System On a Chip, an integrated circuit containing a CPU, memory controller and the peripheral devices needed for a computing system.
SOR	Serial Output Resource. SOR is GPU IP for driving HDMI/DP/LVDS. It converts the output of the display to a more modern high-speed serial protocol. DSI is not included since it’s not GPU IP based
S/PDIF	Sony/Phillips Digital Interconnect Format
SPI	Serial Peripheral Interface Bus, a synchronous serial data link, that operates in full duplex mode.
TSEC	Tegra Security co-processor, an embedded security processor used mainly to manage the HDCP encryption and keys on the HDMI link.
TZ	Trust Zone, a secure operating environment of the ARM CPU and the related secure parts of the SOC backbone and devices
TZRAM	Trust Zone secured RAM on the SOC.
UCQ	Unified Command Queue – a sub module within Video Decoder Engine
VDE	Video Decode Engine, a Tegra hardware acceleration block dedicated to decoding compressed video in various formats.
vGPIO	Virtual General-Purpose Input/Output
VI	Video Input block, the acronym used to describe the Tegra X1 block used for camera and related pixel input functions.
VIC	Video Image Compositer, a Tegra X1 block that implements video post-processing functions needed by a video playback application to produce the final image for the player window.
YCbCr	An alternative pixel representation that takes advantage of the properties of the human psycho-perceptual vision system. It consists of a luminance channel Y and two color difference signals Cb and Cr.
YUV	See YCbCr. U and V are equivalent to Cb and Cr, respectively.

CHAPTER 2: ADDRESS MAP

Note: *Some subsystem address maps have been separated out of the System Address Map into their own sections.*

2.1 System Address Map

Table 1: System Address Map

Description	Address Start	Address End	Offset Start	Offset End	Default Length
Remap	0100:0000	3fff:ffff			1008 MB

2.3 Available DRAM Address Ranges

Table 3 describes the various address regions that are available as DRAM in Tegra® X1 devices.

The address map available varies by master, because MMIO is not available to any direct MC client except the processors. These other direct MC clients are therefore able to access all DRAMs on 4GB systems, with the spaces reserved for MMIO on the processors available to them as DRAM. This may be used as a carve-out or for similar purposes.

Note: *MMIO in Table 3 below refers to the MMIO target, register, or non-DRAM region. Not all of the MMIO regions actually have an MMIO target.*

Physical/Virtual Address Range is available for Host1x clients for all apertures.

Table 3: DRAM Address Ranges

Aperture		Range	Size (MB)	Hardware Configuration Option	Physical DRAM Range				IOVA Range Available for:	
					2 GB	3GB	4 GB	>4 GB	BPMP-Lite	AHB Clients ?
DRAM		8000_0000 - FFFF_FFFF	2048	Always DRAM	DRAM	DRAM	DRAM	DRAM	Yes	Yes
DRAM2		1_0000_0000 - 2_7FFF_FFFF	6144	Always DRAM	N/A	N/A	N/A	DRAM	No	No
AHB_A2_rsvd		7E00_0000 - 7FFF_FFFF	32	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
AHB_A2		7C00_0000 - 7DFF_FFFF	32	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
AHB_A1_rsvd		7900_0000 - 7BFF_FFFF	48	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
AHB_A1		7800_0000 - 78FF_FFFF	16	Selectable	MMIO	MMIO	MMIO	MMIO	No	No
APB_rsvd		7400_0000 - 77FF_FFFF	64	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
APB		7000_0000 - 73FF_FFFF	64	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
ExtIO_rsvd		6900_0000 - 6FFF_FFFF	112	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
ExtIO		6800_0000 - 68FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
PPSB_rsvd		6100_0000 - 67FF_FFFF	112	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
PPSB		6000_0000 - 60FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
GART		5700_0000 - 5FFF_FFFF	144	Selectable (Note 1)	MMIO	MMIO	MMIO	MMIO	Yes	Yes
Graphics Host rsvd (HOST1X_DR_RSVD)		5500_0000 - 56FF_FFFF	32	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
Graphics Host (HOST1X_DR)		5400_0000 - 54FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
Host1x+PERIPH (Note 2)		5000_0000 - 50FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO		
Host1x+ PERIPH	Host1x	5000_0000 – 5003_FFFF	256KB	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
	PERIPHBASE	5004_0000 - 5005_FFFF	128KB	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
	MSELECT	5006_0000 - 5006_0FFF	4KB	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
RSVD		4B00_0000 - 4FFF_FFFF	80	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
RSVD		4900_0000 - 4AFF_FFFF	32	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
RSVD		4800_0000 - 48FF_FFFF	16	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
IRAM_rsvd		4100_0000 - 47FF_FFFF	112	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
IRAM		4000_0000 - 40FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
PCIE_A3		2000_0000 - 3FFF_FFFF	512	Selectable	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	Yes	Yes
PCIE_A2		0200_0000 - 1FFF_FFFF	480	Selectable	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	Yes	Yes

Table 3: DRAM Address Ranges

Aperture	Range	Size (MB)	Hardware Configuration Option	Physical DRAM Range				IOVA Range Available for:	
				2 GB	3GB	4 GB	>4 GB	BPMP-Lite	AHB Clients ?
PCIE_A1	0100_0000 - 01FF_FFFF	16	Selectable	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	Yes	Yes
IROM_LOVEC	0000_0000 - 00FF_FFFF	16	Selectable (Note 3)	MMIO	MMIO	MMIO	MMIO	No	No

Notes:

1. The GART region, even though defined as configurable, needs to be programmed as MMIO because this region is actually the Kepler GPU MMIO space.
2. Host1x+PERIPH is split into multiple apertures.
3. The IROM_LOVEC region needs to be programmed as MMIO because this region is used to access the IROM and the exception vectors for both Cortex®-A57 CPU and ARM7AVP/BPMP-Lite and to ensure the CCPLEX and BPMP-Lite can access their exception vectors.
4. “DRAM” really means “Memory Controller”. In particular:
   - The GART range (5700_0000 – 5FFF_FFFF) always points to MMIO.
   - All configurable regions that do not have a real MMIO target (labeled as DRAM+) in the above table should be configured as DRAM to provide the largest and uniform IOVA view (in 2GB or 4GB system) for the BPMP-Lite and other clients that generate virtual addresses to access DRAM.
5. Requests from all clients (except the main CPU) are allowed to use SMMU translation. Any request address range that can reach the MC can be translated by the SMMU.
6. SMMU is a sub-unit in the memory controller. Address ranges marked as “No” in the table will not reach the memory controller.
7. If a region does not contain any DRAM (low 2GB region in a 34b system or system with only 2GB of physical memory), the various configurable regions still should be configured as DRAM to allow IOVA/DVA requests from BPMP to be passed through to the Memory Controller (MC).
8. For PCIe configuration and IOIO space, software needs to use SO (Strongly Ordered) or DEV (Device) mem type to guarantee 4 byte transactions.
9. For TZRAM access, software needs to mark the memory as WB cacheable and RW allocate to avoid partial byte enables.

Clients/Controllers are logically (static) grouped in different SWNAME/SWID. SMMU translation can be enabled/disabled for individual SWNAME. The following table gives the Client to Software Name mapping details.

Table 4: Client to Software Name Mapping

Software Group	Client	Description	SMMU Client Type
afi	csr_afir	PCIe reads	34 bits
	csw_afiw	PCIe writes	34 bits
ape	csr_aper	Audio Processing (APE) engine reads	32 bits
	csw_apew	Audio Processing (APE) engine writes	32 bits
avpc	csr_avpcarm7r	ARM7 BPMP-Lite reads via the avp_cache	AHBSLV
	csw_avpcarm7w	ARM7 BPMP-Lite writes via the avp_cache	AHBSLV
axiap	csr_axiapr	AXIAP reads	34 bits
	csw_axiapw	AXIAP writes	34 bits

Table 4: Client to Software Name Mapping

Software Group	Client	Description	SMMU Client Type
dc	csr_display0a	Display reads, window A	34bits
	csr_display0b	Display reads, window B	34 bits
	csr_display0c	Display reads, window C	34 bits
	csr_displayhc	Display reads, cursor	34 bits
	csr_displayt	Display reads, Window T	34 bits
	csr_displayd	Display reads, Window D	34 bits
dcb	csr_display0ab	Display reads, window A	34 bits
	csr_display0bb	Display reads, window B	34 bits
	csr_display0cb	Display reads, window C	34bits
	csr_displayhcb	Display reads, cursor	34 bits
etr	csr_etrr	ETR reads	34 bits
	csw_etrw	ETR writes	34 bits
gpu	csr_gpusrd	3D, ltcx reads	34 bits
	csw_gpuswr	3D, ltcx writes	34 bits
	csr_gpusrd2	3D, ltcx reads; instance 2 of GPU	34 bits
	csw_gpuswr2	3D, ltcx writes; instance 2 of GPU	34 bits
hc	csr_host1xdmar	Host channel data reads	32 bits
	csr_host1xr	Host indirect reads	32 bits
	csw_host1xw	Host indirect writes	32bits
hda	csr_hdar	High-definition audio (HDA) reads	34 bits
	csw_hdaw	High-definition audio (HDA) writes	34bits
isp2	csr_ispra	ISP Read client for Crossbar A	32 bits
	csw_ispwa	ISP Write client for Crossbar A	32 bits
	csw_ispwb	ISP Write client Crossbar B	32 bits
isp2b	csr_isprab	ISP Read client for Crossbar A; instance b of isp2	32 bits
	csw_ispwab	ISP Write client for Crossbar A; instance b of isp2	32 bits
	csw_ispwbb	ISP Write client Crossbar B; instance b of isp2	32 bits
mpcore	csr_mpcorer	Reads from Cortex-A57 4 CPU cores via the L2 cache	N/A[a]
	csw_mpcorew	Writes from Cortex-A57 4 CPU cores via the L2 cache	N/A[1]
nvdec	csr_nvdecsrd		32 bits
	csw_nvdecswr		32 bits
nvenc	csr_nvencsrd		32 bits
	csw_nvencswr		32 bits
nvjpg	csr_nvjpgsrd		32 bits
	csw_nvjpgswr		32 bits
ppcs	csr_ppcsahbdmar	AHB DMA engine reads	32 bits
	csr_ppcsahbslvr	AHB bus reads	32 bits
	csw_ppcsahbdmaw	AHB DMA engine writes	32 bits
	csw_ppcsahbslvw	AHB bus writes	32 bits
ptc	csr_ptcr	Misses from System Memory Management Unit (SMMU) Page Table Cache (PTC)	N/A[b]
sata	csr_satar	SATA reads	34 bits
	csw_sataw	SATA writes	34 bits

Table 4: Client to Software Name Mapping

Software Group	Client	Description	SMMU Client Type
sdmmc1a	csr_sdmmcra	SDMMCA memory read client	34 bits
	csw_sdmmcwa	SDMMCA memory write client	34 bits
sdmmc2a	csr_sdmmcraa	SDMMCB memory read client	34 bits
	csw_sdmmcwaa	SDMMCB memory write client	34 bits
sdmmc3a	csr_sdmmcr	SDMMC memory read client	34 bits
	csw_sdmmcw	SDMMC memory write client	34 bits
sdmmc4a	csr_sdmmcrab	SDMMCD memory read client	34 bits
	csw_sdmmcwab	SDMMCD memory write client	34 bits
se	csr_sesrd	SE Memory Return Data Client Description	AHBSLV
	csw_seswr	SE Memory Write Client Description	AHBSLV
tsec	csr_tsecsrd	TSEC Memory Return Data Client Description	32 bits
	csw_tsecswr	TSEC Memory Write Client Description	32 bits
tsecb	csr_tsecsrdb	TSEC Memory Return Data Client Description; instance B of TSEC	32 bits
	csw_tsecswrb	TSEC Memory Write Client Description; instance B of TSEC	32 bits
vi	csw_viw	VI Write client	32 bits
vic	csr_vicsrd	VIC reads	32 bits
	csw_vicswr	VIC writes	32 bits
xusb_dev	csr_xusb_devr	XUSB reads	34 bits
	csw_xusb_devw	XUSB_DEV writes	34 bits
xusb_host	csr_xusb_hostr	XUSB reads	AHBSLV
	csw_xusb_hostw	XUSB_HOST writes	AHBSLV

a. Cortex-A57 CPU accesses are translated by the MMU in the CPU not the SMMU.

b. SMMU misses do not use IOVA addresses.

The clients behind AHBSLV in the above table are:

- BPMP-Lite crossbar
- ARC controller
- AHB DMA controllers
- USB-OTG controller
- APB DMA controller
- Security Engine (SE)
- USB2 controllers

Each client in the above list has a SWID register field which controls whether the client maps to PPCS or PPCS1 SWNAME.

2.4 SMMU MC Client Address Ranges

All MC clients, except the SMMU and the Cortex-A57 cores, can be translated by the SMMU. The address ranges (either IOVA or PA addresses) that can be used by an SMMU MC client depend on the client. Each SMMU MC client can be assigned to one of three types: 34-bit clients, 32-bits clients, and AHBSLV clients. The table above shows the SMMU MC client type for all clients.

34-bit SMMU clients can send any address between 0_0000_0000 and 2_7FFF_FFFF to the MC.

32-bit SMMU clients can send any address between 0_0000_0000 and 0_FFFF_FFFF to the MC. Addresses above 0_FFFF_FFFF cannot be used by these clients.

AHBSLV clients can send any address between 0_0000_0000 and 0_FFFF_FFFF to the MC except those shown in the table below. Addresses above 0_FFFF_FFFF cannot be used by these clients.

Note: *If any of the selectable DRAM ranges shown in*

Selectable DRAM Address Ranges are not configured as DRAM per the recommendation, those address ranges are also not usable as MC addresses from AHBSLV clients.

Table 5: Unusable IOVA Address Ranges for AHBSLV Clients

Aperture	Range	Size (MB)
AHB_A2	7C00_0000 - 7DFF_FFFF	32
AHB_A1	7800_0000 - 78FF_FFFF	16
APB	7000_0000 - 73FF_FFFF	64
ExtIO	6800_0000 - 68FF_FFFF	16
PPSB	6000_0000 - 60FF_FFFF	16
Host1x	5000_0000 – 5003_FFFF	256
PERIPHBASE	5004_0000 - 5005_FFFF	128
MSELECT	5006_0000 - 5006_0FFF	4
Host1x+PERIPH	5000_0000 - 50FF_FFFF	16
IRAM	4000_0000 - 40FF_FFFF	16
IROM_LOVEC	0000_0000 - 00FF_FFFF	16

Table 6: Selectable DRAM Address Ranges

Aperture	Range	Size (MB)
AHB_A2_rsvd	7E00_0000 - 7FFF_FFFF	32
AHB_A1_rsvd	7900_0000 - 7BFF_FFFF	48
APB_rsvd	7400_0000 - 77FF_FFFF	64
ExtIO_rsvd	6900_0000 - 6FFF_FFFF	112
PPSB_rsvd	6100_0000 - 67FF_FFFF	112
Graphics Host rsvd (HOST1X_DR_RSVD)	5500_0000 - 56FF_FFFF	32
RSVD	4B00_0000 - 4FFF_FFFF	80
RSVD	4900_0000 - 4AFF_FFFF	32
RSVD	4800_0000 - 48FF_FFFF	16
IRAM_rsvd	4100_0000 - 47FF_FFFF	112

CHAPTER 3: INTERRUPT CONTROLLER

This section provides the mapping of the Tegra® X1 family processor interrupts. It also describes the architecture for routing and handling of these interrupts. It describes semaphores, which provide a mechanism for the processors to arbitrate for the use of various resources.

From the perspective of interrupts: devices (GPU, Memory Controller, Video encode/decode engines, and various I/O devices) are the sources of interrupts; and processors are the targets of interrupts. From sources, interrupts go to interrupt controllers which, based on configuration, prioritize and route them to the appropriate target processor. There are two different types of interrupt controllers used in Tegra X1 devices: the ARM® GIC-400 and the Legacy Interrupt Controller (LIC).

Glossary and Acronyms

Acronym	Description
BPMP-L	Boot and Power Management Processor - Lite
CPU	Unless specified otherwise, refers to Cortex®-A57 and/or Cortex-A53 CPUs
FIQ	Fast Interrupt Request
GIC-400	Also known as GIC. ARM Generic Interrupt Controller
IPI	Inter Processor Interrupt
IRQ	Interrupt Request
LIC	Legacy Interrupt Controller (used for the BPMP-L)
MSI	Message Signaled Interrupt
PPI	Private Peripheral Interrupts
SGI	Software Generated Interrupt
SMP	Symmetric Multiprocessors
SPI	Shared Peripheral Interrupts

3.2 Interrupt Mapping

The following six tables show the mapping of the interrupts from system devices to the bit fields in the Tegra X1 interrupt controllers.

Table 7: Primary Interrupt Controller (PRI_ICTLR) Mapping

Global Interrupt Number	Interrupt Target	LIC Interrupt Number	Interrupt Name	Source Block	Interrupt Description
31		31	SDMMC4	SDMMC	SDMMC4 Controller

Table 7: Primary Interrupt Controller (PRI_ICTLR) Mapping

Global Interrupt Number	Interrupt Target	LIC Interrupt Number	Interrupt Name	Source Block	Interrupt Description
30		30	Unmapped		Unassigned
29	CPU	29	ARB_SEM_GNT_CPU	Semaphore	GNT.0 Arbitration Grant Status of CPU
28	BPMP-Lite	28	ARB_SEM_GNT_COP	Semaphore	GNT.1 Arbitration Grant Status of BPMP-Lite
27	CPU	27	Unmapped		Unassigned
26	CPU	26	APB_DMA_CPU	APB_DMA	APB Bridge DMA Controller (CPU)
25	BPMP-Lite	25	FC_INT	Flow Controller	Flow Controller to BPMP-Lite for Wake Sequence
24		24	PMC_INT	PMC	PMC Wake Events
23		23	SATA_CTL	SATA	SATA Controller Interrupt
22		22	Unmapped		Unassigned
21		21	USB2	USB	USB Device
20		20	USB	USB	USB Device
19		19	SDMMC3	SDMMC	SDMMC3 Controller
18		18	Unmapped		Unassigned
17		17	VII2C_INT	VII2C	I2C inside VI
16		16	VGPIO_INT	VGPIO	VGPIO Interrupt
15		15	SDMMC2	SDMMC	SDMMC2 Controller
14		14	SDMMC1	SDMMC	SDMMC1 Controller

3.3 Functional Description

3.3.1 Interrupt Handling Mechanism

The two different types of interrupt controllers (GIC-400 and LIC) receive interrupts from devices (i.e., hardware interrupts also known as SPIs) or processors (i.e., software interrupts including IPI), arbitrate them, and send them to the appropriate target processor(s). From an interrupt perspective, there are two different types of processors: CPUs and BPMP (ARM7 BPMP-Lite). The GIC-400 is the interrupt controller for the CPUs, and the LIC is the interrupt controller for the ARM7 BPMP-Lite. Any processor can initiate a software interrupt, targeted to any one or more processors (including itself). However, IPIs can only be initiated by a Cortex-A57 CPU to any one or more Cortex-A57 CPUs (including itself).

There are 192 hardware interrupts in Tegra X1 devices. Interrupt sources are allocated one or more interrupts as required. The 192 interrupts are grouped into slices of 32, where each slice can be configured independently.

3.3.1.1 ARM Processors' IRQ and FIQ

ARM processors (Cortex-A57, and ARM7) each have two input pins to receive two different types of interrupts. These interrupts are called IRQ (Interrupt Request) and FIQ (Fast Interrupt Request). The interrupts are implemented as active-low pins on the ARM processor input; thus the processor pins are named nIRQ and nFIQ.

The ARM processor goes into the IRQ mode or the FIQ mode depending up on which interrupt is activated. Generally, interrupts that require low latency or are time critical are configured as FIQ. All other interrupts are configured as IRQ. Non-secure interrupts can only be IRQ.

3.3.1.2 Interrupt Controllers

The interrupt controller receives interrupts from a large number of sources. The interrupt sources can be assigned a target processor, a type (IRQ versus FIQ), priority levels, etc., by configuring interrupt-controller registers. The interrupt controller arbitrates among different incoming interrupts and sends the interrupt to the nIRQ or nFIQ pin of the targeted processor.

In general, any incoming hardware interrupt can be routed to either nIRQ or nFIQ pin of any of the processors.

The Legacy Interrupt Controller (LIC) is primarily used for BPMP (ARM7). But it is also used for generating interrupts as wake events for CPUs. This is an important use case when the core is in retention. All of the device hardware interrupt signals are sent to the LIC first, which routes them to the ARM7 BPMP-Lite as well as forwards them to the GIC. The LIC also provides a software set/clear mechanism for all of the interrupts.

The interrupt controller used for CPUs (Cortex-A57 CPUs) is called GIC-400. Because the internal interrupt controller/interface incorporated in the Cortex-A57 CPU does not include a distributor function, the Cortex-A57 CPU is configured to rely on an external interrupt controller. The Tegra X1 ARM CCPLEX uses a GIC-400, an ARM IP, as an external interrupt controller. The GIC implements GIC Security Extensions and GIC Virtualization Extensions. The GIC is configured to support 4 interfaces

3.3.1.3 GIC Interrupt Sources

The vGIC supports 192 SPI interrupts and 32 PPI and SGI interrupts. All interrupts are identified by a unique ID. There are three types of interrupt sources for the GIC and vGIC: SGIs, PPIs, and SPIs.

Software Generated Interrupts (SGIs)

SGIs are software interrupts which are generated by writing to the Software Generated Interrupt register (GICD_SGIR). Each CPU interface can generate a maximum of 16 SGIs, with ID0-15 for each target processor. The SGIs are also referred to as IPIs (Inter Processor Interrupts).

Private Peripheral Interrupts (PPIs)

PPIs are interrupts generated by a peripheral that is specific to a single processor.

There are seven PPIs for each Cortex-A57 processor: virtual maintenance interrupt (ID25), hypervisor timer interrupt (ID26), virtual timer interrupt (ID27), legacy nFIQ (ID28), secure physical timer interrupt (ID29), non-secure physical timer interrupt (ID30), and legacy nIRQ (ID31).

Tegra X1 devices use all PPIs.

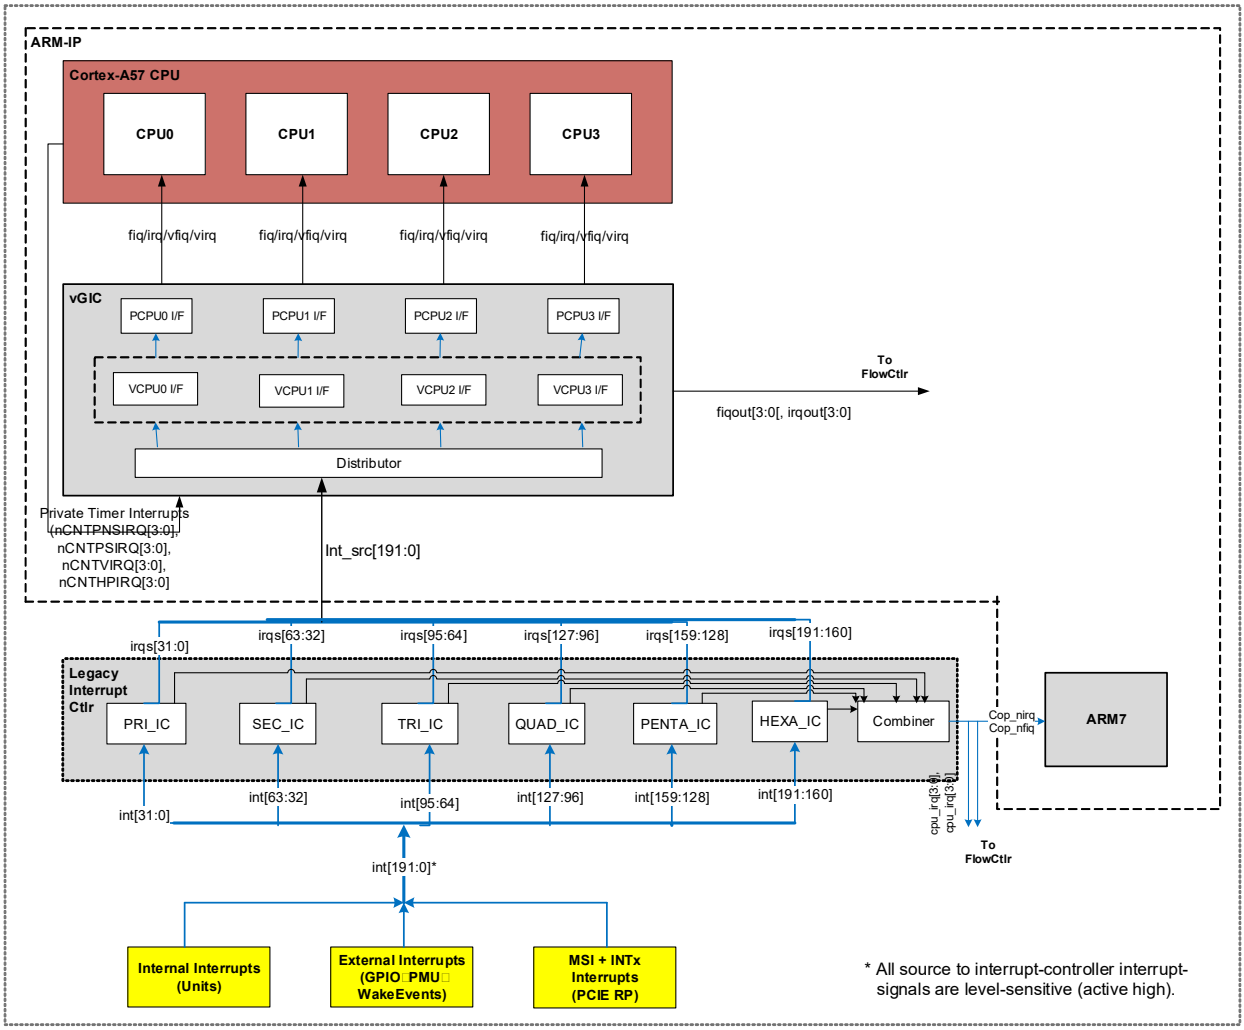
Shared Peripheral Interrupts (SPIs)

SPIs are external hardware interrupts which are generated by asserting signals on GIC or vGIC input pins (called IRQs). From a Tegra hardware perspective, these are the interrupts which are generated by various units to be sent to interrupt controllers. Tegra X1 devices use 192 of the possible 480 SPIs generated through the IRQS[191:0] pins. SPIs start at ID32. Tegra X1 devices use level-sensitive SPIs only.

3.3.1.4 Interrupt Routing

Tegra hardware interrupts (also known as shared peripheral interrupts) can be generated by internal SoC units, external events (through GPIO, USB, etc.), or PCIe® unit (MSI or legacy INTx, or Wake interrupts). All of these hardware interrupts are routed through sideband active-high level-sensitive signals to the LIC. The MSI and INTx (from external PCIe devices) are intercepted by the PCIe unit and converted to a sideband interrupt signal. The PCIe unit ensures MSI ordering; that is, it ensures that upstream writes ahead of MSI have been completed/acknowledged before asserting an interrupt signal to the LIC. Also, the PCIe unit captures MSI information into a register that software can read to identify MSI vectors, etc.

Figure 3: Interrupt Routing (Top-Level View)



As shown in the figure above, hardware interrupts are routed to the interrupt controllers (called IC32) within the LIC, where each IC32 handles 32 interrupts. The interrupt signals are synchronized within the LIC to the system clock. The synchronized signals are combined with software set/clear bits per interrupt. This allows software to set or clear individual interrupts, provided the corresponding interrupt is not asserted by hardware. The resulting interrupt signals are broadcast to the GIC-400 for further processing.

Within the LIC, the interrupt signals after combining with Software Set/Clear bits are also used by flow controller as Wake Events (after masking) and by BPMP-Lite as Interrupts (after masking).

3.3.1.5 Interrupt Blocking to Support Retention

The Tegra X1 device implements blocking of interrupts routed to the GIC, which supports the CPU retention state. The block implementing this feature is represented in Figure 4 as Blocking.

To support retention, the LIC contains a one shot disable for all the interrupts. When the system goes into retention, BPMP software sets this bit to disable the interrupts.

The Flow Controller watches all the interrupts triggered and triggers the BPMP to bring the core out of retention when any interrupt bit is asserted. Once the system is out of retention, the BLOCK _CCPLEX_GIC_INTR bit is cleared, and the interrupt is serviced by the GIC.

Refer to Chapter 18: Flow Controller for more information on retention.

3.3.2 Generic Interrupt Controller (GIC-400)

This section describes the Cortex-A57 GIC (also known as GIC-400). The GIC-400 is an implementation of the ARM® GICv2 architecture. The Tegra X1 processor does not use the built-in GIC interface logic. For more information, refer to the ARM Cortex-A57 MPCore Processor Technical Reference Manual for the GIC implementation specific specification and the CoreLink™ GIC-400 Generic Interrupt Controller Technical Reference Manual.

The GIC-400 consists of the physical CPU interface. In addition, to support CPU virtualization it consists of the virtual CPU Interface which is configured by the Hypervisor and used by the virtual machine (VM).

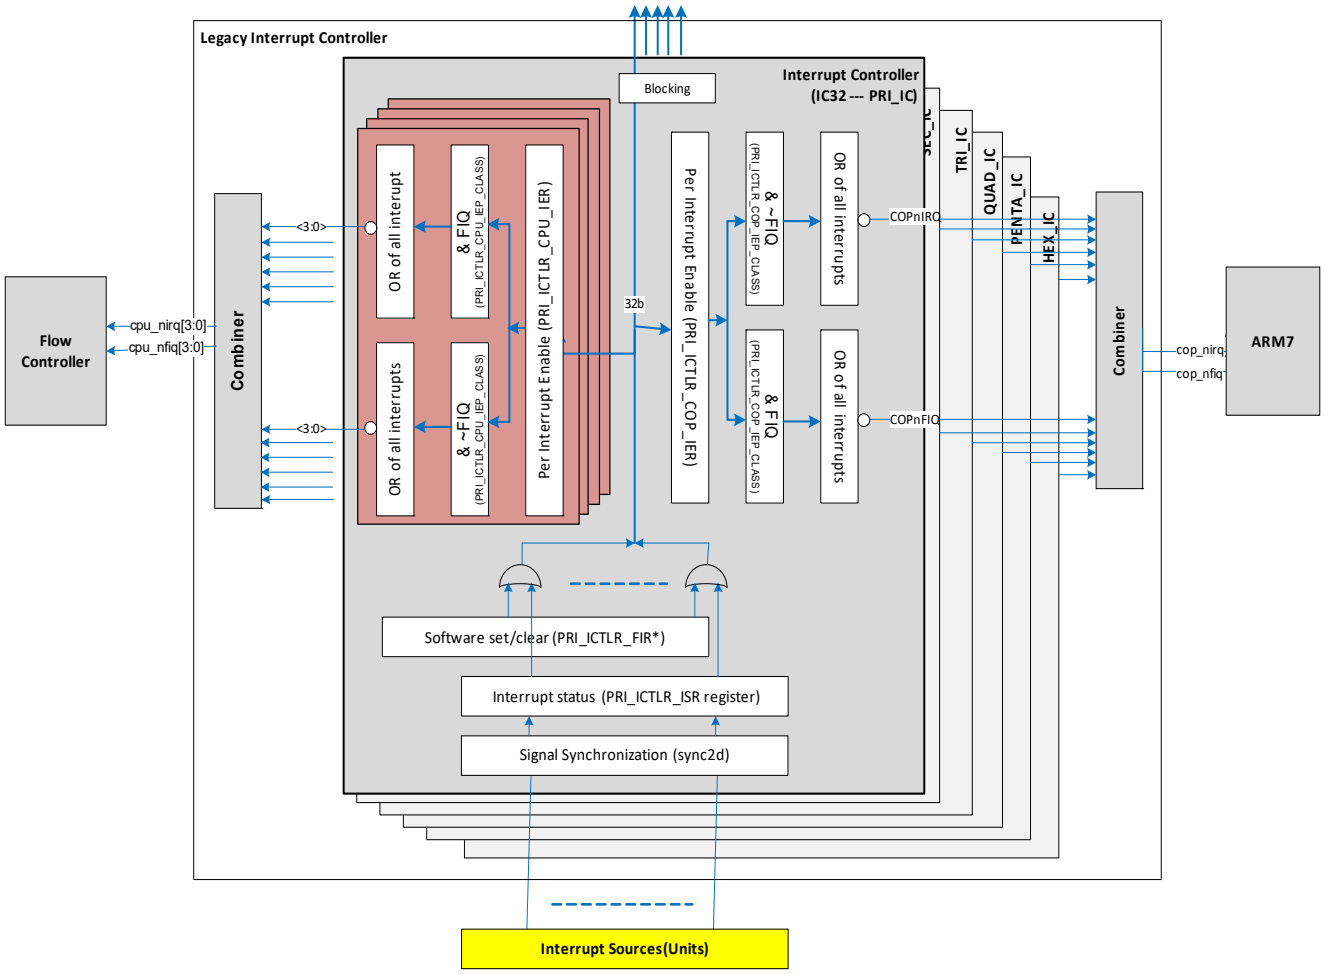
The GIC-400 presents the Flow Controller with four sets of FIQOUT and IRQOUT signals, one set for each CPU core. These signals serve as an indication (to the Flow Controller) that there are outstanding interrupts targeting one or more CPU cores. When one or more CPU cores are in a power state deeper than C1 (i.e., STANDBYWFx) such as retention or power gated state, upon observing an interrupt, the Flow Controller will initiate a power sequence to bring the respective CPU core or CPU cluster back into C0 (or CC0, Active) state.

The GIC-400 interrupt controller resides on the VDD_SoC power rail. The GIC-400 will not be externally power gated or clock gated. As long as the VDD_SoC rail is powered on, the GIC-400 will be powered on as well. With the exception of the LP0 power state, during which GIC-400 is powered down, the GIC-400 will be monitoring the interrupt requests throughout all the CCPLEX and SoC power states and route them to the Flow Controller, indicating that a pending interrupt to the CPU cores. In retention as explained above the cores would be idle and all interrupts to the GIC would be blocked. So, the GIC will not generate any interrupt signals.

3.3.3 Legacy Interrupt Controller (LIC)

Interrupts from various Tegra X1 units are routed to the LIC. The LIC consists of six interrupt controllers (called IC32); each IC32 handles 32 interrupts (for a total of 192 interrupts). Each IC32 generates five sets of IRQ/FIQ interrupts: one for BPMP (ARM7 BPMP-Lite) and the other ones for CPU<3:0>. The interrupts for CPU<3:0> are used by the flow controller only for wake events. A use case for this is explained in Section 3.3.1.5: Interrupt Blocking to Support Retention.

Figure 4: Legacy Interrupt Controller Block Diagram



The following text discusses interrupts as they relate to the BPMP-Lite IRQ/FIQ interrupts. Unless specified otherwise, this also applies to the CPU<3:0> IRQ/FIQ interrupts.

This is a general LIC functional description that assumes blocking is not enabled. See Section 3.3.1.5: Interrupt Blocking to Support Retention for information on blocking.

3.3.3.1 LIC Functional Description

Each IC32 in the LIC handles 32 interrupts. As shown in above figure, the IC32 synchronizes the incoming hardware interrupt requests and combines (bitwise OR) them with software interrupts (FIR). The software interrupt can set be set or cleared by the FIR register. The combined software/hardware interrupt signals are broadcast to the GIC-400, and are used by the IC32 for targeting interrupts to the BPMP-Lite. This allows any interrupt to be routed to any one or more processors (Cortex-A57/ ARM7) in a Tegra system. Note that routing can be changed dynamically. In addition, any of these interrupts can be mapped to either IRQ or FIQ.

The interrupt routing (to the BPMP-Lite) is achieved by configuring the Interrupt Enable Register (IER) and the Interrupt Class Registers (IEP_CLASS). Each IC32 has a set of IER and IEP Class registers. The BPMP-Lite registers are called COP_IER and COP_IEP_CLASS. Similarly, the CPU IER/IEP Class Registers are called CPU_IER/CPU<1,2,3>_IER and CPU_IEP_CLASS/CPU_IEP_CLASS.

When a 1 is set in the proper bit position in the COP_IER register, that particular source is capable of interrupting the BPMP-Lite. Also, the class is set in the proper bit position of COP_IEP_CLASS for the corresponding interrupt to be routed as IRQ or FIQ.

The interrupt status register (ISR) allows the processor to view the state of the pending hardware interrupt requests regardless of the bit enables programmed in COP_IER. The forced interrupt status register (FIR) allows the software to selectively force set or clear specific interrupts. The read-only VIRQ/VFIQ allows the BPMP-Lite to determine the source of the interrupt request(s) causing the processor to enter the interrupt service routine.

The nIRQ signals generated by six IC32 controllers are logically ANDed in the combiner to generate the final nIRQ which is routed to the BPMP-Lite. Similarly, nFIQ signals are logically ANDed in the combiner to generate nFIQ which is routed to the BPMP-Lite.

3.3.3.2 LIC Registers Description

Each IC32 has sixteen 32-bit registers. The BPMP-Lite and CPU<n> interrupt enable registers (COP_IER/CPU_IER) indicate the interrupts enabled for the BPMP-Lite and CPU<3:0>, respectively. These registers have their respective SET and CLR registers that allow setting or clearing individual bits of these registers without the need of a Read-Modify-Write cycle.

The BPMP-Lite/CPU Interrupt Class Register (COP_IEP_CLASS/CPU_IEP_CLASS) controls whether the interrupt will be routed to the IRQ or the FIQ interrupt of the respective processor.

The Forced Interrupt Status Register (FIR) allows the software to force the set and clear of individual interrupts. This can be used for debugging/testing purposes or can be used in the working system. Note that software cannot force set/clear an interrupt which is already asserted by a hardware source. The FIR has its corresponding SET and CLR registers.

The Valid Interrupt Status Register (VIRQ_COP/VIRQ_CPU) and Valid FIQ Interrupt Status Register (VFIQ_COP/VFIQ_CPU) indicate the currently active interrupts that are valid on the respective pins (nIRQ or nFIQ).

The differences between ISR and VFIQ/VIRQ registers are:

- The VFIQ/VIRQ registers indicate the interrupt which is sent to the processor (i.e., these registers indicate interrupts outgoing from the interrupt controller). On the other hand, the ISR indicates hardware interrupts incoming into the interrupt controller.
  - The VFIQ/VIRQ registers indicate the interrupts set by hardware or by software. The ISR register indicates registers set by only hardware.
  - The VFIQ/VIRQ registers only show the enabled interrupts. ISR shows the interrupt status irrespective of whether the interrupt is enabled or not.
  - The ISR shows the interrupt to be active whether it is routed to the FIQ pin or to the IRQ pin. The VFIQ/VIRQ registers contain only the routed interrupts.

The VIRQ_COP and VIRQ_CPU registers are calculated as follows.

VIRQ_COP = (ISR **|** FIR) **&** IER_COP **&** (**~**COP_IEP_CLASS)

VIRQ_CPU<n> = (ISR **|** FIR) **&** IER_CPU<n> **&** (**~**CPU_IEP_CLASS)

Similarly, the VFIQ_COP and VFIQ_CPU<n> registers are generated as follows.

VIRQ_COP = (ISR **|** FIR) **&** IER_COP **&** COP_IEP_CLASS

VIRQ_CPU<n> = (ISR **|** FIR) **&** IER_CPU<n> **&** CPU<n>_IEP_CLASS

3.3.4 Routing of Interrupt Signals from the LIC to the Flow Controller

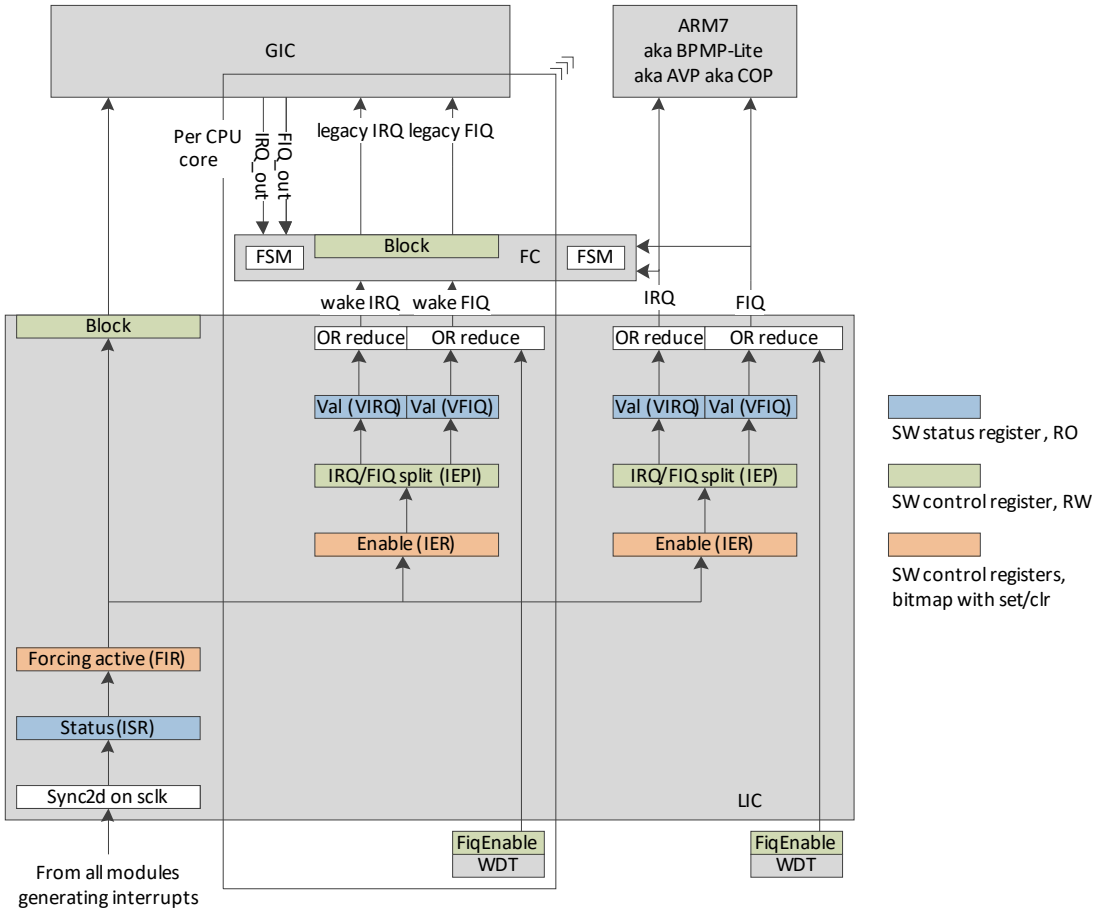
The interrupt signals are routed to the GIC-400 without any masking.

The interrupt signals are routed to the Flow Controller after masking with the Interrupt Enable Registers. Wake IRQ/FIQ at the LIC to FC interface in Figure 5 are the same as the signals CPU_nIRQ/CPU_nFIQ[3:0] in Figure 3.

The VFIQ signal generated for each core is combined with the Watch Dog Timer. Refer to Chapter 8: Timers for more information on the Watch Dog Timer.

The flow controller routes the interrupt signals to the legacy FIQ/ IRQ signal present for each core in the GIC. The legacy FIQ is used by the FIQ debugger.

Figure 5: Signal Routing with Respect to the LIC



3.3.5 Arbitration Semaphores

Arbitration semaphores provide a mechanism by which the CPU and BPMP-Lite can arbitrate for the use of various resources. These semaphores provide a hardware locking mechanism, so that when a processor is already using a resource, the second processor is not granted that resource. There are 32 bits of Arbitration semaphores provided in the system. The hardware does not enforce any resource association to these bits. It is left to the software to assign and use these bits. Any processor that needs to access a particular resource will request for the corresponding bit in the Arbitration semaphores by writing a one to that bit in the Arbitration Semaphore Request register (SMP_GET register). Software will then check the corresponding bit in the Semaphore Granted Status register (SMP_GNT_ST register)

If the requesting processor has been granted the resource, then the status returned will be a one. Alternately, the processor can configure the interrupt controller to generate an interrupt when the resource becomes available.

When the processor has finished using the resource, it releases the resource by writing a one to the corresponding bit in the Arbitration Semaphore Put Request register (SMP_PUT register). Additionally, pending request status is provided through the Arbitration Request Pending Status register (SMP_REQ_ST register).

The Primary Interrupt Controller (PRI_ICTLR) supports Arbitration Grant Interrupts. When a processor is granted access to a resource, the Arbitration semaphore module can be programmed to send a Grant signal to the interrupt controller. The interrupt controller can then interrupt the processor to indicate that it has been granted exclusive access to a particular resource. The individual ARB_GNT bits are ORed together and presented to the Primary Interrupt controller as Interrupt Number 29.

The Arbitration/Grant interrupts mechanism registers are described in the Arbitration Chapter 4: Semaphores of this document.

3.3.6 Interrupts Used for Processor Power-Ups

The interrupt signals (nIRQ and nFIQ per processor) are routed to the Flow Controller unit from which they could also continue to either processor as allowed by the flow controller. Based on configuration, the flow controller uses them to power up the corresponding CPU. Refer to Chapter 18: Flow Controller in this TRM for the details of processor wake-up.

3.4 Interrupt Registers

3.4.1 Interrupt Controller Registers

> ***Note:*** *The interrupt controller (IC32) register descriptions do not follow the standard register table protocol described in Section 1.4: Reading Register Tables in the Introduction chapter. Each register's relative offset, access type, and power-on reset value are located in Table 14. The bit descriptions for each register are defined in Table 15 according to interrupt controller (IC32).*

Each IC32 has a set of 34 registers with names using the form <ID>_<FUNCTION>_0:

- ID identifies the specific IC32: PRI_ICTLR, SEC_ICTLR, TRI_ICTLR, QUAD_ICTLR, PENTA_ICTLR, HEXA_ICTLR. Based on the IC32, ID defines a base address and mapping (see below).
- FUNCTION identifies the use for this register. Refer to the Section 3.3.3.2: LIC Registers Description for more details. FUNCTION is defined as one of the following:
  - VIRQ_<DEST> and VFIQ_<DEST>: indicates the Valid status, as an IRQ or FIQ, respectively, for this destination. DEST is BPMP-Lite, CPU, CPU1, CPU2, or CPU3.
  - ISR: indicates the latched Interrupt Status
  - FIR: indicates Force Interrupt
  - FIR_SET and FIR_CLR: to control FIR, bits set to 1 are set or cleared, respectively, in FIR.
  - <DEST>_IER: indicates that the corresponding event is enabled as an interrupt
  - <DEST>_IER_SET and <DEST>_IER_CLR: to control IER, bits equal to 1 are set or cleared, respectively, in IER.
  - <DEST>_IEP_CLASS: Interrupt Enable Priority Class, a bit set to 0 indicates IRQ, and set to 1 indicates FIQ.

Table 13 associates the following with each IC32: the ID (used in the register names), the base offset (address map of the five IC32s), and interrupt mapping reference.

Table 13: IC32 Characteristics

ID	Base Offset	Mapping
PRI_ICTLR	0x000	See Table 7: Primary Interrupt Controller (PRI_ICTLR) Mapping
SEC_ICTLR	0x100	See Table 8: Secondary Interrupt Controller (SEC_ICTLR) Mapping
TRI_ICTLR	0x200	See Table 9: Tertiary Interrupt Controller (TRI_ICTLR) Mapping
QUAD_ICTLR	0x300	See Table 10: Quaternary Interrupt Controller (QUAD_CTLR) Mapping
PENTA_ICTLR	0x400	See Table 11: Fifth Interrupt Controller (PENTA_ICTLR) Mapping
HEXA_ICTLR	0x500	See Table 12: Sixth Interrupt Controller (HEXA_ICTLR) Mapping

The table below summarizes all 34 registers for each IC32 (where <ID> is the controller name), their relative offsets, register access types (RO, WO, or RW), and their 32-bit power-on reset values. The actual offset for each register is the base offset (from the table above) plus the relative offset. The PRI_ICTLR, SEC_ICTLR, TRI_ICTLR, QUAD_ICTLR, PENTA_ICTLR, and HEXA_ICTLR have the same set of registers at the same address offset with the exception of the ARBGNT registers which are only in PRI_ICTLR. The ARBGNT registers are defined in Section 3.4.2: Arb_gnt Specific Interrupt Controller Registers.

Table 14: Interrupt Controller IC32 Register Set

Name	Relative Offset	Read/ Write	Reset	Remark
<ID>_VIRQ_CPU_0	0x00	RO	x	Valid Interrupt Request Status for CPU0 Register
<ID>_VIRQ_COP_0	0x04	RO	x	Valid Interrupt Request Status for BPMP-Lite Register
<ID>_VFIQ_CPU_0	0x08	RO	x	FIQ Valid Interrupt Status for CPU0 Register

3.4.2 Arb_gnt Specific Interrupt Controller Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

Arbitration semaphores provide a mechanism by which the two processors can arbitrate for the use of various resources. These semaphores provide a hardware locking mechanism, so that when a processor is already using a resource, the second processor is not granted that resource. There are 32 bits of Arbitration semaphores provided in the system.

The hardware does not enforce any resource association to these bits. It is left to the firmware to assign and use these bits.

The Arbitration Semaphores can also generate an interrupt when a hardware resource becomes available. The registers in this module configure these interrupts. When a 1 is set in the corresponding bit position of the Arbitration Semaphore Interrupt Source Register (CPU_enable or COP_enable), an interrupt will be generated when the processor achieves Grant Status for that resource.

The current Grant status can be viewed in the CPU_STATUS or COP_STATUS registers.

3.4.2.1 PRI_ICTLR_ARBGNT_CPU_STATUS_0

CPU Arbitration Semaphore Interrupt Status Register

Offset: 0x40 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GNT31_GNG0: Each bit is set by hardware when the corresponding arbitration semaphore ownership is granted to the CPU. Interrupt is cleared when the CPU writes the ARB_SMP.PUT register with the corresponding bit set.

3.4.2.2 PRI_ICTLR_ARBGNT_CPU_ENABLE_0

CPU Arbitration Semaphore Interrupt Enable Register

Offset: 0x44 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	GER31_GER0: Writing a 1 in any bit position will enable the corresponding arbitration semaphore interrupt.

3.4.2.3 PRI_ICTLR_ARBGNT_COP_STATUS_0

BPMP-Lite Arbitration Semaphore Interrupt Status Register

Offset: 0x48 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GNT31_GNG0: Each bit is set by hardware when the corresponding arbitration semaphore ownership is granted to the BPMP-Lite. The interrupt is cleared when the BPMP-Lite writes the ARB_SMP.PUT register with the corresponding bit set.

3.4.2.4 PRI_ICTLR_ARBGNT_COP_ENABLE_0

BPMP-Lite Arbitration Semaphore Interrupt Enable Register

Offset: 0x4c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	GER31_GER0: Writing a 1 in any bit position will enable the corresponding arbitration semaphore interrupt.

CHAPTER 4: SEMAPHORES

4.1 Arbitration Semaphores

Arbitration semaphores provide a mechanism by which two processors can arbitrate for the use of various resources.

These semaphores provide a hardware locking mechanism to ensure that when a processor is already using a resource, the second processor is not granted that resource. There are 32 bits of arbitration semaphores provided in the system. The hardware does not enforce any resource association to these bits and it is left to the user to assign and use these bits.

Any processor that needs to access a particular resource will request for the corresponding bit in the arbitration semaphores by writing a one to that bit in the Arbitration Semaphore Request register (SMP_GET register). Firmware will then check the corresponding bit in the Semaphore Granted Status register (SMP_GNT_ST register). If the requesting processor has been granted the resource, then the status returned will be a one.

Alternately, the processor can configure the interrupt controller to generate an interrupt when the resource becomes available. When the processor has finished using the resource, it releases the resource by writing a one to the corresponding bit in the Arbitration Semaphore Put Request register (SMP_PUT register). Additionally, pending request status is provided through the Arbitration Request Pending Status register (SMP_REQ_ST register).

(Note that an alternative mechanism to this exists in the Atomics block. Refer to the corresponding section of this document for further details. At the time of this writing, NVIDIA software does not make use of the Atomics block.)

4.2 Shared Semaphores

Shared semaphores are formed by three registers, each 32 bits wide:

- A read-only register showing the current value of the semaphore
- Two write-only registers to set and clear individual semaphore bits

These semaphores can be used to synchronize processors acting in a producer/consumer relationship; that is, a pair of them can be used to implement either a two-way or four-way handshake.

Correct operation of the shared semaphores requires to statically allocate an owner for each bit, because it is impossible to implement an atomic test and set (or similar operation) given the register interface. It also means that calling them semaphores is a little bit of stretch, they are simply atomic set and atomic clear registers.

4.3 Shared Mailboxes (Message Passing Elements)

This is limited to two instances of a single element mailbox, with an associated empty/not full status flag and the capability to generate interrupts.

The naming implies a specific direction of transfer (SHRD_INBOX and SHRD_OUTBOX), with the CPU as the reference to establish direction; that is, IN refers to the COP to CPU direction. This distinction is in fact enforced by hardware because the TAG bit semantic is dependent on the source of a transaction: TAG is write 1 clear for CPU (IN) or COP (OUT).

All message passing is via one register only, which contains 28 bits of uncommitted data (with a suggested usage), two bits controlling the generation of interrupt, and a field operating as status flag or a control bit depending on the direction of the transaction.

4.4 Semaphore Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

4.4.1 Arbitration Semaphore Registers

4.4.1.1 ARB_SEMA_SMP_GNT_ST_0

Semaphore Granted Status Register

Offset: 0x0 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	ARB_31_ARB_0: A one in any bit indicates that the processor reading this register as granted status for that bit. A zero indicates semaphore not granted.

4.4.1.2 ARB_SEMA_SMP_GET_0

Request Arbitration Semaphore Register

Offset: 0x4 | Read/Write: WO | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	GET_31_GET_0: Writing a one in any bit is a request for that semaphore bit by the processor performing the register write.

4.4.1.3 ARB_SEMA_SMP_PUT_0

Arbitration Semaphore Put Request Register

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	PUT_31_PUT_0: Writing a one in any bit will clear the corresponding semaphore bit by the processor performing the register write.

4.4.1.4 ARB_SEMA_SMP_REQ_ST_0

Arbitration Request Pending Status (1=PENDING) Register

Offset: 0xc | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	REQ_31_REQ_0: A one in any bit indicates a request pending status. The corresponding bits are set when the request for the individual resource is pending. The read by the CPU of this register shows the pending status for the CPU and a read of this register by BPMP-Lite shows the pending status for BPMP-Lite.

4.4.2 Shared Resource Semaphore Registers

4.4.2.1 RES_SEMA_SHRD_SMP_STA_0

Shared Resource Semaphore Status

Offset: 0x0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	SMP_31_SMP_0: SMP.27:SMP.24: Available in APB_DMA.REQUESTORS register

4.4.2.2 RES_SEMA_SHRD_SMP_SET_0

Shared Resource Semaphore Set-Bit Request

Offset: 0x4 | Read/Write: WO | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SET_31_SET_0: Semaphore set register. Writing a one to any bit will set the corresponding semaphore bit. Shared resource set-bit requests.

4.4.2.3 RES_SEMA_SHRD_SMP_CLR_0

Shared Resource Semaphore Clr-bit Request Register

Offset: 0x8 | Read/Write: WO | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	CLR_31_CLR_0: Corresponding semaphore bit.

4.4.2.4 RES_SEMA_SHRD_INBOX_0

Shared Resource Inbox (Messages from COP (ARM7) to CPU)

Offset: 0x10 | Read/Write: R/W | Reset: 0x00000000 (0b000x0000000000000000000000000000)

Bit	Reset	Description
31	0x0	IE_IBF: Interrupt CPU on INBOX Full (TAG=1) 0 = EMPTY 1 = FULL
30	0x0	IE_IBE: Interrupt COP on INBOX Empty (TAG=0) 0 = EMPTY 1 = FULL
29	0x0	TAG: Set when the COP writes this register and cleared when CPU writes this register with this bit set to 1 (write one clear). 0 = INVALID 1 = VALID
27:24	0x0	IN_BOX_STAT: General-purpose data bits, suggested usage is for INBOX status (software can change the definition)
23:17	0x0	IN_BOX_CMD: General-purpose data bits, suggested usage is for INBOX command (software can change the definition)
16:0	0x0	IN_BOX_DATA: General-purpose Inbox data bits, suggested usage is for INBOX data (software can change the definition)

4.4.2.5 RES_SEMA_SHRD_OUTBOX_0

Shared Resource Outbox (Messages from CPU to COP (ARM7))

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0b000x0000000000000000000000000000)

Bit	Reset	Description
31	0x0	IE_OBF: Interrupt COP on OUTBOX Full (TAG=1) 0 = EMPTY 1 = FULL
30	0x0	IE_OBE: Interrupt CPU on OUTBOX Empty (TAG=0) 0 = EMPTY 1 = FULL
29	0x0	TAG: Set when the CPU writes this register and cleared when the COP writes this register with this bit set to 1 (write one clear). 0 = INVALID 1 = VALID
27:24	0x0	OUT_BOX_STAT: General-purpose data bits, suggested usage is for Outbox OUTBOX status (software can change the definition)

Bit	Reset	Description
23:17	0x0	OUT_BOX_CMD: General-purpose data bits, suggested usage is for Outbox OUTBOX command (software can change the definition)
16:0	0x0	OUT_BOX_DATA: General-purpose Outbox data bits, suggested usage is for OUTBOX data (software can change the definition)

CHAPTER 5: CLOCK AND RESET CONTROLLER

The Clock and Reset (CAR) block contains all the logic needed to control most of the clocks and resets to the Tegra® X1 device. The CAR block provides the registers to program the PLLs and controls most of the clock source programming, and most of the clock dividers.

Power on reset (SYS_RESET_N_) is the primary reset for the Tegra X1 chip and is provided by the external PMIC.

5.1 Functional Description

Because this chip is the system controller, resets are generated in hardware automatically as part of the power-on (POR) or system (either hardware or software) reset sequence.

In POR, all blocks will be held in reset (with clocks disabled) except the minimal set of modules that are needed for system boot-up. At POR, the appropriate bits in RST_DEVICES_L/H/U/V/W/X/Y registers are set automatically by hardware. A “1” in the bit position signifies that block will be held at reset after POR. A “0” in the bit position signifies that block will have its reset de-asserted after POR.

Similarly for clocks, the appropriate bits in CLK_OUT_ENB_L/H/U/V/W/X/Y registers are set automatically by hardware. A “1” in the bit position signifies that block will have clock running during and after POR. A “0” in the bit position signifies that block will not have clock running during or after POR.

The blocks necessary for boot (known as boot blocks) include:

- The ARM7 Processor (BPMP-Lite) and its L1 cache, IRAM
- All system buses (PPSB, AHB, APB, etc.)
- Timer
- RTC
- eFUSE
- GPIO
- CoreSight

Each of the boot block devices will have their reset de-asserted at the end of the POR period (as well as their clocks enabled and use the Oscillator clock for their clock source). Boot blocks clock dividers are all set to divided-by-one.

During POR or system reset, the reset controller will de-assert reset to the boot blocks first and extend the resets to the CPU/ARM7 for another 256 oscillator clock periods. This will prevent either processor from talking to a boot device while it is still in the reset state.

Releasing a non-boot block/device from reset to bring into operation will require software to initiate a carefully controlled sequence with clock and reset control registers. This sequence must be implemented by software precisely to ensure correct operation of the hardware.

5.1.1 Notes

- Unless noted elsewhere, all modules support changing the clock divider ratio without disabling the clock.
- Unless noted elsewhere, all modules' clock switching is glitch-free except “audio_sync_clk”.
- For "audio_sync_clk", the clock source select needs to be set up before changing the device clock source to use that audio clock or to enable the device which use that audio sampling clock.
- At the time of writing, only 38.4 MHz is supported by NVIDIA for a crystal (or external clock) frequency. Other frequencies mentioned in this section are not supported.

- Before stopping the clock (via CLK_OUT_ENB_L/H/U/V/W/X/Y registers) and/or asserting reset (via RST_DEVICES_L/H/U/V/W/X/Y registers) to a module, first check the module to make sure it is not active. Stopping clock/asserting reset while the module is still busy can cause relatively minor problem such as incorrect data read/written, or catastrophic problem such as system hang. To ensure a module is not active, (a) disable the module by programming its disable bit if not already done so, and (b) wait until the module is not active by checking for its busy bit, done bit, count, or similar mechanism.

5.1.2 Clk_m Divisor

Clk_m which is generated from the oscillator pad input to the AP is used as the default option at which clocks startup in most of the clock multiplexors. It is also used to clock all the logic in CAR module (Example: The FSMs in switches that ensure that a change in switch parameters is glitch-less at the clock output).

For supporting various crystal frequencies without compromising on ULP use-cases, there is a special glitch-less divider in clk_m path which is capable of doing /1, /2, /3 and /4. A specific sequence is required for going to the divisor value that is needed. The default value of CLK_M_DIVISOR is to do a div1 (value = 0). The sequence to get to a divisor value that will work is:

Sequence for div1to div 3:

div1(reg value = 0) [RESET value] -> div4(reg value = 3) -> div3(reg value = 2)

Sequence for div1 to div2:

div1(reg value = 0) [RESET value] -> div4(reg value = 3) -> div2(reg value = 1).

Sequence for div1 to div4:

div1(reg value = 0) [RESET value] -> div4(reg value = 3)

The expectation is that this CLK_M_DIVISOR will only be changed once after powering VDD_SOC on in cold boot/LP0 exit path. So these sequences are verified with an oscillator clock of 38.4 MHz; div2 setting of the CLK_M divisor must be used. The result is 19.2 MHz clk_m.

Note: *Div2 is the recommended clk_m divisor value. Do not use any other value.*

Several register values in other IP blocks are dependent on the clk_m rate. Refer to the following sections for more information:

- The “TIMERUS_USEC_CFG_0” section of Chapter 8: Timers.
- The parts of Chapter 34: PCI Express (PCIe) Controller that mention “CLK25M” (CLK25M is driven by clk_m).

Common configuration for PLLs with fixed input divider policy:

- Always set fixed M-value based on the reference rate
- Always set P-value 1:1 for output rates above VCO minimum
- Choose minimum necessary P-value for output rates below VCO maximum
- Calculate N-value based on selected M and P
- Calculate SDM_DIN fractional part

5.1.3 Clock Generation Logic for SDMMC

There is a single clock switch for generating the timeout clock for all instances of SDMMC controllers(SDMMC1/SDMMC2/SDMMC3/SDMMC4). The timeout clock is set according to the timeout requirement of SDMMC controllers and is typically fixed to a frequency. This legacy timeout root clock is controlled like any other first level clock using CLK_RST_CONTROLLER_CLK_SOURCE_SDMMC_LEGACY_TM_0 which chooses the clock source and divisor. This root clock can be gated using control CLK_ENB_SDMMC_LEGACY_TM.

Apart from this root clock gate, there is a second level clock gate for this legacy timeout clock which goes to specific SDMMC controllers. The specific clock branch to SDMMCx controller is enabled by a logical expression which takes into account the following:

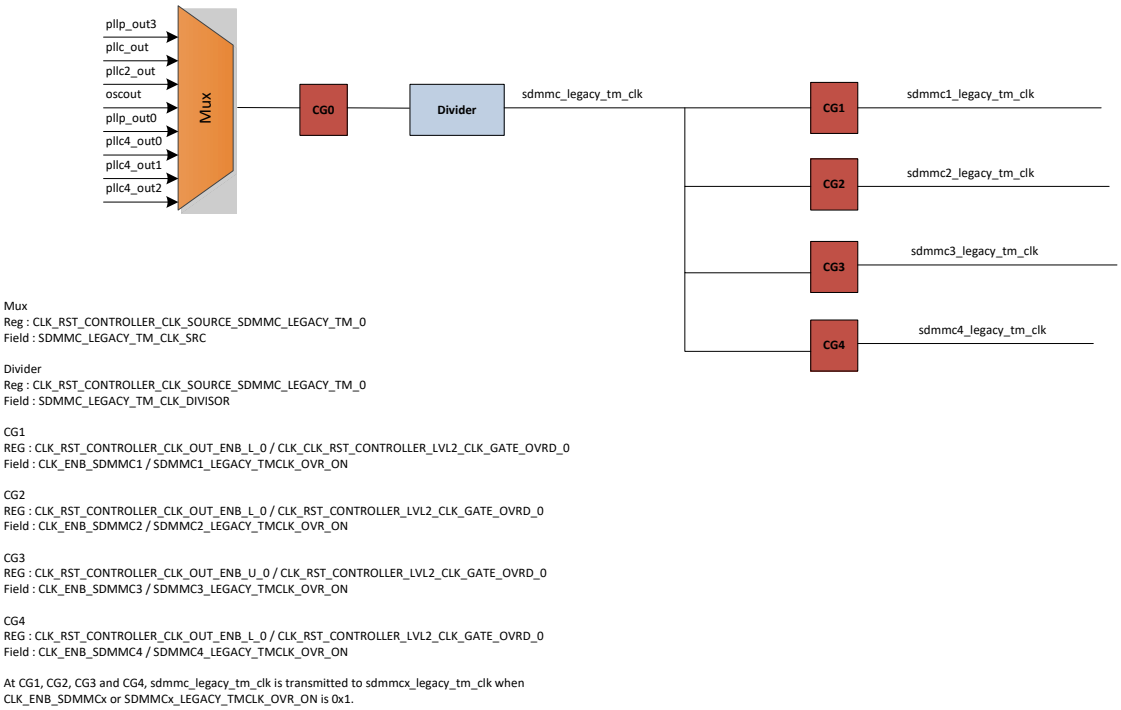
- The first level clock for the corresponding SDMMC controller [CLK_ENB_SDMMCx] AND the signal from the SDMMCx controller indicating the need for this clock are enabled.
- [OR] Override control in CAR to ignore all clock gating conditions [SDMMCx_LEGACY_TMCLK_OVR_ON].

Software does not need to program SDMMC1_LEGACY_TMCLK_OVR_ON==1 to get the clock running. It should be kept to '0' (default) only.

As long as CLK_ENB_SDMMC1==1, sdmmc1_legacy_tmclk will carry to SDMMC1 controller.

Similarly, if CLK_ENB_SDMMC2==1, sdmmc2_legacy_tmclk will carry to SDMMC2 controller.

Figure 6: SDMMC Timeout Clock Frequency



5.1.4 Audio Sync Clock

The audio sync clock synchronizes communication between 2 audio devices to prevent a FIFO overrun/underrun condition in either of the audio devices. For example, one can receive data from SPDIFIN and transmit the same data back out to an I2S speaker. But if the SPDIFIN stream is 43.9 kHz while transmitting a 44.1 kHz sample rate to I2S, the SPDIFIN receive FIFO can get overrun while the I2S transmit FIFO can get underrun.

> ***Note:*** *There is no clock switching protection for the audio sync clock so one needs to set up the desired clock source before enabling the audio transmit/receive device.*

5.1.5 Analog PLLs

The following PLLs are analog:

- PLLP
- refPLLE

- PLLU
- PLLA
- PLLE
- PLLC4
- UTMIP
- PLLM
- PLLD
- PLLD2, PLLDP
- PLLX
- PLLG

To start the PLL:

1. Change IDDQ from 1 to 0.
2. Wait 5 µs (10 µs in case of UTMIPLL). If wait is less, then PLL lock time can be higher than the specification.
3. Program PLL registers (when IDDQ=0 and ENABLE=0).
4. Enable 0 →1 (clock-in must be running before asserting ENABLE).
5. Wait for LOCK assertion to use PLL [PLL_STATE=LOCKED].

To stop the PLL:

6. Use ENABLE 1→0 to stop [PLL_STATE=DISABLED, Lower latency wake up]. Go to Step 4 to turn it back on.
7. With ENABLE=0, change IDDQ from 0→1 for better power savings [PLL_STATE=IDDQ]. Go to Step 1 to turn it back on.
8. Use reference clock enable controls to save more power but make sure to turn it back on before powering it up.

Notes:

- *The core voltage rail can be brought down any time after Step 6 but ideally after Step 7. The PLL inputs will be clamped and the PLL will be in deep power down mode. All the PLL controls will be reset to their defaults when the rail is powered back up and so re-initialization will start from Step 1.*
- *PLL analog voltage rails are expected to be turned off in LP0 state in Tegra X1. This is different to prior Tegra chips.*
- *PLLM can be auto-started when powering up from LP0. The sequencing is taken care in hardware.*

5.1.5.1 Dynamic ramp and fractional NDIV [Where feature available in PLL]

1. Program NDIV_NEW, SDM_DIN_NEW to target frequency. Program DYNRAMP_STEPA and DYNRAMP_STEPB.
2. Set EN_DYNRAMP=1, PLL starts to acquire lock to target frequency.
3. PLL asserts DYNRAMP_DONE
4. Program SDM_DIN= SDM_DIN_NEW, NDIV=NDIV_NEW
5. Set EN_DYNRAMP=0

5.1.5.2 Spread using SDM

- PLLD2

- PLLDP

Program SDM-SSC controls and set EN_SSC to 1 before using PLL.

5.1.5.3 Spread using SDA

- PLLE

For PLLE SDA

To turn on Spread using SSA:

1. Load Spread Coefficients
2. BYPASS_SS=0
3. SSC_BYP=0
4. Wait 300nS and INTERP_RESET=0 At this stage spread spectrum is enabled

To turn OFF spread spectrum:

1. BYPASS_SS=1
2. INTERP_RESET=1, SSC_BYP=1

5.1.6 Hybrid PLLs (HPLLs)

The following PLLs are hybrid:

- PLLC
- PLLA1
- PLLC2
- PLLC3

To start the PLL:

1. Assert RESET if not already asserted.
2. Program PLL registers.
3. IDDQ 1 ->0. Wait for a 25 cycles of reference clock.
4. Change RESET from 1->0.
5. Change ENABLE from 0->1.
6. Wait for frequency and phase LOCK to start using the PLL.

To stop the PLL:

1. Change ENABLE control to 0 and RESET to 1. Back to step 4 to turn ON PLL.
2. Optionally engage the reference clock gating control to save some power. It is to be enabled prior to turning the PLL back on.
3. Change IDDQ to 1 for better power savings.
4. Change frequency dynamically.
5. Use LOOP_CTRL=0 or LOOP_CTRL=1 for major/minor changes in frequency. Change NDIV/fractional NDIV parameter for the change in frequency.
6. Wait for frequency and phase LOCK for completion of sequence in hardware.

5.1.7 Generic Clock Switch Programming Sequence

To set up a non-boot device for operation (only apply if a device has a CLK_SOURCE_<mod> register)

1. Make sure the device's reset is asserted (via RST_DEVICES_L/H/U/V/W/X/Y registers).
2. Enable clock to the device (via CLK_OUT_ENB_L/H/U/V/W/X/Y registers).
3. Change the clock divisor to the device (via CLK_SOURCE_ register).
4. Wait 2 µs to make sure the clock divider has changed.
5. Change the clock source to the device (via the CLK_SOURCE_<mod> register).
6. Wait 2 µs to make sure clock source/device logic is stabilized.
7. De-assert the device's reset (via RST_DEVICES_L/H/U/V/W/X/Y registers).

To change a device's clock divider and/or source after boot-up (only apply if a device has a CLK_-SOURCE_<mod> register):

(A) Method 1 -- (using reset).

1. Make sure the device is disabled (via the device's register).
2. Assert device's reset (via RST_DEVICES_L/H/U/V/W/X/Y registers).
3. Make sure clock to the device is enabled (via CLK_OUT_ENB_L/H/U/V/W/X/Y registers).
4. Change the clock divisor to the device (via CLK_SOURCE_<mod> register).
5. Wait 2 µs to make sure the clock divider has changed.
6. Change the clock source to the device (via the CLK_SOURCE_<mod> register).
7. Wait 2 µs to make sure clock source/device logic is stabilized.
8. De-assert the device's reset (via RST_DEVICES_L/H/U/V/W/X/Y registers).

(B) Method 2 -- (not using reset when unit is running).

1. Make sure the clock to the device is enabled (via CLK_OUT_ENB_L/H/U/V/W/X/Y registers).
2. Depending on the maximum rated frequency of the device and the current and target clock source/divider value, either change the divider first or the clock source first to avoid a temporary situation where the maximum frequency for that device is violated. Make sure to wait for 2 µs between changing the divider and clock source programming.).
3. Wait 2 µs to make sure the device logic is stabilized.

De-assert reset to device (without need to change clock) after boot-up:

1. Make sure the device's reset is asserted (via RST_DEVICES_L/H/U/V/W/X/Y registers).
2. Wait 2 µs to make sure the device logic is stabilized.
3. De-assert the device's reset (via RST_DEVICES_L/H/U/V/W/X/Y registers).

Method used to wait for 2 µs:

1. To use one of the four timers, refer to Chapter 8: Timers of this document.
2. Program the TMR_PTV register's TMR_PTV field with the desired microsecond count.
3. Program the TMR_PTV register's EN field to enable the timer.
4. Poll the TMR_PCR register's TMR_PCV field until it reaches 0 to indicate the microsecond count has been reached.
5. Program the TMR_PTV register's EN field to disable the timer.

5.1.7.1 Clock Configuration for Each Peripheral

In general, each block or module has a dedicated CLK_SOURCE_ register that provides clock source and clock divider control to that device. The clock source select is typically 2 bits long to select one of the four clock sources. The divider is typically 8 bits

long, consisting of a 7-bit integer and a 1-bit fraction. Furthermore, depending on the specific module, the CLOCK_SOURCE_ register may contain additional control bits.

Note: *The 16-bit UARTA/UARTB/UARTC clock divider control is provided by the UART register set and not by the CLK_SOURCE_ registers. To switch from one clock source to the next, both clock sources must be active/running.*

5.1.8 Main Clock Sources Used by the System:

(A) Primary clocks.

- "osc" - 38.4 MHz in Tegra X1 platforms (At the time of writing, only 38.4 MHz is supported by NVIDIA for a crystal (or external clock) frequency. Other frequencies mentioned in this section are not supported.)
  - "clk_m" - Derived from above and run at 19.2 MHz
  - "clk_s" – 32.768 kHz clock from system PMIC

(B) PLL clocks.

Notes:

- *Before reprogramming a clock source to generate a higher rate, software must first ensure that the voltage regulator that supplies the clock source and any downstream devices is set to at least the minimum required voltage for that rate. Similarly, after a clock source is reprogrammed to generate a lower rate, it may be possible for software to program the voltage regulator to reduce the voltage supplied to the rail to save energy. Information on the appropriate minimum voltage levels can be obtained from NVIDIA.*
- *For PLLCx, programming/sequencing is performed by the clocking software. All settings applied by the central clock driver are provided by NVIDIA. If the customer's software is developed from scratch by the customer (not based on NVIDIA kernel with NVIDIA clock driver), they can potentially redefine PLLCx configurations and usage. However, user-defined configurations are not guaranteed to be part of the chip characterization. Only configurations set by the NVIDIA clock software are guaranteed to be characterized by NVIDIA.*
- *All pad PLLs are managed by IP drivers.*

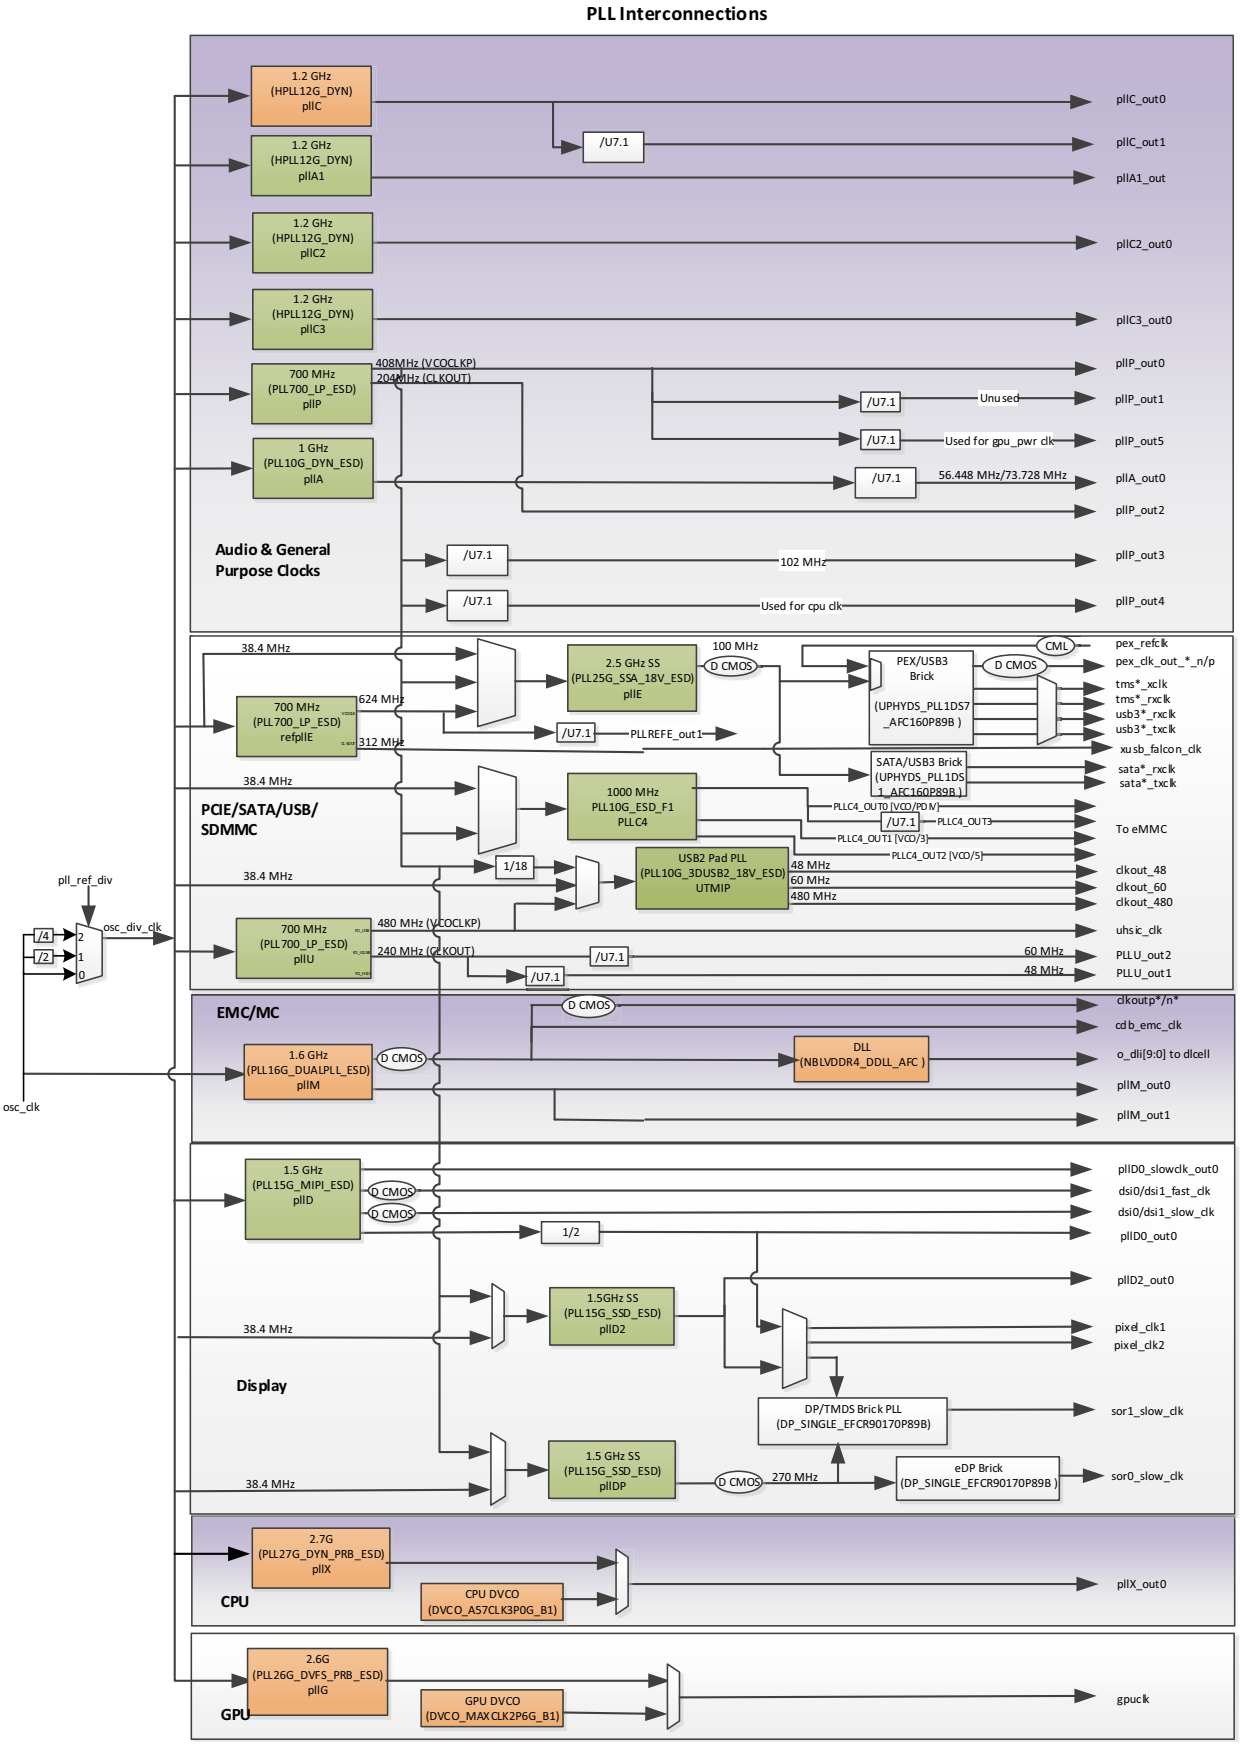
- "PLLC" is general purpose and its output is called "pllC_out". PLLC is for camera subsystem. The frequency is programmed by the clocking software based on the frequency requests from camera drivers delivered by NVIDIA. This frequency is a function of the sensor and the camera use case.
- "PLLC2" is general purpose and its output is called "pllC2_out". PLLC2 is shared between SE, VIC, TSECB, NVJPG and is set according to the requirement from these drivers by Clocking software.
- "PLLC3" is general purpose and its output is called "pllC3_out". PLLC3 is shared between NvENc, NvDec and is set according to the requirement from these drivers by Clocking software.
- "PLLC4" has 3 outputs: PLLC4_out0/1/2: OUT0=VCO/PDIV, OUT1=VCO/DIV3, OUT2=VCO/DIV5. Primarily used for SD/eMMC and also a source for system buses.
- "PLLM" is a composite clock source that supplies a clock for the DRAM interface and controller. PLLM consists of two symmetric, internal PLLs, PLLMA and PLLMB, and a multiplexer that selects which internal PLL provides the PLLM clock output. The dual-PLL architecture provides a stable, high-frequency clock source to system memory during DVFS operations.
- "PLLP" (peripheral) has a fixed frequency and its output is called "pllP_out0". This runs at 408 MHz and is the VCO output of PLLP.
- "PLLA" (audio) is used for audio purposes, generating precise codec sampling frequencies.
- "PLLA1"(audio) is used for clocking the ADSP and its output is called "PLLA1_out".

- “PLLU” (USB) has two fixed outputs at 480 MHz for HSIC and 240 MHz used for other USB clocks.
- “PLLD” (DSI) is primarily used for the display and its output PLLD_out. After a /2 fix is called “pllD_out0”.
- “PLLD2”(display) is primarily used for the display and its output (after a /2 fix) is called “pllD2_out0”.
- “PLLDP” (display port) is primarily used for supplying the reference clock to display port SOR brick. Its output is called “pllDP_out0”.
- “PLLX” has extra high frequency used by CPUs and is called “pllX_out0”. It is the primary source for Slow CPU but not for Fast CPU as it is not voltage noise-aware. (Note: A53 cluster has PLLX as the primary source.) There is no other PLL but we have DVCO-based voltage noise aware clocking source called CLDVFS.
- “refPLLE” is only used by PLLE, XUSB Falcon, CoreSight debug clocks.
- “PLLE” provides spread spectrum for PCIe, SATA, USB3 (if they are present). PLLE output frequency must be 100 MHz.
- UTMIPLL is for USB2.0 and its output frequency must be fixed at 480 MHz. Note: UTMIPLL is initially configured by clock driver, but in case of USB2 UTMIPLL run-time IDDQ mode is under USB2 driver control.

(C) PLL divided down clocks (each divider has 7 integer bits and 1 fractional bit).

- “pllC_out1” is divided-down from “pllC_out0”.
- “pllM_out1” is divided-down from “pllM_out0”.
- “pllP_out1” is divided-down from “pllP_out0”.
- “pllP_out2” is divided-down from “pllP_VCO”. This is done using the divP of the PLLP. DIVP is not glitch-free. So have to ensure that out2 is not used before it can be changed.
- “pllP_out3” is divided-down from “pllP_out0”.
- “pllP_out4” is divided-down from “pllP_out0”.
- “pllP_out5” is divided-down from “pllP_out0”.
- “pllA_out0” is divided-down from the “pllA” output.

Figure 7: Clocking Sources



PLLP Configuration Information

PLLP is configured as a fixed frequency PLL. The code in the Boot ROM configures PLLP at a fixed 408 MHz with help from hardware by programming osc_freq. Later on, software (typically the Boot Loader) may change this to another “fixed” frequency.

Table 16: Boot ROM Configuration to 408 MHz

Reference Frequency	38.4 MHz	19.2 MHz	12.0 MHz	48.0MHz	Resulting Frequency
DIVN	085 (055h)	085 (055h)	034 (022h)	034 (022h)	-
DIVM	08 (08h)	04 (04h)	01 (01h)	04 (04h)	-
DIVP	1 (1h)	1 (1h)	1 (1h)	1 (1h)	PLLP_out2 = 204 MHz
KVCO	0 (0h)	4 (4h)	8 (8h)	8 (8h)	-
KSETUP	0 (0h)	0 (0h)	0 (0h)	0 (0h)	-
KCP	0 (0b)	0 (0b)	0 (0b)	0 (0b)	-
OUT1 div ratio	42.5 (0dh)	42.5 (0dh)	42.5 (0dh)	42.5 (0dh)	9.6 MHz
OUT3 div ratio	4.0 (06h)	4.0 (06h)	4.0 (06h)	4.0 (06h)	102.0 MHz
OUT4 div ratio	4.0 (06h)	4.0 (06h)	4.0 (06h)	4.0 (06h)	102.0 MHz
OUT5 div ratio	2.0 (02h)	2.0 (02h)	2.0 (02h)	2.0 (02h)	204.0 MHz

Table 17: PLLU Configuration Information (Reference Clock osc_div_clk and Outputs fixed at 12 MHz/48 MHz/60 MHz/480 MHz

Reference Frequency	38.4 MHz	19.2 MHz	12.0 MHz	48.0MHz	Resulting Frequency
DIVN	025 (019h)	025 (019h)	040 (028h)	040 (028h)	
DIVM	02 (02h)	01 (01h)	01 (01h)	04 (04h)	
DIVP	02 (01h)	02 (01h)	02 (01h)	02 (01h)	240 MHz at VCO/ DIVP
KCP	0 (0h)	0 (0h)	0 (0h)	0 (0h)	
KVCO	0 (0h)	0 (0h)	0 (0h)	0 (0h)	
SETUP	0 (0h)	0 (0h)	0 (0h)	0 (0h)	
OUT1 div ratio	5 (08h)	5 (08h)	5 (08h)	5 (08h)	48 MHz
OUT2 div ratio	4.0 (06h)	4.0 (06h)	4.0 (06h)	4.0 (06h)	60 MHz

Notes:

- *Most of the PLLs unless specified have "osc_div_clk" as the reference clock. This is the same frequency as "osc":38.4 MHz: Does not need to be divided in Tegra X1. The option to divide down the osc clock is still present but not used for improving clock quality.*
- *At the time of writing, only 38.4 MHz is supported by NVIDIA for a crystal (or external clock) frequency. Other frequencies mentioned in this section are not supported.*

PLLM Programming Sequence During Core DVFS:

1. One of the PLLM* PLLs that is inactive is reprogrammed to generate the desired rate and enabled. (If the memory clock source is generated by PLLP, then either PLLMA or PLLMB can be used.)
2. The EMC clock glitchless mux is reprogrammed. This initiates a hardware sequence that switches the active PLLM clock source to the PLL that was programmed in step 1.
3. The PLLM* PLL that is now inactive is turned off to save energy.

PLL Programming Constraints:

In general, there are 3 requirements for each PLL with which software needs to comply:

- Input frequency range (REF).

- Comparison frequency range (CF). CF = REF/DIVM, where DIVM is the input divider control.
- VCO frequency range (VCO). VCO = CF * DIVN, where DIVN is the feedback divider control.

Note: *The final PLL output frequency (FO) = VCO/DIVP, where DIVP is the post divide control, which is encoded.*

All supported crystals are used by the PLLs directly, without any pre-divider.

Contact your NVIDIA representative for more details on the PLLs.

Table 18: PLDIV - Divider Control for CLKOUT

PLDIV[3:0]	CLKOUT
0000	vcoclock/1 (pdivider is powered down)
0001	vcoclock/2
0010	vcoclock/3
0011	vcoclock/4
0100	vcoclock/5
0101	vcoclock/6
0110	vcoclock/8
0111	vcoclock/10
1000	vcoclock/12
1001	vcoclock/16
1010	vcoclock/12
1011	vcoclock/16
1100	vcoclock/20
1101	vcoclock/24
1110	vcoclock/32
1111	Reserved

Note: *In this document, CPULP, SCPU, and Slow CPU are synonymous as are CPUG, FCPU, and Fast CPU. In this switched cluster implementation for Tegra X1, the switch used for generating the clocks is the same. Except for BURST_POLICY and SUPER_CCLK_DIVIDER, use the 'G' registers for both SCPU and FCPU control. For these two registers use the 'G' and 'LP' registers for FCPU and SCPU, respectively.*

5.1.9 CPU (CCLK) and BPMP-Lite/System (SCLK) Clock Control

In this section, MPCore A57/A53 is referred to as CPU while ARM7 is referred to as BPMP-Lite. In this context, CPU refers to the active CPULP or CPUG cluster. Each CCLK and SCLK clock domain can have 5 states: SUSP (suspend) where the clock source is 32 kHz, and normal states (IDLE, RUN, IRQ, FIQ).

Each of the normal states can be selected by software from 8 different clock sources. Furthermore, if any of the CPU/BPMP-Lite FIQ/IRQ bit is enabled, a hardware auto trigger feature will be enabled such that hardware will jump from any state to IRQ or to FIQ automatically. Of course, if the source is from a PLL, software needs to guarantee that the PLL clock is running and stable before changing clock sources.

There are many usage models that can be derived from this mechanism: For example:

- Software can keep changing the clock source to one state (i.e., CWAKEUP_IDLE_SOURCE) without changing the CPU_STATE field.
- Software can have the concept of multiple states by first setting up CWAKEUP__SOURCE and then changing the CPU_STATE field.

- Software can enable hardware auto detect of IRQ/FIQ to jump to the IRQ or FIQ state.

Note: *Whenever the clock source is switched, the clock is stopped for approximately 400-600 ns.*

5.1.10 CCLK and SCLK Super Clock Divider Control

The super clock divider allows a very fine tune of clock frequency going to CPU and BPMP-Lite/system using clock skipping technique. It is different from a traditional divider (1/n) in that both the numerator and denominator are programmable (m/n). Both the numerator and denominator are 8 bits each. Thus, “effective” frequency = source frequency * (m/n). Furthermore, if any of the CPU/BPMP-Lite FIQ/IRQ bits is enabled, hardware will auto disable the super clock divider functionality.

There are many usage models that can be derived from this mechanism. For example:

- There is no clock source switching penalty. Software can pick a PLL output as a maximum frequency source via CCLK/SCLK_BURST_POLICY and keep changing SUPER_CCLK/SCLK_DIVIDER to yield the desired lower “effective” frequency.
- For applications where the “osc” frequency is more than sufficient to do the job, PLLs can be turned off to save power and the super clock divider can further divide down the "osc" clock to yield even more power saving.
- If auto IRQ/FIQ feature is enabled, CCLK/SCLK will automatically jump back to full frequency to handle high priority interrupt routines.

Note: *From a dynamic voltage scaling (DVS) standpoint, the full clock frequency source (not the output frequency of the super clock divider) going into the super clock divider should be used to determine how low one can lower the voltage. If m > n, the resulting super clock divider output frequency will be the same as the input frequency. In other words, there will be no clock skip or divide down.*

5.2 Clock and Reset Controller Registers

Refer to Section 1.4 Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

5.2.1 CLK_RST_CONTROLLER_RST_SOURCE_0

WatchDog (Deadman) Timer

The watchdog timer is used to recover from hang/lockup condition by resetting the system and/or BPMP-Lite (ARM7) and/or CPU (MPCore). Either timer1 or timer2 can be used as watchdog timer. Refer to Chapter 8: Timers of this document for more information on watchdog timer usage.

Offset: 0x0 | Read/Write: R/W | Reset: 0x000XXX00 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00x000)

Bit	R/W	Reset	Description
19	RO	X	WDT_CPU3_RST_STA: CPU3 reset by watchdog timer (RO)
18	RO	X	WDT_CPU2_RST_STA: CPU2 reset by watchdog timer (RO)
17	RO	X	WDT_CPU1_RST_STA: CPU1 reset by watchdog timer (RO)
16	RO	X	WDT_CPU0_RST_STA: CPU0 reset by watchdog timer (RO)
13	RO	X	SWR_SYS_RST_STA: System reset by software (RO)
12	RO	X	WDT_SYS_RST_STA: System reset by watchdog timer (RO)
11	RO	X	SWR_COP_RST_STA: BPMP-Lite reset by software (RO)
10	RO	X	WDT_COP_RST_STA: BPMP-Lite reset by watchdog timer (RO)
9	RO	X	SWR_CPU_RST_STA: CPU reset by software (RO). This bit has been deprecated. Always returns 1'b0.
8	RO	X	WDT_CPU_RST_STA: CPU reset by watchdog timer (RO)
5	RW	DISABLE	WDT_EN: Enable WatchDog Timer (Dead Man Timer) 0 = DISABLE 1 = ENABLE
4	RW	TIMER1	WDT_SEL: WatchDog Timer Select 0 = TIMER1 1 = TIMER2
2	RW	DISABLE	WDT_SYS_RST_EN: Enable WatchDog Timer reset for system. 0 = DISABLE 1 = ENABLE
1	RW	DISABLE	WDT_COP_RST_EN: Enable WatchDog Timer reset for BPMP-Lite 0 = DISABLE 1 = ENABLE
0	RW	DISABLE	WDT_CPU_RST_EN: Enable WatchDog Timer reset for CPU 0 = DISABLE 1 = ENABLE

5.2.2 CLK_RST_CONTROLLER_RST_DEVICES_L_0

Offset: 0x4 | Read/Write: R/W | Reset: 0x1cd3dXXX (0b0xx111xx11x1xx1111x1xx1x11xx100x)

Bit	R/W	Reset	Description
31	RW	DISABLE	SWR_CACHE2_RST: Reset BPMP-Lite cache controller. 0 = DISABLE 1 = ENABLE
28	RW	ENABLE	SWR_HOST1X_RST: Reset HOST1X. 0 = DISABLE 1 = ENABLE
27	RW	ENABLE	SWR_DISP1_RST: Reset DISP1 controller. 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
26	RW	ENABLE	SWR_DISP2_RST: Reset DISP2 controller. 0 = DISABLE 1 = ENABLE
23	RW	ENABLE	SWR_ISP_RST: Reset ISP controller. 0 = DISABLE 1 = ENABLE
22	RW	ENABLE	SWR_USBD_RST: Reset USB controller. 0 = DISABLE 1 = ENABLE

5.2.15 CLK_RST_CONTROLLER_OSC_FREQ_DET_0

Oscillator Frequency Detect

The supported crystal frequency for “osc” in Tegra X1 devices is 38.4 MHz. Hardware provides the following mechanism to detect which frequency of osc is running. To determine the osc frequency, program the number of 32.768 kHz clock periods to create a fixed time window in which the "osc" clocks will be counted. Once the counting process is done, the count value can be used to determine the osc frequency.

OSC Frequency (MHz)	Approximate OSC_FREQ_DET_CNT (using two 32 kHz periods as window)
38.40	2344 (0x0928)
12.00	732 (0x02DC)
13.00	794 (0x031A)
16.80	1025 (0x0401)
19.20	1172 (0x0494)
26.00	1587 (0x0633)
48.00	2930 (0x0B72)

15:0	0x0	I2C2_CLK_DIVISOR: Divide by (n+1). (lsb denotes 1.0x)

5.2.73 CLK_RST_CONTROLLER_CLK_SOURCE_EMC_0

When changing the EMC frequency, internal logic sequencing handles the requirement that the DRAMs must be placed into self-refresh before its clock frequency is changed.

To support this, certain register fields when written do not get immediately applied but rather are applied at the correct time during the sequencing. These registers are referred to as "shadowed".

Other fields initiate the sequencing state machine and therefore should be written last. Note that the value of the field must change to start the state machine - writing the same value to the field is insufficient.

At the end of the sequencing, the DRAMs are restored to being operational.

There are EMC/MC configuration registers that are shadowed or can initiate a clock change sequence are described below:

- Initiates sequencing (value must change):
  - CLK_SOURCE_EMC.EMC_2X_CLK_SRC
  - EMC_2X_CLK_DIVISOR
  - MC_EMC_SAME_FREQ
- Shadowed (will be applied during sequencing):
  - CLK_SOURCE_EMC.EMC_2X_CLK_SRC
  - EMC_2X_CLK_DIVISOR
  - MC_EMC_SAME_FREQ
- Not shadowed:
  - CLK_SOURCE_EMC.EMC_INVERT_DCD (must be set during initial configuration and before the EMC clock is started)

Bit	Reset	Description
0	ENABLE	DVFS_DFLL_RESET: Assert the reset to DFLL. 0 = DISABLE 1 = ENABLE

5.2.100 CLK_RST_CONTROLLER_RST_DEV_L_SET_0

The RST_DEV_(L,H,U, V, W, X, Y)_(SET,CLR) and CLK_ENB_(L,H,U, V, W, X, Y)_(SET,CLR) registers are provided as an alternate method of programming the same registers found in RST_DEVICES_(L,H,U, V, W, X, Y) and CLK_OUT_ENB_(L,H,U, V, W, X, Y) registers, respectively.

Therefore, using either methods will change the same underlying peripherals reset, and clock enable control for writes. For reads, you can use either method to retrieve the reset/clock-enable state of each peripheral.

Offset: 0x300 │ Read/Write: R/W │ Reset: 0x1cd3dXXX (0b0xx111xx11x1xx1111x1xx1x11xx100x)

5.2.122 CLK_RST_CONTROLLER_CLK_CPUG_CMPLX_0

The CPUG complex consists of the CPUG, L2 cache controller, and a number of bridge devices interfacing the CPUG and L2 cache to the rest of the system. Except for the CPUG, L2 cache controller, and bridge logic to external memory which always runs at the non-divided-down CPUG frequency, other bridge devices can run at various programmable divided-down CPUG clock ratios.

Note: Because the CPUG clock can be selected from 1-of-9 clock sources (refer to the CCLKG_BURST_POLICY register), it is the user’s responsibility to not select a bridge divide-down CPUG clock ratio that will exceed 1/4 of the maximum CPUG frequency supported.

5.2.159 CLK_RST_CONTROLLER_UTMIP_PLL_CFG0_0

The data sampling frequency relies on a 960 MHz clock, so the goal of the PLL is to have:
In_Frequency * (PLL_VCOMULTBY2+1) * (PLL_NDIV/PLL_MDIV) = 960 MHz. With a 12 MHz input from PLL_U, the default setting of PLL_VCOMULTBY2 = 1, PLL_NDIV = 40, and PLL_MDIV = 1 results in a correct output.

This register is used to configure the PHY PLL contained in the UTMIP module.

UTMIP PLL Configuration Register 0

Offset: 0x480 | Read/Write: R/W | Reset: 0x001901XX (0bxxx00000000110010000000 1xxxxx001)

Bit	R/W	Reset	Description
28:27	RW	0x0	UTMIP_PLL_VREG_CTRL: Voltage regulator voltage level control.
26:25	RW	0x0	UTMIP_PLL_KCP: KCP of the UTMIP PHY PLL. Charge Pump Gain control. Default value is zero. See cell specification.
23:16	RW	0x19	UTMIP_PLL_NDIV: NDIV[7:0] input of UTMIP PLL. This is the feedback divider on the VCO feedback. 0x0 is not allowed. See cell specification.
15:8	RW	0x1	UTMIP_PLL_MDIV: MDIV[7:0] input of the UTMIP PLL. This is the predivide on the PLL. 0x0 is not allowed. See cell specification.
3	RO	X	UTMIP_PLL_RESERVED: Reserved.
2	RW	0x0	UTMIP_PLL_LOCK_OVR: LOCK_OVERRIDE control of the UTMIP PLL. Forces PLL_LOCK to 1. See cell specification.
1	RW	0x0	UTMIP_PLL_RESERVED2: RESERVED.
0	RW	0x1	UTMIP_PLL_EN_LCKDET: ENB_LCKDET input of UTMIP PLL. When set to 1, powers down the lock detect. Setting ENB_LCKDET=X, LOCK_OVERRIDE=1, PLL_LOCK=1, and PLL_FREQLOCK=1 also powers down lock detect. 0 0 0->1 (after lock) 0->1 (after lock) 1 0 0 0 lock detect power down.

5.2.160 CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0

UTMIP PLL Configuration and Parameters

In normal operation, the following clock generators are in play for USB:

Crystal (Xtal) clock -> enters PLL_U to generate 12 MHz clock -> enters USB_PHY PLL to generate 480/60 MHz clock.

The following parameters control the bring-up of the PLLs (coming out of reset or suspend):

- PllUOnState: start pllu_enable_count and pll_lock_count
  - Wait ~1 µs to enable the PLL_U (pllu_enable_count == ClkXtal * PLLU_ENABLE_DLY_COUNT * 8)
  - Wait ~1 ms until PLL_U is stable (pll_lock_count == ClkXtal * PLLU_STABLE_COUNT * 256) => USB_PHY PLL_ENABLE
  - pll_active_count = 0

- Wait 10 µs to enable pll_active: pll_active_count == ClkXtal * PLL_ACTIVE_DLY_COUNT * 16 => USB_PHY PLL_ACTIVE

- Wait ~2.5 ms until USB_PHY is stable (pll_lock_count == ClkXtal * XTAL_FREQ_COUNT * 256) => USB_PHY

Values for a 19.2 MHz Xtal clock are:

- PLLU_ENABLE_DLY_COUNT[4:0] = 1 * 19.2 / 8 = 2.4 = 3 = 0x03
- PLLU_STABLE_COUNT[11:0] = 1000 * 19.2 / 256 = 75 = 0x4b
- PLL_ACTIVE_DLY_COUNT[5:0] = 10 * 19.2 / 16 = 12 = 0x0c
- XTAL_FREQ_COUNT[11:0] = 2500 * 19.2 / 256 = 187 = 0xbb

1	RW	DISABLE	NONE	PLLE_CML1_OEN: PLLE CML1 clock out enable. Used for SATA. 0 = DISABLE 1 = ENABLE
0	RW	DISABLE	NONE	PLLE_CML0_OEN: PLLE CML0 clock out enable. Used for PCIe. 0 = DISABLE 1 = ENABLE

5.2.163 CLK_RST_CONTROLLER_SATA_PLL_CFG0_0

SATA Power Sequencer Input Software Control Program Guide

The software control input can be used for test coverage or diving the power sequencer SM via software. The SATA power sequencer is driven by 3 primary reset and power-down input signals: reset, lane_pd, and padpll_pd. The normal power-up sequence de-asserts in this order: padpll_pd > lane_pd > reset. The normal power-down sequence asserts in this order: reset > lane_pd > padpll_pd.

It is acceptable to assert all three signals at the same time. It is also acceptable for reset or lane_pd to return to the power-up state in the middle of a power-down sequence.

Offset: 0x490 │ Read/Write: R/W │ Reset: 0x0X0X3803 (0b0000xx10xxxxxxxx001110000000x011)

7:0	0x0	SATA_LANE_IDDQ2_PADPLL_IDDQ_DLY: PT1: Delay from placing lane in IDDQ to PAD PLL in IDDQ.

5.2.165 CLK_RST_CONTROLLER_PCIE_PLL_CFG_0

PCIe Power Sequencer Input Software Control Program Guide

The software control input can be used for test coverage or driving power sequencer SM via software.

The PCIe power sequencer is driven by 1 primary reset input signal: reset. Reset is expected to be held static until the power-up or power-down sequence is complete.

Offset: 0x498 │ Read/Write: R/W │ Reset: 0x0X00000c (0bxxxxxx10xxxxxxxxxxxxxxxxxx0011xx)

Bit	R/W	Reset	Description
27:26	RO	X	PCIE_SEQ_STATE: PCIe power sequencer state 0 = SEQ_OFF 1 = SEQ_ON 2 = SEQ_BUSY

5.2.166 CLK_RST_CONTROLLER_PROG_AUDIO_DLY_CLK_0

- Clock doubler with 1X/2X is available for the I2S1-I2S5 and S/PDIF clock.
- The CLK_ENB_*_DOUBLE bits in the CLK_OUT_ENB_V register must be enabled for either SYNC_1X_CLK or SYNC_2X_CLK to operate.
- PROG_DLY_CLK_SPDIF provides programmable delay for the clock doublers.
- Audio sync clock source mux options: SPDIFIN, I2S1, I2S2, I2S3, I2S4, I2S5, PLLA_OUT0, EXT_VIMCLK

Enable Sync Clocks

There are 3 related clock enables/selects to enable the sync clocks:

- CG_1. AUDIO_SYNC_CLK_I2S1-SYNC_CLK_DIS: disable output of sync_clk mux
- CG_2. CLK_OUT_ENB_V-CLK_ENB_I2S1_DOUBLER: disable input to doubler
- SEL_3. PROG_AUDIO_DLY_CLK-I2S1_1X_SEL: Select 1x sync clock. 0=2x, 1=1x

Flow of Clock Logic

sync_clk mux (CG_1) -> (CG_2) (SEL_3) doubler -> clk switch

Suggested Programming for Sync Clock Enable:

- Leave CG_2 as default enabled.
- Use CG_1 to disable or enable (default) sync clock.
- Use SEL_3 to select 1x or 2x sync clock.

SYNC_CLK_DIS	CLK_ENB_I2S1_DOUBLER	I2S1_1X_SEL	SYNC_CLK
0	1	0	2x (Default)
0	1	1	1x
1	1	X	0 (off, recommended)
1	X	X	0 (off)
X	0	X	0 (off)

5.2.179 CLK_RST_CONTROLLER_CPU_FINETRIM_BYP_0

CPU Trimmer Registers

Bit	Name	Direction	Default Value	Description
7	byp	Read/Write	0	When asserted, the trimmer is bypassed.
6	select	Read/Write	0	When asserted, rise'rise clock propagation delay will be specified by {dr,r} fields. Otherwise, hardwired default delay will be applied. Similarly, fall'fall clock propagation delay will be specified by {df, f} fields when select is asserted.
5	dr	Read/Write	0	0: Minimal rise'rise clock propagation delay 1: Use one of the four delay steps specified by the {r} field.
4:3	r	Read/Write	0	00,01,10,11: Increment rise'rise clock delay by 1, 2, 3, or 4 steps
2	df	Read/Write	0	0: Minimal fall'fall clock propagation delay 1: Use one of the four delay steps specified by {f} field.
1:0	f	Read/Write	0	00, 01, 10, 11: Increment fall'fall clock delay by 1, 2, 3, or 4 steps

Note: The clock shaper registers are not designed to be modified "on-the-fly". These registers can only be written when the CPU clock is stopped. Failure to do so may affect the integrity of the CPU clock.

XUSB I/O PLL Power Sequencer Input Software Control Program Guide

The software control input can be used for test coverage or driving power sequencer SM via software.

The XUSB power sequencer is driven by a primary reset input signal: reset. Reset is expected to be held static until the power-up or power-down sequence is complete.

Offset: 0x51c | Read/Write: R/W | Reset: 0x0X0X380d (0b0000xx10xxxxxxxx00111000x0001101)

CHAPTER 6: CL-DVFS

The CL_DVFS module contains control logic that provides a hardware mechanism for controlling the clock rate and power supply voltage of the fast CPU complex.

This chapter describes the closed-loop dynamic voltage and frequency scaling (CL-DVFS) registers. It is not intended to be a programming guide to CL-DVFS, as it is expected that NVIDIA supplied drivers will always be used with it. However, the register interface is documented to aid with understanding those drivers.

6.1 CL-DVFS Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

6.1.1 CL_DVFS_CTRL_0

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1:0	0x0	DFLL_CTRL_MODE: DFLL Control Mode. 0 = DISABLE: Disabled. The ring oscillator does not run. 1 = ENABLE_OPEN_LOOP: In Enable Open Loop mode, the ring oscillator will run, but the control loop will remain inactive. 2 = ENABLE_CLOSED_LOOP: In Enable Closed Loop mode, the control loop is enabled and the I2C interface will continuously update the control output in order to maintain the desired frequency set in the DFLL_FREQ_REQ_xxxx fields.

6.1.2 CL_DVFS_CONFIG_0

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000006 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000110)

Bit	Reset	Description
7:0	0x6	DFLL_CONFIG_DIV_S: Refclk divider for setting DFLL control loop sample rate. Refclk is divided by 32x the value in this field

6.1.3 CL_DVFS_PARAMS_0

Offset: 0x8 | Read/Write: R/W | Reset: 0x000000f0 (0bxxxxxxx000000000xxxxx00011110000)

Bit	Reset	Description
24	0x0	DFLL_PARAMS_CG_SCALE: If set to 1, reduces the overall loop gain by a factor of 8.
23:22	0x0	DFLL_PARAMS_FORCE_MODE: 0 = DISABLE: Disabled. The I2C control value is never forced during a frequency change. 1 = FIXED: In Fixed Delay mode, the I2C control value is forced for a fixed number of sample periods. 2 = AUTO: In Auto mode, the I2C control value is forced for a calculated number of sample periods.
21:16	0x0	DFLL_PARAMS_CF_PARAM: Length of time that a forced I2C control value will be applied after a frequency change if forcing was requested for that change. In Fixed Delay mode, it provides the number of sample periods to force the I2C control value. In Auto mode, the force time is equal to I2C control output delta * cf_param / 16

Bit	Reset	Description
10:8	0x0	DFLL_PARAMS_CI_PARAM: Integral term gain in the control loop controls how a cycle deficit/surfeit after a frequency change is cleared. It temporarily raises or lowers the core voltage to allow the total clock cycle count to converge with the ideal number of cycles that should have been produced since the last frequency change request. 0 = DISABLE 1 = DIV2 2 = DIV4 3 = DIV8 4 = DIV16 5 = DIV32 6 = DIV64 7 = DIV128
7:0	0xf0	DFLL_PARAMS_CG_PARAM: Overall loop gain control (SIGNED value), controls the overall response time of the control loop

6.1.4 CL_DVFS_TUNE0_0

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	DFLL_TUNE0_DLY_STK: Drives I_DLY_SPARE<15:0>
15:8	0x0	DFLL_TUNE0_DLY_STK: input bits to both coarse (4) and fine (4) tune the delay of stacked gates like chain. Drives I_DLY_STK<7:0>.
7:0	0x0	DFLL_TUNE0_DLY_INV: Input bits to both coarse (3) and fine (5) tune the delay of the inverter path. Drives I_DLY_INV<7:0>.

6.1.5 CL_DVFS_TUNE1_0

Offset: 0x10 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:23	0x0	DFLL_TUNE1_DLY_FINE: Input bits to tune the two phases of the clock. 8 bits to tune, and 1 bit to choose high vs. low. Drives I_DLY_FINE<8:0>.
22:12	0x0	DFLL_TUNE1_DLY_SRAM: input bits to both coarse (3) and fine (5) tune the delay of sram path like chain.Drives I_DLY_SRAM<10:0> of DVCO macro
11	0x0	DFLL_TUNE1_DLY_SPARE1: Drives I_DLY_SPARE<16> of DVCO macro
10:0	0x0	DFLL_TUNE1_DLY_WIRE: Input bits to both coarse (2) and fine (9) tune the delay of wire dominated path. Drives I_DLY_WIRE<10:0>.

6.1.6 CL_DVFS_FREQ_REQ_0

Offset: 0x14 | Read/Write: R/W | Reset: 0x0000ff40 (0bxxx00000000000011111111101000000)

Bit	Reset	Description
28	0x0	DFLL_FREQ_REQ_FORCE_EN: Set to '1' to force I2C control output to initial value specified by the 'force_val' field
27:16	0x0	DFLL_FREQ_REQ_FORCE_VAL: Value forced onto the integrator during a frequency transition, only used if the 'force_en' field below is '1' AND the global 'force_mode' field of the dfll_params register is not set to 'disable'. The best value is (desired I2C control value - safe I2C control value) x 128) / Cg.
15:8	0xff	DFLL_FREQ_REQ_SCALE: Proportion of output clock cycles (+1) to *not* skip over a period of 256 cycles
7	0x0	DFLL_FREQ_REQ_VALID: Set to '1' to indicate that the frequency configuration is valid and should be used. If this bit is '0', the control loop will revert to 'open loop' mode, and the I2C control interface value will be determined by the 'safe' value.
6:0	0x40	DFLL_FREQ_REQ_MULT: Primary frequency multiplication factor 'F'. The ring oscillator output frequency will be (REF_CLK/2) x F.

6.1.7 CL_DVFS_SCALE_RAMP_0

Offset: 0x18 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	DFLL_OUTPUT_RAMP_RATE: The ramp up/ramp down rate of the control signal to the output scaler. Determines the number of cycles (+1) to wait for each counter step.

6.1.8 CL_DVFS_DROOP_CTRL_0

Offset: 0x1c | Read/Write: R/W | Reset: 0x00000810 (0bxxxxxxxx00000000xxxx100000010000)

Bit	Reset	Description
23:16	0x0	DFLL_DROOP_CTRL_MIN_FREQ: The minimum allowed ring oscillator frequency before the 'droop' clock skipper is enabled. The value written determines the minimum number of cycles that are allowed in 4 REF_CLK cycles' Fmin = droop_ctrl.min_freq * (REF_CLK / 4)
11:8	0x8	DFLL_DROOP_CTRL_CUT: CPU clock is scaled by (cut+1)/16 immediately after reaching the minimum ring oscillator frequency
7:0	0x10	DFLL_DROOP_CTRL_RATE: Controls the rate at which clock cycles are re-introduced to the droop skipper after it has been ramped down to compensate for a frequency droop. It is the number of cycles (+1) to wait for each counter step

6.1.9 CL_DVFS_OUTPUT_CFG_0

Offset: 0x20 | Read/Write: R/W | Reset: 0x50200000 (0bx1010000xx100000xx00000000000000)

Bit	Reset	Description
30	0x1	DFLL_OUTPUT_CONFIG_I2C_ENABLE: Master enable control for I2C control value updates. If this field is '0', then I2C control messages are inhibited, regardless of the DFLL mode.
29:24	0x10	DFLL_OUTPUT_CONFIG_SAFE: 'Safe' value for the OUTPUT control interface. This value will be output whenever OUTPUT is enabled but the DFLL is disabled, or in open loop mode.
21:16	0x20	DFLL_OUTPUT_CONFIG_MAX: Maximum allowed value on the OUTPUT control interface.
13:8	0x0	DFLL_OUTPUT_CONFIG_MIN: Minimum allowed value on the OUTPUT control interface.
7	0x0	DFLL_OUTPUT_CONFIG_DELTA_EN: 1: In conjunction with 'clk_en'=1, causes the PWM clock/data output to only become active (for 32 cycles) whenever a change in the PWM value occurs. 0: The PWM data/clock outputs run continuously when enabled.
6	0x0	DFLL_OUTPUT_CONFIG_CLK_EN: Enables the PMIC control clock output for digitally controlled PMICs.
5:0	0x0	DFLL_OUTPUT_CONFIG_DIV_D: Divider setting for PWM PMIC control output (divides the SOC clock).

6.1.10 CL_DVFS_OUTPUT_FORCE_0

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
6	0x0	DFLL_OUTPUT_FORCE_ENABLE: Enable the force value onto the OUTPUT control output
5:0	0x0	DFLL_OUTPUT_FORCE_VALUE: Value to force OUTPUT control output whenever the i2c_ctrl_force_enable field is set to 1.

6.1.11 CL_DVFS_MONITOR_CTRL_0

Offset: 0x28 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2:0	0x0	DFLL_MONITOR_CTRL_SELECT: Selects a control loop data source for monitoring 0 = DISABLE 1 = CYCLE_INT 2 = PRO_TERM 3 = INT_TERM 4 = OUTPUT_INT 5 = OUTPUT_VALUE 6 = FREQ

6.1.12 CL_DVFS_MONITOR_DATA_0

Offset: 0x2c | Read/Write: RO | Reset: 0x000XXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
16	X	DFLL_MONITOR_DATA_NEW: Set to '1' whenever a new sample is generated. Cleared on reads.
15:0	X	DFLL_MONITOR_DATA_VAL: Read data monitor source selected by dfll_monitor_ctrl_select. If monitoring is enabled, this field is updated every sample period.

6.1.13 CL_DVFS_I2C_CFG_0

Offset: 0x40 | Read/Write: R/W | Reset: 0x0010f000 (0bxxxxxxxxxxxx1x0001111x00000000000)

Bit	Reset	Description
20	0x1	I2C_BUS_ARB: Enables arbitration for bus
18:16	0x0	I2C_MASTER_CODE: Master code for high-speed transfers
15	0x1	I2C_PACKET_MODE: Enables Packet mode for high-speed transfers
14:12	0x7	I2C_SIZE: Size of voltage values from 1 to 7
10	0x0	I2C_ADDR_7BIT_10BIT: 0: Selects 7-bit addressing 1: Select 10-bit addressing
9:0	0x0	I2C_SLAVE_ID: External slave ID address

6.1.14 CL_DVFS_I2C_VDD_REG_ADDR_0

Offset: 0x44 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:8	0x0	I2C_DEFAULT_DATA: Default data
7:0	0x0	I2C_ADDR_DATA: Address for voltage sel

6.1.15 CL_DVFS_I2C_STS_0

Offset: 0x48 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
6:1	X	I2C_LAST_VALUE: Output value from the DFLL of last I2C request that was completed successfully
0	X	I2C_REQ_PENDING: Indicates there is an outstanding I2C request

6.1.16 CL_DVFS_INTR_STS_0

Offset: 0x5c | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	MAX_VDD_LIMIT_INTR: Interrupt to indicate the DFLL has hit the VDD ceiling as programmed in DFLL_OUTPUT_CONFIG_MAX

Bit	Reset	Description
0	0x0	MIN_VDD_LIMIT_INTR: Interrupt to indicate the DFLL has hit the VDD floor as programmed in DFLL_OUTPUT_CONFIG_MIN

6.1.17 CL_DVFS_INTR_EN_0

Offset: 0x60 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	MAX_VDD_LIMIT_INTR_EN: Enable for interrupt to indicate the DFLL has hit the VDD ceiling as programmed in DFLL_OUTPUT_CONFIG_MAX
0	0x0	MIN_VDD_LIMIT_INTR_EN: Enable for interrupt to indicate the DFLL has hit the VDD floor as programmed in DFLL_OUTPUT_CONFIG_MIN

6.1.18 CL_DVFS_I2C_CLK_DIVISOR_REGISTER_0

The divisor values (N) must be programmed so that:

- SCL frequency (Std/Fast/Fm+ modes) = ClkSourceFreq/((tlow+thigh+3)*(N+1)) for lower values of N, up to 3
- SCL frequency (Std/Fast/Fm+ modes) = ClkSourceFreq/((tlow+thigh+2)*(N+1)) for higher values of N, above 3
- SCL frequency (HS mode) = ClkSourceFreq/((ths_low+ths_high+4)*(N+1)) for lower values of N, up to 4
- SCL frequency (HS mode) = ClkSourceFreq/ ((ths_low+ths_high+2)*(N+1)) for higher values of N, above 4

Offset: 0x16c | Read/Write: R/W | Reset: 0x00190001 (0b00000000000110010000000000000001)

Bit	Reset	Description
31:16	0x19	I2C_CLK_DIVISOR_STD_FAST_MODE:N = Divide by n+1
15:0	0x1	I2C_CLK_DIVISOR_HSMODE:N = Divide by n+1

6.1.19 CL_DVFS_OUTPUT_LUT_0

This lookup table (LUT) contains voltage LUT values stored in a 33-deep by 8 bit wide RAM. To program the LUT, simply sequentially address the RAM, using the base offset address of 0x20 (10’b10xxxxxxx). Addresses are DWORD aligned, not BYTE aligned. PMIC values must be programmed to span the entire desired operating range, and be monotonically increasing. The logic assumes that the middle entry (16th) corresponds to the ‘safe’ initial voltage, as specified in the DFLL_OUTPUT_CONFIG.SAFE field. DFLL_OUTPUT_CONFIG_SAFE is initialized by default to 0x10, which corresponds to the middle of the LUT. However, the safe value can point to any LUT entry.

6.1.20 DVFS_DFLL_THROTTLE_CTRL_0

Offset: 0x64 | Read/Write: R/W | Reset: 0x00000006 (0bxxxxxxxxxxxxxxxxxxxxx0000xxxx0110)

Bit	Reset	Description
11:9	0x0	DFLL_THROTTLE_OVERRIDE_INDEX: Index value for override
8	0x0	DFLL_THROTTLE_OVERRIDE_EN: Override soc2cldvfs throttling of CLDVFS. Aids debug by giving software direct control of the index
3	0x0	DFLL_THROTTLE_CONSTRAIN_MIN: If set to '1' the throttle constrains OUTPUT_CONFIG_MIN. This should be chosen if the PMIC has negative gain, because the maximum voltage is, in that case, represented by the minimum control value
2	0x1	DFLL_FAVOR_HW_ARB: Prioritize hardware I2C requests when throttling enabled
1	0x1	DFLL_THROTTLE_DISABLE_OUTPUT_FORCE: Set to '1' to disable software-controlled OUTPUT_FORCE during hardware-controlled voltage throttling
0	0x0	DFLL_THROTTLE_EN: Enable hardware-controlled voltage throttling

6.1.21 DVFS_DFLL_THROTTLE_LIGHT_0

Offset: 0x68 | Read/Write: R/W | Reset: 0xff402000 (0b11111111x1000000x0100000xxxxxxx0)

Bit	Reset	Description
31:24	0xff	LIGHT_SCALE: Skipper-2 control during light throttling
22:16	0x40	LIGHT_MULT: Frequency multiplier during light throttling
14:8	0x20	LIGHT_VSEL_MAX: Maximum voltage limit during light throttling
0	0x0	LIGHT_OVERRIDE: Set to '1' to override DFLL_THROTTLE_LIGHT frequency multiplier, frequency scale, and maximum voltage limit with software-requested values

6.1.22 DVFS_DFLL_THROTTLE_MEDIUM_0

Offset: 0x6c | Read/Write: R/W | Reset: 0xff402000 (0b11111111x1000000x0100000xxxxxxx0)

Bit	Reset	Description
31:24	0xff	MEDIUM_SCALE: Skipper-2 control during medium throttling
22:16	0x40	MEDIUM_MULT: Frequency multiplier during medium throttling
14:8	0x20	MEDIUM_VSEL_MAX: Maximum voltage limit during medium throttling
0	0x0	MEDIUM_OVERRIDE: Set to '1' to override DFLL_THROTTLE_MEDIUM frequency multiplier, frequency scale, frequency scale, and maximum voltage limit with software-requested values

6.1.23 DVFS_DFLL_THROTTLE_HEAVY_0

Offset: 0x70 | Read/Write: R/W | Reset: 0xff402000 (0b11111111x1000000x0100000xxxxxxx0)

Bit	Reset	Description
31:24	0xff	HEAVY_SCALE: Skipper-2 control during heavy throttling
22:16	0x40	HEAVY_MULT: Frequency multiplier during heavy throttling
14:8	0x20	HEAVY_VSEL_MAX: Maximum voltage limit during heavy throttling
0	0x0	HEAVY_OVERRIDE: Set to '1' to override DFLL_THROTTLE_HEAVY frequency multiplier, frequency scale, frequency scale, and maximum voltage limit with software-requested values

6.1.24 DVFS_CC4_HVC_0

Note that HVC is now referred to as CC3. See Chapter 16: CPU Complex for more information on CC3 and CC4.

Offset: 0x74 | Read/Write: R/W | Reset: 0x00000101 (0bxxxxxxxxxxxxxxxxxxxxxxxxx100000001)

Bit	Reset	Description
8	0x1	CC4_HVC_FORCE_ENABLE: Enable force value onto OUTPUT control output
7:2	0x0	CC4_HVC_FORCE_VALUE: Value to force OUTPUT control output whenever the i2c_ctrl_force_enable field is set to 1
1:0	0x1	CC4_HVC_DFLL_CTRL_MODE: 0 = DISABLE: 0 = DFLL Disabled. The ring oscillator does not run. 1 = ENABLE_OPEN_LOOP. The ring oscillator will run, but the control loop will remain inactive 2 = ENABLE_CLOSED_LOOP. The control loop is enabled, and the I2C interface will update the control output as needed in order to maintain the desired frequency set in the CLDVFS DFLL_FREQ_REQ_xxxx fields.

CHAPTER 7: ATOMICS

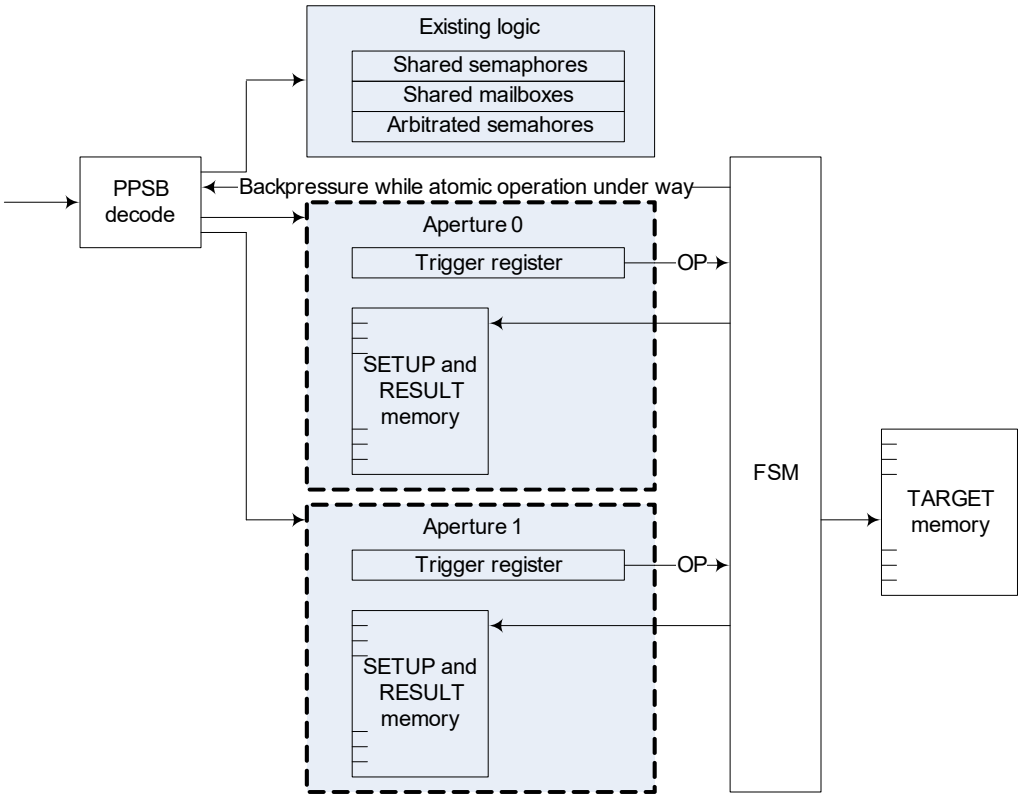
7.1 Introduction

The Atomics block assists software tasks with maintaining synchronization. It is parallel to the existing Semaphores block and intended to extend that block's functionality with new capabilities.

7.2 Functionality

The figure below shows a reference decomposition of the hardware synchronization elements in functional blocks.

Figure 8: Reference Block Diagram



7.3 Synchronization Elements

The synchronization elements are atomic primitives. Their main advantage is to allow some specific algorithms that access shared resources to be performed lock free, for better performance.

In general, the atomic primitives below have results equivalent to atomic RMW operations on a target register. The cycle is made atomic without using locked bus accesses as explained below.

7.3.1 General Principles

Atomic primitives maintain atomicity by splitting the whole operation in three phases:

- A setup phase where parameters are prepared in registers. There are as many sets of setup registers as there are apertures.

- A trigger register that starts a specific operation. The trigger register fits in one 32-bit word to ensure atomic issue of the operation. There is one trigger register per aperture. The trigger register specifies:
  - The primitive operation to be performed.
  - The index of the target register for the primitive operation.
- A result phase where the results of the operation are made available. There are as many sets of result registers as there are sets of setup registers. The operation, once triggered, is executed atomically.

The setup, result and trigger registers are duplicated in separate apertures, one aperture per client of the block. There are two such apertures in Tegra X1, normally one used by CPU, the other by BPMP-Lite, but this is not enforced by hardware as it is for the arbitrated semaphores.

Setup, target and result registers are 32-bits each with no further structure imposed by hardware. The trigger register is 32 bits, structured in command and target fields.

The description of the different operations is based on pseudo code that uses the following conventions:

- ATOMIC_OP identifies the exact operation and index ID identifies a given target register. Both ATOMIC_OP and ID are duplicated per aperture
- Index A identifies the aperture from which the operation is executed.
- The setup registers in a set are stored in arrays v and c. The result registers are stored in array old. All of these are duplicated per aperture.
- The target registers are not duplicated per aperture and are stored in an array T.
- The semantic of assignment is like C. All assignments are assumed to take place instantaneously. Intermediate values are used to get the equivalent of clocked operations of the hardware. Typically, the hardware implementation has no intermediate values if operations are performed in one clock cycle.
- Arithmetic operations are performed as signed 32 bits operations modulo 232 using 2s complement coding.

7.3.2 Atomic Exchange

The only purpose of an atomic exchange is to read a value and replace it with another value in an atomic fashion.[1]

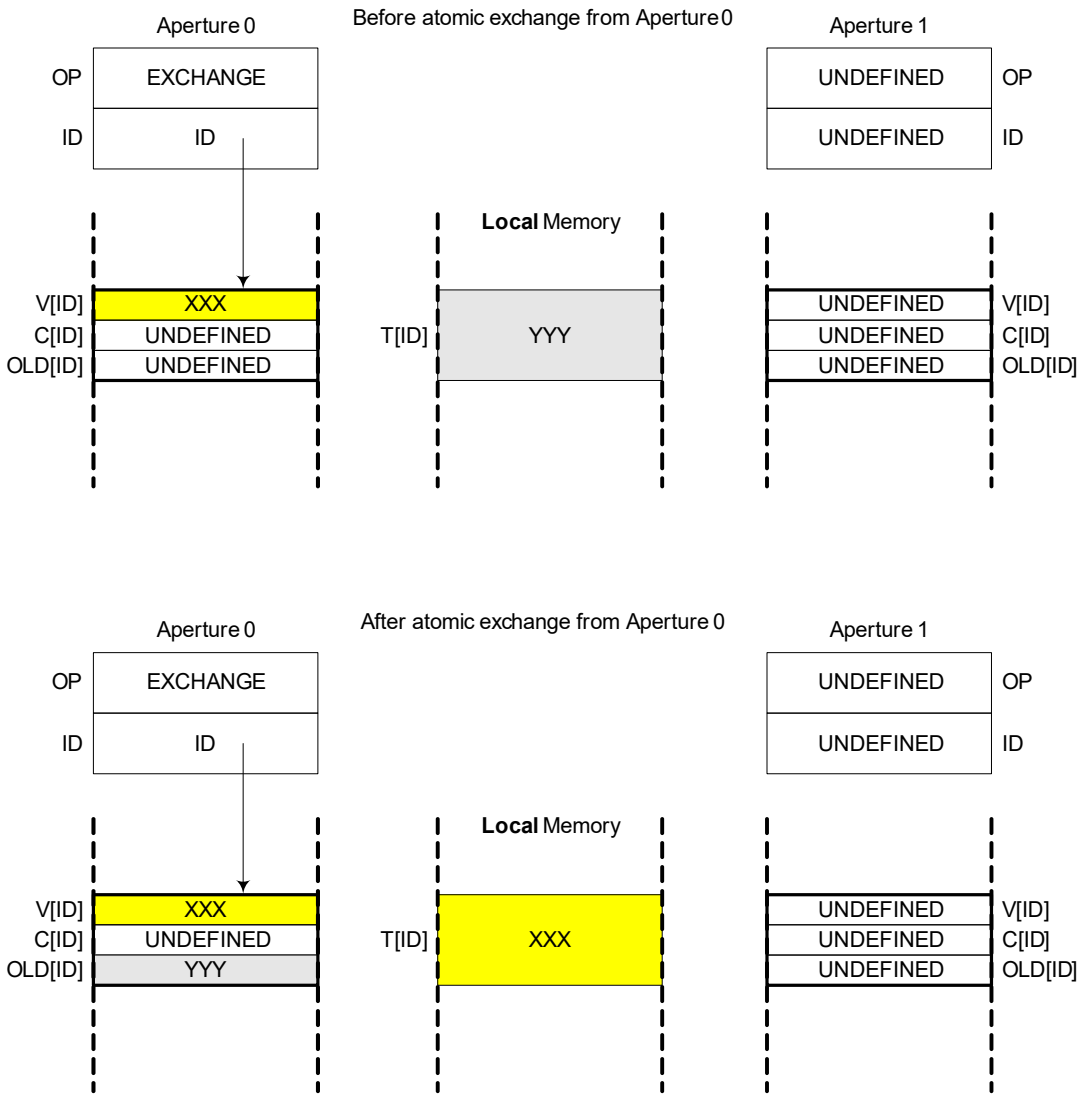
The corresponding pseudo code is

```
if (ATOMIC_OP[A] == EXCHANGE) {
  old[A][ID[A]] = T[ID[A]]
  T[ID[A]] = v[A][ID[A]]
}
```

The figure below illustrates an atomic exchange performed using aperture 0.

1. The result register always contains the old value of the target register, i.e. the value before applying the atomic operation. This is true even for PUT, so that PUT and EXCHANGE are semantically equivalent with the current definition.

Figure 9: Atomic Exchange Operation



7.3.3 Atomic Compare and Exchange

This is a variant of atomic exchange where the exchange only takes place if the old value matches the second setup register.

```
if (ATOMIC_OP[A] == COMPARE_AND_EXCHANGE) && (T[ID[A]] == c[A][ID[A}]) {
  old[A][ID[A]] = T[ID[A]]
  T[ID[A]] = v[A][ID[A]]
}
```

7.3.4 Atomic Increment

The atomic increment simply ensures that different processors can increment a shared value without losing any increment. The operation is labeled INCREMENT, but, for 32 bit operations, incrementing by 232 – k is equivalent to decrementing by k.

```
if (ATOMIC_OP[A] == INCREMENT) {
  old[A][ID[A]] = Target[ID[A]]
  T[ID[A]] += v[A][ID[A]]
}
```

The variant DECREMENT_WITH_ZERO_SATURATE is similar, adding a saturation to zero when going down. This may be used to manage shared resources that are present in finite numbers.

```
if (ATOMIC_OP[A] == DECREMENT_WITH_ZERO_SATURATE) {
  old[A][ID[A]] = T[ID[A]]
  T[ID[A]] -= v[A][ID[A]]
  if MSB(T[ID[A]]) == 1b && MSB(r[A][ID[A]]) == 0b { T[ID[A]] = 0 }
}
```

7.3.5 Atomic Get and Put

These are trivial for hardware if there is only one access port, in which case they act as normal register operations. They are nevertheless defined to allow more complex future implementations where the atomic operation blocks could present multiple hardware interfaces to the rest of the system.

```
if (ATOMIC_OP[A] == GET) {
  old[A][ID[A]] = T[ID[A]]
}

if (ATOMIC_OP[A] == PUT) {
  old[A][ID[A]] = T[ID[A]]
  T[ID[A]] = v[A][ID[A]]
}
```

7.3.6 Atomic Test and Set□Test and Clear□Test and Invert

These are simple extensions of previous cases, where the operation is either a bit set, bit clear or bit invert.

```
if (ATOMIC_OP[A] == TEST_AND_SET) {
  old[A][ID[A]] = T[ID[A]]
  T[ID[A]] |= v[A][ID[A]]
}

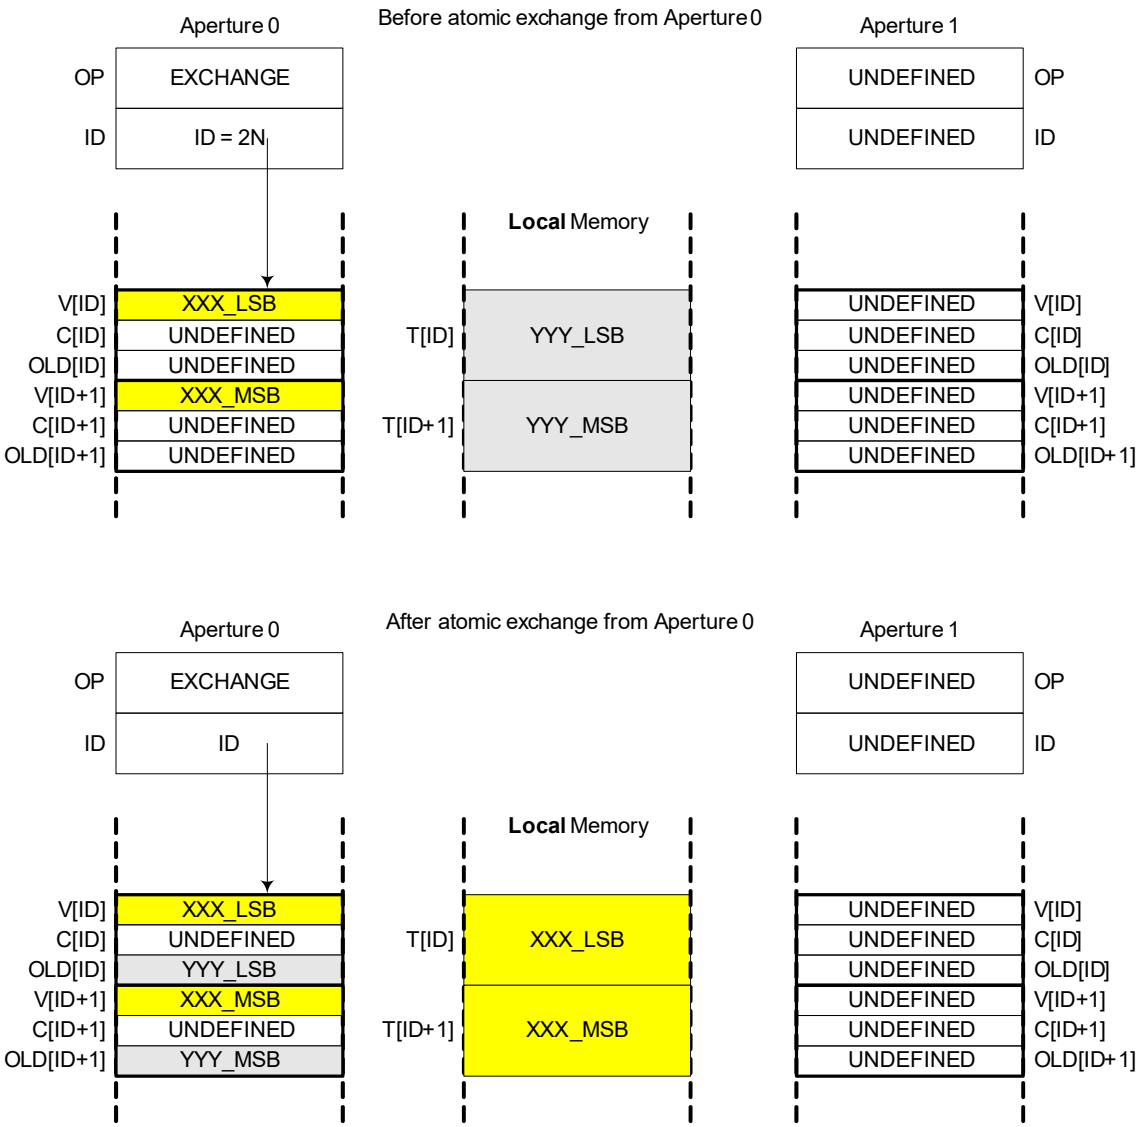
if (ATOMIC_OP[A] == TEST_AND_CLEAR) {
  old[A][ID[A]] = T[ID[A]]
  T[ID[A]] &= ~v[A][ID[A]]
}

if (ATOMIC_OP[A] == TEST_AND_INVERT) {
  old[A][ID[A]] = T[ID[A]]
  T[ID[A]] ^= v[A][ID[A]]
}
```

7.3.7 Width of Operations

All operations can operate on 32 bits or 64 bits. 64 bits operations use an even/odd pair of address, with the MSB at the odd address. The next figure shows how a 64 bits exchange operates. Other operations behave similarly. In the case of atomic increment and decrement operations, the carry will correctly propagate from the LSB to the MSB.

Figure 10: 64-bit Atomic Exchange Operation



7.4 Atomics Registers

7.4.1 ATOMICS_AP0_TRIGGER_0

Trigger Registers

Offset: 000h | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxx

7.4.8 ATOMICS_AP1_RESULT_0

This is an array of 128 identical register entries; the register fields below apply to each entry.

Offset: 1800h..19ffh | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31:0	X	R

CHAPTER 8: TIMERS

This chapter documents the various timers available to software in a Tegra® X1 system. The following table summarizes these timers.

Table 19: List of Timers

Name	Primary Use	Related Interrupt	Secure	Freq.	Notes
RTC	Wall Clock Timer	RTC	Pseudo	32kHz	See Chapter 11: Real-Time Clock in this TRM for detailed information.
TMR	NVIDIA® Generic Timers	TMR9-0 TMR10-13	Cfg	1MHz OSC	Configurable to be secure
WDT	Per CPU/COP	WDT_<>	Cfg	1MHz	Configurable to be secure
TSC	Reference for GT	N/A	Yes	OSC	Counter value can only be updated in secure mode.
GT	ARM CPU Generic Timers	PPIs(1)	Yes	TSC	These timers use TSC as reference.

1. PPIs are per CPU Private Peripheral Interrupts

8.1 ARM CPU Generic Timers (GTs)

The ARM® Generic Timer architecture defines generic CPU timer requirements. The architecture requires that the SoC supply a timestamp counter reference that is independent of the CPU clock frequency. Cortex®-A57 generic timer events are not affected by CPU clock frequency change.

The CPU Generic Timer includes:

- A physical counter that contains the count value of the system counter.
- A virtual counter that indicates virtual time. The virtual counter contains the value of the physical counter minus a 64-bit virtual offset.
- A set of four timers per CPU.

The four timers are the following:

- Secure Physical Timer
- Non-Secure Physical Timer
- Hypervisor Timer
- Virtual Timer

Refer to the appropriate ARM Architecture Reference Manual for generic timer specifications.

8.2 Generic Timer System Counter (TSC)

The ARM Generic Timer Specification requires a system time-stamp counter (TSC) supplied by the SoC.

The TSC is implemented as part of the Tegra X1 Power Management Controller (PMC). It is a 56-bit counter which runs at the crystal oscillator clock frequency. During LP0 (when osc may be optionally disabled), the TSC can run with 32,768 kHz clock while still counting at the osc frequency. Refer to Chapter 12: Power Management Controller in this TRM for additional TSC information.

8.3 NVIDIA Timers (TMR)

The programmable timer block contains fourteen 29-bit programmable timer counters (TMRs) and one 32-bit timestamp counter.

The TMRs run at either a fixed 1 MHz clock rate derived from the oscillator clock (TMR0-TMR9]) or directly at the oscillator clock (TMR10-TMR13). Each TMR can be programmed to generate one-shot, periodic, or watchdog interrupts. When a TMR is enabled, it loads the Present Trigger Value (PTV) timer into its counter and starts decrementing at its associated rate. When the Present Count Value (PCR) timer decrements to zero, it generates a timer interrupt. When the periodic interrupt mode is enabled, then timer generates an interrupt and reloads the counter with the PTV value and starts to decrement again.

Each TMR generated (one-shot or periodic) interrupt is routed to an interrupt controller independently so that it can be independently configured to be secure or non-secure. Also, each TMR can be configured to be secure or non-secure (see Section 8.5: Secure TMRs and Secure WDTs).

TMR0 through TMR9 run at a fixed 1 MHz clock rate that is generated from the crystal oscillator clock. However, Tegra X1 devices support several crystal oscillator frequencies. To be able to generate a fixed 1 MHz clock rate, the timer's logic requires "USEC_DIVIDEND" and "USEC_DIVISOR" information to be configured at cold and warm boot (see the TIMERUS_USEC_CFG register description) based on platform oscillator frequency. Note, if the oscillator is disabled, then the timer's logic will not generate the 1 MHz clock. As a result, the Timer and Watchdog will not function when the oscillator is disabled.

The timer count is 29 bits wide, therefore, it can support a periodic interrupt every 536.87 s maximum and 1 µs minimum for TMR0 through TMR9 and platform-dependent limits for TMR10 through TMR13.

8.4 Watchdog Timers (WDTs)

A watchdog timer facilitates recovery from system lockup conditions. The watchdog timer can interrupt the processor when the selected timer counter expires. Under normal operation, this interrupt is serviced by reading the timer status register (TIMER_WDTx_STATUS).

If the interrupt is not serviced by the processor before the watchdog timer counts down to zero for the Nth time (see the TIMER_WDTx_CONFIG register description), this is treated as a lockup condition. When this occurs, the watchdog timer can generate a per processor-reset or system reset, etc.

The Tegra X1 processor provides five Watchdog Timers, one for each pair of CPUs in the fast and slow clusters, and one for BPMP-Lite:

- WDT0 through WDT3 are allocated with CPU<i> of the currently active cluster
- WDT4 is allocated to BPMP-Lite

There are no dedicated timers for the WDTs. Each WDT can be configured to use any one of the TMR0-TMR9 timers as its timer source. Note that TMR10 through TMR13 cannot be selected as source.

Based on the configuration of the TIMER_WDTx_CONFIG register, a WDT works as follows:

- When the timer decrements to zero the first time, a WDT interrupt can be generated
- When the timer consecutively decrements down to zero a second time, without the processor reading the interrupt status register (TIMER_TMRx_TMR_PCR of the corresponding TMR), an FIQ WDT interrupt can be generated. This is not routed directly to the CPU interrupt controller (GIC).
- When the timer consecutively decrements down to zero a third time, without the processor reading the interrupt status register (TIMER_TMRx_TMR_PCR), a per CPU reset can be generated.
- When the timer consecutively decrements down to zero a fourth time without the processor reading the interrupt status register, a system reset can be generated. The cause of this system reset can be read by reading PMC_RST_STATUS[RST_SOURCE] (see Chapter 12: Power Management Controller for more information).

8.5 Secure TMRs and Secure WDTs

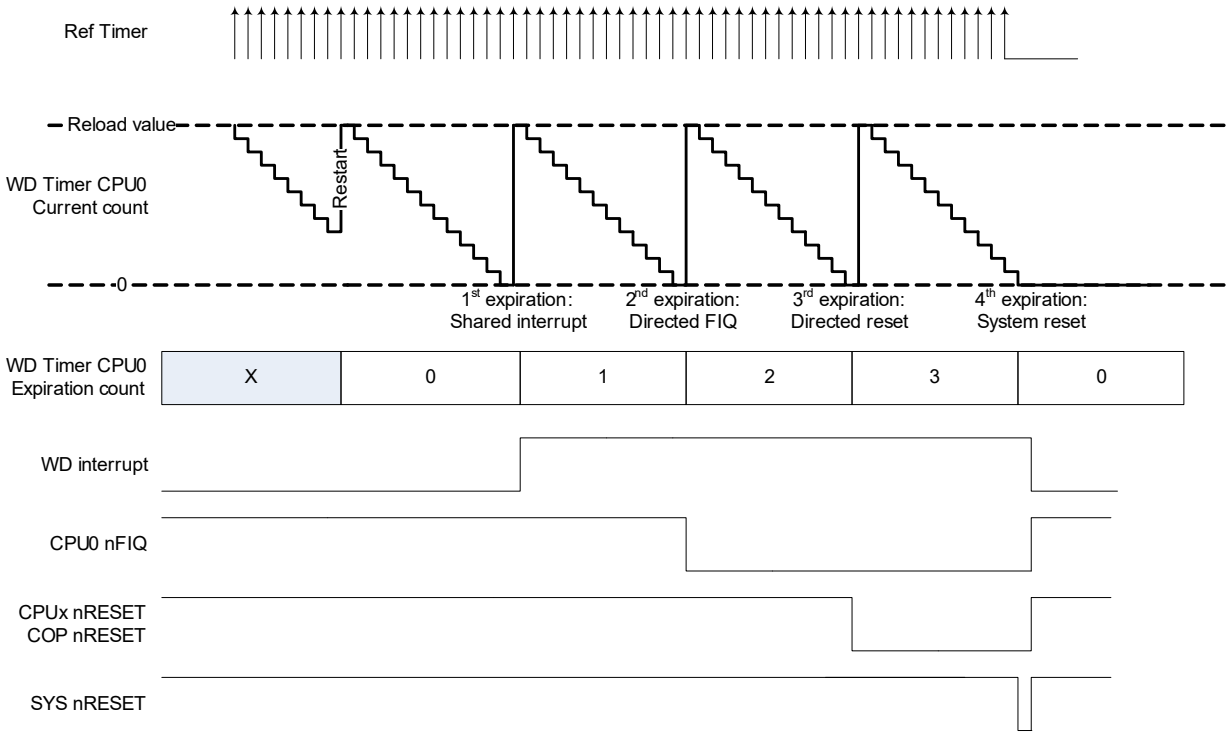
The Tegra X1 processor TMRs and/or WDTs can be configured to be secure timers. A secure register TIMER_SECURE_CFG -- which itself can only be written by secure writes – can be configured such that each of the TMRs and WDTs can be independently configured to be secure. By default all of TMRs and WDTs are non-secure and backward compatible.

8.6 Watchdog Timer Programming Guide

The five watchdog timers operate as follows:

- Select any one of the general-purpose timers as timing reference
- Standard down counter with programmable period, that also counts expirations, specific action are taken at the counter expiration
  - If the expiration count is 0, a normal interrupt may be generated (probably pooled)
  - If the expiration count is 1, the FIQ for the corresponding processor may be asserted, this operation bypasses the normal interrupt controller
  - If the expiration count is 2, the reset for a programmable set of processors is asserted, this may be the null set
  - If the expiration count is 3, a system wide reset may be asserted (two variants, standard system or closer to external hardware reset)

Figure 11: Watchdog Example Timing Diagram



Any operation that targets CPU0 is done in the following way:

- Any output is broadcast to both instances of CPU0, in CPU cluster 0 (G) and 1 (LP). This applies to the reset and FIQ signals.
- Resetting any of the CPU0 results in resetting the WD associated with CPU 0

Although the timing diagram implies that you need to restart the timer when you service the interrupt, this is not necessary as long as you can always service the interrupt (clear the TMR interrupt) before the next timeout occurs. The reset only happens if a new timeout occurs when the TMR interrupt is still active.

8.7 Timers Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

Each timer uses two registers called PTV and PCR at two consecutive word addresses. The format is the same for all 14 timers and is defined only once with <t> taking values between 0 and 13. Note that the start offset sequence is haphazard for legacy reasons.

Table 20: Start Offsets for PTV and PCR Timer Registers

Timer	Start Offset for Register Pair
TMR1	0x00
TMR2	0x08
TMR3	0x50
TMR4	0x58
TMR5	0x60
TMR6	0x68
TMR7	0x70
TMR8	0x78
TMR9	0x80
TMR0	0x88
TMR10	0x90
TMR11	0x98
TMR12	0xa0
TMR13	0xa8

8.7.1 TIMER_TMR<t>_TMR_PTV_0

Parameter <t> takes a value from 0 to 13. The start offset for the timer is defined relative to the start address in Table 20.

Before programming the timer:

- Input oscillator frequency must be specified in the TIMERUS_USEC_CFG register.
- Program the number of 1 µs timer counts per “tick” in the PTV (Present Trigger Value) register.
- Set the PTV EN (enable bit) to start counting down.
- When the count reaches zero, an interrupt is generated.
- To auto-reload the timer counter, set the PTV PER (periodic) bit. Otherwise, leave it clear for a one-shot.

Timer Present Trigger Value (Set) Register

Offset: See Table 20 | Read/Write: R/W | Reset: 0x00000000 (0b00x00000000000000000000000000000)

Bit	Reset	Description
31	0x0	EN: Enable Timer 0 = DISABLE 1 = ENABLE
30	0x0	PER: Enable Periodic Interrupt 0 = DISABLE 1 = ENABLE
28:0	0x0	TMR_PTV: Trigger Value: count trigger value (count length). This is in n+1 scheme. If you program the value n, the count trigger value will actually be n+1.

8.7.2 TIMER_TMR<t>_TMR_PCR_0

Parameter <t> takes a value from 0 to 13. The start offset for the timer is defined relative to the start address in Table 20.

When an interrupt is generated, write “1” to PCR[30] to clear the interrupt

Timer Present Count Value (Status) Register

Offset: See Table 20 + 0x4 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bx0xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
30	RW	0x0	INTR_CLR: 1 = clears the interrupt, 0 = no affect. Write-1-to-Clear
28:0	RO	X	TMR_PCV: Counter value: decrements from PTV.

8.8 Fixed Time Base Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

The USEC_CFG/CNTR_1US registers provide a fixed time base (in microseconds) to be used by the rest of the system regardless of the clk_m frequency (i.e., 12 MHz or 38.4 MHz).

8.8.1 TIMERUS_CNTR_1US_0

This free-running read-only register/counter changes once every microsecond and is used mainly by hardware (can also be used by software). It starts counting from 0 once it is out of system reset and will continue counting forever, unless the oscillator clock is stopped or during a system reset.

(A) Software Use

Although there is no interrupt mechanism for this register, software can read the content of this register multiple times to determine the amount of time that has elapsed.

(B) Hardware Use

- To provide a periodic USEC pulse to be used by the flow controller to count the programmable number of microseconds before a flow control condition is triggered.
- Used by secure boot logic.

Offset: 0x0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:16	x	HIGH_VALUE: Elapsed time in microseconds
15:0	x	LOW_VALUE: Elapsed time in microseconds

8.8.2 TIMERUS_USEC_CFG_0

Software should first configure this register by telling what fraction of 1 microsecond each clk_m represents. For example, if the clk_m is running at 12 MHz, then each clk_m represents 1/12 of a microsecond.

"USEC_DIVIDEND" and "USEC_DIVISOR" are used to indicate what fraction of 1 microsecond each clk_m represents.

Refer to Chapter 5: Clock and Reset Controller in this TRM for more information on clk_m.

Table 21: clk_m Frequency Indicator for USEC

clk_m Frequency	Dividend/Divisor	USEC_DIVIDEND/USEC_DIVISOR
12 MHz	1/12	0x00 / 0x0b
38.4 MHz	5/192	0x04 / 0xbf

Offset: 0x4 | Read/Write: R/W | Reset: 0x0000000c (0bxxxxxxxxxxxxxxxx0000000000001100) | Default: 0x0000000b

Bit	Reset	SW Default	Description
15:8	0x0	NONE	USEC_DIVIDEND: Microsecond dividend. (n+1)

Bit	Reset	SW Default	Description
7:0	0xc	0xb	USEC_DIVISOR: Microsecond divisor. (n+1)

8.8.3 TIMERUS_CNTR_FREEZE_0

Offset: 0x3c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	DBG_FREEZE_COP: 1 = freeze timers when COP is in debug state, 0 = no freeze.
3	0x0	DBG_FREEZE_CPU3: 1 = freeze timers when CPU3 is in debug state, 0 = no freeze.
2	0x0	DBG_FREEZE_CPU2: 1 = freeze timers when CPU2 is in debug state, 0 = no freeze.
1	0x0	DBG_FREEZE_CPU1: 1 = freeze timers when CPU1 is in debug state, 0 = no freeze.
0	0x0	DBG_FREEZE_CPU0: 1 = freeze timers when CPU0 is in debug state, 0 = no freeze.

8.9 Watchdog Timers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

Each Watchdog timer uses four registers called CONFIG, STATUS, COMMAND, and UNLOCK PATTERN, at four consecutive word addresses. The format is the same for all watchdog timers and is defined only once with <w> taking values from 0 to 4.

The following register offsets are relative to the TMR block base.

Each Watchdog timer has the following:

- CoreWatchdog Configuration Register
- Period of 0 results in MAX period
- The generated interrupt is dependent on the WD index.
- WD0 to WD3 generate a CPU_WD_Interrupt
- WD4 generates a COP_WD_Interrupt
- CPU<i> settings apply to both clusters
- Core numbering: 0-3 applies to CPU0-CPU3, 4 applies to COP

8.9.1 TIMER_WDT<w>_CONFIG_0

Parameter <w> takes a value from 0 to 4.

Core Watchdog Configuration Register

Offset: 0x100 + (0x20 * <w>) | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000000000000000000)

Bit	Reset	Description
20:16	0x0	CoreResetBitmapEn: Enable reset of a set of cores at third expiration counter (one bit per processor) same level the signal from PMC asserted in case of external reset.
15	0x0	Pmc2CarResetEn: Enable Full system reset at fourth expiration of the counter 0 = DISABLE 1 = ENABLE
14	0x0	SystemResetEnable: Enable system reset at fourth expiration of the counter, at same level as existing watchdog interrupt 0 = DISABLE 1 = ENABLE
13	0x0	FIQEnable: Enable FIQ assertion at second expiration of the counter 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
12	0x0	InterruptEnable: Enable interrupt at first expiration of the counter 0 = DISABLE 1 = ENABLE
11:4	0x0	Period: Measured in periods of selected timer, this is the reload value
3:0	0x0	TimerSource: Select the timer used as reference (TMR0 – TMR9) 0 = TMR0 1 = TMR1 2 = TMR2 3 = TMR3 4 = TMR4 5 = TMR5 6 = TMR6 7 = TMR7 8 = TMR8 9 = TMR9

8.9.2 TIMER_WDT<w>_STATUS_0

Parameter <w> takes a value from 0 to 4.

Core Watchdog Status

Offset: 0x104 + (0x20 * <w>) | Read/Write: RO | Reset: 0x0000XXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
13:12	X	CurrentExpirationCount: Current count of expiration since the last start of expiration
11:4	X	CurrentCount: Current value of the counter
2	X	FiqStatus: Current status of FIQ, cleared by start
1	X	InterruptStatus: Current status of interrupt, cleared by start
0	X	Enabled: 1 when counter is active. When true, writes to the corresponding config register are ignored

8.9.3 TIMER_WDT<w>_COMMAND_0

The StartCounter bit enables watchdog counter operation, loads the watchdog counter, starts the watchdog timer to count down, resets the expiration count to 0, and clears all flags. Also used as restart.

The counter can be disabled by setting the DisableCounter bit, but only if the unlock register has been programmed before with the correct pattern. Writing to the command register always clears the disable unlock register. When set while StartCounter is 0 and the unlock register contains the unlock pattern the Watchdog transitions back to disabled.

The register fields are Write to set only.

Parameter <w> takes a value from 0 to 4.

CoreWatchdogCommand Register

Offset: 0x108 + (0x20 * <w>) | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	DisableCounter: Write 1 to disable WDT counter if unlocked
0	0x0	StartCounter: Write 1 to enable WDT counter

8.9.4 TIMER_WDT<w>_UNLOCK_PATTERN_0

Parameter <w> takes a value from 0 to 4.

CoreWatchdogDisableUnlock Register

Offset: 0x10c + (0x20 * <w>) | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	UnlockPattern: Must be written with value 0xC45A to allow write to DisableCounter to take effect. The pattern is reset at each write to Command Reg.

8.10 Timer Shared Interrupt Status

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

TimerSrcBitmap is used for Timers 6 through 10 which share a common interrupt line to the controller. Bit b is set if timer 6+b generated an interrupt. The corresponding bit is cleared by writing INTR_CLR bit of the TMR_PCR register.

WatchdogSrcBitmap is used for the 5 watchdog timers. This is the set of Interrupt Status bits from the corresponding CoreWatchdogStatus, but as a bitmap.

8.10.1 SHARED_INTR_STATUS_0

Offset: 0x0 | Read/Write: RO | Reset: 0x00000XXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
10:6	X	TimerSrcBitmap: Timer[0,9:6] interrupt status in bitmap form
4:0	X	WatchdogSrcBitmap: WDT[4:0] interrupt status in bitmap form

8.10.2 SHARED_TIMER_SECURE_CFG_0

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxx0000xxx0xxx00000xx0000000000)

Bit	Reset	Description
27	0x0	TMR13: Timer13 secure mode config. See the TMR0 bit description.
26	0x0	TMR12: Timer12 secure mode config. See the TMR0 bit description.
25	0x0	TMR11: Timer11 secure mode config. See the TMR0 bit description.
24	0x0	TMR10: Timer10 secure mode config. See the TMR0 bit description.
20	0x0	USEC: TIMERUS_USEC_CFG secure mode config. If this bit is set (=1) then TIMERUS_USEC_CFG register can only be written by secure writes. If this bit is cleared then TIMERUS_USEC_CFG register can be written by secure or non-secure writes. This register can always be read by secure or non-secure reads. Note: this bit should be set if any one of the TMR is enabled to be secure. 1: ENABLE 0: DISABLE
16	0x0	WDT4: WDT4 secure mode config. See the WDT0 bit description. This bit is reserved since WDT4 belongs to COP and it has no notion of Secure or Non-Secure transactions
15	0x0	WDT3: WDT3 secure mode config. See the WDT0 bit description.
14	0x0	WDT2: WDT2 secure mode config. See the WDT0 bit description.
13	0x0	WDT1: WDT1 secure mode config. See the WDT0 bit description.
12	0x0	WDT0: WDT0 secure mode config. If this bit is set (=1) then WDT0 registers (i.e. TIMER_WDT0_{CONFIG,COMMAND,UNLOCK_PATTERN}) can only be written by secure writes. A non-secure read will not trigger read-side-effect, but would return proper read value. If this bit is cleared then the WDT0 registers can be written by secure or non-secure writes. WDT0 registers can always be read by secure or non-secure reads. Note: if this bit is set, then the TMR used for this WDT0 should be enabled to be secure. 1: ENABLE 0: DISABLE
9	0x0	TMR9: Timer9 secure mode config. See the TMR0 bit description.
8	0x0	TMR8: Timer8 secure mode config. See the TMR0 bit description.
7	0x0	TMR7: Timer7 secure mode config. See the TMR0 bit description.

Bit	Reset	Description
6	0x0	TMR6: Timer6 secure mode config. See the TMR0 bit description.
5	0x0	TMR5: Timer5 secure mode config. See the TMR0 bit description.
4	0x0	TMR4: Timer4 secure mode config. See the TMR0 bit description.
3	0x0	TMR3: Timer3 secure mode config. See the TMR0 bit description.
2	0x0	TMR2: Timer2 secure mode config. See the TMR0 bit description.
1	0x0	TMR1: Timer1 secure mode config. See the TMR0 bit description.
0	0x0	TMR0: Timer0 secure mode config. If this bit is set (=1) then TMR0 registers (i.e., TIMER_TMR0_TMR_{PTV,PCR}) can only be written by secure writes. A non-secure read will not trigger read-side-effect, but would return proper read value. If this bit is cleared then TMR0 registers can be written by secure or non-secure writes. TMR0 registers can always be read by secure or non-secure reads. 0: DISABLE 1: ENABLE

CHAPTER 9: MULTI-PURPOSE I/O PINS AND PIN MULTIPLEXING (PINMUXING)

9.1 Overview

Tegra® X1 devices can be configured with different I/O functions on particular pins to allow use in a variety of different configurations. This section discusses how this is controlled and how the pins themselves are set up.

Many of the pins on Tegra X1 devices are connected to multi-purpose I/O (MPIO) pads. An MPIO can operate in two modes: either acting as a signal for a particular I/O controller, referred to as a Special-Function I/O (SFIO); or as a software-controlled general-purpose I/O function, referred to as GPIO. Each MPIO has up to four SFIO functions as well as being a GPIO.

Though each MPIO has up to 5 functions (a GPIO function and up to 4 SFIO functions), a given MPIO can only act as a single function at a given point in time. The Pinmux controller in Tegra X1 devices includes the logic and registers to select a particular function for each MPIO.

The VGPIO controller supports 8-bit general-purpose input/output (VGPIO) ports (port A through port D). These ports allow VGPIO signals to be mapped onto unused individual functional pins which might not be present in the same device. This provides a means to virtualize various pins that cannot be mapped in the same package and have to be moved to a companion device.

Note: *The VGPIO controller function is not supported.*

This section describes the following features of MPIOs, the Pinmux controller, the GPIO controller, and the VGPIO controller:

- Basic capabilities of the MPIO pads
- Differences between the variety of MPIO pads
- Mapping of MPIO pads to I/O controllers (i.e., pinmuxing)
- Behavior of the MPIO pads during power-up
- Behavior of the MPIO pads before, during, and after deep sleep
- Recommendations for software programming related to the MPIO pads.

This section covers the Multi-Purpose digital I/O pads. It does not address the special-purpose I/O pads, such as those used for USB, IC_USB, SATA, PCIe, TVO/DAC, MIPI DSI, MIPI CSI, the oscillator, or DRAM interfaces.

9.2 Terms and Acronyms

Some common terms used with Tegra X1 processor pinmuxing are as follows:

Term	Definition
ACPI	Advanced Configuration and Power Interface
CZ	Controlled-output impedance MPIO pads
DD	Dual-driver MPIO pads
Deep sleep	Also known as LP0. A full-chip power state in which VDD_CORE is turned off but VDD_RTC (i.e., VDD_AO) and many of the I/O power rails remain on
DPD	Deep Power Down (a mode in which the pad can tolerate VDD_CORE being turned off)
GPIO	General-Purpose I/O
LP0	See Deep sleep above.

Term	Definition
LV	Low-voltage MPIO pads
MPIO	Multi-Purpose I/O
OD	Open-drain MPIO pads
PMIC	Power Management Integrated Control (synonymous with PMU)
SFIO	Special-Function I/O
ST	Standard MPIO pads
VGPIO	Virtual GPIO

9.3 MPIO Pad Description

Each MPIO pad consists of:

- An output driver with:
  - Tristate capability
  - Drive strength controls AND
  - Push-pull mode, open-drain mode, or both
- An input receiver with:
  - Schmitt mode, CMOS mode, or both
- A weak pull-up and a weak pull-down

Tegra X1 devices include six types of MPIO pads, which all share a common structure. The following table summarizes the differences between the six MPIO pad types.

Table 22: MPIO Pad Types

Pad Type	I/O Rail Voltage (V)	Input Buffer	Output Buffer	I/O Voltage Tolerance	Nominal Pull Strength	"Slew Rate" Control	Drive Strength Control
ST	1.8	Schmitt & CMOS	push-pull	VDDIO	100 kΩ	No	5 bits, up & down
CZ	1.8, 3.3	Schmitt & CMOS	push-pull	VDDIO	18 kΩ (pull-up and pull-down)	2 bits, up & down	7 bits, up & down
DD	1.8	Schmitt & CMOS	push-pull & open-drain	3.3V for open-drain, VDDIO otherwise	100 kΩ	No	5 bits, up & down
LV_CZ	1.2, 1.8	Schmitt & CMOS	push-pull	VDDIO	15 kΩ	2 bits, up & down	5 bits, up & down
ST_EMMC	1.2, 1.8	Schmitt & CMOS	push-pull	VDDIO		3 bits, down only	5 bits, up & down
DP_AUX	1.8	Diff/Open Drain	push-pull & open-drain	3.3V	NA	NA	NA

Table 23: Pad Details and Controls

Pad Type Pad Details	ST	CZ	DD	LV_CZ	ST_EMMC
I/O rail voltage	1.8V	1.8V/3.3V	1.8V	1.8V	1.8V
Input Buffer	Schmitt & CMOS	Schmitt & CMOS	Schmitt & CMOS	Schmitt & CMOS	Schmitt & CMOS
Output Buffer	Push-pull	Push-pull	Push-pull & Open Drain	Push-pull	Push-pull
I/O Voltage tolerance	1.8V	VDDIO	Open Drain: 3.3V Otherwise: VDDIO	1.8V	1.8V
Nominal Pull strength	100kΩ	18kΩ (PU and PD)	100kΩ	15kΩ	

Table 23: Pad Details and Controls

Pad Type Pad Details	ST	CZ	DD	LV_CZ	ST_EMMC
"Slew Rate" control	No	2 bits up/down	No	2 bits up/down	3 bits up/down
Drive strength control	5 bits up/down	7 bits up/down	5 bits up/down	5 bits up/down	5 bits up/down
Per Pad Control					
PUPD	√	√	√	√	√
Tristate_control	√	√	√	√	√
DPD_PARKING_CONTROL	√	√	√	√	√

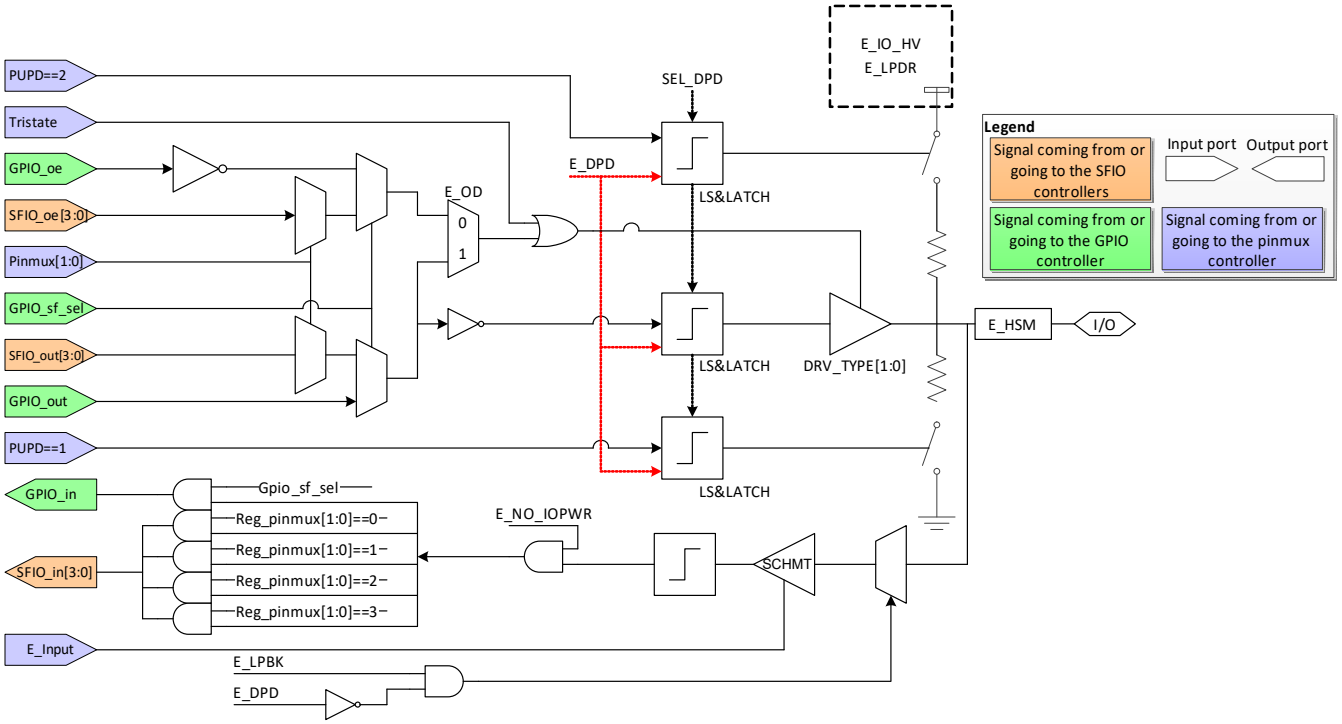
DRV_TYPE[1:0]		√		√	

1. Do not change E_OD. LEAVE IT AT THE DEFAULT VALUE.

Figure 12: Generic MPIO Pad Diagram with Pinmuxing Structure



The ST (standard) MPIO pads are the most common pads on the chip. They are used for typical General Purpose I/O.

The DD (dual-driver) MPIO pads are similar to the ST pads. A DD pad can tolerate its I/O pin being pulled up to 3.3V (regardless of supply voltage) as long as the pad's output-driver is set to open-drain mode. There are special power-sequencing considerations when using this functionality.

> ***Note:*** *Refer to "Power Sequencing" in the NVIDIA Tegra X1 Processors Data Sheet (DS-07224-001) for a complete description of the power-up sequencing requirements for Tegra X1 processors.*

The CZ (controlled output impedance) MPIO pads are optimized for use in applications requiring a tightly controlled output impedance. They are similar to ST pads except for changes in the drive strength circuitry and in the weak pull-ups/pull-downs. Tegra X1 processors include CZ pads on the VDDIO_SDMMC1 and VDDIO_SDDMC3 power rails. Each of those rails also includes a CZ_COMP pad. Because SDMMC3 is connected with a removable SD card, these rails support 3.3V operation. Circuitry within the Tegra X1 device continually matches the output impedance of the CZ pads to the on-board pull-up resistors attached to the CZ_COMP pad. The SDMMC1 interface also can be used for a removable SD card. Apart from this, the Quad SPI interface, which needs to operate around 166 MHz, also uses the BDSDMEM pads to enable 3.3V tolerance.

The LV_CZ (low voltage controlled impedance) pads are similar to CZ pads but are optimized for use with a 1.2V supply voltage (and signaling level). They support a 1.8V supply voltage (and signaling level) as a secondary mode. The Tegra X1 processors use LV_CZ pads for SPI interfaces operating at 1.8V. The eMMC interface uses ST_EMMC, which is the IOBRICK, and supports higher speed DDR operation compliant to eMMC5.0.

The ST_EMMC (Standard and EMMC) pads are I/O bricks that support the eMMC5.0 standard involving DDR and also legacy eMMC standards such as LV_CZ. This way the platforms can connect a new eMMC5.0 based device as well as the legacy devices. These pads support normal ST type of operation so that the bricks can be used as GPIO when it is not used for eMMC. This brick has internal integrated Clock and Calibration pads, used in the SDMMC4 interface which typically connects the secondary boot device. This interface operates in 1.8V mode only because supported eMMC devices operate in 1.8V mode. The same brick is used in the SDMMC2 interface also connects two eMMC5.0 devices to support the high-throughput requirement of Clamshell and Advanced Tablets.

The DP_AUX pad is used as an Auxiliary control channel for the Display Port which needs differential signaling. Because the same I/O brick is used for the Display Port and HDMI to ensure the control path to the display interface is minimized, the DP_AUX pads can operate in open-drain mode so that the HDMI control path (i.e., DDC interface which needs I2C) can also be used in the same pad.

Note: *Refer to "Pin Definitions" in the NVIDIA Tegra X1 Processors Data Sheet (DS-07224-001) for the list of the pad types and the nominal pull-up/-down strength associated with each MPIO. See the columns labeled "MPIO Pad Type" and "Nominal Pull Strength." The power rail information is located in the "Power Sequencing" section.*

9.4 Special Purpose Pads

Beyond the above mentioned pads, there are some special purpose pads used for targeted purposes. These are different from special purpose PHYs used for interfaces such as USB, Display etc. Given below are the special purpose pads.

Table 24: Special Purpose Pad Types

Pad	I/O Rail Voltage	Functional Name	Brief Description
MEM_COMP	1.8 /3.3V	SDMMC Calibration Pads	Used for generating PVT compensated impedance calibration code for the SDMEM pads (typically used for interfacing SDMMC devices). It is connected with an external reference resistor of 50 Ohms with ±1% variation.
JT_RST	1.8V	JTAG and Reset Pads (Input Only)	Used for JTAG (except JTAG TDO) and Reset interface. Has a special mode of operation called VDD only mode where in the pad becomes operational without having the I/O rail up. This mode of operation is needed for Reset pads which have to propagate the reset before I/O rails are up. This is achieved by permanently RCVR_SEL of this pad to Logic 0. For JTAG pads RCVR_SEL is tied to Logic 1 so that it becomes operational when the VDDP rail is up. The TEST_MODE is also made to operate in Core only mode to ensure mode detection for Oscillator which is needed during power on is propagated correctly.

9.5 Pad Controls

The Tegra X1 devices include many controls for each MPIO pad. Some of these controls can be set on a per-pin basis. Other controls are shared across multiple pins.

9.5.1 Per Pad Options

The following controls can be independently configured on a per-pad basis:

Table 25: Per Pad Controls

Control	Description
PUPD	Internal Pull-up/down option: Option to enable internal Pull-up, Pull-down resistors or neither. Applicable to all pads.
TRISTATE_CONTROL	Tristate (high-Z) option: Disables or enables the pad's output driver. This setting overrides any other functional setting and also determines whether the pad is selected for SFIO or GPIO. Can be used when the pad direction changes or the pad is assigned to different SFIO to avoid glitches. During Cold Boot, most of the pads come with this bit set to TRISTATE so that they do not actively drive anything. For Normal Operation, this bit has to be set to PASSTHROUGH state.
DPD_PARKING_CONTROL	The PARKING state holds control during DPD/deep sleep (LP0). During LP0 entry, all pads (except for a few pads in the AO region) are put in the DPD state. This is set in the Pinmux register by default (i.e., as Power on Value). In LP0 exit until this bit is cleared typically by the LP0 exit pinmux recovery code, the pads are in DPD state, i.e., PARKED in the same value as that of LP0 entry. In case the LOCK bit is set for a specific Pinmux register ensure this bit set to Logic1.
E_INPUT	Input Receiver (Enable/Disable): Enables or disables input receiver. Applicable to all pads.
E_LPDR	Enable Base Drivers when set High. Typically set when interfacing chips require minimal rise/fall time such as I2C. Applicable to ST and DD pads.
E_OD	Reserved
E_IO_HV	Enables open-drain pull-up capability to 3.3V thereby enabling High Voltage Operation. Enables 3.3V Receive. If E_IO_HV=1 is set, the pad can support 3.3V open-drain driving with I/O pull-up tolerance up to 3.3V and the Receiver is adjusted to 3.3V DC characteristics. Applicable to DD pads.
E_HSM	High Speed Mode (Enable/Disable). Enables High speed operation for Receiver and Transmitter. Applicable to CZ pads.
SCHMT	Schmitt Trigger (Enable/Disable): Enabling Schmitt provides better noise margin characteristics for the input and, depending on driver's logic threshold levels, this can be enabled. Applicable to all pads
DRV_TYPE[1:0]	Enables different combination of impedance code mapping for the pads. By making this control available to each pad individually, the impedance can be fine-tuned for every pad though the same impedance code is driven to every pad. Applicable to CZ/LV_CZ pads.

During normal operation, these per-pad controls are driven by the pinmux controller registers. See Section 9.6: Pinmuxing below for more information.

During deep sleep, the PMC bypasses and then resets the pinmux controller registers. Software should reprogram these registers as necessary after returning from deep sleep. See Section 9.9: Deep Sleep Behaviors for more information on the interaction of PMC, software, and the pinmux controller following deep sleep.

9.5.2 Per Pad Control Group

The MPIO pads are partitioned into multiple "pad control groups". The following controls can be configured independently for each pad control group. For more flexibility for the I/Os, all the ST and DD pads are given with separate configuration groups for each pads. Though the ST_EMMC pads can be configured as GPIO, there the group of pads has one common control because of how the I/O brick is designed. So the flexibility is not available for balls sharing these I/O bricks.

DRVDN / UP	Drive Down / Up. Driver Output Pull-Up/Pull-Down drive strength code. Normally, the code is 5 bits but for CZ type pads, it is 7 bits.

SLWR/ SLWF	Slew Falling / Rising. Driver Output Pull-Up/Pull-Down slew control code. Normally, the code is 2 bits. In general, the code corresponding to the minimum slew is set (2'b11).

The controls are configured via the "pad control group registers". There is one pad control register per pad control group. During deep sleep, all of these pad control registers automatically return to their power-on-reset state. Software should reprogram these registers as necessary following deep sleep.

Table 26 lists the register address for each pad control group. Additionally, the table describes the bit positions of the controls within each register. Refer to Section 21.1.2: Pad Control Registers in the APB chapter for more details on these registers.

For example, clearing bits 12 through 24 of register 0x7f00008f4 will minimize the drive strength (both up and down) of pads in the AP_MCLK pad control group.

Note: *APB_MISC_GP_SDMMC1_CLK_LPBK_CONTROL_0 (offset 0x8d4) controls the loop back aspect of SDMMC pad. It is defined separately since this control field does not have to be controlled from a functional angle for the other pads.*

Note 1 - These represent the DRVDN and DRVUP codes for the COMP pads.

Note 2 – These represent the PU/PD values for each pin in the brick. 0 = CMD pins PD, 1 = CMD pins PU, 2 = CLK pins PU, etc. Refer to Section 21.1: APB Miscellaneous Registers in the APB chapter for more details.

9.5.3 Per I/O Power Rail

These per-power-rail controls are included in the PMC registers which maintain their state during deep sleep. Software does NOT need to reprogram these register following deep sleep. The following table summarizes the functionality of these signals along with how they are controlled in the PMC.

Table 27: Per Power Rail Controls

Pin Name	Pin Description	Control/Grouping Mechanism in PMC
E_33V	Active high 3.3V mode select. When low, selects VDDP 1.8V mode.	Except for the interface where it is required for boot, it is driven from the register in the PMC which can be configured. By default, it is maintained at Logic 1 to ensure safe power up of I/Os that are pulled to 3.3V

Table 27: Per Power Rail Controls

Pin Name	Pin Description	Control/Grouping Mechanism in PMC
E_NO_IOPWR	Active high. When high, prevents leakage when I/O power is gone while core power is still on.	Maintained per power rails for power rails associated with MPIO. Ideally, should have been set during Cold Reset so that I/O rail voltage ramping does not affect the pad. E_NO_IOPWR is kept at Logic 0. Whenever an I/O power rail is shut off on any specific use case, this bit has to be set to Logic1 before the I/O rails are brought down to avoid excessive leakage to the pad.

9.5.4 Pad DPD Controls

The following signals are individually controlled by the PMC logic as part of power sequencing. These signals help to put the pad in low power states. Typically, most of the pads (except the pads that are part of SYS DPD group) are put into the low power state during the deep sleep (LP0) state of the chip. Apart from this as a use case basis specific set of pads belonging to an individual DPD group(s) can be put in low power state in those cases the pads are not needed for operation.

Table 28: Pad DPD Controls

Pin Name	Pin Description	Control/Grouping Mechanism in PMC
DPD_IO_[1..0]	Programs I/O to Hi/Lo/Tristate for DPD mode. (2 bits)	Controlled via PMC logic by means of latching the I/O value prior to entering the DPD state and driving the same throughout DPD.
SEL_DPD	Selects input source for driving the pad output. SEL_DPD=0 selects the A pin of the pad (which is driven by functional logic) SEL_DPD=1 selects DPD_IO_[1..0].	Generated based on“APBDEV_PMC_DPD_ENABLE_0” in the PMC with some delayed transition so that E_DPD and DPD_IO are at proper values. Deassertion happens based on the removal of DPD_PARKING_CONTROL or DPD_SAMPLE bit (whichever is later). DPD_PARKING_CONTROL is reset after pinmux recovery by the LP0 exit code so that there is no glitch happening during LP0 cycles.
E_DPD	Active high. Places pad in DPD mode by deactivating bias, clamping settings for DPD mode, and gating-out inputs from core	PMC Logic drives during the LP0 cycle Generated based on“APBDEV_PMC_DPD_ENABLE_0” register in PMC”

9.5.5 Special Control for SDMMC CLK Pins

The external loopback feature is controlled by the E_LPBK pin of the SDMMC*CLK pads. Generally, E_LPBK is used by the DFT logic; however, for SDMMC, the functional logic also controls the pin with a default value of Logic 1 to ensure loopback clock is available for SDMMC operation.

Because E_LPBK is set to Logic 1 for the SDMMC*CLK pads when they are used as GPIO, the software has to explicitly ensure the E_LPBK is cleared for correct usage in input mode.

9.6 Pinmuxing

Tegra X1 processors include many types of I/O controllers (such as I^2C, SDMMC, and SPI). For some of these controller types, Tegra X1 processors include multiple “controller instances”. For example, Tegra X1 processors include six active I^2C controller instances.

Each controller instance on a Tegra X1 processor communicates with external devices via a set of “external signals”. For each controller instance, each signal can be brought out on (at least) one MPIO. For example, each I^2C controller has two external signals: CLK and DAT. The CLK signal of the I2C1 controller is available on the MPIO whose ball name is GEN1_I2C_SCL.

Many of the pins on Tegra X1 devices are connected to multi-purpose I/O (MPIO) pads. To connect an MPIO to a particular I/O controller, configure it as a Special-Function I/O (SFIO) rather than a General-Purpose I/O (GPIO). Each MPIO has up to four SFIO functions. Each MPIO can as also be programmed to function as a GPIO. For example, the pin named DMIC1_DAT can act in one of three ways:

- As a GPIO
- As the data signal corresponding to the microphone, i.e., DMIC1_DAT
- As the data signal corresponding to I2S2 interface, i.e., I2S2_SDATA

Though each MPIO supports up to 5 functions (i.e., a GPIO function and up to 4 SFIO functions), a given MPIO can only act as a single function at a given point in time. The Pinmux controller includes the logic and registers to select a particular function for each MPIO.

Some controller instances make their entire set of signals available on two or more sets of MPIOs. That is, such controllers have more than one “interface”. Before using any controller, make sure that the pinmux registers are programmed to bring out the controller’s signals on at most ONE interface.

Note: *The Pinmux controller includes one register per MPIO. It can be controlled on a per-pin basis.*

Figure 12 shows the pinmux logic associated with a single MPIO. The ENB in the diagram (equivalent to the EN pin at the pad) is active Low. Thus, the pad is active when ENB is Low and is in the High-Z state when ENB is High. In the figure, GPIO_OE and SFIO_OE[3:0] are considered active Low; that is, when they are Low, the pad’s output is enabled.

At pad level when ENB =1, the output drivers are disabled. The GPIO unit has different polarity; thus there is an inverter. The polarity for SFIOs is the same as pad level so there is no inverter.

The pinmux controller includes one register per MPIO. The table below describes the layout of each Pinmux controller register.

Table 29: Pinmux Register Format

Field Name	Default Value	Description
LOCK	UNLOCKED	Lock control for writing to the register. Used for security purposes to permanently lock the value to a pinmux register. 0: Writes to this register are accepted 1: Writes to this register are ignored (until the next wake from Deep Sleep) This is a sticky bit. Once software sets this bit to 1, the only way to clear it is to reset the chip or enter and exit Deep Sleep.
E_LPDR	ENABLE/DISABLE (Typically enabled for pads that are used for I2C interface)	Enable only one Base Driver when set High. Typically set when interfacing chips require minimal rise/fall time such as I2C. Applicable to ST and DD pads.
E_OD	DISABLE	DISABLED: Do not use.
E_INPUT	ENABLE	Input Receiver (Enable/Disable): Enables or disables input receiver. Applicable to all the pads.
TRISTATE_CONTROL	TRISTATE/PASSTHROUGH (Most pads have TRISTATE as the default value)	Tristate (High-Z) option: Disables the pad’s output driver. This setting overrides all other functional settings and also whether pad is selected for SFIO or GPIO. Can be used when the pad direction changes or the pad is assigned to a different SFIO to avoid glitches. During Cold Boot, most of the pads come with this bit set to TRISTATE so that they do not actively drive anything. For Normal Operation, the bit has to be set to PASSTHROUGH state. Used by the Pinmux logic to drive the appropriate pad control signals.
PUPD	NORMAL/PU/PD (depending on the pad)	Internal Pull-up/down option: Option to enable internal Pull-up, Pull-down resistors, or neither. Applicable to all the pads.
DPD_PARKING_CONTROL	PARKED (does not affect Cold Boot and comes into effect automatically during LP0 exit)	PARKING state holds control during DPD/LP0. During LP0 (deep sleep) entry, all pads (except a few pads in the AO region) are put in the DPD state This bit is set in the Pinmux register by default during Reset. In LP0 exit until this bit is cleared (typically by the LP0 exit pinmux recovery code), the pads are in the DPD state, i.e., PARKED in the same value as that of LP0 entry. Used by mini_pad_macro logic to appropriately control the DPD controls of the pads. This bit is also clamped to Logic 1 during LP0 entry by the hardware. During LP0 exit until the software clears the bit (the default value being PARKED state) ensures the pads are kept in DPD state. In case the LOCK bit is set for a specific Pinmux register, ensure this bit set to Logic 1 so that deep sleep sequences are proper.

Table 29: Pinmux Register Format

Field Name	Default Value	Description
E_IO_HV	ENABLE/DISABLE (Disabled for PMIC I2C interface)	Enables open-drain pull-up capability to 3.3V, thereby enabling High Voltage Operation. Enables 3.3V Receive. If E_IO_HV=1, the pad can support 3.3V open-drain driving with I/O pull-up tolerance up to 3.3V and the Receiver is adjusted to 3.3V DC characteristics. Default enabled for all the pads so that they can safely operate without knowing whether externally it is pulled up to 3.3V or 1.8V until the pins get used actively. Until that point, it can be driven to High-Z or Logic 0. The platform software can read the status of pull-up values and configure the E_IO_HV before actually using the pin. For the PMIC I2C interface (i.e., PWR_I2C_SCL and PWR_I2C_SDA), it is set at Logic 0 because this interface is needed during boot and the PMIC interface typically has the pull-up at 1.8V. Applicable to DD pads.
E_HSM	DISABLE	High Speed Mode (Enable/Disable). Enables High speed operation for Receiver and Transmitter. Applicable to CZ pads.
SCHMT	DISABLE (for specific interfaces like PMIC the default might be ENABLE depending on the timing requirement)	Schmitt Trigger (Enable/Disable): Enabling Schmitt provides better noise margin characteristics for the input. Depending on driver's logic threshold levels, this can be enabled. Applicable to all pads
DRV_TYPE[1:0]	2X DRIVER MODE (0x01) [This corresponds to 50/33 Ohm impedance configuration]	Enables different combinations of Impedance code mapping for the pads. By making this control available to each pad individually, the impedance can be fine-tuned for every pad though the same impedance code is driven to every pad. Applicable to CZ/LV_CZ pads. For Boot related interfaces like eMMC/QSPI, the default value needed is 0x1 and for the other interfaces it can be changed to 0x3 by the boot loader. For pads in GPIO and AUDIO_HV rails there are no corresponding COMP pads and hence their DRV_TYPE setting should stay in 0x03 only. For SPI_HV rails when they are used for non QSPI purpose the COMP resistor need not have to be mounted and in such cases DRV_TYPE should be set to 0x03 otherwise when COMP resistor is mounted leave to the default value of 0x01.

Refer to the Tegra X1 Pinmux spreadsheet for a list of the SFIO functions supported by each MPIO on Tegra X1 devices. Each SFIO is listed in the table with the following format: <ControllerType><ControllerInstance><InterfaceLetter>-<Signal>

- **ControllerType** indicates the type of I/O controller associated with this SFIO function
- **ControllerInstance** indicates the I/O controller, if the Tegra X1 processor has more than one I/O controller of the specified type
- **InterfaceLetter** differentiates between the pin sets, if the controller instance can connect to more than one set of pins
- **Signal** identifies the particular role this SFIO plays for the I/O controller.

For some of the MPIOs, the hardware includes SFIO functions that are omitted from the spreadsheet. Many of these are deprecated. Contact NVIDIA for more information.

9.7 Cold Boot Reset

The following list is a simplified description of the device power on/boot process for Tegra X1 devices concentrating on those aspects which relate to the MPIO pins.

- System-level hardware executes the power-up sequence. This sequence ends when system-level hardware releases SYS_RESET_N.
- Each MPIO pin has a deterministic power-on-reset state. The particular reset state for each pin is chosen to minimize the need of on-board components like pull-up resistors in a Tegra X1 based system. For example, the on-chip weak pull-ups are enabled during power-on-reset for pins which are usually used to drive active-low chip selects.

- Pins that act as a strap source for cold boot must have their inputs enabled (through E_INPUT control). If they have MPIO Pinmuxing enabled, the strap source should be the primary function.
- The rising edge of SYS_RESET_N does not trigger any of the MPIOs to change their output state.

> ***Note:*** *Refer to "POR Behavior" in the NVIDIA Tegra X1 Processors Data Sheet (DS-07224-001) for a list of the power-on-reset states for each of the MPIOs.*

Following the power-up sequence, most of the MPIOs on the chip will stay in their power-on-reset state until system-dependent software (e.g., the Boot Loader or the OS) reprograms them. However, depending on the secondary boot device used in a given system, the Boot ROM may change the state of some of the MPIOs. The following sections list the MPIOs that the Boot ROM uses for each type of secondary boot device.

9.8 Secondary Boot

The following list is a simplified description of the device boot process for Tegra X1 devices concentrating on those aspects which relate to the MPIO pins.

1. System-level hardware executes the power-up sequence. This sequence ends when system-level hardware releases SYS_RESET_N.
2. The Boot ROM on the Tegra X1 device begins executing and programs the on-chip I/O controllers to access the secondary boot device.
3. The Boot ROM on the Tegra X1 device fetches the BCT and Boot Loader from the secondary boot device.
4. If the BCT and Boot Loader are fetched successfully, Boot ROM on the Tegra X1 device yields to the Boot Loader.
5. Otherwise, Boot ROM on the Tegra X1 device enters USB recovery mode.

Each MPIO pin has a deterministic power-on-reset state. The particular reset state for each pin is chosen to minimize the need of on-board components like pull-up resistors in a Tegra X1 based system. For example, the on-chip weak pull-ups are enabled during power-on-reset for pins which are usually used to drive active-low chip selects.

> ***Note:*** *Refer to "POR Behavior" in the NVIDIA Tegra X1 Processors Data Sheet (DS-07224-001) for a list of the power-on-reset states for each of the MPIOs.*

System designs must adhere to the described power-up sequence.

Following the power-up sequence, most MPIOs on the Tegra X1 device will stay in their power-on-reset state until system-dependent software (the Boot Loader or the OS) reprograms them. However, depending on the secondary boot device used in a given system, the Boot ROM may change the state of some of the MPIOs and associated pinmux so that the Boot ROM can interface with the secondary device to fetch the Boot Loader.

The following subsections list the MPIOs that the Boot ROM uses for each type of secondary boot device. Depending on the type of secondary boot device used, the associated I/O rails have to be brought up by the Boot ROM/PMIC to facilitate the data exchange.

9.8.1 SPI Boot

In systems using a SPI flash as the secondary boot device the Quad SPI controller and associated interface is used. Though it is meant for Quad SPI, it will operate in x1 mode by default and fetch the initial Boot Loader from the SPI device.

All the SPI functionality of Quad SPI is mapped to the primary interface of pinmux. From Boot ROM angle the following needs to be ensured in the respective Pinmux control to enable access to the SPI device:

- Make the TRISTATE_CONTROL to PASSTHROUGH Mode.
- Enable E_INPUT.

The following balls are associated with the Quad SPI and they are part of VDDIO_SPI_HV rail.

Table 30: Pins Associated with SPI Boot

Ball Name	Primary
QSPI_SCK	QSPI_SCK
QSPI_CS_N	QSPI_CS_N
QSPI_IO0	QSPI_IO0
QSPI_ IO1	QSPI_ IO1
QSPI_ IO2	QSPI_ IO2
QSPI_ IO3	QSPI_ IO3

To gain the speed advantage of Quad SPI once the initial Boot Loader is loaded into the Tegra device, it gets executed out of IRAM and the initial Boot Loader has the code for configuring the Quad SPI controller. The following are the broader level steps involved in Boot:

1. [Boot ROM] Initial steps in Boot ROM.
2. [Boot ROM] Fetch BCT, load Initial portion of the Boot Loader to IRAM.
3. [Boot ROM] Jump to IRAM and start executing the Boot Loader.
4. [Boot ROM] Keep the Quad SPI controller interface under idle state.
5. [Boot Loader] Initialize the Quad SPI controller for x4 mode of operation.
6. [Boot Loader] Start the Quad SPI controller and fetch extended Boot Loader, etc.

9.8.2 eMMC Boot

There are four SDMMC interfaces; the one used as a secondary boot interface is SDMMC4. SDMMC4 has all the necessary functionality for SDMMC assigned as primary function, and thus there is no need to change the Pinmux configuration.

From Boot ROM angle the following thing needs to be ensured in the respective Pinmux control to enable access to the SDMMC device

1. Make the TRISTATE_CONTROL to PASSTHROUGH Mode.
2. Enable E_INPUT.

Ball names include:

- SDMMC4_CLK
- SDMMC4_CMD
- SDMMC4_DAT0
- SDMMC4_DAT1
- SDMMC4_DAT2
- SDMMC4_DAT3
- SDMMC4_DAT4
- SDMMC4_DAT5
- SDMMC4_DAT6
- SDMMC4_DAT7
- SDMMC4_COMP

9.8.3 USB RCM Boot

RCM is not a regular boot mode. It is used for recovery purposes (through a combination of key presses). RCM expects that the device is already attached to the host before cold boot, so only D+/D- is used and the other signals are ignored. RCM utilizes

device mode, so current is not provided through VBUS and thus no VBUS condition. Because connection is expected before cold boot, device mode connection detection via valid VBUS is also not used.

9.8.4 SATA Boot

SATA boot requires sideband signals like DEVSLP (Device Sleep-Output) and optionally DA (Data Active-Input) during boot. They require specific pinmux programming considering their mode of operation; for example, Device Sleep operates in Open Drain mode.

9.9 Deep Sleep Behaviors

Deep Sleep is an ultra-low-power standby state in which a Tegra X1 device maintains much of its I/O state while most of the chip is powered off. The following lists offer simplified descriptions of the deep sleep entry and exit concentrating on those aspects which relate to the MPIO pads.

9.9.1 Deep Sleep Cycle

9.9.1.1 Deep Sleep Entry

The steps to enter deep sleep are as follows:

1. LP-entry software programs the PMC to alert about Deep Sleep entry.
2. I/O controllers are brought into the IDLE state.
3. The PMC latches much of Tegra X1's I/O state, i.e., currently driven by functional logic by sampling the pinmux controllers output. There are small variations on this logic depending on the pad type (mentioned below). Latching of the I/O state is triggered by writing into APBDEV_PMC_DPD_SAMPLE_0 register maintained in the PMC register space.
    a. Set the WAKE_DET_EN bit in the APBDEV_PMC_CNTRL2_0 register to Logic 1 while entering deep sleep to ensure the wake status is correctly captured and held correctly for the entire wake.
4. Write the DPD_PARKING_CONTROL bit in the Pinmux register to Logic 1. (This step can be omitted because the default value of DPD_PARKING_CONTROL is in the PARKED state.)
5. Along with latching the I/O values, various pad controls, such as E_IO_HV and E_33V, have to be latched and driven depending on the pad type.
6. The PMC runs the state machine to drive the control pins in the pad that puts them in the DPD state. There are two control pins (E_DPD and SEL_DPD) which have to be driven with proper timing as per the Pad data sheet. The PMC logic provides a configurable timer to select this. The timer is provided in the APBDEV_PMC_SEL_DPD_TIM_0 register. Entering into DPD is triggered through APBDEV_PMC_IO_DPD_REQ_0. Both registers are in the PMC register space.
7. Various clamps are enabled between the SoC to AO domain. Ensure that DPD_PARKING_CONTROL is clamped to Logic1 during deep sleep entry.
8. The PMC deasserts CORE_PWR_REQ.
9. The PMIC powers down VDD_CORE.
10. The PMC continues to drive the I/O state that it has latched.
11. As a result of the deep sleep entry sequence, the pads are put in the DPD state by asserting E_DPD and SEL_DPD. When these signals are asserted, the core supply to the pad (VAUXC_CORE) can be successfully removed and the pad can be powered using VDD_AO/VDD_RTC. This way the pads keep the I/O states yet consume low power.

Note: *For more information about deep sleep entry, refer to the NVIDIA Tegra X1 Processors Data Sheet (DS-07224-001) as well as Chapter 12: Power Management Controller in this TRM.*

9.9.1.2 Deep Sleep Exit

1. The PMC detects a wake event (for example, a rising edge on an appropriately configured MPIO).
2. The PMC asserts CORE_PWR_REQ.
3. The PMIC powers up VDD_CORE.
4. The PMC resets the logic within VDD_CORE.
5. The Boot ROM executes Warm Boot code and does not clear the APBDEV_PMC_DPD_SAMPLE_0 register.
   a. Set the E_INPUT bit of the PINMUX_AUX_GPIO_PA6_0 register to Logic 1.
6. The deep sleep exit code in DRAM retrieves pinmux registers for every pin and ensures all bits are set to their original stored values.
   a. Set the WAKE_DET_EN bit in the APBDEV_PMC_CNTRL2_0 register to Logic 0 to ensure the wake status is correctly captured and held for all the wakes.
7. The PMC takes the I/Os out of E_DPD but continues to drive them in SEL_DPD mode. This way the I/O values do not change during Deep Sleep exit until platform-specific software (i.e., typically customer owned) takes control of the I/Os.
8. The deep sleep -exit code in DRAM re-initializes the I/O controllers.
9. The deep sleep -exit code in DRAM changes the Pinmux configurations to the appropriate controller (based on what was configured during LP0) and clears TRISTATE/PARKED in the Pinmux register of each pin.
10. The deep sleep -exit code in DRAM sets the DPD_PARKING_CONTROL bit in the Pinmux register to Logic 0 in the respective pinmux registers.
11. The deep sleep -exit code in DRAM, after restoring all the Pinmux register, clears the APBDEV_PMC_DPD_SAMPLE_0 register, which results in SEL_DPD removal of the pad through hardware logic.

Note: *For more information about deep sleep exits, refer to the NVIDIA Tegra X1 Processors Data Sheet (DS-07224-001) as well as Chapter 12: Power Management Controller in this TRM.*

9.9.2 Pad Capabilities During Deep Sleep

The MPIO pads do not all have identical behavior during deep sleep. They differ with respect to:

- Output buffer behavior during deep sleep:
  - Does it maintain a programmable (0, 1, or tristate) constant value OR
  - Is it capable of changing state while the chip is still in deep sleep?
- Input buffer behavior during deep sleep:
  - Is it forcibly disabled OR
  - Can it be enabled for use as a “GPIO wake event” OR
  - Can it be enabled for some other purpose (for example, a “clock request” pin)?
- Behavior coming out of deep sleep
  - All the pads should maintain the state until software configures the I/O controller
- Pads that do not enter DPD mode during deep sleep.
  - Some pads whose outputs are dynamic have a special type and they don’t enter DPD mode during deep sleep. The PMC has a configurable option to exclude specific pads from entering DPD during deep sleep (see the PMC register APBDEV_PMC_DPD_PADS_ORIDE_0). Typically, these are pads in VDDIO_SYS domain which are related to system interface like clock, reset, and pins interfacing with mechanical switches
  - Pads that are associated with PMIC logic do not enter DPD mode during deep sleep: CLK_REQ, CPU_PWR_REQ, PWR_INT_N, SHUTDOWN,SYS_RESET_N, CORE_PWR_REQ, CLK_32K_IN

- Some pads like JTAG do not enter DPD mode.

- Special pads in low power state
  - There are two sets of DP_AUX pads corresponding to the HDMI/DP port and eDP/DP port. Both have to be controlled via their Display controller using their internal configuration registers during deep sleep using the appropriate clamps.

Refer to the “Deep Sleep Behavior” section in the *NVIDIA Tegra X1 Processors Data Sheet* (DS-07224-001) for more information on deep sleep.

9.9.2.1 Output Buffers During Deep Sleep

The output buffers of most MPIO pads are “configurable” during deep sleep. Immediately prior to entering deep sleep, the PMC latches the state of the output buffers for such pads. If the pad was driving high (or low) prior to entering deep sleep, the PMC ensures that it continues to drive high (or low) throughout deep sleep. If the pad was tristated during deep sleep, the PMC ensures that it remains tristated throughout deep sleep.

The weak pull-ups and pull-downs of most of the MPIO pads are “configurable” during deep sleep. If the pull-up (or pull-down) was enabled prior to entering deep sleep, the PMC ensures that it remains enabled throughout deep sleep. Similarly, if the pull-up (or pull-down) was disabled prior to entering deep sleep, the PMC ensures that it remains enabled throughout deep sleep.

9.9.2.2 Input Buffers During Deep Sleep

The input buffers of most MPIO pads are “disabled” during deep sleep. The input buffers are placed in an ultra-low power state. The Tegra X1 device will not respond to transitions on these pads while it is in deep sleep.

Some MPIO pads have an input buffer which has a “special” behavior during deep sleep. Most of these pads can act as “Deep Sleep Wake Sources”. Others offer some other functional behavior. For example, SYS_CLK_REQ can function as a clock request pin even during deep sleep.

For a complete description of the behavior of these pads during deep sleep, refer to the *NVIDIA Tegra X1 Processors Data Sheet* (DS-07224-001). Pads whose input can be sampled during Deep Sleep are mentioned as ENABLED in the input buffer column. To ensure the PMC wake logic can sense these wake events, the signals must be directly taken from the ZI pin of the pad because pinmux controls are not available during deep sleep. Pads that are acting as a wake source should satisfy the following condition: The pad’s power rail should be active.

Deep Sleep Debounced Wake

Tegra X1 devices offer debouncing capability to the GPIOs. This enables mechanical push-button switches to be connected to any pins. Most of the mechanical buttons act as deep-sleep wake sources, which means their key press is debounced during deep sleep. However, the debounce logic in GPIO is not in Always ON (AO) domain and hence they are not available during deep sleep. So to enable debouncing of mechanical key press during deep sleep, few balls that act as wake source go through debounce circuit present in PMC during deep sleep to filter out glitches. It is recommended that mechanical switches are connected to these pads.

The following wake pads have these capabilities:

- BUTTON_POWER_ON
- BUTTON_VOL_UP
- BUTTON_VOL_DOWN
- BUTTON_SLIDE_SW
- BUTTON_HOME

9.10 GPIO Controller

The GPIO controller for Tegra X1 devices provides the tools for configuring each MPIO for use as a software-controlled GPIO.

The GPIO controller is divided into 8 banks. Each bank handles the GPIO functionality for up to 32 MPIOs. Within a bank, the GPIOs are arranged as four ports of 8 bits each. The ports are labeled consecutively from A through Z and then AA through FF. Ports A through D are in bank 0. Ports E through H are in bank 1. In total, there are approximately 170 GPIOs, (however, approximately 170 physical GPIOs are available in the chip), and the banking and numbering conventions will have some break in between but will maintain backward compatibility in register configurations for the GPIOs as that of previous generation chips.

Note: *Refer to the "Pin Descriptions" section in NVIDIA Tegra X1 Processors Data Sheet (DS-07224-001) for a map of each of the Tegra X1 device MPIO pads to a particular GPIO port and bit. See the column labeled "GPIO."*

Each GPIO can be individually configurable as Output/Input/Interrupt sources with level/edge controls.

GPIO configuration has a lock bit controlling every bit separately. When the LOCK bit is set, the associated control aspects of the bits (for example, whether it is an Output/Input or used as GPIO or SFIO or values driven) cannot be modified (locked). The LOCK bit gets cleared only by system reset; it is sticky. This bit can be used for security-related functionality where an authorized entity owning the GPIO can set the configuration and lock it. The lock bit also covers the GPIO output value, so this may not be varied dynamically once lock is enabled.

The GPIO controller also has masked-write registers. Values written to these registers specify both a mask of bits to be updated in the underlying state (the mask bits are not sticky) as well as new values for that state. Individual bits of the state can be updated without the need for a read-modify-write sequence. Thus different portions of software can modify the GPIO controller state without coordination.

9.10.1 GPIOs in Loopback Mode

In the specific case of when the GPIO status is polled back because of debugging or other such reasons, the following restrictions arise:

1. If the GPIO output is actively driven the software can immediately poll:
   a. Configure the pin as GPIO output/input.
   b. Drive the output value Active 0 or Active 1.
   c. Poll the input i.e. the same pin or some other pin depending on the loopback configuration.
2. If the GPIO output is configured with the weak internal pull-up or pull-down, then software cannot immediately poll the pin value because the internal pull-up/pull-down have an impedance of around 100K for the pad and the charge/discharge RC delays will govern the time at which the output can be successfully polled. This means the software has to introduce a delay before polling. Conservatively, taking the value of 100K, then 10pF gives RC delays of ~1 µs. The usual required waiting time is 5 RC delays so in the order of 5 µs. To accommodate all the production spread of silicon, software should put a 20 us waiting delay in such cases:
   a. Configure the pin as GPIO output/input.
   b. Bring the output value to weak pull-up or pull-down.
   c. Wait for 20 µs.
   d. Poll the input i.e. the same pin or some other pin depending on the loopback configuration.

9.10.2 Debouncing GPIOs

Tegra X1 devices provide debouncing capabilities for GPIOs. The default is debouncing disabled.

Debouncing logic consists of an Input Synchronizer, Edge Detectors, and Debouncing Counter. Debouncing logic operates off of a 32K clock. The 32K clock is taken as input to the GPIO module.

The debouncing threshold is common to all 8 GPIO pins in a port. The debouncing interval provided is in the order of 128 ms.

The reserved space locations in the existing address space provides debounce control like threshold whether Debounce is enabled or not.

Since the GPIO is not active during deep sleep, the debounce logic is not active during deep sleep. A different debounce logic is used in the PMC for deep sleep wakes that need to be debounced.

9.11 VGPIO Controller

Note: *The VGPIO controller function is not supported.*

The VGPIO controller supports four 8-bit general-purpose input/output ports (port A through port D). These ports allow system designers to map VGPIO signals onto unused individual functional pins which might not be present in the same device. This provides a means to virtualize various pins that cannot be mapped in the same package and have to be moved to a companion device.

The VGPIO_VIN_EN.A – D inputs control the module to select inputs between CPU configured (when in GPIO mode) and system side port status (virtual pin). When this bit is 0, the pin is driven LOW or HIGH according to the state of the OUT bit in the VGPIO_OUT.REG.A – D registers. When this bit is '1', the state is directly taken from a port.

The IN bit of the VGPIO_IN.REG.A – D registers contain the registered input values configured by the ACPI.

9.11.1 VGPIO Features

- Interrupts are programmable on each individual VGPIO pin
- Can act as a GPIO as well as a virtual pin
- Separate interrupt status for input and output directions
- Interrupt levels also programmable
- All pin configurations are independent of the other pins
- Masked-write registers

Each port has a set of eight 8-bit configuration registers, which are used for:

- Receiving the input via ACPI software.
- Enabling interrupts
- Checking status
- Clearing interrupts

In addition, each of these eight registers has a 16-bit version for masked writes.

9.11.2 VGPIO Mapping

Sidebands are available for SD Card Interfaces, and HDMI related pins are moved to Tegra. The USB connection to the controller goes through XUSB_PADCTL which is the wrapper module in Tegra X1 to direct the connection to appropriate USB controller. The XUSB_PADCTL has the appropriate configuration registers to redirect the signal to the correct controller.

Table 31: VGPIO Mapping

Pin Name	Direction	Width	VGPIO Mapping	Tegra X1 Top Level Connection
SDCARD_DETECT1	IN	1	VGPIO.vgpioc_sys_out[0]	Connect directly to appropriate SDMMC controller from either VGPIO or through Tegra GPIOs based on the select control to provide maximum flexibility to the platform.
SDCARD_WP1	IN	1	VGPIO.vgpioc_sys_out[1]	
SDCARD_DETECT2	IN	1	VGPIO.vgpioc_sys_out[2]	
SDCARD_WP2	IN	1	VGPIO.vgpioc_sys_out[3]	

Table 31: VGPIO Mapping

Pin Name	Direction	Width	VGPIO Mapping	Tegra X1 Top Level Connection
HDMI_HPD	IN	1		A direct pin is assigned in Tegra. Note: These indications can be routed to Tegra via primary pin in which case the APB_MISC_GP_VGPIO_GPIO_MUX_SEL_0 should be set to 0.
USB_ID	IN	1	VGPIO.vgpiod_sys_out[0]	Goes from VGPIO through XUSB_PADCTL which appropriately connects to the correct USB controller. Also the USB controller has provided software override to provide more flexibility
USB_ID_A	IN	1	VGPIO.vgpiod_sys_out[1]	
USB_ID_B	IN	1	VGPIO.vgpiod_sys_out[2]	
USB_ID_C	IN	1	VGPIO.vgpiod_sys_out[3]	
USB_OC	IN	1		Provided in Tegra and over loaded with USB_VBUS_EN
USB_B_VLD	IN	1	VGPIO.vgpiod_sys_out[5]	Goes from VGPIO through XUSB_PADCTL which appropriately connects to the correct USB controller. Also the USB controller has provided software override to provide more flexibility
VBUS_WAKEUP	IN	1	VGPIO.vgpiod_sys_out[6]	
VBUS_VLD	IN	1	VGPIO.vgpiod_sys_out[7]	
USB_OTG_PPE (VBUS_ENABLE)	OUT	1		Dedicated Tegra I/Os are provided for VBUS_ENABLE, i.e., USB_VBUS_EN0 & USB_VBUS_EN1
USB2_PPE (VBUS_ENABLE)	OUT	1		
V_GPIO0-7	IN/OUT	8	VGPIO.Port A	Software directly controls it through MMPIO read/write

9.12 Programming Considerations

9.12.1 Pads in Open Drain Mode

Open Drain Pads are used to emulate wired and functionality. The multiple drivers can be shorted on the board with an external pullup. These pads do not drive Active 1, but drives Active 0 or floats the pin. The external onboard pullup takes care of ensuring the correct value on the node (i.e. if all the drivers are floating it is at Logic1; if any of the drivers are driving Active 0, it is at Logic0. Therefore, these pads require a different programming sequence. Any logic (either functional or software based GPIO) should never put pads to Active 1. Both the ST pads and DD pads can operate in Open Drain Mode. But the DD pads have specific control to tolerate the IO swing of 3.3 V.

1. Configure the Pad for 3.3 V swing tolerance by driving the E_IO_HV pin (controlled through Pinmux register) to Logic1.

9.12.2 Controller Instances with Multiple Pin-outs

Several of the I/O controller instances on a Tegra X1 device have more than one pin-out. That is, the controller can communicate with the outside world via more than one set of pins. Special care is warranted when programming the Pinmux controller for these SFIOs. For a given signal on a given controller's interface, only a single pin-out should be selected in the pinmux registers.

The following is the generic procedure to handle multiple pins. For example, assume an output signal from a controller is available on four pins. Depending on the value programmed into the corresponding pinmux registers, each of those four pins might toggle when the controller is sending data. Whichever pin requires this functionality, that pinmux register should be enabled and associate with the controller.

Similarly, if an input signal to the controller is available on four pins then depending on the value programmed into the corresponding pinmux registers, the controller might see the logical-OR of the signal on those four pins. This scenario will almost certainly lead to data corruption. To avoid this, the pinmux registers for the other three pins should be programmed to some other function or disabled through E_INPUT kept at ZERO.

To ensure for controllers whose input can be programmed to sample from multiple pads we must ensure the value driven to the core from the pad is at a constant even if the pads are floating (i.e., unused pin). This is achieved by setting the bit in the

APB_MISC_PP_PINMUX_GLOBAL_0_0 register. Because the default value of TRISTATE/PARKED control in Pinmux is set to Logic 1, it ensures the inputs to the core are clamped at ZERO. The above setting will ensure the input to the core from Pinmux is at Logic 0 irrespective of pinmux configuration. This is as good as setting E_INPUT of the pads to Logic 0 before configuring appropriate pinmux configurations.

9.12.3 Resume From Deep Sleep

As the Tegra X1 device enters Deep Sleep, most of its register state is lost. In particular the pinmux, GPIO, and pad control registers lose their state during deep sleep (LP0). LP0 exit software restores pinmux values, etc. CPU drivers are responsible for reprogramming the I/O controllers, etc. upon resume from deep sleep.

9.12.4 Unused Pins

For each unused MPIO, assert its tristate (TRISTATE_CONTROL) bit and disable its input buffer (E_INPUT) bit. Disable the Pullup/Pull down control to minimize the unnecessary power consumption on the unused pins.

If all of the pins in a pad-control group are unused, set the drive strengths and slew rates to minimum.

If all of the pins on a power-rail are unused, assert E_NOIOPOWER for that rail in the PMC registers.

9.12.5 Security Considerations for the Pinmux Register

Though attacks via Pinmux are mostly Denial Of Service (DoS) attacks, there are specific cases which are a concern, for example:

- Pins interfacing with Platform PMICs (by reprogramming those pinmuxes, one can cause severe user disruption)
- Any I/O device that is transferring secret data (typically like Serial PROMs having keys). By reprogramming the pinmux, it is possible to redirect the data to wrong interface

In such cases, it is better to make use of the LOCK bit in the Pinmux control register so that values cannot be tampered with. Each I/O can be individual locked or unlocked. The Boot Loader can perform this task so that customer software does not have to configure those pins. As part of deep sleep (LP0) exit, the lock bit will have to be re-enabled, because the lock is not retained across deep sleep. Since LP0 exit sequence has multipass iterations, setting the lock bit has to happen on the last pass to ensure all bits are retrieved correctly. Similarly, the GPIO controller has a lock bit for each GPIO to preserve the configuration, value driven, and also the pin is configured as GPIO or SFIO. The configuration can be protected using the lock bit in the GPIO register. This way secure software such as a Boot Loader can ensure that certain pins have the required configuration, irrespective of the actions of less secure software.

9.12.6 Drive Strengths

For all pads that do not have corresponding calibration pads, the drive strength has to be programmed. The common default value assumed for the pad drive impedance is 50 ohms and hence pads have to be programmed with a code that can give 50 ohm impedance. Because the code depends on VDDP, i.e., I/O rail, and also PVT (Process, Voltage and Temperature) corners default a code corresponding to TT-NV-NT (Typical process, Normal Voltage, and Normal Temperature) corner as a function of VDDP voltage is chosen.

In Tegra X1 devices, the primary boot device (SDMMC4) has an auto-calibration option. Thus those pads get an impedance code that matches the PVT conditions, etc. and hence enable the boot process. For all other MPIO pads (which are not involved during boot), the BCT can have a value of the code based on the I/O rail and pad data sheet. The same is programmed by the Boot Loader or any platform-specific software, and it overrides the default Power on Reset values. If the values have to be changed based on SI results, then the same can be loaded in the primary device.

9.13 GPIO Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

Each port of each GPIO controller has several registers for the control and monitoring of the port's 8 GPIO pins. The registers provide per-pin control of the following features:

- GPIO_CNF_* / GPIO_MSK_CNF — Select SPIO or GPIO
- GPIO_OE_* / GPIO_MSK_OE_* — Output Enable
- GPIO_OUT_* / GPIO_MSK_OUT_* — GPIO Output Value
- GPIO_IN_* — GPIO Input Value (Read Only)
- GPIO_INT_STA_* / GPIO_MSK_INT_STA_* — GPIO Interrupt Status
- GPIO_INT_ENB_* / GPIO_MSK_INT_ENB_* — Interrupt Enable
- GPIO_INT_LVL_* / GPIO_MSK_INT_LVL_* — Interrupt Selection (Edge/Level)
- GPIO_INT_CLR_* — Interrupt Flag Set-to-Clear
- GPIO_DB_CNT_* — Debounce Counter

Many of the control registers are accessible from two offsets. Accesses to the lower offsets affect all 8 pins for the GPIO port. Accesses to the upper offsets provide a per-pin mask capability allowing adjustments to a subset of the pins. Using the upper offsets can eliminate the need for Read-Modify-Write operations. For example, a write to GPIO_MSK_CNF can substitute for a Read-Modify-Write of GPIO_CNF.

Table 32: GPIO Register Address Map

Register Name	Offset (Lower: Read-Modify-Write)				Offset (Upper: Per-Pin Mask Write)			
GPIO Controller 1 – Port	**A**	**B**	**C**	**D**	**A**	**B**	**C**	**D**
GPIO_CNF_[0/1/2/3]	000	004	008	00C	080	084	088	08C
GPIO_OE_[0/1/2/3]	010	014	018	01C	090	094	098	09C

Table 32: GPIO Register Address Map

Register Name	Offset (Lower: Read-Modify-Write)				Offset (Upper: Per-Pin Mask Write)			
GPIO_OE_[0/1/2/3]	710	714	718		790	794	798	

In Tegra X1 devices, E_LPBK for SDMMC1_CLK and SDMMC3_CLK pads have a default value of 1. Enabling E_LPBK makes Zi = A (bypassing the I/O). To use this pad as INPUT, E_LPBK has to be programmed to 0. This can be achieved by programming the following registers:

- APB_MISC_GP_SDMMC1_CLK_LPBK_CONTROL_0 for sdmmc1_clk pad
- APB_MISC_GP_SDMMC3_CLK_LPBK_CONTROL_0 for sdmmc3_clk pad

Note:

- SDMMC1_CLK pad is connected to pin '0' of port M in GPIO
- SDMMC3_CLK pad is connected to pin '0' of port P in GPIO

9.13.1 GPIO_CNF_0

Designates whether each pin operates as a GPIO or as an SFIO. By default all pins come up in SFIO mode. These can be programmed to GPIO mode at any stage.

Lock bits are used to control the access to the CNF and OE registers. When set, no one can write to the CNF and OE bits. They can be programmed ONLY during Boot and get reset by chip reset only.

This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port A - D Configuration Registers

Offset: 0h..fh | Read/Write: R/W | Reset: 0b0000000000000000

Bit	Reset	Description
15	DISABLE	LOCK_7: Lock access to pin 7 CNF, OE and OUT 0 = DISABLE 1 = ENABLE

0	0x0	BIT_0: Configures each pin to be in either GPIO or SFIO mode 0 = SPIO 1 = GPIO

9.13.2 GPIO_OE_0

GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid.

The set of registers below are used to either drive the signal out or as an Input. This needs to be programmed depending upon whether the pin needs to be in either Input or Output.

This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Enable Registers

Offset: 10h..1fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = TRI_STATE 1 = DRIVEN
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN

9.13.3 GPIO_OUT_0

GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be valid. This register will take affect only in GPIO mode. This register is used to drive the value out on a given pin.

This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Output Value Registers (Read/Write)

Offset: 20h..2fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
6	0x0	BIT_6: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
5	0x0	BIT_5: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
4	0x0	BIT_4: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
3	0x0	BIT_3: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
2	0x0	BIT_2: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
1	0x0	BIT_1: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
0	0x0	BIT_0: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH

9.13.4 GPIO_IN_0

GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. This is a read-only register used to read the value from the pin. This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Input Value Registers (Read Only)

Offset: 30h..3fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = LOW 1 = HIGH
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH

Bit	Reset	Description
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH

All GPIO inputs can be independently programmed to generate an interrupt request.

In addition, the individual trigger level for interrupt on each input pin can be programmed as either active-on-high or active-on-low. For example, to program an active-on-high interrupt on bit 3 of GPIO-PORT_C, write '1' into bit 3 of GPIO_INT.LVL.C register (this sets the interrupt to be active-on-high), and then write '1' into bit 3 of GPIO_INT.ENB.C (this enables interrupt on the named bit).

The interrupt flag status can be read in the appropriate bit of the GPIO_INT.STA.C register. Once the programmed interrupt occurs, status should be cleared by writing into the appropriate bit of the GPIO_INT.CLR.C register. Note that the interrupt thus generated is routed to the processor only if the corresponding bit for GPIO interrupts in the Secondary interrupt controller is enabled.

9.13.5 GPIO_INT_STA_0

GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. Every GPIO pin generates an Interrupt when switching from Low-High to High-Low. Interrupt status for each port is saved in an Interrupt status register.

This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Interrupt Status Registers

Offset: 40h..4fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE

Bit	Reset	Description
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE

9.13.6 GPIO_INT_ENB_0

Every bit of the GPIO pin has an enable which, when enabled, routes the Interrupt to the Interrupt controller. This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Interrupt Enable Registers

Offset: 50h..5fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE

9.13.7 GPIO_INT_LVL_0

The GPIO can detect an interrupt for any edge- or level-sensitive signal.

This is an array of 4 identical register entries; the register fields below apply to each entry

GPIO Port Interrupt Activation Level Registers

Offset: 60h..6fh | Read/Write: R/W | Reset: 0b00000000000000000000000000

Bit	Reset	Description
23	0x0	DELTA_7: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
22	0x0	DELTA_6: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
21	0x0	DELTA_5: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
20	0x0	DELTA_4: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
19	0x0	DELTA_3: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
18	0x0	DELTA_2: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
17	0x0	DELTA_1: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
16	0x0	DELTA_0: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
15	0x0	EDGE_7: 1 means Configure as Edge-Triggered Interrupt

13	0x0	EDGE_5: 1 means Configure as Edge-Triggered Interrupt
12	0x0	EDGE_4: 1 means Configure as Edge-Triggered Interrupt
11	0x0	EDGE_3: 1 means Configure as Edge-Triggered Interrupt
10	0x0	EDGE_2: 1 means Configure as Edge-Triggered Interrupt
9	0x0	EDGE_1: 1 means Configure as Edge-Triggered Interrupt
8	0x0	EDGE_0: 1 means Configure as Edge-Triggered Interrupt
7	0x0	BIT_7: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
6	0x0	BIT_6: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
5	0x0	BIT_5: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
4	0x0	BIT_4: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
3	0x0	BIT_3: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
2	0x0	BIT_2: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
1	0x0	BIT_1: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
0	0x0	BIT_0: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH

9.13.8 GPIO_INT_CLR_0

This write-only register clears the Interrupts that are set. This is valid only in GPIO mode when GPIO_INT.ENB is set.

This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Interrupt Flag Set-to-Clear Registers

Offset: 70h..7fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR

9.13.9 GPIO_MSK_CNF_0

Each register is provided with an individual 16-bit version for enabling Masked Writes to avoid a Read-Modify-Write operation by the firmware. The exception is for the interrupt clear register, whose functionality is combined in the interrupt status register. Individual pins only can be programmed by suitably enabling the write masks in the upper byte of these 16-bit registers.

This is an array of 4 identical register entries; the register fields below apply to each entry.

MASKED PRIMARY GPIO/SFIO Config Registers (Masked Writes)

Offset: 80h..8fh | Read/Write: R/W | Reset: 0b0000000000000000

Bit	R/W	Reset	Description
15	WO	0x0	MSK7: 0=Disable bit for write 0 = DISABLE 1 = ENABLE
14	WO	0x0	MSK6: 0=Disable bit for write 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description

9.13.22 GPIO_DB_CNT_P3_0

GPLO PORT 3 Debounce Control Register

Offset: 0xfc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	P3_DBC_CNT: Debounce count. This value sets the debounce count with respect to 1ms period. The interval is associated with the input transitions to capture the input after the specific Debouncing period is over. 0 = No debounce N = N ms

9.14 VGPIO Registers

Each VGPIO Controller has four 8-bit VGPIO interfaces. Each pin can be programmed independently.

A VGPIO interrupt can be enabled, status checked, and cleared for any of these pins individually, the interrupt trigger level being programmable. Each port has a set of eight 8-bit registers, for enabling output, receiving the input, and finally, for enabling the interrupt, checking the status, and clearing the interrupt.

Each of these eight registers has a 16-bit version for masked writes to avoid doing a Read-Modify-Write. The interrupt clear register is an exception to this; its functionality is combined in the interrupt status register.

Each port of each VGPIO controller has several registers for the control and monitoring of the port's 8 VGPIO pins. The registers provide per-pin control of the following features:

- VGPIO_LCK — Lock bits for OE
- VGPIO_OE_* / GPIO_MSK_OE_* — Output Enable
- VGPIO_OUT_* / GPIO_MSK_OUT_* — VGPIO Output Value
- VGPIO_IN_*/ GPIO_MSK_IN_* — VGPIO Input Value (Read/Write)
- VGPIO_INT_STA_* /VGPIO_MSK_INT_STA_* — VGPIO Interrupt Status
- VGPIO_INT_ENB_* /VGPIO_MSK_INT_ENB_* — Interrupt Enable

- VGPIO_INT_LVL_* Interrupt Selection (Edge/Level)
- VGPIO_INT_CLR_* Interrupt Flag Set-to-Clear
- VGPIO_INT_STA_ACPI_*/VGPIO_MSK_INT_STA_ACPI* V-GPIO ACPI Interrupt Status
- VGPIO_INT_CLR_ACPI_* ACPI Interrupt Flag Set-to-Clear

Many of the control registers are accessible from two offsets. Accesses to the lower offsets affect all 8 pins for the VGPIO port. Accesses to the upper offsets provide a per-pin mask capability allowing adjustments to a subset of the pins. Using the upper offsets can eliminate the need for Read-Modify-Write operations. For example, a write to VGPIO_MSK_OUT can substitute for a Read-Modify-Write of VGPIO_OUT.

Table 33: VGPIO Register Address Map

Register Name	Offset (Lower: Read-Modify-Write)				Offset (Upper: Per-Pin Mask Write)			
GPIO Controller 1 – Port	**A**	**B**	**C**	**D**	**A**	**B**	**C**	**D**
VGPIO_LCK	000	004	008	00C				
VGPIO_OE	010	014	018	01C	090	094	098	09C
VGPIO_OUT	020	024	028	02C	0A0	0A4	0A8	0AC
VGPIO_IN	030	034	038	03C	0B0	0B4	0B8	0BC
VGPIO_INT_STA	040	044	048	04C	0C0	0C4	0C8	0CC
VGPIO_INT_ENB	050	054	058	05C	0D0	0D4	0D8	0DC
VGPIO_INT_LVL	060	064	068	06C				
VGPIO_INT_CLR	070	074	078	07C				
VGPIO_INT_STA_ACPI	100	104	108	10C	180	184	188	18C
VGPIO_INT_CLR_ACPI	110	114	118	11C				

Note that the Address map is kept exactly the same as GPIO except for an additional two registers (last two) specific to the ACPI driver only.

9.14.1 VGPIO_LOCK_0

Lock bits are used to control the access to OE and OUT registers. When the lock bits are set, no one can write to OE and OUT bits. These can be programmed ONLY during Boot and get reset by chip reset only; that is, once set, the lock bits can be cleared only by applying chip reset.

VGPIO Port A - D Lock Bits (Read/Write)

Offset: 0x0..0xf | Read/Write: R/W | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxx00000000xxxxxxxx)

Bit	R/W	Reset	Description
15	RW	DISABLE	LOCK_7: Lock access to pin 7 OE and OUT 0 = DISABLE (i.e., OE and OUT bits unlocked, can be written) 1 = ENABLE (i.e., OE and OUT bits locked, cannot be written)
14	RW	DISABLE	LOCK_6: Lock access to pin 6 OE and OUT 0 = DISABLE 1 = ENABLE

9	RW	DISABLE	LOCK_1: Lock access to pin 1 OE OUT 0 = DISABLE 1 = ENABLE
8	RW	DISABLE	LOCK_0: Lock access to pin 0 OE and OUT 0 = DISABLE 1 = ENABLE
7	RO	X	RES_7: Lock access to each pin
6	RO	X	RES_6: Lock access to each pin
5	RO	X	RES_5: Lock access to each pin
4	RO	X	RES_4: Lock access to each pin
3	RO	X	RES_3: Lock access to each pin
2	RO	X	RES_2: Lock access to each pin
1	RO	X	RES_1: Lock access to each pin
0	RO	X	RES_0: Lock access to each pin

9.14.2 VGPIO_OE_0

The set of registers below is used to enable the VGPIO output interrupt (ACPI interrupt). The interrupt can be due to the VGPIO_OUT register or a virtual pin depending on the VGPIO_VIN_EN setting. This needs to be programmed depending upon whether the pin is either Input or Output.

This is an array of 4 identical register entries; the register fields below apply to each entry.

VGPIO Port A - D Output Enable Registers (Read/Write)

Offset: 0x10..0x1f | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7	0x0	BIT_7: 0 = ACPI interrupt disabled 1 = ACPI interrupt enabled
6	0x0	BIT_6: 0 = ACPI interrupt disabled 1 = ACPI interrupt enabled
5	0x0	BIT_5: 0 = ACPI interrupt disabled 1 = ACPI interrupt enabled
4	0x0	BIT_4: 0 = ACPI interrupt disabled 1 = ACPI interrupt enabled
3	0x0	BIT_3: 0 = ACPI interrupt disabled 1 = ACPI interrupt enabled
2	0x0	BIT_2: 0 = ACPI interrupt disabled 1 = ACPI interrupt enabled
1	0x0	BIT_1: 0 = ACPI interrupt disabled 1 = ACPI interrupt enabled
0	0x0	BIT_0: 0 = ACPI interrupt disabled 1 = ACPI interrupt enabled

9.14.3 VGPIO_OUT_0

VGPIO_OE.x=1 (VGPIO output enabled) must be true for this register to be valid. This register will take affect only in VGPIO mode. This register is used to drive the output interrupt (ACPI interrupt).

This is an array of 4 identical register entries; the register fields below apply to each entry.

VGPIO Port A-D Output Value Registers (Read/Write)

Offset: 0x20.0x2f | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7	0x0	BIT_7: VGPIO_VIN_EN.x=0 (in VGPIO mode) AND VGPIO_OE.x=1 (VGPIO output enabled) must be true for this to be a valid state. 0 = LOW 1 = HIGH

5	0x0	BIT_5: VGPIO_VIN_EN.x=0 (in VGPIO mode) AND VGPIO_OE.x=1 (VGPIO output enabled) must be true for this to be a valid state. 0 = LOW 1 = HIGH
4	0x0	BIT_4: VGPIO_VIN_EN.x=0 (in VGPIO mode) AND VGPIO_OE.x=1 (VGPIO output enabled) must be true for this to be a valid state. 0 = LOW 1 = HIGH
3	0x0	BIT_3: VGPIO_VIN_EN.x=0 (in VGPIO mode) AND VGPIO_OE.x=1 (VGPIO output enabled) must be true for this to be a valid state. 0 = LOW 1 = HIGH
2	0x0	BIT_2: VGPIO_VIN_EN.x=0 (in VGPIO mode) AND VGPIO_OE.x=1 (VGPIO output enabled) must be true for this to be a valid state. 0 = LOW 1 = HIGH
1	0x0	BIT_1: VGPIO_VIN_EN.x=0 (in VGPIO mode) AND VGPIO_OE.x=1 (VGPIO output enabled) must be true for this to be a valid state. 0 = LOW 1 = HIGH
0	0x0	BIT_0: VGPIO_VIN_EN.x=0 (in VGPIO mode) AND VGPIO_OE.x=1 (VGPIO output enabled) must be true for this to be a valid state. 0 = LOW 1 = HIGH

9.14.4 VGPIO_IN_0

This register stores the input pin value, used by the ACPI driver to copy the value from the PMIC pin.

This is an array of 4 identical register entries; the register fields below apply to each entry.

VGPIO Port A-D Input Value Registers (Read/Write)

Offset: 0x30..0x3f | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7	0x0	BIT_7: Input value 0 = LOW 1 = HIGH
6	0x0	BIT_6: Input value 0 = LOW 1 = HIGH

Bit	Reset	Description
5	0x0	BIT_5: Input value 0 = LOW 1 = HIGH
4	0x0	BIT_4 Input value 0 = LOW 1 = HIGH
3	0x0	BIT_3: Input value 0 = LOW 1 = HIGH
2	0x0	BIT_2: Input value 0 = LOW 1 = HIGH
1	0x0	BIT_1: Input value 0 = LOW 1 = HIGH
0	0x0	BIT_0: Input value 0 = LOW 1 = HIGH

9.14.5 VGPIO_INT_STA_0

All VGPIO inputs can be programmed to generate an interrupt request (CPU or ACPI). This configuration is also independent of that of the other pins.

In addition, the individual trigger-level for interrupt on each input can be programmed as either active-on-high or active-on-low. For example, to program an active-on-high interrupt on bit 3 of VGPIO-PORT_C, write '1' into bit 3 of the VGPIO_INT.LVL.C register (this sets the interrupt to be active-on-high), and then write '1' into bit 3 of VGPIO_INT.ENB.C (this enables interrupt on the named bit).

The interrupt flag status can be read in the appropriate bit of the VGPIO_INT.STA.C register by the CPU. When the programmed interrupt occurs, status should be cleared by writing into the appropriate bit of the VGPIO_INT.CLR.C register. Note that the interrupt generated will be routed to the processor only if the corresponding bit for VGPIO interrupts in the secondary interrupt controller is enabled.

The interrupt controls also apply to the Interrupt generation logic for the ACPI. All controls are shared except the enable ‘VGPIO_INT.ENB’. Instead the VGPIO_OEx is used to enable the interrupt for the ACPI. Also the flag status is read in the VGPIO_INT_STA_ACPI bits by the ACPI software. When the programmed interrupt occurs, status should be cleared by writing into the appropriate bit of the VGPIO_INT_CLR_ACPI register

VGPIO Port A-D Interrupt Status Registers

VGPIO_INT.ENB.x=1 must be true for this condition to be valid.Every VGPIO pin generates an Interrupt when switching from Low-High to High-Low.The Interrupt status for each port is saved in Interrupt status registers.

This is an array of 4 identical register entries; the register fields below apply to each entry.

Offset: 0x40..0x4f | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7	0x0	BIT_7: VGPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE

9.14.6 VGPIO_INT_ENB_0

Every VGPIO pin has an associated enable bit, which when enabled, routes the Interrupt to the CPU interrupt controller.

This is an array of 4 identical register entries; the register fields below apply to each entry.

VGPIO Port A-D Interrupt Enable Registers

Offset: 0x50..0x5f | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7	0x0	BIT_7: Enables the interrupt for VGPIO_IN registers 0 = DISABLE 1 = ENABLE
6	0x0	BIT_6: Enables the interrupt for VGPIO_IN registers 0 = DISABLE 1 = ENABLE
5	0x0	BIT_5: Enables the interrupt for VGPIO_IN registers 0 = DISABLE 1 = ENABLE
4	0x0	BIT_4: Enables the interrupt for VGPIO_IN registers 0 = DISABLE 1 = ENABLE
3	0x0	BIT_3: Enables the interrupt for VGPIO_IN registers 0 = DISABLE 1 = ENABLE
2	0x0	BIT_2: Enables the interrupt for VGPIO_IN registers 0 = DISABLE 1 = ENABLE
1	0x0	BIT_1: Enables the interrupt for VGPIO_IN registers 0 = DISABLE 1 = ENABLE
0	0x0	BIT_0: Enables the interrupt for VGPIO_IN registers 0 = DISABLE 1 = ENABLE

9.14.7 VGPIO_INT_LVL_0

VGPIO can detect an interrupt for any Edge /Trigger/Level signals. The following register bits [7:0] are set when a Level signal toggles.

Bits [15:8] toggles whenever an Edge changes from High to Low.

Bits [15:8] toggles whenever an Edge changes from High to Low or Low to High

This is an array of 4 identical register entries; the register fields below apply to each entry

VGPIO Port A-D Interrupt Activation Level Registers

Offset: 0x60..0x6f | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000000000000000000000)

Bit	Reset	Description
23	0x0	DELTA_7: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
22	0x0	DELTA_6: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
21	0x0	DELTA_5: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
20	0x0	DELTA_4: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
19	0x0	DELTA_3: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
18	0x0	DELTA_2: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
17	0x0	DELTA_1: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
16	0x0	DELTA_0: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
15	0x0	EDGE_7: 1 means Configure as Edge-Triggered Interrupt
14	0x0	EDGE_6: 1 means Configure as Edge-Triggered Interrupt
13	0x0	EDGE_5: 1 means Configure as Edge-Triggered Interrupt
12	0x0	EDGE_4: 1 means Configure as Edge-Triggered Interrupt
11	0x0	EDGE_3: 1 means Configure as Edge-Triggered Interrupt
10	0x0	EDGE_2: 1 means Configure as Edge-Triggered Interrupt
9	0x0	EDGE_1: 1 means Configure as Edge-Triggered Interrupt
8	0x0	EDGE_0: 1 means Configure as Edge-Triggered Interrupt
7	0x0	BIT_7: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
6	0x0	BIT_6: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
5	0x0	BIT_5: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
4	0x0	BIT_4: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
3	0x0	BIT_3: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
2	0x0	BIT_2: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
1	0x0	BIT_1: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
0	0x0	BIT_0: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH

9.14.8 VGPIO_INT_CLR_0

This write-only register clears the CPU Interrupts that are set. This is valid only in VGPIO mode and when VGPIO_INT.ENB is set.

This is an array of 4 identical register entries; the register fields below apply to each entry.

VGPIO Port A-D Interrupt (CPU) Flag Set-to-Clear Registers

Offset: 0x70..0x7f | Read/Write: WO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7	0x0	BIT_7: VGPIO mode and VGPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
6	0x0	BIT_6: VGPIO mode and VGPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
5	0x0	BIT_5: VGPIO mode and VGPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
4	0x0	BIT_4: VGPIO mode and VGPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
3	0x0	BIT_3: VGPIO mode and VGPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
2	0x0	BIT_2: VGPIO mode and VGPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
1	0x0	BIT_1: VGPIO mode and VGPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
0	0x0	BIT_0: VGPIO mode and VGPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR

Each register is provided with an individual 16-bit version for enabling Masked Writes and to avoid a Read-Modify-Write operation by the firmware. The exception is for the interrupt clear register, whose functionality is combined in the interrupt status register. Individual pins only can be programmed by enabling the write masks in the upper byte of these 16-bit registers.

VGPIO A-D Masked Output Enable (Masked Writes)

This is an array of 4 identical register entries; the register fields below apply to each entry.

Offset: 0x90..0x9f | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	R/W	Reset	Description

CHAPTER 10: ACTIVITY MONITOR

This chapter describes the activity monitor (ACTMON) block. The ACTMON acts as a repository for activity indicators from various units, performs averaging of past samples, and indicates any abnormality in activity levels by sending an interrupt to software. Devices provide an idle/busy signal to the ACTMON block.

10.1 Functional Description

Activity monitoring is a means to dynamically measure the utilization of units in the system to help drive software power management policies. In Tegra processors, Dynamic Voltage and Frequency Scaling (DVFS) is used as a power management mechanism. It uses utilization information from various units to select an efficient voltage and frequency that the unit should operate at, while providing the requisite performance. Voltage change decisions are handled by this central software agent, but the unit frequency can be modulated in one of the following ways:

- The unit controls its own frequency - no need for activity monitoring support.
- The device driver controls the unit frequency based on calculated workload or hints from a user-level driver – no need for activity monitoring support.
- The device driver controls the unit frequency based on utilization information from a “unit ACTMON”.
- The central DVFS agent controls the unit frequency based on utilization information from a “central ACTMON”.

In addition to tracking utilization, activity monitoring is also used to provide hardware support to make the process of activity monitoring interrupt-driven instead of polling-based. This support is in the form of averaging, watermark detection, and histogram hardware. This reduces software overhead in procuring and tracking utilization data.

The ACTMON block has the following features:

- One 32-bit counter for each signaling device that accumulates activity counts.
- Running average computation for each counter over past N samples (N=128).
- Watermark breach detection logic for each counter. This is used to detect abrupt change in utilization.
- Interrupt-driven operation.

The DVFS thread can directly access and use the activity monitors to compute the target frequency (and consequently, voltage) for each unit for the next sampling interval.

The following table summarizes the Tegra X1 activity monitors.

Table 34: Activity Monitors

Module	Counter Description (Counter Width = 32 Bits)
A7AVP	Number of system clock cycles that A7AVP is in the halt state
AHB	Number of AHB clock cycles when no data transfer is detected on the bus. Can select one specific master or all of them.
APB	Number of APB clock cycles when no data transfer is detected on the bus. Can select one specific master or all of them.
CPU	Statistics for CPU frequency. The flow controller asserts a signal when ALL the cores are halted.
MC-ALL	Number of Memory Controller clock cycles when any (including CCPLEX) memory access event is detected. The MC toggles a signal to ACTMON every ‘W’ cycles.
MC-CPU	Number of MC clock cycles when any memory access event from CCPLEX is detected. MC toggles a signal to ACTMON every ‘W’ cycles.
VIC	Number of video pipe cycles when the pipe is empty. This is a unit ACTMON.
NVENC	Number of pipe cycles when the pipe is empty or the engine is seeing memory bottlenecks. This is a unit ACTMON.

Table 34: Activity Monitors

Module	Counter Description (Counter Width = 32 Bits)
NVJPEG	Number of pipe cycles when the pipe is empty or the engine is seeing memory bottlenecks. This is a unit ACTMON.
NVDEC	Number of pipe cycles when the pipe is empty or the engine is seeing memory bottlenecks. This is a unit ACTMON.

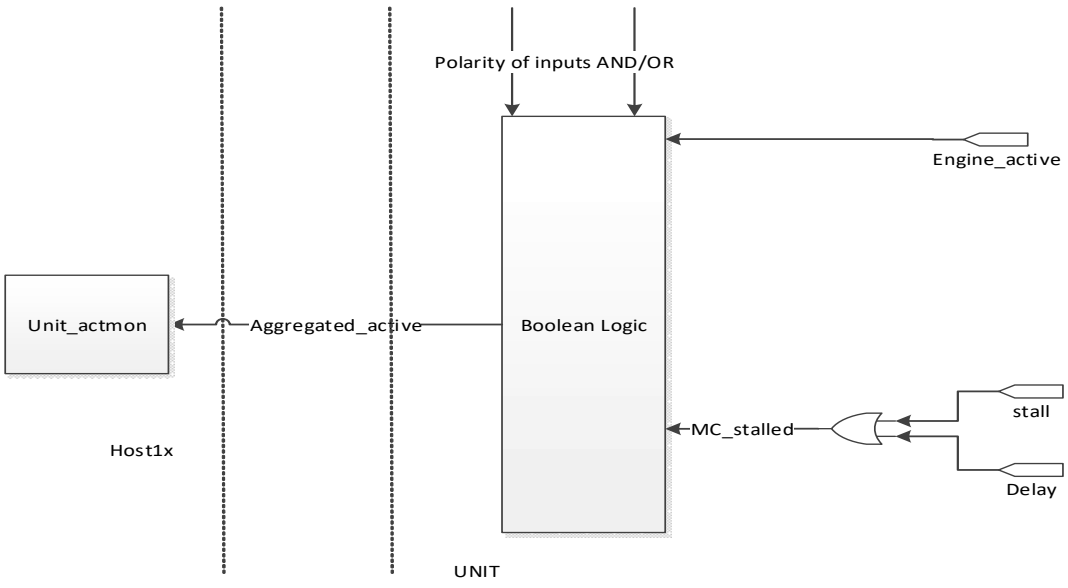
The table above assumes that the following units either run at a fixed frequency or do their own frequency management based on fixed workload, so they do not need central ACTMON support.

- VI/CSI (fixed)
- Display (workload-based, no monitors needed)
- Host (fixed)
- ISP (workload-based)
- NVENC (input-buffer based)
- VIC (utilization-based, uses per-unit ACTMON)
- SEC (fixed frequency)
- USB3 –Falcon (workload-based)
- MSELECT (frequency is based on other units and cannot be controlled independently)
- CPU Frequency: This ACTMON counts the CPU clock cycles. It has an edge detector and will count each edge of a divided CPU clock (1/1024). When the CPU is clock gated, the input will be zero. To prevent the ACTMON from breaching lower watermarks and interrupting software, software is expected to disable the ACTMON before going into clock gating or any other lower power state.

10.1.1 Enhancements to the Video Engine Unit ACTMONs for NVDEC/NVJPEG/NVENC

In Tegra X1 devices, unit ACTMONs for NVDEC/NVENC/NVJPG export an aggregated signal to the unit ACTMON in the Host1x controller as shown in the figure below.

Figure 13: Tegra X1 Video Engine Unit-ACTMON Implementation



The various signals in the above figure are described as follows:

- “Engine_active” goes HIGH for the ACTIVE cycle. This signal is asserted HIGH if any of the subunits of the engine is active.
- “Stall” goes HIGH when the engine is unable to issue a request to memory. (i.e., STALLED cycle)
- “Delay” goes HIGH when the engine is waiting for a read-response or write-acknowledge from memory.
- Hence, “MC_stalled” goes HIGH when the engine is stalled on memory or waiting for a response/acknowledge from memory.

The unit_ACTMON in the Host1x counts this Aggregated_active signal. The Aggregated active signal can be configured to be several things; a few examples are given below:

- Engine_active AND !(MC_stalled) – Only count cycles when the engine was active and not stalled on memory
- Engine_active – count cycles when the engine was active
- !(MC_stalled) – count cycles when the engine was not stalled on memory
- Engine_active AND MC_stalled – count cycles when the engine was active and stalled on memory

Devices such as MC, NVDEC, NVENC, NVJPG (unit ACTMON) operate at much higher frequencies than the ACTMON clock. Since ACTMON relies on idle/active pulses from these devices, a number of pulses will be dropped due to the slower ACTMON clock. To solve this problem, instead of sending active/idle for each clock, the device will toggle a signal for every ‘N’ active pulses of the device. (N is programmable). ACTMONs for such high-frequency devices will have an edge detector which will detect the toggle and update the corresponding counter by ‘N’. ‘N’ is the ratio of the device to ACTMON frequency and needs to be programmed by software into the client. Since the toggle rate of this signal is guaranteed to be slower than the ACTMON clock, no pulses will be missed.

The divided down CPU clock frequency is tracked using this ACTMON.

10.2 ACTMON Registers

Refer to “Reading Register Tables” in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

10.2.1 ACTMON GLB Status Register

10.2.1.1 ACTMON_GLB_STATUS_0

Offset: 0x0 | Read/Write: RO | Reset: 0xXX00XX00 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	CPU_INTR: CPU Monitor Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
30	X	COP_INTR: COP Monitor Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
29	X	AHB_INTR: AHB Monitor Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
28	X	APB_INTR: APB Monitor Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
27	X	CPU_FREQ_INTR: CPU Frequency Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
26	X	MCALL_INTR: MC_ALL Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR

Bit	Reset	Description
25	X	MCCPU_INTR: MC_CPU Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR: 1 = INTR
15	X	CPU_MON_ACT: CPU monitor active status. 1 = active 0 = INACTIVE 1 = ACTIVE
14	X	COP_MON_ACT: COP monitor active status. 1 = active 0 = INACTIVE 1 = ACTIVE
13	X	AHB_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE
12	X	APB_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE
10	X	CPU_FREQ_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE
9	X	MCALL_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE
8	X	MCCPU_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE

10.2.2 ACTMON Global Period Register

10.2.2.1 ACTMON_GLB_PERIOD_CTRL_0

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx000000000)

Bit	Reset	Description
8	0x0	SOURCE: 0 = MSEC: Sampling period time base in milliseconds 1 = USEC: Sampling period time base in microseconds
7:0	0x0	SAMPLE_PERIOD: Sampling period in milliseconds/microseconds (implemented as n+1 counter). Programming a 0 implies a 1 millisecond/microsecond sampling period.

10.2.3 CPU Registers

10.2.3.1 ACTMON_CPU_CTRL_0

Monitor Control Register

Offset: 0x80 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx110xxxxxxxxx)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by software to enable sampling. Cleared in one of the following ways: (a) When software intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detected. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled

Bit	Reset	Description
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches that need to occur to raise an interrupt 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for number of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled
21	0x0	AVG_ABOVE_WMARK_EN: Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled
20	0x0	AVG_BELOW_WMARK_EN: Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled
19	0x0	AT_END_EN: Enable interrupt at the end of sample period. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE: periodic mode is disabled, samples for only 1 period 1 = ENABLE: periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

10.2.3.2 ACTMON_CPU_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x84 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.3.3 ACTMON_CPU_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x88 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.3.4 ACTMON_CPU_INIT_AVG_0

Initial AVG value, specified by SW to set up the filter

Offset: 0x8c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.3.5 ACTMON_CPU_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x90 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.3.6 ACTMON_CPU_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x94 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.3.7 ACTMON_CPU_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x98 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.3.8 ACTMON_CPU_COUNT_0

Monitor Status0 Register

Offset: 0x9c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.3.9 ACTMON_CPU_AVG_COUNT_0

Monitor Status1 Register

Offset: 0xa0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.3.10 ACTMON_CPU_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0xa4 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt; writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt; writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected

Bit	Reset	Description
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect. 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected

10.2.4 COP Registers

10.2.4.1 ACTMON_COP_CTRL_0

Monitor Control Register

Offset: 0xc0 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx110xxxxxxxxxx)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by software to enable sampling. Cleared in one of the following ways: (a) When software intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detected. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for the Number of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
21	0x0	AVG_ABOVE_WMARK_EN: Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
20	0x0	AVG_BELOW_WMARK_EN: Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
19	0x0	AT_END_EN: Enable interrupt at the end of sample period. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE: periodic mode is disabled, samples for only 1 period 1 = ENABLE: periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

10.2.4.2 ACTMON_COP_UPPER_WMARK_0

Upper Watermark Register

Offset: 0xc4 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.4.3 ACTMON_COP_LOWER_WMARK_0

Lower Watermark Register

Offset: 0xc8 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.4.4 ACTMON_COP_INIT_AVG_0

Initial AVG value, specified by software to set up the filter

Offset: 0xcc | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.4.5 ACTMON_COP_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0xd0 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.4.6 ACTMON_COP_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0xd4 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.4.7 ACTMON_COP_COUNT_WEIGHT_0

Count Weight Register

Offset: 0xd8 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.4.8 ACTMON_COP_COUNT_0

Monitor Status0 Register

Offset: 0xdc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.4.9 ACTMON_COP_AVG_COUNT_0

Monitor Status1 Register

Offset: 0xe0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.4.10 ACTMON_COP_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0xe4 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected

10.2.5 AHB Registers

10.2.5.1 ACTMON_AHB_CTRL_0

Monitor Control Register

Offset: 0x100 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx1100000000000)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by software to enable sampling. Cleared in one of the following ways: (a) When software intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detected. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for the Number of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
21	0x0	AVG_ABOVE_WMARK_EN: Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
20	0x0	AVG_BELOW_WMARK_EN: Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
19	0x0	AT_END_EN: Enable interrupt at the end of sample period. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE: periodic mode is disabled, samples for only 1 period 1 = ENABLE: periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

Bit	Reset	Description
9:4	0x0	MONITOR_COND: Selection criteria on parent module for the activity signal, used only for APB/AHB monitors. Indicates which AHB master to monitor. All 1s means any master. 0 = CPU 1 = COP 2 = NA1 3 = CSITE 4 = ARC 5 = AHBDMA 6 = USB 7 = APBDMA 8 = NA2 9 = NA3 10 = NA4 11 = NA5 12 = NA6 13 = NA7 14 = SE 15 = DDS 16 = BSEA 17 = NA8 18 = USB2 19 = NA9 63 = ALL
3:0	0x0	SAMPLE_COND: Selection criteria on parent module for type of pulse signal, used only for APB/AHB monitor. 0 = AHB_MASTER_ACTIVE 1 = AHB_MASTER_SLAVE_ACTIVE 2 = AHB_DATA_XFER 3 = AHB_IDLE 4 = MASTER_IDLE 5 = AHB_BUSY 6 = DISABLE

10.2.5.2 ACTMON_AHB_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x104 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.5.3 ACTMON_AHB_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x108 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.5.4 ACTMON_AHB_INIT_AVG_0

Initial AVG value, specified by software to set up the filter

Offset: 0x10c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.5.5 ACTMON_AHB_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x110 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.5.6 ACTMON_AHB_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x114 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.5.7 ACTMON_AHB_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x118 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.5.8 ACTMON_AHB_COUNT_0

Monitor Status0 Register

Offset: 0x11c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.5.9 ACTMON_AHB_AVG_COUNT_0

Monitor Status1 Register

Offset: 0x120 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.5.10 ACTMON_AHB_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0x124 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected

Bit	Reset	Description
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected

10.2.6 APB Registers

10.2.6.1 ACTMON_APB_CTRL_0

Monitor Control Register

Offset: 0x140 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx1100000000000)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by SW to enable sampling. Cleared in one of the following ways: (a) When SW intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detected. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for the Number of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
21	0x0	AVG_ABOVE_WMARK_EN: Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
20	0x0	AVG_BELOW_WMARK_EN: Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
19	0x0	AT_END_EN: Enable interrupt at the end of sample period. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE: periodic mode is disabled, samples for only 1 period 1 = ENABLE: periodic mode is enabled, keeps on sampling and updating value after every sample period

Bit	Reset	Description
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.
9:4	0x0	MONITOR_COND: 0 = DTV 1 = I2C1 2 = I2C2 3 = I2C3 4 = I2C4 5 = DVC 6 = I2C6 7 = Unused, reserved 8 = Reserved 9 = SPI1 10 = SPI2 11 = SPI3 12 = SPI4 13 = SPI5 14 = SPI6 15 = QSPI 16 = UARTA 17 = UARTB 18 = UARTC 19 = UARTD 63 = ALL
3:0	0x0	SAMPLE_COND: Selection criteria on parent module for type of pulse signal, used only for APB/AHB monitor. 0 = PSEL_ACTIVE 1 = PREADY_ACTIVE 2 = PENABLE_PSEL_ACTIVE 3 = APB_IDLE 4 = DISABLE

10.2.6.2 ACTMON_APB_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x144 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.6.3 ACTMON_APB_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x148 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.6.4 ACTMON_APB_INIT_AVG_0

Initial AVG value, specified by SW to set up the filter

Offset: 0x14c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.6.5 ACTMON_APB_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x150 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.6.6 ACTMON_APB_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x154 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.6.7 ACTMON_APB_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x158 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.6.8 ACTMON_APB_COUNT_0

Monitor Status0 Register

Offset: 0x15c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.6.9 ACTMON_APB_AVG_COUNT_0

Monitor Status1 Register

Offset: 0x160 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.6.10 ACTMON_APB_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0x164 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected

Bit	Reset	Description
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected

10.2.6.11 ACTMON_APB_CTRL_SAPB_0

Monitor Interrupt Register

Offset: 0x168 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxx0000000000)

Bit	Reset	Description
9:4	0x0	MONITOR_COND_SAPB: Selection criteria on parent module for the activity signal, used only for APB/AHB monitors. 0 = APB2JTAG 1 = APE 2 = ATOMICS 3 = CEC 4 = CSITE 5 = DDS 6 = DP2 7 = DVFS 8 = EMC0 9 = EMC1 10 = EMCB 11 = FUSE 12 = HDA 13 = KFUSE 14 = LA 15 = MC0 16 = MC1 17 = MCB 18 = MIPICAL 19 = MISC 20 = PINMUX_AUX 21 = PMC 22 = PWM 23 = RTC 24 = SATA 25 = SATA_AUX 26 = SDMMC1 27 = SDMMC2 28 = SDMMC3 29 = SDMMC4 30 = SE 31 = SOC_THERM 32 = SECURE_REGS 33 = STM 34 = SYSCTR0 35 = SYSCTR1 36 = XUSB_DEV 37 = XUSB_HOST 38 = SUXB_PADCTL 63 = ALL

10.2.7.2 ACTMON_CPU_FREQ_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x184 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.7.3 ACTMON_CPU_FREQ_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x188 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.7.4 ACTMON_CPU_FREQ_INIT_AVG_0

Initial AVG value, specified by SW to set up the filter

Offset: 0x18c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.7.5 ACTMON_CPU_FREQ_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x190 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.7.6 ACTMON_CPU_FREQ_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x194 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.7.7 ACTMON_CPU_FREQ_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x198 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Weight value for count measurements.

10.2.7.8 ACTMON_CPU_FREQ_COUNT_0

Monitor Status0 Register

Offset: 0x19c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.7.9 ACTMON_CPU_FREQ_AVG_COUNT_0

Monitor Status1 Register

Offset: 0x1a0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.7.10 ACTMON_CPU_FREQ_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0x1a4 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. a write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. a write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected

21	0x0	AVG_ABOVE_WMARK_EN: Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
20	0x0	AVG_BELOW_WMARK_EN: Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
19	0x0	AT_END_EN: Enable interrupt at the end of sample period. 0 = DISABLE: interrupt is disabled. 1 = ENABLE: interrupt is enabled.
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE: periodic mode is disabled, samples for only 1 period 1 = ENABLE: periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

10.2.9.2 ACTMON_MCCPU_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x204 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.9.3 ACTMON_MCCPU_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x208 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.9.4 ACTMON_MCCPU_INIT_AVG_0

Initial AVG value, specified by software to set up the filter

Offset: 0x20c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.9.5 ACTMON_MCCPU_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x210 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.9.6 ACTMON_MCCPU_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x214 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.9.7 ACTMON_MCCPU_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x218 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.9.8 ACTMON_MCCPU_COUNT_0

Monitor Status0 Register

Offset: 0x21c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.9.9 ACTMON_MCCPU_AVG_COUNT_0

Monitor Status1 Register

Offset: 0x220 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.9.10 ACTMON_MCCPU_INTR_STATUS_0

Monitor interrupt Register

Offset: 0x224 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR: 0 = interrupt not detected 1 = INTR: 1 = interrupt detected

10.2.10 Histogram Registers

10.2.10.1 ACTMON_HISTOGRAM_CONFIG_0

Histogram Configuration

Offset: 0x300 | Read/Write: R/W | Reset: 0x00000XXX (0bxxxxxxxxxxxxxxxx0000xxxxxxxxxxxx)

Bit	Reset	Description
15:12	NONE	SOURCE: 0 = NONE 1 = AHB 2 = APB 3 = COP 4 = CPU 5 = MC_ALL 6 = MC_CPU 7 = CPU_FREQ 8 = NA 9 = APB_MMIO
8:4	X	SHIFT: Scaling factor for the idle counter before the value is used to update histogram bucket.
3	X	STALL_ON_SINGLE_SATURATE: FALSE: continue incrementing buckets even when another bucket has saturated TRUE: stop incrementing bucket when at least one other bucket has saturated 0 = FALSE 1 = TRUE
2	X	NO_UNDERFLOW_BUCKET: FALSE: increase bucket 0 when idle time is less than the minimum value TRUE: ignore idle times that are less than the minimum value 0 = FALSE 1 = TRUE
1	X	LINEAR_MODE: DISABLE: bucket width increases exponentially with a power of two ENABLE: bucket width is the same for all buckets 0 = DISABLE 1 = ENABLE
0	X	ACTIVE: ENABLE: enable histogram recording 0 = DISABLE 1 = ENABLE

10.2.10.2 ACTMON_HISTOGRAM_CTRL_0

Offset: 0x304 | Read/Write: R/W | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	CLEAR: Clear all

10.2.10.3 ACTMON_HISTOGRAM_DATA_0

This is an array of 32 identical register entries; the register fields below apply to each entry.

Offset: 0x380..0x3ff | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VALUE

CHAPTER 11: REAL-TIME CLOCK

The Real-Time Clock (RTC) module maintains seconds and milliseconds counters, and five alarm registers. The RTC is in the ‘always-on’ power domain, allowing for the counters to run and alarms to trigger when the system is in low-power state. If configured, interrupts triggered by the RTC can cause the system to wake up from a low-power state.

Features

- 10-bit milliseconds counter that runs off of a 32.768 kHz clock source.
- 32-bit seconds counter that increment for every 1000 milliseconds.
- Alarm feature that triggers an interrupt when the specified value matches the milliseconds counter.
- Alarm feature that triggers an interrupt when the specified value matches the seconds counter.
- Count-down alarm feature that triggers an alarm after counting down the specified number of seconds.
- Count-down alarm feature that triggers an alarm after counting down the specified number of milliseconds.
- Security bit that disables further processor writes to the seconds counter and ensures that the RTC clock keeps running.
- Hardware adjusts drift in clock which can occur due to PPM variations in oscillator output.

11.1 Functional Description

The RTC operates in two clock domains: the APB clock domain and the 32 kHz clock domain. The RTC continues updating the millisecond and second counters and continues triggering interrupts even when the MAIN partition is powered down. Since the APB clock is disabled when MAIN is powered down, registers are implemented in the 32 kHz clock domain.

All the registers except the BUSY register are implemented in the 32 kHz clock domain. Writes are transferred to the 32 kHz domain with BUSY.STATUS set to BUSY until the transfer is completed. Reads are shadowed in the APB clock domain and return immediately.

The RTC implements a Seconds Counter register, a Milliseconds Counter register, three Alarm registers, two countdown alarms, and various interrupt-related registers.

Writes to the seconds counter can be disabled by writing to the CONTROL.DIS_WR_SEC_CNT bit. Alarm registers and countdown alarm registers set interrupt bits when corresponding events occur. Interrupt status, mask, set and source registers reflect the status and also allow setting and clearing of various bits.

Resets

The RTC receives an asynchronous reset which is synchronized to the APB clock and RTC clock domains.

11.2 RTC Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

11.2.1 APBDEV_RTC_CONTROL_0

Control Register

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	WR_SEC_CNT: When set, writes to the SECONDS counter are disabled. Can only be cleared by resetting the RTC module 0 = DISABLE 1 = ENABLE

11.2.2 APBDEV_RTC_BUSY_0

Busy Register

Offset: 0x4 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	STATUS: This bit is set when a write is initiated on the APB side. It is cleared once the write completes in RTC 32 kHz clock domain, which could be several thousands of APB clocks. This must be IDLE before a write is initiated. Note that this bit is only for writes. 0 = IDLE 1 = BUSY

11.2.3 APBDEV_RTC_SECONDS_0

Seconds Counter Register

The SECONDS register is copied over to the APB side every eight 32 kHz clocks (~250 µs). Because of this, performing a read immediately after a write might return an old value. This covers 49710.26 Days (or) 136.192 Years of 365 days each.

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECONDS: The seconds counter is incremented every 1000 milliseconds.

11.2.4 APBDEV_RTC_SHADOW_SECONDS_0

Shadowed Seconds Counter Register

Shadow SECONDS register is updated over to the APB side whenever there is a read to milliseconds counter.

Since the software cannot read both registers at any given point of time, the Seconds register content is captured in this register. If software needs to read both seconds and milliseconds, read the MILLI_SECONDS register followed by a read of this register.

Offset: 0xc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	SHADOW_SECONDS: A snapshot of the SECONDS counter is taken, whenever there is a read to MILLI_SECONDS Register.

11.2.5 APBDEV_RTC_MILLI_SECONDS_0

Milliseconds Counter Register

The Milliseconds register is copied over to the APB side every eight 32 kHz clocks (~250 µs). Because of this, performing a read immediately after a write might return an old value.

Offset: 0x10 | Read/Write: RO | Reset: 0x00000XXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
9:0	X	MILLI_SECONDS: Milliseconds counter is incremented using the Bresenham algorithm

11.2.6 APBDEV_RTC_SECONDS_ALARM0_0

Seconds Alarm0 Registers

When the value in this register matches the seconds counter, the corresponding interrupt status bit is set. If enabled, the interrupt line is asserted. A value of zero disables the alarm.

Offset: 0x14 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECS_MATCH_VALUE: Match value to trigger the alarm

11.2.7 APBDEV_RTC_SECONDS_ALARM1_0

Seconds Alarm1 Registers

When the value in this register matches the seconds counter, the corresponding interrupt status bit is set. If enabled, the interrupt line is asserted. A value of zero disables the alarm.

Offset: 0x18 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECS_MATCH_VALUE: Match value to trigger the alarm

11.2.8 APBDEV_RTC_MILLI_SECONDS_ALARM_0

Milliseconds Alarm Register

When the value in this register matches the milliseconds counter, the corresponding interrupt status bit is set. If enabled, the interrupt line is asserted. A value of zero disables the alarm.

Offset: 0x1c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxx0000000000)

Bit	Reset	Description
9:0	0x0	MSEC_MATCH_VALUE: Milliseconds match value.

11.2.9 APBDEV_RTC_SECONDS_COUNTDOWN_ALARM_0

Countdown Alarm Register

If ENABLE is set to ENABLED, an internal counter is loaded with VALUE and counted down once per second. The interrupt bit corresponding to the seconds countdown alarm (SEC_CDN_ALARM in the APBDEV_RTC_INTR_STATUS_0 register) is set after the specified number of seconds have elapsed. If REPEAT is ENABLED, the countdown operation is performed repeatedly.

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	ENABLE: Enable bit for the countdown operation. If repeat is not set, this bit is cleared once the internal counters counts down to specified value. 0 = DISABLED 1 = ENABLED
30	0x0	REPEAT: Repeat bit for the countdown operation 0 = DISABLED 1 = ENABLED
29:0	0x0	VALUE: Number of seconds to countdown

11.2.10 APBDEV_RTC_MILLI_SECONDS_COUNTDOWN_ALARM_0

Countdown Alarm Register

If ENABLE is set to ENABLED, an internal counter is loaded with VALUE and counted down. The interrupt bit corresponding to the milliseconds countdown alarm (MSEC_CDN_ALARM in the APBDEV_RTC_INTR_STATUS_0 register) is set after the specified number of milliseconds have elapsed. If REPEAT is ENABLED, the countdown operation is performed repeatedly.

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	ENABLE: Enable bit for the countdown operation. If repeat is not set, this bit is cleared once the internal counters counts down to specified value. 0 = DISABLED 1 = ENABLED
30	0x0	REPEAT: Repeat bit for the countdown operation 0 = DISABLED 1 = ENABLED
29:0	0x0	VALUE: Number of milliseconds to countdown

11.2.11 APBDEV_RTC_INTR_MASK_0

Interrupt Mask Register

This register stores the masks for the interrupts. If a bit is set 1 and the corresponding interrupt condition is satisfied, interrupt line to system interrupt controller is asserted.

Offset: 0x28 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	MSEC_CDN_ALARM
3	0x0	SEC_CDN_ALARM
2	0x0	MSEC_ALARM
1	0x0	SEC_ALARM1
0	0x0	SEC_ALARM0

11.2.12 APBDEV_RTC_INTR_STATUS_0

Interrupt Status Register

This register is RWC. Bits in it are high after the interrupt condition is satisfied. Any bits that are set to one in the data written to this register will clear their corresponding data bits. Any bits set to zero have no effect.

Offset: 0x2c | Read/Write: RWC | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	MSEC_CDN_ALARM
3	0x0	SEC_CDN_ALARM
2	0x0	MSEC_ALARM
1	0x0	SEC_ALARM1
0	0x0	SEC_ALARM0

11.2.13 APBDEV_RTC_INTR_SOURCE_0

Interrupt Source Register

This read-only register returns the AND of the Interrupt Source and Interrupt Mask registers.

Offset: 0x30 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
4	X	MSEC_CDN_ALARM
3	X	SEC_CDN_ALARM
2	X	MSEC_ALARM
1	X	SEC_ALARM1
0	X	SEC_ALARM0

11.2.14 APBDEV_RTC_INTR_SET_0

Interrupt Set Register

Reserved. This write-only register is used for testing purposes only.

Offset: 0x34 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	MSEC_CDN_ALARM
3	0x0	SEC_CDN_ALARM
2	0x0	MSEC_ALARM
1	0x0	SEC_ALARM1
0	0x0	SEC_ALARM0

11.2.15 APBDEV_RTC_CORRECTION_FACTOR_0

Correction Factor (Digital Trimming) Register

Support is for +/- 500 ppm. The expected maximum deviation of the standard clock sources is +/- 50 ppm.

Offset: 0x38 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxx0000000000)

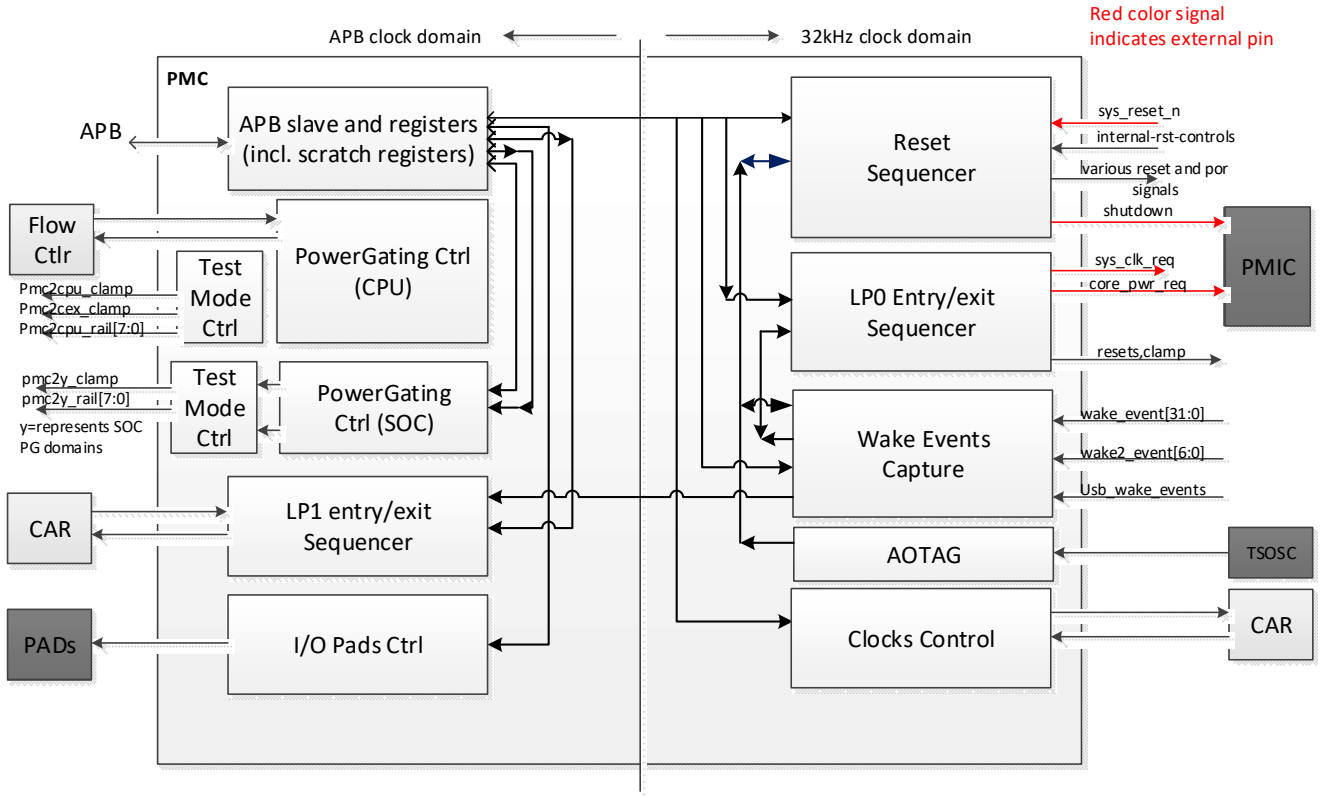
Bit	Reset	Description
9	0x0	DIRECTION: DECREMENT must be used when the 32 kHz clock is above its nominal frequency. 0 = DECREMENT 1 = INCREMENT
8:0	0x0	PPM

CHAPTER 12: POWER MANAGEMENT CONTROLLER

The Power Management Controller (PMC) block interacts with an external Power Manager Integrated Circuit (PMIC) through sideband signals. The PMC controls the entry and exit of the system from different sleep modes. It provides power-gating controllers for SoC and CPU power partitions except for the Maxwell GPU power partition. The PMC also provides deep power down (DPD) mode control for pads, and scratch storage to save some of the context during sleep modes (when the CPU and/or SoC power rails are off).

Sleep (LP1) and deep sleep (LP0) require specific logic to maintain some states and control the power domains, including signaling to the external PMIC to provide power to the main logic in the Tegra® X1 devices. All this logic is centralized in the PMC block.

Figure 14: PMC Block Diagram



Glossary

Term	Definition
AOTAG	Always-On Thermal Alarm Generator
Cold boot	The SoC partition power transitions from OFF to ON with no previous state available. Software must construct all states from scratch. Boot ROM is executed. DRAM is brought on-line.
HVC	Hardware Vmin Control: The hardware initiated flow to enter/exit the Vmin state on VDD_CPU. Now referred to as CC3.
LP0	Low Power 0 state in which DRAM is put in self-refresh, system state is saved in PMC + DRAM, the VDD_SOC and VDD_CPU rails are powered off, and the PMC is configured to monitor “LP0 exit wake events” which would trigger LP0 exit. This is also called the Deep Sleep state.
LP1	Low Power 1 state. Devices are power-gated, SoC clock domains are set to the minimum frequency (12 MHz and 38.4 MHz), the flow controller is configured to monitor “LP1 exit wake events,” DRAM is put in self-refresh, and the VDD_CPU rail is powered off. Also known as the Suspend state.
PMIC	Power Management IC (off-chip)
TSC	Timer’s System Counter (also known as Time Stamp Counter)
VDD_AO	Always ON power rail (also known as VDD_RTC power rail)
VDD_CPU	CPU power rail
VDD_SOC	SOC power rail (also known as VDD_CORE power rail)
Warm boot	Exit from LP0 state.

12.1 External Interface

Table 35: PMC External Interface Signals

Signal Name	Type	Signal Description
CLK_32K_OUT	Out	32 kHz clock out (active even during Deep Sleep). Can be used for systems that want a blinking LED during Deep Sleep
CORE_PWR_REQ	Out	Used to reach Vmin for CC3.
CPU_PWR_REQ	Out	
SHUTDOWN	Out	Shutdown indication from the Tegra processor to the platform.
CLK_REQ	Out	For systems where the system clock reference can be disabled during sleep
SYS_RESET_N	In	Hardware active-low reset signal. When this signal is asserted, the entire chip is reset including the PMC.
Wake-up Inputs	In	There are 47 pins designated as wake-up for triggering wake-up from Deep Sleep mode. These include 4 internal wake events from Deep Sleep mode for USB (UTMIP and UHSIC) and 1 internal wake event for XUSB.

12.1.1 Flow Controller Interface

The Tegra X1 flow controller manages CPU power and rail gating transitions. The flow controller sends CPU/non-CPU power-gating on/off or CPU rail on/off requests to the PMC. This interface is based on asynchronous req/ack. The flow controller explicitly requests (through cpu_id<>) which CPU it wants to be powered on/off.

See Chapter 18: Flow Controller for more information on CPU power gating.

12.2 Power Gating and Ungating

12.2.1 Clamp/Reset/Clock/PG-Enable Sequencing

12.2.2 Power Gating

For power-gating (powering off) a partition, the clamp, reset, clocks, and PG-enable (also known as sleep-enable) controls must be sequenced as shown in following diagram. For CCPLEX PG partitions, this sequencing is ensured by hardware (when

power-gating is done via the flow controller). For SoC (non-CCPLEX) PG partitions, this sequencing needs to be ensured by software.

The following registers are used for the Clamp/PG-Enable control of each PG partition:

- PMC_PWRGATE_TOGGLE
- PMC_REMOVE_CLAMPING_CMD

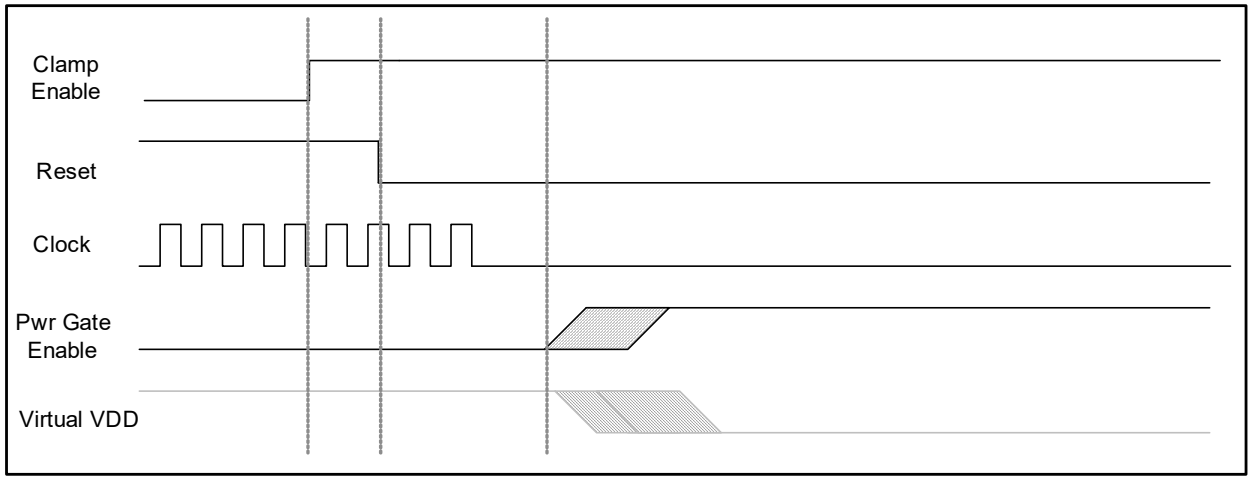
The following registers are used for the Clock/Reset control of each unit:

- RST_DEVICES_L/H/U/V/W/X
- CLK_OUT_ENB_L/H/U/V/W/X

In general, clamp-enable should be asserted before reset (as shown in the diagram). This works with synchronous or asynchronous clamping.

The figure below shows the required order of the various power-gating controls. Note that the reset shown here is an active low signal.

Figure 15: Power-Gating Timing Sequence for Clamp/Reset/Clock/PG-Enable

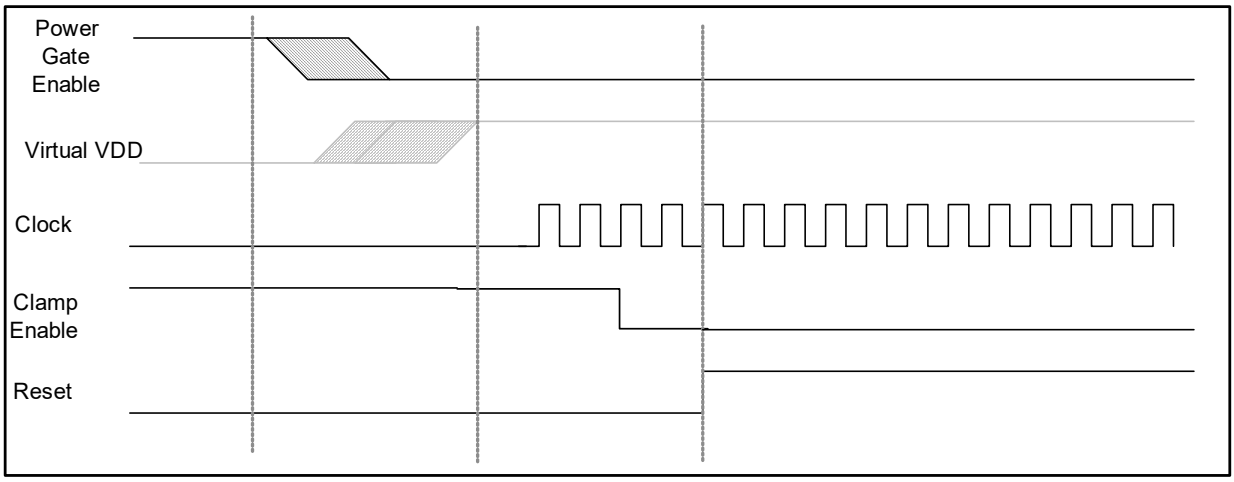


12.2.2.1 Power Ungating

For power-ungating (powering on) a partition, ensure that the clamp, reset, clocks, and PG-enable (sleep-enable) controls are sequenced as shown in the following diagram. For CCPLEX PG partitions, this sequencing is ensured by hardware (when power-gating is done via the flow controller). For SoC (non-CCPLEX) PG partitions, this sequencing needs to be ensured by software.

In general, the clamp enable should be deasserted before reset (as shown in the diagram). This works with synchronous or asynchronous clamping. To ensure that clocks have been brought up before any other activity progresses, software should add a 2us gap after the clock-activating command.

Figure 16: Power-Ungating Timing Sequence for Clamp/Reset/Clock/PG-Enable



12.2.3 Power Gating Zones

Both the PMC (power-controller for the SoC rail units) and the flow-controller (power-controller for the CPU rail units) divide each partition into 8 zones. Software configurable inter-zone timings are then provided. A single configurable timer is provided for all SOC rail partitions. When power-gating/ungating is triggered, the controllers sequence the pg-enable signals of consecutive zones with the programmed delays. The zones are powered up in one order and powered down in reverse order, but using the same inter-zone timings.

GPU power-gating is controlled by the GPMU unit internal to the GPU.

12.2.4 Context Save/Restore

For the CPU and SOC rail units, each unit's driver is responsible for saving and restoring any necessary state before and after a power-gating event. In the GPU, the GPMU is instead responsible for saving/restoring appropriate state.

12.2.5 Software Programming Guide

This section covers the software procedures for power gating and ungating the SOC rail power domains. Power gating and ungating of CPU power domains is not covered here as it is handled through Flow-Controller hardware unit.

Some clocks are routed to more than one power domain. If such a clock is disabled at the source due to the powering down of this source domain, the other domains depending on this clock will also be affected. Such clock dependencies are described here. Software has the responsibility to ensure that enabling or disabling of the clocks and domains is performed safely.

12.2.6 Power-Gating Policy

The power-management-framework coordinates the gating of all the SOC rail units. The high-level policy is defined below:

- A single kernel thread exists which has a 'power-management work-queue' data-structures for every unit.
- Any work request for a unit causes a reference count to be incremented in the work-queue for that unit. The unit's driver is responsible for requesting this.
- Any time work is completed, this work queue reference count must be decremented. The unit's driver may again request this decrement. This may be triggered by an interrupt from the unit hardware notifying that requested work has been completed.
- The reference counts are allowed to represent different kinds of work requests. For example, some could refer to register configuration accesses; others could be data (perhaps display frame) processing requests.
- A callback function into the power-management framework must be called any time the reference count reaches 0. This will cause a power-state transition to be considered.

- On reaching a reference count of 0, the unit must first be clock-gated. At the same time a timer must be set-off. When the timer reaches 0, and the unit is still idle, it must be power-gated.

The above flow necessitates that:

- All work requests for any power-gateable unit go through the reference-count tracking mechanism.
- The power-gating procedure appears atomic and is serialized with respect to any work requests.

If violated, a unit could be erroneously gated while still active OR the work request could be lost as the unit is already in the process of being gated.

The serialized and atomic requirement can be met by ensuring that when a work request is received while the power-gating procedure is in progress, power-gating the unit is either aborted or the work request delayed until the gating completes and the unit is then immediately un-gated.

12.2.6.1 ADSP

The ADSP unit in Tegra X1 may have some other module within the APE request work directly to it. However, since the ADSP is not power-gated independently to the rest of the APE (i.e. a single reference count exists for the whole APE), this does not create any problems. No other work requests, such as network audio wake events, are expected to be forwarded directly to the ADSP.

12.2.6.2 USB

Any wake events going to XUSB are routed through the non-power-gated PADCTL interrupt handling logic, subsequently handled by the XUSB PEP filter drivers. This ensures that work requests during power-gating don’t get lost.

12.2.7 Summary of Power-Gating Procedure

The general procedure for power gating an SOC power domain is as follows:

1. Write MC register to flush and block MC clients.

   Flush request is asserted during the hot-reset process, i.e. whenever a unit must be turned off. Software asserts the appropriate FLUSH_ENABLE bit in the MC_CLIENT_HOTRESET_CTRL_0 register. It then polls the MC_CLIENT_HOTRESET_STATUS_0 register for a “1” in the appropriate bit. When the register reads back 1, the pipe has been flushed and the unit can be power-gated or reset.
2. Write CAR register to assert unit resets.
3. Write CAR register to disable clocks.
4. Write PMC register to gate power domain (PMC will assert clamps itself before power-gating the unit).

The general procedure for power ungating of an SOC power domain is as follows:

1. Write PMC register to ungate power domain.
2. Write CAR register to enable clocks.
3. Write PMC register to disable clamps and poll CLAMP_STATUS to detect completion.
4. Write CAR register to de-assert resets.
5. Write MC register to enable MC clients.

In some cases, partitions require specific deviations from the general procedure due to various reasons. Deviations will be covered in the domain specific sections below.

Note: *Software must ensure that a unit is not already power-gated before attempting to power-gate it and that it is not already un-gated before attempting to un-gate it. This can be done by polling the unit specific APBDEV_PMC_PWRGATE_STATUS_0 register.*

Note: *Software must ensure that when a unit is gated no other units will be capturing the outputs of the unit to be gated. This is to ensure that the output meta-stability possible due to the asynchronous assertion of clamps and resets does not affect any neighboring units.*

12.2.7.1 Procedures for DIS Power Domain

DIS contains DisplayA module, and PLLD PLL. Power partitions DIS and DISM share the same PMC control. The two physical partitions are treated as a single logical partition called DIS. For any DSI output use-case, PLLD is needed. PLLD is the only PLL capable of generating differential clocks needed for DSI brick and is the only PLL connected to the brick as well. PLLD is on an un-power-gated supply. It stays running even if the corresponding partition is power-gated.

DIS Power Gating

1. Flush MC client DC by setting the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.DC_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bits are set:
   a. DC_HOTRESET_STATUS
3. Set the following bits to assert reset to DIS:
   a. CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_DISP1_RST
4. Clear the following bits to disable clocks to DIS:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_DISP1
5. Shut down PLLD (only if it’s not needed by any other unit)
6. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = DIS
   b. START = ENABLE
7. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit DIS is clear.

DIS Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = DIS
   b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit DIS is set
3. Reprogram PLLD and enable it (assuming PLLD is used for DisplayA and was not enabled already)
4. Set the following bits to enable clocks to DIS:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_DISP1
5. Remove power gating clamps by writing a 1 to the following bits:
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD.DIS
6. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD until bit DIS is cleared
7. Clear the following bits to de-assert reset to DIS:
   a. CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_DISP1_RST
8. Enable MC client DC by clearing the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.DC_FLUSH_ENABLE

12.2.7.2 Procedures for DISB Power Domain

DISB contains DisplayB module, and PLLD2 and PLLDP PLLs. The logical PMC partition “DISB” controls both DISB and DISBM physical partitions. The sequence is the same as DIS above, but also use the following:

- DISP2 for CAR reset and clock enable
- DCB for MC hot reset, and DISB for PMC
- PLLD2/PLLDP instead of PLLD

PLLD2/DP are on an un-power-gated supply. They stay running even if the corresponding partition is power-gated.

12.2.7.3 Procedures for SOR Power Domain

The SOR partition contains SOR, SOR1, DPAUX, DPAUX1, DSI, DSIB, CSICIL, and MIPI_CAL modules. For any DSI output use-case, PLLD in the DIS partition is needed. PLLD is the only PLL capable of generating differential clocks needed for DSI brick and is the only PLL connected to the brick as well.

> ***Note:*** *For any access to DPAUX registers, it is required that Host1x is clocked and out of reset, this is assumed to already be completed in the SOR sequence below.*

SOR Power Gating

1. If desired, perform SOR or SOR1 shutdown sequence. This is not strictly necessary as reset, below, will power down the pad.
2. Set the following bits to assert reset to all modules:
   a. CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_SOR0_RST
   b. CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_SOR1_RST
   c. CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_DPAUX_RST
   d. CLK_RST_CONTROLLER_RST_DEVICES_Y_0.SWR_DPAUX1_RST
   e. CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_MIPI_CAL_RST
   f. CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_CSI_RST
   g. CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_DSI_RST
   h. CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_DSIB_RST
3. Clear the following bits to disable clocks to all modules:
   a. <same modules as above>
4. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = SOR
   b. START = ENABLE
5. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit SOR is clear

SOR Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = SOR
   b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit SOR is set
3. Program clock sources, and set the following bits to enable clocks to DIS:
   a. <same modules as above>

4. Remove powergating clamps by writing a 1 to the following bits:
    a. APBDEV_PMC_REMOVE_CLAMPING_CMD.SOR
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD until bit SOR is cleared
6. Clear the following bits to de-assert reset to required SOR modules:
    a. <subset of modules above>
7. If DPAUX or DPAUX1 is not needed, power down the respective AUX pad.
    a. HYBRID_SPARE.PAD_PWR=POWERDOWN

Once the SOR partition is power-gated (which contains the internal HDA codec for HDMI/DP audio), the codec disappears from HDA link. The HDA controller sits in the APB partition so it will be kept alive. When SOR is powered back up, the HDA driver must assert and then de-assert the HDA link reset (CRST) and take the codec through the enumeration sequence. Otherwise, the codec would not be assigned an address (since the address would be lost during the power gating cycle). If this is not done, there is likely a chance that the codec would not reliably respond to commands after power un-gating.

Minimal Sequence when Programming the DPAUX Control for I2C6

If only I2C6 is required, follow this sequence to program the DPAUX Pad Control Register:

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
    a. PARTID = SOR
    b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the SOR bit is cleared
3. Set the following bits to enable clocks to DPAUX:
    a. CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_DPAUX
    b. CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_HOST1X (only required if Host1x is not already out of reset and clocked)
4. Remove power-gating clamps by writing a 1 to the following bit:
    a. APBDEV_PMC_REMOVE_CLAMPING_CMD_0.SOR
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the SOR bit is cleared
6. Clear the following bits to deassert the reset to DPAUX:
    a. CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_DPAUX_RST
    b. CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_HOST1X_RST (only required if Host1x is not already out of reset and clocked)

To enable I2C on DPAUX:

1. Enable Module Clock for DPAUX.
2. Release Module Reset for DPAUX.
3. Enable Clock for HOST1X.
4. Release HOST1X reset.
5. Enable Module Clock for I2C6.
6. Release Module Reset for I2C6.
7. Program MODE=I2C, I2C_SDA_INPUT_RCV=ENABLE, I2C_SCL_INPUT_RCV=ENABLE in DPAUX_HYBRID_PADCTL_0 register. (RTRegWr32(NV_ADDRESS_MAP_DPAUX_BASE + DPAUX_HYBRID_PADCTL_0 * 4, 0x0000C001);)
8. Program PAD_PWR =POWERUP in DPAUX_HYBRID_SPARE_0 register.

12.2.7.4 Procedures for MPEA Power Domain

From a software perspective, MPEA and MPEB are one logical partition. MPEA and MPEB power partitions share the same power gate timers.

The PMC also has an option to sequence both partitions at the same time to shorten power-gating latency. The TD_PWRGATE_INTER_PART_TIMER[3:0] register can be programmed to configure the period between two partitions power-gate up/down sequence. Partitions are powered up in order – MPEA, followed by MPEB. Power gating down is executed in reverse order. Programming a 0 value in the TD_PWRGATE_INTER_PART_TIMER register will trigger simultaneous power gating of both partitions.

Note: *There is a power domain (MPE) made up of two partitions: MPEA (NVENC Partition A) and MPEB (NVENC Partition B). See Section 12.4.6: SoC Rail Partitions for details.*

MPEA Power Gating

1. Flush MC client NVENC by setting the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.NVENC_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bits are set:
   a. NVENC_HOTRESET_STATUS
3. Set the following bits to assert reset to NVENC:
   a. CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_NVENC_RST
4. Clear the following bits to disable clocks to NVENC:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_NVENC
5. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = MPEA
   b. START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit MPEA is clear.

MPEA Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = MPEA
   b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit MPEA is set:
3. Set the following bits to enable clocks to NVENC:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_NVENC
4. Remove powergating clamps by writing a 1 to the following bits:
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD.MPEA
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD until bit MPE is cleared.
6. Clear the following bits to de-assert reset to NVENC:
   b. CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_NVENC_RST
7. Enable MC client NVENC by clearing the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.NVENC_FLUSH_ENABLE

12.2.7.5 Procedures for MPEB Power Domain

This partition is in the same power-domain as MPEA. The procedure previously described for MPEA therefore implicitly works for this partition too.

12.2.7.6 Procedures for XUSBB Power Domain

XUSBB Power Gating

1. Flush MC client XUSB_DEV by setting the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.XUSB_DEV_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bits are set:
   a. XUSB_DEV_HOTRESET_STATUS
3. Set the following bits to assert reset to XUSB_DEV:
   a. CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_XUSB_DEV_RST
4. Clear the following bits to disable clocks to XUSB_DEV:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_XUSB_DEV
5. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = XUSBB
   b. START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit XUSBB is clear.

XUSBB Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = XUSBB
   b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit XUSBB is set
3. Set the following bits to enable clocks to XUSB_DEV:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_XUSB_DEV
4. Remove powergating clamps by writing a 1 to the following bits:
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD.XUSBB
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD until bit XUSBB is cleared
6. Clear the following bits to de-assert reset to XUSB_DEV:
   a. CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_XUSB_DEV_RST
7. Enable MC client XUSB_DEV by clearing the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.XUSB_DEV_FLUSH_ENABLE

12.2.7.7 Procedures for XUSB Power Domain

See Section 22.8.7: XUSB Controller Power Gating.

12.2.7.8 Procedures for PCX Power Domain

See Section 34.3.5: ELPG.

12.2.7.9 Procedures for SAX Power Domain

SAX Power Gating

1. Program the following XUSB_PADCTL registers to put UPHY to IDDQ:
   a. XUSB_PADCTL_UPHY_MISC_PAD_S0_CTL_2_0[TX_IDDQ_OVRD]:= 1
   b. XUSB_PADCTL_UPHY_MISC_PAD_S0_CTL_2_0[TX_IDDQ]:= 1
   c. XUSB_PADCTL_UPHY_MISC_PAD_S0_CTL_2_0[RX_IDDQ_OVRD]:= 1
   d. XUSB_PADCTL_UPHY_MISC_PAD_S0_CTL_2_0[RX_IDDQ]:= 1
2. Program the following XUSB_PADCTL registers to put UPHY PAD PLL to IDDQ:
   a. XUSB_PADCTL_UPHY_PLL_S0_CTL_1_0[PLL0_PWR_OVRD]:= 1
   b. XUSB_PADCTL_UPHY_PLL_S0_CTL_1_0[PLL0_IDDQ]:= 1
3. Check the assertion status of DEVSLP and set the DEVSLP override with the following SATA AUX registers accordingly.
   a. $DEVSLP:= SATA_AUX_RX_STAT_INT_0[SATA_DEVLSP]
   b. SATA_AUX_MISC_CTRL_1_0[DEVSLP_OVERRIDE]:= '$DEVSLP'
4. Set the following CAR register bits to '1' to assert reset to SATA
   a. CLK_RST_CONTROLLER_RST_DEV_V_SET_0[SET_SATA_RST]:= 1
   b. CLK_RST_CONTROLLER_RST_DEV_V_SET_0[SET_SATA_OOB_RST]:= 1
   c. CLK_RST_CONTROLLER_RST_DEV_W_SET_0[SET_SATACOLD_RST]:= 1
5. Set the following CAR register bits to '1' to disable the clocks to individual SATA partitions.
   a. CLK_RST_CONTROLLER_CLK_ENB_V_CLR_0[CLR_CLK_ENB_SATA]:= 1
   b. CLK_RST_CONTROLLER_CLK_ENB_V_CLR_0[CLR_CLK_ENB_SATA_OOB]:= 1
6. System Power Management driver disables the SATA power rails.
   a. APBDEV_PMC_PWRGATE_TOGGLE_0[START]:= 1
   b. APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID]:= 'SAX'

Power Ungating

1. System Power Management driver enables the SATA power rails.
   a. APBDEV_PMC_PWRGATE_TOGGLE_0[START]:= 1
   b. APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID]:= 'SAX'
2. Read the following PMC register bits to confirm the power gating status of SATA
   a. APBDEV_PMC_PWRGATE_STATUS_0[SAX] == 'ON'
3. Set the following CAR register bits to '1' to enable the clocks to the SATA partition.
   a. CLK_RST_CONTROLLER_CLK_ENB_V_SET_0[SET_CLK_ENB_SATA]:= 1
   b. CLK_RST_CONTROLLER_CLK_ENB_V_SET_0[SET_CLK_ENB_SATA_OOB]:= 1
4. Set the following PMC register bits to '1' to remove the power clamps to the SATA partitions.
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [SAX]:= 1

      Read the following PMC register bits to confirm the power clamps to the SATA partition are removed.

   a. APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [SAX] == '0'
5. Set the following CAR register bits to '1' to de-assert reset to SATA
   a. CLK_RST_CONTROLLER_RST_DEV_V_CLR_0[CLR_SATA_RST]: = 1

b. CLK_RST_CONTROLLER_RST_DEV_V_CLR_0[CLR_SATA_OOB_RST]:= 1

c. CLK_RST_CONTROLLER_RST_DEV_W_CLR_0[CLR_SATACOLD_RST]:= 1

6. If DEVSLP is asserted, de-assert DEVSLP via the following SATA AUX register.
   a. SATA_AUX_MISC_CTRL_1_0[DEVSLP_OVERRIDE]:= '0'
7. Program the following XUSB_PADCTL registers to bringup up UPHY from IDDQ:
   a. XUSB_PADCTL_UPHY_MISC_PAD_S0_CTL_2_0[TX_IDDQ_OVRD]:= 0
   b. XUSB_PADCTL_UPHY_MISC_PAD_S0_CTL_2_0[TX_IDDQ]:= 0
   c. XUSB_PADCTL_UPHY_MISC_PAD_S0_CTL_2_0[RX_IDDQ_OVRD]:= 0
   d. XUSB_PADCTL_UPHY_MISC_PAD_S0_CTL_2_0[RX_IDDQ]:= 0
8. Program the following XUSB_PADCTL registers to bringup UPHY PAD PLL from IDDQ:
   a. XUSB_PADCTL_UPHY_PLL_S0_CTL_1_0[PLL0_PWR_OVRD]:= 0
   b. XUSB_PADCTL_UPHY_PLL_S0_CTL_1_0[PLL0_IDDQ]:= 0

12.2.7.10 Procedures for NVDEC and NVJPG Power Domains

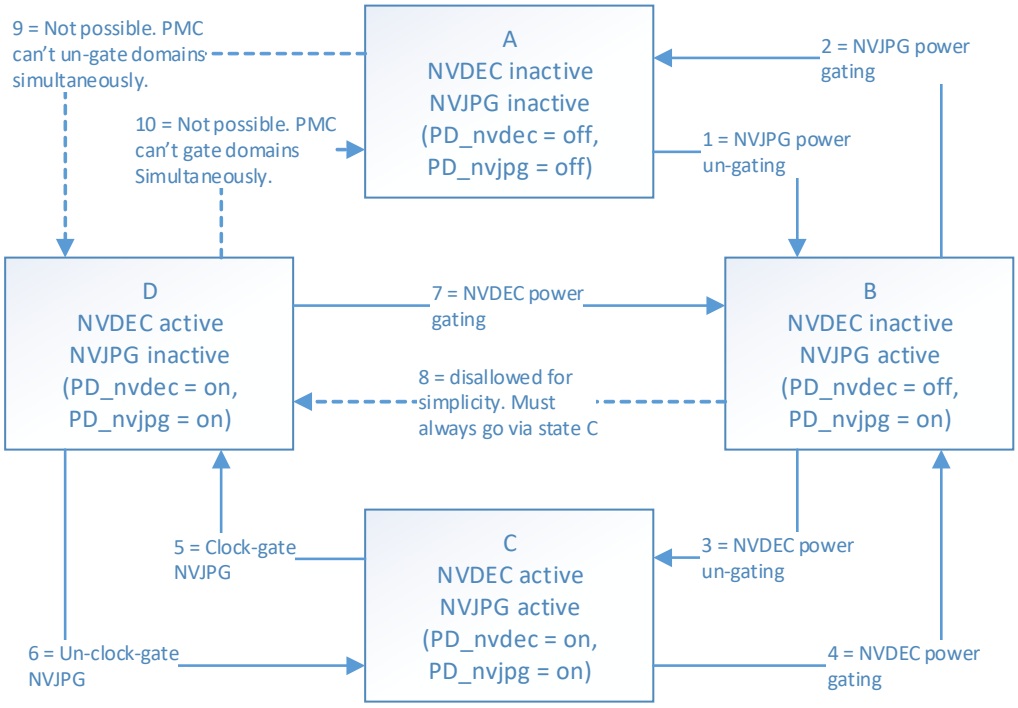
NVJPG contains the units NVJPG and NVDEC/Part A. This implies:

- When only NVDEC is required, such as in a VideoPlayback use case, NVJPG needs to be kept active.
- When only NVJPG is required, such as a gallery view, NVDEC part a needs to be kept active.This has the following additional requirements:

Anytime PD_NVDEC is required, PD_NVJPG must first be powered on. PD_NVJPG must not be power-gated off until after PD_NVDEC has been gated off. To minimize power, when the NVDEC unit is required but NVJPG is not required, NVJPG must be clock-gated off.

The permitted states and transitions are defined in the figure below. The transition details are described in the subsequent sections.

Figure 17: Allowed power states for NVDEC and NVJPG



NVJPG Power Gating

NVDEC has been power gated.

1. Flush MC client NVJPG by setting the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_1_0.NVJPG_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_1_0 until the following bits are set:
   a. NVJPG_HOTRESET_STATUS
3. Set the following bits to assert reset to NVJPG:
   a. CLK_RST_CONTROLLER_RST_DEVICES_Y_0.SWR_NVJPG_RST
4. Clear the following bits to disable clocks to NVJPG:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_NVJPG
5. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = NVJPG
   b. START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit NVJPG is clear.

NVJPG Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = NVJPG
   b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit NVJPG is set
3. Set the following bits to enable clocks to NVJPG/NVDEC:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_NVJPG
   b. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_NVDEC
4. Clear the following bits to disable clocks to NVDEC/NVJPG:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_NVDEC
   b. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_NVJPG (if video decode)
5. Remove powergating clamps by writing a 1 to the following bits:
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD.NVJPG
6. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD until bit NVJPG is cleared
7. Clear the following bits to de-assert reset to NVJPG:
   a. CLK_RST_CONTROLLER_RST_DEVICES_Y_0.SWR_NVJPG_RST
8. Enable MC client NVJPG by clearing the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.NVJPG_FLUSH_ENABLE

NVDEC Power Gating

1. Flush MC client NVDEC by setting the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_1_0.NVDEC_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_1_0 until the following bits are set:
   a. NVDEC_HOTRESET_STATUS
3. Set the following bits to assert reset to NVDEC:
   a. CLK_RST_CONTROLLER_RST_DEVICES_Y_0.SWR_NVDEC_RST

4. Clear the following bits to disable clocks to NVDEC:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_NVDEC
5. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = NVDEC
   b. START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit NVDEC is clear.

NVDEC Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = NVDEC
   b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit NVDEC is set
3. Set the following bits to enable clocks to NVDEC:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_NVDEC
4. Clear the following bits to disable clocks to NVDEC:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_NVDEC
5. Remove powergating clamps by writing a 1 to the following bits:
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD.NVDEC
6. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD until bit NVDEC is cleared
7. Clear the following bits to de-assert reset to NVDEC:
   a. CLK_RST_CONTROLLER_RST_DEVICES_Y_0.SWR_NVDEC_RST
8. Enable MC client NVDEC by clearing the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.NVDEC_FLUSH_ENABLE

12.2.7.11 Procedures for NVDECB and NVDECC Power Domains

These partitions contain the NVDEC unit in the PD_NVDEC power domain and so are described in the section above.

12.2.7.12 Procedures for VIC Power Domain

VIC Power Gating

1. Flush MC client VIC by setting the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.VIC_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bits are set:
   a. VIC_HOTRESET_STATUS
3. Set the following bits to assert reset to VIC:
   a. CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_VIC_RST
4. Clear the following bits to disable clocks to VIC:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_VIC
5. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = VIC
   b. START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit VIC is clear

VIC Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = VIC
   b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit VIC is set
3. Set the following bits to enable clocks to VIC:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_VIC
4. Remove powergating clamps by writing a 1 to the following bits:
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD.VIC
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD until bit VIC is cleared
6. Clear the following bits to de-assert reset to VIC:
   a. CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_VIC_RST
7. Enable MC client VIC by clearing the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.VIC_FLUSH_ENABLE

12.2.7.13 Procedures for VICB VICC VICD Power Domains

All these partitions are in the same power-domain as VICA. The procedure previously describe for VICA works for these partitions too.

12.2.7.14 Procedures for VE Power Domains

VE and VE2 share the same power gate timers. The VE and VE2 partitions contain the ISP units. In practice these are only turned on when CSI or MIPI interfaces are on. These are placed in the SOR partition. Software must therefore ensure that the SOR partition is powered on when VE, and potentially VE2, are on.

VE Power Gating

Software should be aware that disabling the CSI clocks will also affect the CSICIL which is in the SOR power domain.

1. Flush MC clients VI and ISP by setting the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.VI_FLUSH_ENABLE
   b. MC_CLIENT_HOTRESET_CTRL_0.ISP2_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bits are set:
   a. VI_HOTRESET_STATUS
   b. ISP2_HOTRESET_STATUS
3. Set the following bits to assert reset to VI, ISP and CSI:
   a. CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_VI_RST
   b. CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_ISP_RST
   c. CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_CSI_RST
   d. CLK_RST_CONTROLLER_RST_DEVICES_Y_0.SWR_VI_I2C_RST
4. Clear the following bits to disable clocks to VI, ISP and CSI:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_VI
   b. CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_ISP
   c. CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_CSI
   d. CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILAB

e. CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILCD
f. CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILEF
g. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_VI_I2C

5. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = VE
   b. START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit VE is clear.

VE Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = VE
   b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit VE is set
3. If need, set the following bits to enable clocks to VI, ISP and CSI:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_VI
   b. CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_ISP
   c. CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_CSI
   d. CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILAB
   e. CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILCD
   f. CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILEF
   g. CLK_RST_CONTROLLER_CLK_OUT_ENB_Y_0.CLK_ENB_VI_I2C
4. Remove power gating clamps by writing a 1 to the following bits:
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD.VE
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD until bit VE is cleared
6. If need, clear the following bits to de-assert reset to VI, ISP and CSI:
   a. CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_VI_RST
   b. CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_ISP_RST
   c. CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_CSI_RST
   d. CLK_RST_CONTROLLER_RST_DEVICES_Y_0.SWR_VI_I2C_RST
7. Enable MC clients VI and ISP by clearing the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.VI_FLUSH_ENABLE
   b. MC_CLIENT_HOTRESET_CTRL_0.ISP2_FLUSH_ENABLE

12.2.7.15 Procedures for VE2 Power Domain

VE and VE2 share the same power gate timers. The VE and VE2 partitions contain the ISP units. In practice these are only turned on when CSI or MIPI interfaces are on. These are placed in the SOR partition. Software must therefore ensure that the SOR partition is powered on when VE, and potentially VE2, are on.

VE2 Power Gating

1. Flush MC clients ISP2 by setting the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.ISP2B_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bits are set:

a. ISP2B_HOTRESET_STATUS

3. Set the following bits to assert reset to ISP2:
   a. CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_ISPB_RST
4. Clear the following bits to disable clocks to ISP2:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_ISPB
5. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = VE2
   b. START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit VE2 is clear.

VE2 Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = VE2
   b. START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit VE2 is set
3. If need, set the following bits to enable clocks to ISP2:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_ISPB
4. Remove power gating clamps by writing a 1 to the following bits:
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD.VE2
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD until bit VE2 is cleared
6. If need, clear the following bits to de-assert reset to ISP2:
   a. CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_ISPB_RST
7. Enable MC clients VI and ISP by clearing the following bits:
   a. a.MC_CLIENT_HOTRESET_CTRL_0.ISPB_FLUSH_ENABLE

12.2.7.16 Procedures for DFD Power Domain

DFD is a new power gate-able partition in Tegra X1 onwards. The power gating of DFD needs to be under the control of customer using a build time configurable switch in the Boot Loader. i.e. the code to power gate the DFD partition will be present but under a “#ifdef POWERGATE_DEBUG”. The intention of power gating DFD partition is to get continuous power savings once the chips are in end products. Later for any field failure parts that need to be debugged, the boot loader needs to be built with another option to power ungate the DFD partition. So essentially the power gate and ungate is only valid during cold boot for DFD partition. In other words, do not power down the DFD partition with the other partitions before entering LP1 in the chips where the boot loader keeps the DFD powered up. This is because customers would want to use CoreSight for debug during LP1 to access partitions that aren’t power gated.

The only time and method by which the DFD partition should be PG is via the BL under the control of a build time parameter.

DFD contains 2 independent units: coresight_soc400 and internal logic analyzer. Both need to be reset and clock gated before power gating.

Another key thing to note for DFD is that it has 2 MC interfaces (ETR and AXIAP) which need to be flushed before initiating power gating.

DFD Power Gating

1. Flush MC clients by setting the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_1_0.ETR_FLUSH_ENABLE

b. MC_CLIENT_HOTRESET_CTRL_1_0.AXIAP_FLUSH_ENABLE

2. Poll MC_CLIENT_HOTRESET_STATUS_1_0 until the following bits are set:
   a. ETR_HOTRESET_STATUS
   b. AXIAP_HOTRESET_STATUS
3. Set the following bits to assert reset to DFD
   a. CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_CSITE_RST
   b. CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_LA_RST
4. Clear the following bits to disable clocks to DFD:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_CSITE
   b. CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_LA
5. Check APBDEV_PMC_PWRGATE_STATUS_0.DFD is set to ascertain if DFD is Powered up.
6. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = DFD
   b. START = ENABLE
7. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit DFD is clear.

DFD Power Ungating

1. Check APBDEV_PMC_PWRGATE_STATUS_0.DFD is clear to ascertain DFD is power gated.
2. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   a. PARTID = DFD
   b. START = ENABLE
3. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit DFD is set
4. Set the following bits to enable clocks to DIS:
   a. CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_LA
   b. CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_CSITE
5. Remove powergating clamps by writing a 1 to the following bits:
   a. APBDEV_PMC_REMOVE_CLAMPING_CMD.DFD
6. Poll APBDEV_PMC_CLAMP_STATUS_0 until bit DFD is cleared.
7. Clear the following bits to de-assert reset to DFD:
   a. CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_CSITE_RST
   b. CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_LA_RST
8. Enable MC client DFD by clearing the following bits:
   a. MC_CLIENT_HOTRESET_CTRL_0.ETR_FLUSH_ENABLE
   b. MC_CLIENT_HOTRESET_CTRL_0.AXIAP_FLUSH_ENABLE

12.2.7.17 Procedures for GPU Power Domain

Asynchronous resets arriving in GM20b are made synchronous to the osc_div_clk domain but are then consumed in multiple other clock domains. Therefore, there is a synchronization issue between the osc_div_clk and these other domains. The resets arrive during rail-gating and so compared to previous architectures, the sequence changes in bold below are required during rail-gating entry/exit.

GPU Rail-Gating

1. NV_PMC_CLIENT_HOTRESET_CTRL_1_GPU_FLUSH_ENABLE = _ENABLE
2. Wait for NV_PMC_CLIENT_HOTRESET_STATUS_1_GPU_HOTRESET_STATUS=_FLUSH_DONE
3. NV_PAPBDEV_PMC_GPU_RG_CNTRL_RAIL_CLAMP = 1
4. SWR_GPU_RST=1
5. CLK_ENB_GPU=0 and
6. **CLK_ENB_PLLG_REF=0**

GPU Rail-Ungating

1. CLK_ENB_GPU = 1 and **CLK_ENB_PLLG_REF=1**
2. NV_PAPBDEV_PMC_GPU_RG_CNTRL_RAIL_CLAMP = 1
3. NV_PAPBDEV_PMC_GPU_RG_CNTRL_RAIL_CLAMP = 0
4. SWR_GPU_RST=1
5. Delay
6. CLK_ENB_GPU=0
7. SWR_GPU_RST=0
8. CLK_ENB_GPU=1
9. NV_PMC_CLIENT_HOTRESET_CTRL_1_GPU_FLUSH_ENABLE = _DISABLE

12.2.7.18 Procedures for APE Power Domain

APE Power Gating

Tegra X1 devices support power gating of the Audio Processing Engine (APE) during scenarios when the audio subsystem is not used by software. The APE subsystem consists of an ADSP (Cortex®-A9 CPU), ADSP registers, and mailboxes, AHUB, ADMA, and other related logic. The entire cluster is one power domain referred to as APE. The reset default of the APE cluster is to be powered off.

The decision to power gate is made by the audio driver running on main CPUs. The sequence below is followed by software prior to the register writes to PMC to power gate the APE.

1. Software on CPU requests the ADSP to go idle.
2. The ADSP polls the APE clients to make sure they are IDLE.
3. The ADSP flushes caches, save context in DRAM. Sets a sticky flag to indicate context is saved.
4. The ADSP Programs GIC to route interrupts to CPU.
5. The ADSP executes WFI, which causes an interrupt to the CPU
6. This is the trigger to PG the APE.

The PMC supports power gate enable and clamp control registers for APE power gating. The CAR unit implements the reset(s) and clock enables registers.

Note: *While un-gating power to the APE, software needs to sequence the resets in accordance with the boot/PG exit requirements. For example, the ADSP reset is released only after software has written the appropriate reset vector registers.*

Refer to Chapter 23: Audio Processing Engine in this TRM for additional details.

12.2.8 MPE Power Gating

From a software perspective, MPEA and MPEB are one logical partition.

The PMC also has an option to sequence both partitions at the same time to shorten power-gating latency. The TD_PWRGATE_INTER_PART_TIMER[3:0] register can be programmed to configure the period between two partitions power-gate up/down sequence. Partitions are powered up in order – MPEA, followed by MPEB. Power gating down is executed in reverse order. Programming a 0 value in the TD_PWRGATE_INTER_PART_TIMER register will trigger simultaneous power gating of both partitions.

Note: *There is a power domain (MPE) made up of two partitions: MPEA (NVENC Partition A) and MPEB (NVENC Partition B). See Section 12.4.6: SoC Rail Partitions for details.*

12.3 Generic Timer's System Counter (TSC)

The ARM Generic Timer Specification requires a system counter (also known as a Time Stamp Counter) to be implemented in SoCs. The Cortex-A57 timers use this system counter as their reference clock input.

For the Generic Timer Specification, refer to the "The Generic Timer" section in the ARM Architectural Reference Manual (ARMv7-A).

The ARM system counter requirements can be grouped into two groups: basic counter functionality and architectural control and status registers functionality.

12.3.1 Basic Counter Functionality

The basic counter functionality requirements are:

- It should run at a constant clock frequency regardless of the power and clocking state of the processor cores using it.
- A lower bound on the clock frequency of the counter is in the range 1-10MHz.
- When the system is running with an inherently low clock frequency, it is acceptable that the precision of the counter is reduced.
- It must maintain the required counter accuracy, so that it does not gain or lose more than one second in a 24-hour period.
- The size of the counter is recommended to be 64 bits to avoid any roll-over issues. For a counter clock frequency less than 50 MHz, a 56-bit counter is acceptable.

12.3.1.1 Basic Functionality Implementation

Tegra X1 devices include a 56-bit free-running TSC counting at the main oscillator clock frequency. It is reset by pmc-rst (also known as main-rst). During deep sleep, the oscillator clock can be disabled. The PMC provides support for running the counter off a 32.768 kHz clock.

To save power, in the TSC implementation, only an offset counter runs in 32.768 kHz mode. All external (to PMC) visible views of the TSC (i.e., the TSC bus from the PMC, and TSC register readable value) remain frozen during this mode.

Refer to the TSC Clock Switch Programming Requirement section below for more information.

12.3.1.2 TSC Clock Switch Programming Requirement

Normally, the TSC runs at the oscillator clock, which may be optionally disabled during deep sleep.

Oscillator to 32.768 kHz Switch

If the oscillator needs to be disabled, then software has to ensure that the TSC clock is switched to 32.768 kHz before the oscillator is disabled. The clock switch (to 32.768 kHz) is triggered when software sets the

PMC_DPD_ENABLE[TSC_MULT_EN] bit. Hardware waits for the first rising edge (on 32.768 kHz) before switching the clock. Software needs to use the following steps to ensure the TSC clock is switched (to 32.768 kHz):

- Set the APBDEV_PMC_DPD_ENABLE_0[TSC_MULT_EN] bit
- Poll for APBDEV_PMC_TSC_MULT_0[FREQ_STS] to be '1' OR wait for 31 µs (=1 cycle of 32.768 kHz)
- OSC disable can now be initiated as part of the LP0 entry process in the PMC hardware. Software cannot disable OSC.

32.768 kHz to Oscillator Switch

Similar to the oscillator-to-32.768 kHz switch, hardware waits for the first rising edge on 32.768 kHz, before switching to the oscillator clock. It must be ensured that OSC is enabled before the TSC clock is switched to the oscillator. The PMC hardware ensures that the oscillator is enabled at the LP0 exit. The LP0 restore software has to switch the TSC clock to the oscillator by clearing the APBDEV_PMC_DPD_ENABLE_0[TSC_MULT_EN] bit. After switching to the oscillator clock, software does not have to wait for APBDEV_PMC_TSC_MULT_0[FREQ_STS] to be '0' because 32.768 kHz is always running.

12.3.1.3 GPU Time Stamp

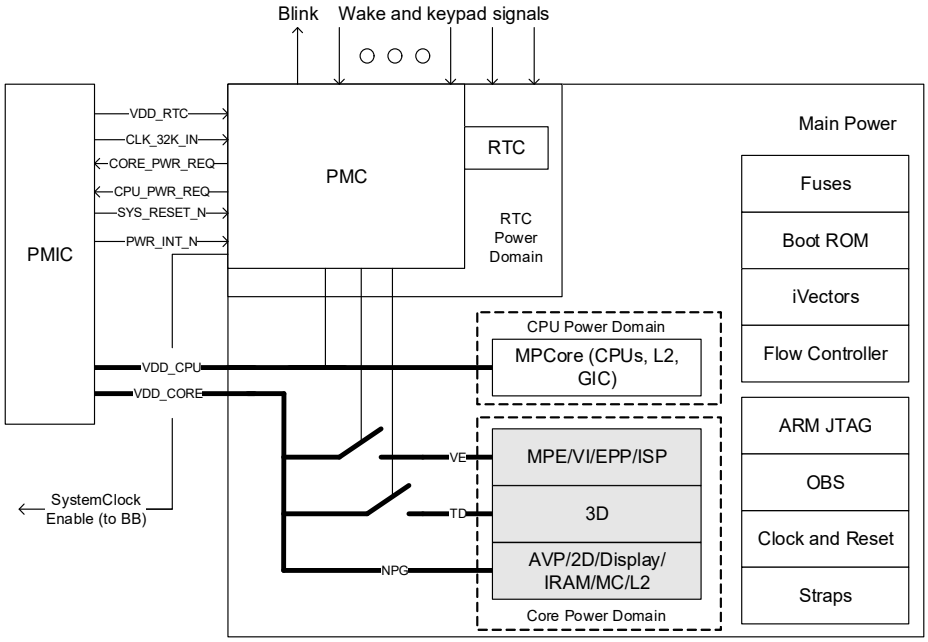
The Gray-encoded TSC is also sent to the GPU, together with a selected bit of the binary TSC acting as a tick clock to minimize power; that is, some logic in the GPU is only activated after an edge on the tick indicator.

The index of the bit selected as tick clock is programmable via APBDEV_PMC_TSC_MULT_0[TICK_SEL], which can take a value between 0 and 5.

12.4 Functionality

The PMC is a part of the RTC power domain. The PMC manages the interface with the external PMIC, including the hardware reset pin, the 32.768 kHz clock, and the power request signal. A high-level schematic view of the power domains inside the Tegra X1 devices is shown below. Refer to "SoC Rail Partitions" for a summary of all power domains.

Figure 18: High-Level View of Power Domains in Tegra X1 Devices



An important aspect of the PMC is the wake-up and reset logic. The following subsections show the expected behavior of the PMC under three scenarios:

- Frozen boot, that is, the VDD_RTC transitioning from OFF to ON, with or without VDD_CORE and VDD_CPU also transitioning from OFF to ON

- Deep Sleep wake-up, where the PMC is responsible to track wake-up events and to request a transition of VDD_CORE and optionally VDD_CPU from OFF to ON
- Suspend mode wake-up, where the PMC is responsible for establishing the power back to the CPU partition

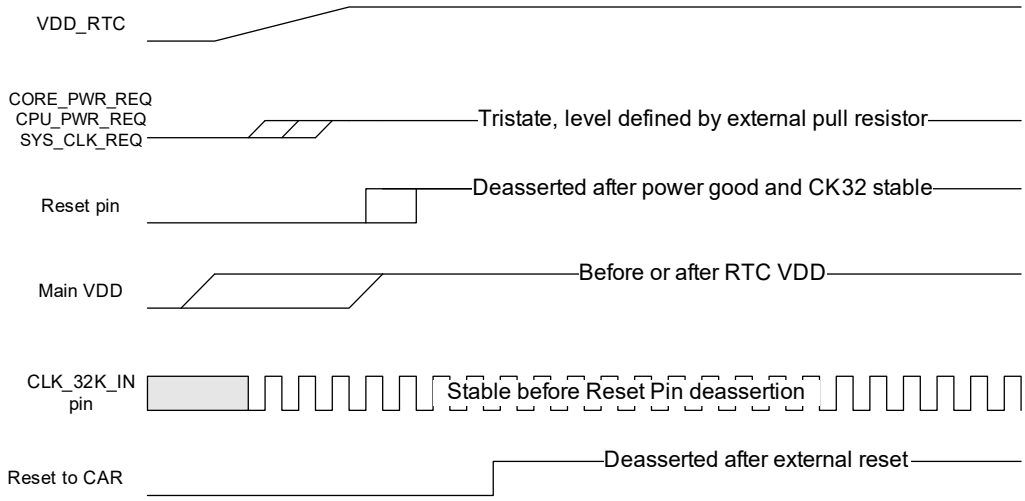
When reset is deasserted to the Tegra X1 devices, the PMC logic performs minimal processing. It forwards a reset signal and the 32.768 kHz clock to the Clock and Reset (CAR) block.

12.4.1 Frozen Boot Sequence

The Frozen Boot wake-up sequence happens when power has been deasserted to the RTC domain:

1. The PMIC detects a turn-on condition and enables power to VDD_RTC.
2. Simultaneously to VDD_RTC enable or shortly afterwards, the PMIC enables power to VDD_CORE and optionally to VDD_CPU.
3. More than 1 ms later, the PMIC enables power to 1.8V I/O rails that need to be enabled for boot.
4. More than 1 ms later, the PMIC enables power to 2.8V/3.3V I/O rails that need to be enabled for boot.
5. The PMIC drives a 32.768 kHz clock to Tegra X1 devices.
6. More than 1 ms later, the PMIC deasserts reset to Tegra X1 devices. The 32.768 kHz clock and all power rails must be stable and at their nominal value before reset is deasserted.
7. The PMC block resets and deasserts reset to the CAR block, which resets the rest of the Tegra X1 chip.
8. Tegra X1 devices begin boot from internal ROM.

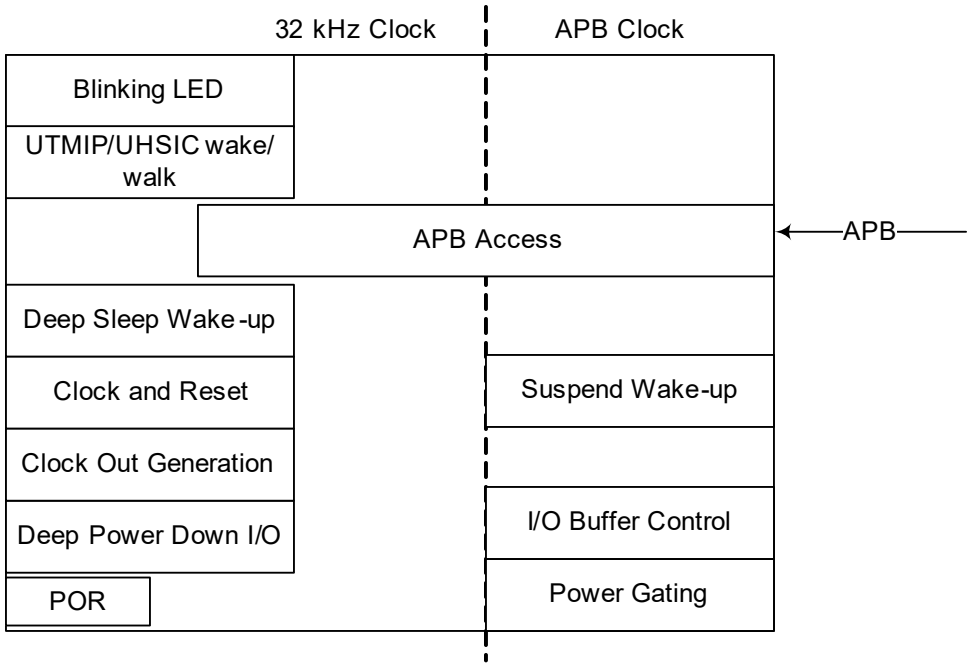
Figure 19: Frozen Boot Sequence



12.4.2 Reference Block Decomposition

The next figure shows a reference decomposition of the PMC.

Figure 20: Reference Block Decomposition Diagram



The blocks inside the PMC are:

- Wake-up logic for Deep Sleep and Suspend modes
- Power-gating logic
- External clock and reset
- Blinking LED
- I/O buffer control (software-driven I/O deep power down)
- APB interface
- UTMIP/UHSIC wake/walk logic
- Deep power down I/O logic (independent of deep sleep)
- Clock out generation

12.4.3 Always-On Thermal Alarm Generator (AOTAG)

The PMC remains powered during “standby” (LP0). It contains the only always on temperature sensor as well as associated temperature measurement and alarm condition generation logic.

The PMC-TAG temperature sensor is configured by software and always left on to monitor for low/high temperature events as well as a catastrophic thermtrip event.

Once software hot/cold events are detected, the Tegra X1 processor shall be woken up and system software shall perform appropriate system management activities for the corresponding alarm.

Once a thermtrip event is detected, it is signaled to the PMIC via an overloaded existing interrupt line.

12.4.3.1 Alarm Types

The PMC-TAG supports the detection and reporting of three alarm conditions: low temperature alarm, high temperature alarm, and thermtrip. For consistency, all alarm conditions are specified by pairs of comparators, one for alarm condition set threshold and another for the alarm condition reset threshold, allowing hysteretic condition set/reset.

12.4.3.2 Security

Event threshold control registers have separate write locking controls for security, similarly an overall AOTAG control write-lock is provided that prevents all further AOTAG register modifications. All write lock bits are cleared only by power on reset.

Power Domains

All of PMC_AOTAG logic is powered by VDD_RTC.

12.4.4 Power Gating/Ungating

The only Suspend mode wake-up specific logic in the PMC is related to the power gating logic as described previously.

12.4.5 CPU Rail Partitions

The Tegra X1 CCPLEX supports a 4+4 configuration where there is a fast cluster consisting of 4 Cortex®-A57 CPU cores and a slower cluster consisting of 4 Cortex-A53 CPU cores. Only one cluster can be in CC0/CC3/CC4 state at a given time, and the other cluster is guaranteed to be in the CC6 state (i.e., all cores and Non-CPU power gated). The cluster switch is managed by software running on BPMP-L.

Each CPU is an independent power-gated domain. The cluster's non-CPU may be power gated as a separate domain. The flow controller would provide option for cluster L2 to be power gated.

The non-CPU cannot be power-gated unless all of the CPUs are power-gated (or inactive). Also the L2 cache needs to be flushed before power-gating the non-CPU.

CPU power-gating control is separated from SoC power-gating control because the CPU rail partitions need different inter-zone delay values (configured in PMC_PWRGATE_TIMER_* registers). There are 8 zones per CPU partition.

In addition, unlike non-CPU SoC partitions (which can only be power gated/ungated by direct PMC register writes), CPU (fast or slow) related partitions can be power gated/ungated by the flow controller requesting PMC to power gate/ungate them. The following table provides a list of CPU rail partitions.

Table 36: CPU Rail Partitions

Partition	Partition Description	Notes
CE0	Cluster0 CPU0	Normally, power-gated on/off via flow-controller interaction. Can be power-gated on/off by direct register write. Uses PMC_PWRGATE_TIMER_CE* inter-zone delays.
CE1	Cluster0 CPU1	
CE2	Cluster0 CPU2	
CE3	Cluster0 CPU3	
C0NC	Cluster0 Non-CPU	
CRAIL	CPU Rail	Normally, power-gated on/off via flow-controller interaction. Can be power-gated on/off by direct register write. On/Off delays are programmed in the PMC_CPUPWRGOOD_TIMER and PMC_CPUPWROFF_TIMER registers. These timers are used only when the platform supports a CPU power good indication.

12.4.6 SoC Rail Partitions

In SoC partitions, only CPULP and C1NC can be power-gated on/off via the flow controller. All other partitions can only be power-gated (on/off) by direct register writes. Tegra X1 PG partitions have 8 zones per partition.

Partition	Gated Power Domain	Description
NVDEC	PD_nvjpg	NVDEC part A and NVJPG
NVDEC_b	PD_nvdec	NVDEC part B
NVDEC_c	PD_nvdec	NVDEC part C
AUD	PD_aud	APE sub system

Partition	Gated Power Domain	Description
ADSP	PD_aud	Audio processor
VIC	PD_vic	VIC Logic
VICB	PD_vic	VIC Logic
VICC	PD_vic	VIC Logic
VICD	PD_vic	VIC Logic
MPEA	PD_mpe	NVENC Part A
MPEB	PD_mpe	NVENC Part B
DIS	PD_dis	Display A core logic
DISM	PD_dis	Display A memory
DISB	PD_disb	Display B core logic
DISBM	PD_disb	Display B memory
SOR	PD_sor	Display interfaces
VE	PD_ve	ISP
VE2	PD_ve2	ISP2
DFD	PD_dfd	DFD debug logic
XUSBA	PD_xusba	XUSBA Device mode
XUSBB	PD_xusbb	XUSBB Device mode
XUSBC	PD_xusbc	XUSC Device mode
PCX	PD_pcx	PCIE core logic
SAX	PD_sax	SATA

12.4.7 Default Power/Clamp/Reset Status of PG Partitions

This subsection provides the default power, clamp, and reset status of the PG partitions.

12.4.7.1 Cold Boot (Power-on Reset)

By default, all of the CCPLEX related partitions (except the C0NC) are power-gated and non-CCPLEX partitions are power-ungated. The clamps are accordingly enabled (for the power-gated domain) or disabled (for the power-ungated domain). The C0NC is power-ungated by default (to keep the CAR reset defaults consistent with the power-gating status at LP0 exit).

Refer to the PMC_PWRGATE_STATUS and PMC_CLAMP_STATUS register descriptions for the default power and clamp status, respectively, of PG partitions.

12.4.7.2 Deep Sleep Exit

At deep sleep exit (LP0), the PMC retains power-gating status of all the PG partitions. The PMC does not restore the CPU rail – if necessary, software needs to power-up the CPU rail during LP0 exit (via a PMC register write).

The CAR unit is powered off during deep sleep, so the CAR provided reset defaults at LP0 exit are the same as its cold boot defaults. At LP0 exit, the C0NC is expected to be power-ungated. Therefore, its cold boot default is power-ungated, so its reset (which is provided by the CAR block) can be kept the same for cold boot and LP0 exit.

12.4.8 GPU Rail Gating

The PMC provides GPU to SoC clamp enable which needs to be set (by software) in the APBDEV_PMC_GPU_RG_CNTRL_0_RAIL_CLAMP register bit before the GPU rail is powered off, and cleared after the GPU rail is powered off. The PMC GPU power-gating logic is not used but remains unchanged (the Tegra X1 GPU has its own ELPG controller).

The GPU rail power-up sequence is as follows:

- Software requests GPU rail power up (via PMIC I2C)
- Wait for power good (based on the software timer)
- Remove the clamp (by writing the PMC_GPU_RG_CNTRL[RAIL_CLAMP] register)
- Enable the CAR to GPU clock (it is enabled by default)
- Deassert CAR to GPU reset (by writing to the CAR register named CLK_RST_CONTROLLER_RST_DEV_X_SET_0_SET_GPU_RST)

The GPU rail power-down sequence is as follows:

- Assert CAR to GPU reset (by writing the CLK_RST_CONTROLLER_RST_DEV_X_SET_0_SET_GPU_RST register)
- Disable CAR->GPU clock (by writing the CLK_RST_CONTROLLER_CLK_ENB_X_SET_0_SET_CLK_ENB_GPU register)
- Enable the clamp (by writing the PMC_GPU_RG_CNTRL[RAIL_CLMAP] register)
- Software requests GPU rail power down (via PMIC I2C)
- Wait for power off (based on the software timer)

  This step depends on the PMIC. Some PMICs do not require power off wait; however, it is likely to be needed.

12.4.9 CPU Power States

The CCPLEX implements the following core level power states:

- C0 – Core is ACTIVE and executing.
- C1 – Core is IDLE and clock gated after having executed a WFI or WFE instruction. The core has to be in this state before it can transition to a deeper power state.
- C7 – Core is power gated.

Individual cores within the same cluster can transition freely and independently between the C0/C1/C6 power states. There is no direct transition from C1 to C7 on Tegra X1. The CPU management drivers can go from C0 to C7 if the core is hot plugged or the C7 is entered from cpuidle. The hot plug policy is controlled by which CPU governor is selected. If runnable governor is selected, the CPU state will be switched depending on the running threshold. Currently, a core enters C7 from cpuidle when the predicted idle time by the cpuidle governor is more than 1 ms. Idle time is predicted using a statistical average with various other parameters influencing the metric. We enter C1 when the predicted idle time is really small (<500 us).

The entry time between C0 and C7 is ~ 0 us, and exit time is ~ 80 us.

The CCPLEX implements the following cluster level power states. They apply to both Cortex-A53 and Cortex-A57 clusters.

- CC0 – One or more cores in the cluster are active (in C0).
- CC1 – All the cores in the cluster are idle and (self) clock gated after having executed a WFI or WFE instruction. At least one core is in C1. Other cores can be in C1 or deeper state.
- CC3 (formerly HVC) – All cores are idle (in WFI mode) and VDD_CPU has been lowered to Vmin.
- CC4 Retention – All cores are idle (in WFI mode) and VDD_CPU has been lowered to Vret.
- CC6 – All cores plus L2 are power gated. The L2 content has been flushed to memory.
- CC7 – All cores plus L2 are power gated. In addition VDD_CPU rail is OFF.

12.4.9.1 CC3/CC4 States

Tegra X1 devices support two new CPU power states: CC3 and retention CC4. This flow is triggered when the CPUs are idle, and the flow controller detects STANDBYWFI assertion from the last core standing. The PMC plays the following roles in the entry sequence:

- Receives a trigger from flow controller and disables CCPLEX TSOSCs from sensing temperature. (A sideband signal driven from the PMC (pmc2soc_therm_crail_voltage_valid) is used to invalidate the temperatures sensing in SOC therm)
- De-asserts CPU_PWR_REQ to request Vmin value from PMIC.
- Notifies the flow controller that CC3 entry is complete.

On the exit sequence from CC4/CC3, the PMC does the following actions:

- When the flow controller requests the voltage change, the PMC asserts CPU_PWR_REQ to ramp up the voltage.
- Waits for a timer expiry to make sure the voltage has reached functional levels and re-enables TSOSCs in CCPLEX.
- Sends the ack back to the flow controller. [the previous step is non-blocking]

CPU retention mode is conditionally entered from the CC3 state, and BPMP-L SW is responsible for all of the retention specific steps. PMC provides a SW hook to clamp the CCLPLEX -> CORE interface through PMC_SET_SW_CLAMP register. BPMP-L SW will use this register to assert the VDD_CPU -> VDD_CORE clamp signal before VDD_CPU is brought down to retention levels. On exit from retention, this clamp is released after VDD_CPU is back at functional levels.

The latency of entering CC1 and CC3 is quick as it is hardware sequenced:

CC1: Few clocks

CC3: < 10 µs

CC4: Entry/exist involves BPMP processor which takes more latency. The entry time is < 50 µs, and exist time is 140 µs.

PMIC Control for CC3/CC4 State Transitions

The PMC supports an optional mechanism to de-assert CPU_PWR_REQ as part of CC3 flows, with the intention of signaling the need to transition to Vmin to the PMIC, instead of going over the normal VID transfer mechanism of the PMIC (i2c/PWM). This sideband signaling can be masked by programming the PMC_CC4_HVC_CONTROL.MASK_CPUP_PWRREQ bit.

The table below summarizes the regulator control mechanism and configuration settings in the PMC and CL-DVFS for the supported PMIC types.

PMIC	VID Protocol	Vmin Selection Mechanism	CL-DVFS Settings	PMC Settings	Standby_ GPIO
OVR	PWM-VID	PWM VID Transfer	DVFS_CC4_HVC.CC4_HVC_FORCE_VALUE=VID (Vmin) DVFS_CC4_HVC.CC4_HVC_FORCE_ENABLE=1 DVFS_DFLL_OUTPUT_CFG.DFLL_OUTPUT_CONFIG_DELTA_EN=0	PMC_CC4_HVC_CONTROL.MASK_CPUPWRREQ=1	Software needs to assert this I/O to enter retention
MAX8973	I2C	DVS	DVFS_CC4_HVC.CC4_HVC_FORCE_VALUE=VID (Vmin) DVFS_CC4_HVC.CC4_HVC_FORCE_ENABLE=1	PMC_CC4_HVC_CONTROL.MASK_CPUPWRREQ=0	Not used

12.4.10 Wake Events

The PMC provides support for 64 wake events and ties off unused wake-event inputs.

The wake-up logic performs the following tasks:

- Tracks the state of a programmable set of wake-up events
- Detects deep sleep wake-up condition
- Optionally generates an interrupt based on wake-up events

A wake-up event is an assertion or a change of level on any event in a set of specified pins/events, *or* an assertion of an interrupt in a set if specified interrupts (e.g., RTC interrupts). The logic that tracks for change of levels in external pins contains

a glitch filter that can be optionally disabled. Internal events/interrupts do not require de-glitching logic, but are passed through the same logic, as this is also the synchronization logic. A conceptual schematic is shown in the following figure.

The latched wake-up events are readable by software once the CPU (or CPU) is active. The logic accumulates all events that take place while in LP0 mode. Normally only one enabled event is present in the set, but simultaneous events could take place. Each bit of the latched wake-up event register is cleared by writing a '1' to it.

The wake-up detection logic can also be configured to generate WakeInterrupt in which case it accumulates events when interrupt-generation-mode is enabled.

A second set of latches is also present, with the same structure as the wake-up event register but under software control. The most important difference between the two sets is that events that occur outside of the deep sleep (LP0) mode will be captured in the second set, including:

- Events that could occur during the LP0 mode transition itself, i.e., before the hardware enters the deep sleep (LP0) state, but after software has instructed hardware to enter the LP0 state.
- Events that occur after the hardware wake-up, but before software has enabled the peripheral functions that process the signals tied to the wake-up events, i.e., the GPIO event logic.

The table below shows the wake assignments. The assignment of the external wake events is given by the specific platform's pinmux table, and this is where the system designer describes which pins the platform should wake from. This assignment is application and platform specific.

Table 37: Wake Assignments

Wake Event#	PMC Wake1 Register Bit	PMC Wake2 Register Bit	Wake signal	Internal/ External
wake0	0		Wake signal	EXT
wake1	1		Wake signal	EXT
wake2	2		Wake signal	EXT

12.4.10.1 Deep Sleep Wake Events as Interrupts

The deep sleep wake detection logic can be used to generate an interrupt (WakeInterrupt) in active states (by configuring WAKE_DET_EN). It can also be used to detect (by configuring the WAKE_DET_EN bit) and generate (by configuring the WAKE_INT_EN bit) interrupt (WakeInterrupt) outside of the LP0 state, based on the wake event.

12.4.10.2 Clearing Wake Status

The wake status accumulated in PMC_WAKE*_STATUS registers can be cleared by software by writing the corresponding bit of the PMC_WAKE*_STATUS register to '1'. These wake status registers are also cleared by the PMC during LP0 entry provided WAKE_DET_EN is not set. If WAKE_DET_EN is set, then these registers can only be cleared by software.

The wake status accumulated in PMC_SW_WAKE*_STATUS registers can be cleared by software by writing '1' to corresponding register.

12.4.10.3 USB Wake Events

USB wakes events are expected to be configured (by setting PMC_WAKE2_LVL[ALLOW_PULSE_WAKE]=1) as pulse events. From a PMC hardware perspective, they can be configured to be pulse or level – the PMC will sequence LP0 exit in either case. However, at LP0 exit, the PMC_WAKE*_STATUS register provides the status of USB wakes only if they were configured as pulse. If they are configured as level, then the PMC_WAKE*_STATUS register will not provide status of USB wake events. The PMC_SW_WAKE*_STATUS registers provide status irrespective of pulse or level configuration.

In Tegra X1 devices, USB wake events (VBUS and USBID) are supported through the PMIC.

12.4.10.4 Wake Event Debouncing Support

Tegra X1 devices support wake event debouncing. The PMC wake event de-bounce logic runs on 1 kHz clock (derived from 32 kHz clock) and uses the same de-bounce structure as used in GPIO blocks as described below.

Functionality of Debounce Block:

- When a key is pressed on a mechanical switch, the input is passed via a synchronizer.
- The output of the synchronizer is registered to new_value (i).

The input to the debounce logic is the new_value(i), is assigned to the output only if the new_value remains stable/No signal transitions for the registered space of time i.e., defined by the register field de-bounce count in terms of the 1ms period.

PMC will support de-bouncing capability to a select set of 8 wake inputs (wake events [31:24]). The following registers will contain the configuration to enable this feature.

Refer to the DEBOUNCE_DELAY and WAKE_DEBOUNCE_EN fields in the PMC_WAKE_DEBOUNCE_EN_0 register for more information.

12.4.10.5 PMC_WAKE_DELAY

PMC_WAKE_DELAY is an existing mechanism in PMC (i.e not new in Tegra X1) to delay the servicing of wake events once CORE_PWR_REQ is turned off in LP0 entry. The settings of APBDEV_PMC_WAKE_DELAY register define the wake delay in terms of 32 KHz clock cycles. This is a configurable option to make sure that CORE_PWR_REQ stays de-asserted for a minimum amount of time, before LP0 exit starts.

12.4.11 LPx States

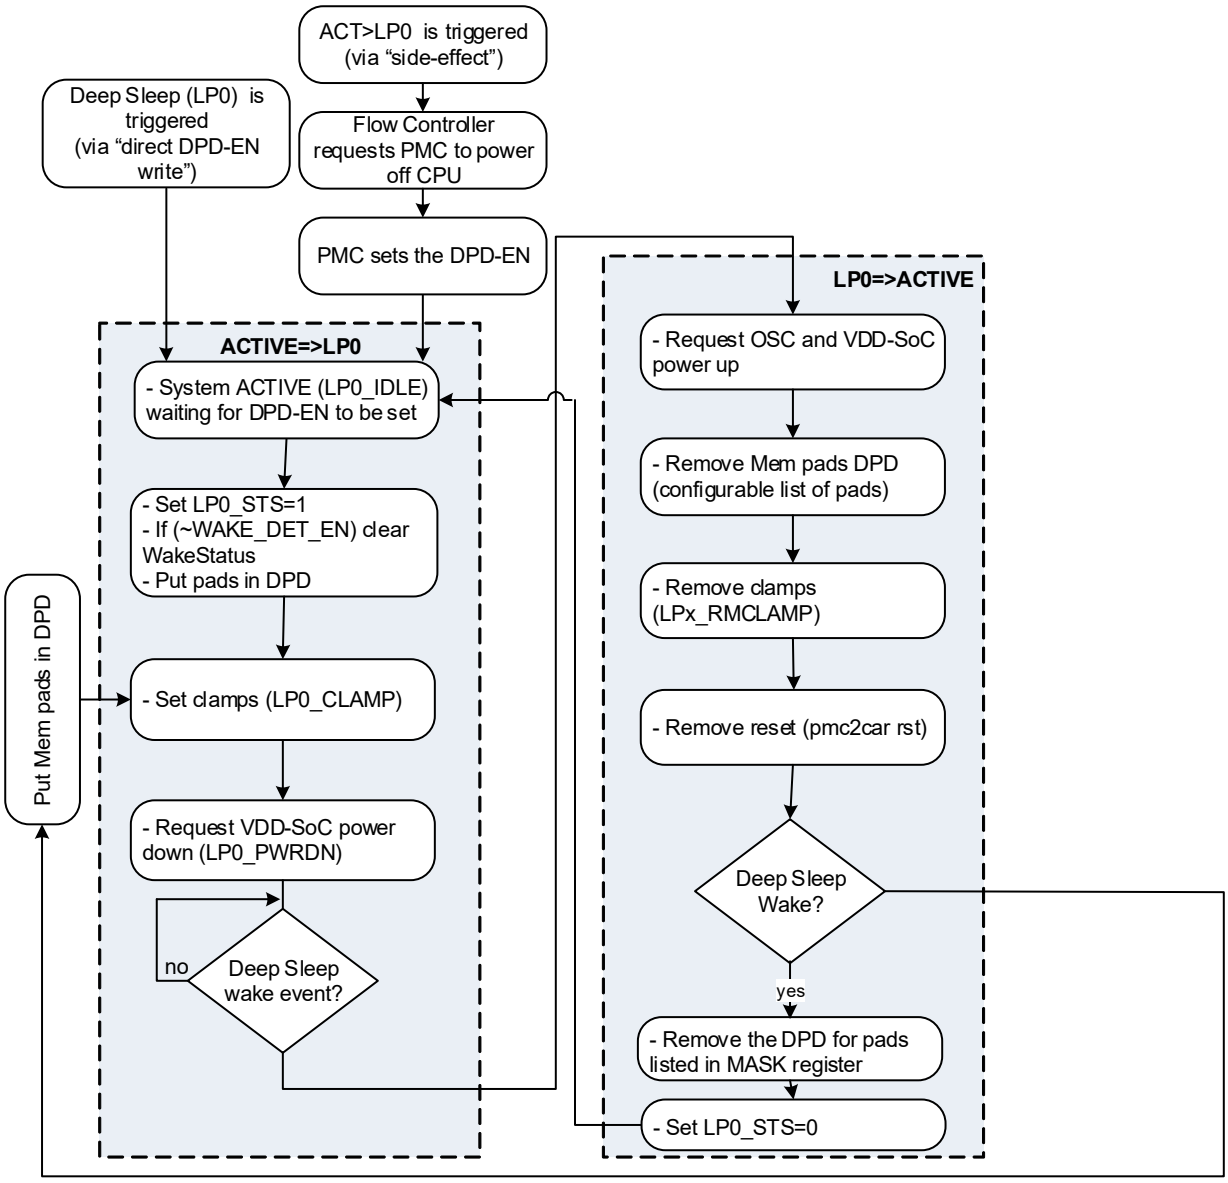
Tegra X1 processors are enabled to enter the deep sleep (LP0) state after the CPU complex enters the CC7 state. Each CPU core communicates its CC7-latency tolerance to BPMP-Lite, which then decides whether to transition the system into LP0 or not, based on the energy cost of LP0 entry and exit. LP0 is also referred to as Standby or Deep Sleep state on the platform.

The LPx states described here are system Low Power states. There are two LP states:

- LP0**:** Low Power 0 (Deep Sleep) state in which DRAM is put in self-refresh, system state is saved in PMC + DRAM, the VDD_SOC and VDD_CPU rails are powered off, and the PMC is configured to monitor “LP0 exit wake events” which would trigger LP0 exit.
- LP1**:** Low Power 1 (Suspend) state. Devices are power-gated, SoC clock domains are set to the minimum frequency (12 MHz and 38.4 MHz), the flow controller is configured to monitor “LP1 exit wake events,” DRAM is put in self-refresh, and the VDD_CPU rail is powered off.

  The following figure shows a flow diagram of the LPx states. The states marked as LP0_<> represent the states of existing LP0 state machine.

Figure 21: LPx Entry/Exit Flow Diagram



12.4.11.1 Deep Sleep Entry (ACTIVE=>LP0)

The deep sleep (LP0) entry happens after an ordered shutdown of the Tegra CPU (excluding always-on logic). As part of the shutdown procedure, most of external interfaces are placed in their idle condition (DPD – Deep Power Down). The PMC provides the logic that ensures that interfaces maintain their idle state during deep sleep. Software is responsible to sample the idle state by writing to the DPD sample bit (PMC_DPD_SAMPLE[0] bit) before entering deep sleep.

Software must also ensure that I/O paths that must remain active during LP0 are identified as such, by correct configuration of ownership bits in a PMC register if applicable.

Software must also ensure that LP0 wake-up conditions are programmed properly. Wake-up mask and wake-up level should reflect expected wake-up events. The Power Good Timer and Power Down Timer must be set according to the PMIC specification.

The deep sleep entry/wake-up logic operates largely on the 32.768 kHz clock, so software must respect a minimal delay between an LP0 exit and before issuing the next LP0 entry command. This delay is of the order of 2 periods of the 32.768 kHz clock. Normally, this should never be a problem given that the LP0 exit (Boot ROM and Recovery Code) requires much more time.

There is one way to enter deep sleep:

- *Direct-write:* Writing directly into the PMC_DPD_ENABLE register. Deep sleep is entered on POR.

The PMC deep sleep state entry is similar to existing deep sleep entry except:

- The PMC sets LP0_STS bit when it starts to enter the deep sleep state.
- The PMC clears WakeStatus only if WAKE_DET_EN=0

Refer to the PMC_CNTRL2_0 register for the LP0_STS bit description.

One time configuration:

Note: this is expected to be one (at cold boot) time configuration. However, the PMC does not care whether it is programmed once at boot or every time before deep sleep entry or never (use hardware reset default).

- [SW] Configure power-good timers. Note that the values are dependent on the PMIC specification and board configuration. PWRGOOD timers are used during LP0 exit (see “LP0 exit” for details).
  - Write PMC_PWRGOOD_TIMER register (default of 0x7f cycles of 32 kHz => 3.8 ms)
  - If the PMIC supports Power-Good signal, then enable Power-Good (See the “VDD_CPU Power-Good” section)
- [SW] Configure wake-delay. This is the minimum delay required between VDD_SOC power OFF to ON request. It is based on the PMIC specification. However, it is expected that this delay is not needed.
  - Write PMC_WAKE_DELAY register (default value 0x0)
- [SW] Setup polarity of power-request signals
  - Write PMC_CNTRL[CPUPWRREQ_POLARITY, PWRREQ_POLARITY] bits
  - Note: SYSCLK polarity is fixed (active-high)
- [SW] If need be, configure IO_DPD*_OFF_MASK registers

At every Deep Sleep entry:

- [SW] Power (and/or clock) gate units and peripherals not needed

---

Note: *PMC hardware does not care whether software power-gate non-CPU SOC partitions or not. However, it is expected that software would power-gate non-CPU SOC partitions before initiating LP0 (or LP1) entry. At the deep sleep exit, the PMC would bring SOC partitions in the same state as they were in before deep sleep entry.*

- [SW] Configure wakeup events. The corresponding I/O rail for a wakeup pin needs to be powered on in order for the wakeup to function. If no wake event is configured, then only POR reset can reset the chip.
  - Write PMC_WAKE*_MASK and PMC_WAKE*_LVL registers
- [SW] Program scratch registers with the context information needed to restore from deep sleep
  - Write context data into PMC_SCRATCH* registers

- [SW] Ensure all I/O interfaces are in idle

> ***Note:*** *The PMC does not provide any "global" idle status. Software needs to check individual devices/ IOs.*

- [SW] Put DRAM into self-refresh
- [SW] Sample IO (pads) current values which would be driven during deep sleep
  - Write PMC_DPD_SAMPLE register
- [SW] Configure pads override (which would override above sampled value)
  - Write PMC_ DPD_PADS_ORIDE register
- [SW] Write PMC_DPD_ENABLE register to trigger LP0
- [PMC] Set LP0_STS register bit to '1'
- [PMC] Request for sys-clk shutdown (this is required only when none of the 3 incoming clock requests are asserted)
- [PMC] Assert PAD mux selection signal
- [PMC] After some delay (1/2 clk32 cycle) to let mux-selection propagate, put I/Os into DPD, and put all the PLLs into DPD.
- [PMC] Clamp all the signals from VDD_CPU/SOC domain into AO or I/Os.
- [PMC] Request SOC power off
  - De-assert CORE_PWR_REQ to PMIC to turn off VDD_SOC domain

12.4.11.2 Deep Sleep Exit (LP0=>ACTIVE)

The corresponding I/O rail for a given wakeup pin needs to be powered on in order for the wakeup to function. The VDD_SOC and VDD_CPU power rails are turned off during LP0. Wakeup signals are routed from the pads directly to the RTC for the wakeup sequence to be initiated.

Deep Sleep Exit Sequence

- [PMC] Detect wake-up condition and latch the condition into the PMC_WAKE_STATUS register
  - [PMC] If enabled, latch the wake-up condition(s) into PMC_SW_WAKE_STATUS register.
- [PMC] Ensure PMC_WAKE_DELAY has passed from previous wake-event handling
- [PMC] Request OSC power up by asserting the sys-clk-req signal, and start pre-SoC Power Good timer
  - Wait for 4*PMC_PWRGOOD_TIMER[23:16] cycles of 32 kHz (note: multiplier of 4)
- [PMC] Request VDD_SoC power up by asserting the core-pwr-req signal
  - Wait for PMC_PWRGOOD_TIMER[7:0] cycles of 32 kHz
- [PMC] Remove DPD mode for all I/Os
- [PMC] Remove main (VDD_SOC domain) clamps
- [PMC] Wait for post PG OSC timer
  - Wait for 4*PMC_PWRGOOD_TIMER[15:8] number of 32kHz cycles (note: multiplier of 4)
- [PMC] Set the LP0_STS register bit to '0'
  - This update can be done before or in parallel with CAR reset de-assertion. If APB-clock is off at the time of hardware LP0_STS update, then it is okay to hold update of software-readable LP0_STS register bit until APB-clock is up and running.
- [PMC] De-assert the reset to CAR.

Note: *VDD_CPU is brought up to the same state (power on or off) it was in before entering deep sleep*

12.4.12 Power-Gating Logic

The power-gating logic is a simple programmable sequencer. When the power-gating logic is triggered, it sequences the set of power-gating signals with a programmable period (measured in cycles) between the toggling of consecutive power-gating signals.

The power-gated domains are listed in Section 12.4.5: CPU Rail Partitions and Section 12.4.6: SoC Rail Partitions. For all of them, the trigger can be a register write (see the register definitions). The CPU power-gated domain has an extra trigger coming from the flow controller. The PMC and flow controller provide a full handshake, with the PMC acknowledging the flow controller when the CPU power has completed its transition (this would normally only be for OFF to ON transition at Suspend mode wake-up).

The power-gating logic operates on the APB clock.

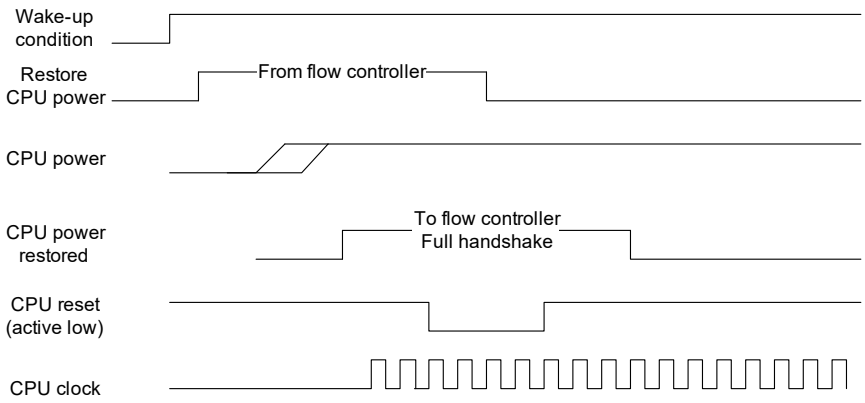
The power-gating logic may be triggered either by direct register writes using the PMC toggle register or by interaction with the flow controller. The second control path is used when entering Deep Sleep or Suspend mode to allow for an orderly shutdown of the processor. The sequence can be summarized in the following manner:

1. The CPU decides to enter either Deep Sleep or Suspend mode.
2. In both cases, power to the CPU must be gated off.
3. The CPU does any required clean-up. This is especially important for Deep Sleep (all interfaces in idle, save context, etc.).
4. The CPU informs the flow controller it wants to remove its power with two variants:
   - For Suspend mode, the CPU also defines the set of flow controller events that will wake up the CPU (the flow controller is not power gated together with the CPU).
   - For Deep Sleep, a write to a DPD sample register preserves the I/O state to be driven when the chip enters Deep Sleep mode. For Deep Sleep, the CPU must define in the PMC the set of wake-up events for the whole Tegra X1 device and set the DPD trigger enable bit.
5. The CPU enters an endless loop, executing the WFI/WFE instruction.
6. The flow controller asserts reset to the CPU.
7. The flow controller informs the PMC that CPU power-gating OFF is requested.
8. The PMC power gates the CPU OFF, then informs the flow controller.

The Deep Sleep wake-up was described before and is essentially a full reset of the core logic. The Suspend mode wake-up logic includes an interlock with the flow controller that works like this:

1. The flow controller detects the Suspend mode wake-up condition.
2. The flow controller informs the PMC that power-gating ON is requested.
3. The PMC power gates the CPU ON, then informs the flow controller.
4. The flow controller deasserts the reset to the CPU.
5. The CPU checks different status registers to establish this was in fact a Suspend mode wake-up.

Figure 22: Power-Gating Logic



12.4.12.1 Software and Hardware PG Request Interlocking

The PMC power-gating controller can only power gate (or ungate) one partition at a time. However, the PMC can get independent PG requests from software by a direct register write and hardware through the flow controller.

In Tegra 3 devices, the PMC drops the PG request when it is busy sequencing a hardware-initiated request. In Tegra X1 devices, the behavior of the PMC_PWRGATE_TOGGLE[START] register bit changed as follows:

- Software sets this bit to '1' to request a power-gate toggle.
- Hardware clears this bit to '0' when hardware starts to execute a power-gate toggle request.

For backward-compatibility, the PMC_PWRGATE_TOGGLE[START] register bit can be written to '0' by software. Normally, software should never write this bit to '0'. If software writes it to '1' and then writes it to '0' before hardware starts to execute the request, the software request gets dropped. To know the request completion, software has to poll the PMC_PWRGATE_STATUS register (where the status bit gets updated when the corresponding unit is power gated/ungated).

12.4.12.2 MPE Power Gating

In Tegra X1 devices, the MPE has two partitions that are seen as one Engine Level PG (ELPG) by software, but should be brought up/down sequentially due to power spike concerns. From a software perspective, MPE is one logical partition.

The PMC has an option to sequence both MPE partitions at the same time to shorten power-gating latency. The TD_PWRGATE_INTER_PART_TIMER[3:0] register can be programmed to configure the period between two partitions power gate up/down sequence. Partitions will be powered up in order – MPEA, followed by MPEB. Power gating down will be executed in reverse order. Programming a 0 value in the TD_PWRGATE_INTER_PART_TIMER register will trigger simultaneous power gating of both partitions.

Note: *There is a power domain (MPE) made up of two partitions: MPEA (NVENC Partition A) and MPEB (NVENC Partition B). See Section 12.4.6: SoC Rail Partitions for details.*

12.4.13 I/O Buffer Control

Deep Power Down I/O buffer management ensures that the I/Os are maintained in an idle state while in Deep Sleep mode. The procedure has been described before and requires software sequencing. See Chapter 9: Multi-Purpose I/O Pins and Pin Multiplexing (Pinmuxing) for more information.

1. Software makes sure that the affected I/O ports are in their idle state, i.e., the state that will persist during Deep Sleep.
2. When software sets the PMC_DPD_SAMPLE register, the idle state of the I/O control signals is captured, i.e., the driving direction and the data driven if the direction indicates output.
3. Software writes the DPD enable bit of the respective I/O group (PMC_DPD_REQ, PMC_DPD2_REQ, and PMC_DPD3_REQ) and muxes inside the I/O buffers now drive the stored idle state, while the corresponding control

signals coming from the core are ignored. Software can read back the PMC_DPD_STATUS and PMC_DPD2_STATUS registers to make sure that the I/O group has been placed in DPD mode.

4. Software triggers the Deep Sleep mode, killing itself.
5. Hardware detects the Deep Sleep wake-up condition.
6. Software wakes up and restores the state by writing to APB_MISC_GP* registers.
7. Software clears the APBDEV_PMC_DPD_SAMPLE sample bit.
8. I/O control can be sequenced back to the controlling block once software has initialized the core block to drive outputs to the same idle state they maintained before entering DPD.

The PMC contains software programmable registers (PMC_DPD_REQ, PMC_DPD2_REQ and PMC_DPD3_REQ), with one bit per I/O group. Each bit disables internal logic inside the I/O buffer that would otherwise consume power when the I/O power is OFF. Each bit should be set by software before shutting off the corresponding I/O power. Conversely, each bit should be reset after transitioning the I/O voltage to ON (and before enabling the set of interfaces using the corresponding I/O rail).

The PMC contains two registers related to 3.3V I/O support. Specific power detector cells per I/O voltage domain indicate if their supply voltage is low or high. The detector cells consume significant power, so they should not be left on all the time. The PMC contains a register enabling the detector cells.

12.4.14 Power Detect (PWR_DET) Controls

The reset default values of PWR_DET_VAL register will match boot rail requirements, so Boot ROM is not required to do any register updates for this functionality.

For Rails brought up by software components later in the boot flow, following steps are required to be done:

- PWR_DET_VAL bit must be set to '1' before the rail is programmed to 3.3 V
- PWR_DET_VAL bit must be cleared to '0' after rail is programmed to be at 1.8 V
- PWR_DET register bit should be ‘1’ (default is ‘1’) in order for SW to be able to update the corresponding PWR_DET_VAL register bit

---

Note: *It is illegal from pad electrical point of view, to have the rail at 3.3V without corresponding PWR_DET_VAL bit being 1.*

PWR_DET_VAL for any IO rail capable of 1.8V/3.3V operation, and are required to be used in the BR phase (e.g., IO rail for QSPI), will come up in a state to enable correct functional operation, through the detection mechanism in hardware.

Note: *Defaulting the PWR_DET_VAL at power up to indicate 3.3V operation, is electrically safe for pads capable of 3.3V/1.8V operation. However to exercise IO functionality, PWR_DET_VAL values need to match the actual rail scenario (i.e. it should indicate 1.8V if the pad is actually powered by 1.8V).*

Automotive use cases can potentially use SPI x4 as a boot media. This interface requires the PWR_DET support because the voltage could be 3.3V/1.8V at boot. This functionality is supported through the PWR_DET functionality in the SDMMC calibration pad which shares the same power rail as quad SPI.

The specified sequence to enable power detect from pads perspective is as follows:

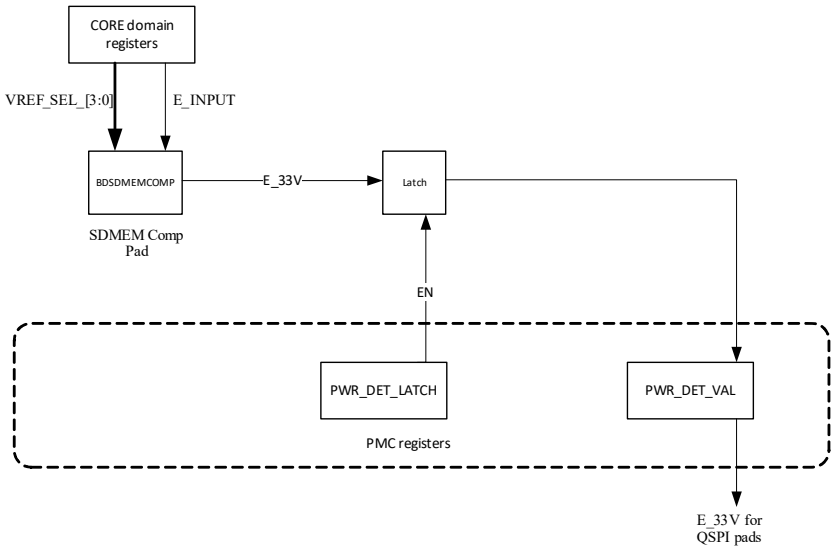
1. Set E_input=1.
   a. Make sure PWR_DET [SPI_HV] bit is ‘1’, default is ‘1’.
   b. Make sure PWR_DET_LATCH register is set to ‘1’, default is ‘1’.
2. Sample e3v3 output and provide to all pads in that interface through PMC.
   a. PWR_DET_VAL register latches the value of e3v3 and uses it to inform other pads about the rail status.

b. PWR_DET_LATCH register should be cleared, after PMC latches the value (~3usec delay), to stop PMC from latching further.

3. Disable pwrdet by setting e_input=0.

The following diagram shows the way in which PMC supports PWR DET functionality from BDSMEMCOMP pad.

The reset default of E_33V for SDMMC pad will be HIGH in the PWR_DET_VAL register. The hardware defaults of the enabling signals for the power detect functionality are expected to be in the required state to enable the propagation of E_33V to the PWR_DET_VAL register in the PMC.



The table below lists the rails that require power detect cell controls. The following rails support 3.3V operation in Tegra X1. They are shown with their corresponding register bits in the PMC_PWR_DET_VAL register.

Table 38: PMC_PWR_DET_VAL Register

Field	Description
VDDIO_SPI_HV	PWR_DET_VAL[23]
VDDIO_GPIO	PWR_DET_VAL[21]
VDDIO_AUDIO_HV	PWR_DET_VAL[18]
VDDIO_SDMMC3	PWR_DET_VAL[13]
VDDIO_SDMMC1	PWR_DET_VAL[12]

Notes:

- *The software can write to the PWR_DET_VAL register with the desired values. Individual bits of the APBDEV_PMC_PWR_DET register act as write enables for the corresponding bits of the PWR_DET_VAL register.*
- *All APBDEV_PMC_PWR_DET bits come up with the reset default of HIGH, so that the software does not need to update this register when the PWR_DET_VAL register is being configured at boot time.*

12.4.15 Power Down I/O Logic

The Tegra X1 PMC provides support for placing interfaces into a deep power down mode outside the Deep Sleep state. The following table lists the DPD domain groups:

Domain Group	Description
HDMI	Puts hdmi_pad in/out of deep power down mode

Domain Group	Description
GPIO	Puts GPIO in/out of deep power down mode
HSIC	Puts HSIC rail in/out of deep power down mode
USB3	Puts USB3 pads in/out of deep power down mode
AUDIO	Puts audio rail in/out of deep power down mode
UART	Puts UART rail in/out of deep power down mode
USB_BIAS	Puts usb_bias in/out of deep power down mode
USB0	Puts USB0 in/out of deep power down mode
USB1	Puts USB1 in/out of deep power down mode
USB2	Puts USB2 in/out of deep power down mode
PEX_CLK2	PEX clk2 pad-DPD control
PEX_CLK1	PEX clk1 pad-DPD control
PEX_BIAS	PEX bias pad-DPD control
MIPI_BIAS	Puts mipi_bias in/out of Deep Power Down mode
DSI	Puts DSI in/out of Deep Power Down mode (Named DSIA in pinout specification)
CSIB	Puts CSIB in/out of Deep Power Down mode
CSIA	Puts CSIA in/out of Deep Power Down mode
AUDIO_HV	Puts audio_hv in/out of deep power down mode
eDP	For eDP display control (APBDEV_PMC_IO_DPD2_REQ_0 [25])
DP	Puts DP in/out of deep power down mode
DMIC	Puts DMIC in/out of deep power down mode
SPI_HV	Puts SPI_HV in/out of deep power down mode
SPI	Puts SPI in/out of deep power down mode
CSIF	Puts CSIF in/out of deep power down mode
CSIE	Puts CSIE in/out of deep power down mode
CSID	Puts CSID in/out of deep power down mode
CSIC	Puts CSIC in/out of deep power down mode
DSID	Puts DSID in/out of deep power down mode
DSIC	Puts DSIC in/out of deep power down mode
DSIB	Puts DSIB in/out of deep power down mode
EMMC2	Puts EMMC2 in/out of deep power down mode
CAM	Puts CAM in/out of deep power down mode
EMMC	Puts EMMC in/out of deep power down mode
SDMMC3	Puts SDMMC3 in/out of deep power down mode
SDMMC1	Puts SDMMC1 in/out of deep power down mode

The logic for Deep Power Down ensures that the I/Os are maintained in an idle state while in Deep Sleep (LP0) mode. This requires the following SW sequencing.

Entering DPD Mode

- [SW] Set PMC_SEL_DPD_TIM to value corresponding to minimum 80 ns (this allows for proper timing sequence between sel_dpd, e_dpd)
  - This is a one time configuration, and can be done at cold boot only.
- [SW] Make sure that the affected I/O ports are in their idle state
- [SW] Set the DPD sample register (PMC_DPD_SAMPLE)
  - When software sets this register, the idle state of the I/O control signals is captured, i.e., the driving direction and the data driven if the direction indicates output.

- [PMC or SW] DPD is enabled (by direct register write)
  - The muxes inside the I/O buffers now drive the stored idle state, while the corresponding control signals coming from the core are ignored.

Note: *PMC_IO_DPDx_STATUS registers are updated to match the requests in the PMC_IO_DPDx_REQ register.*

Exiting DPD Mode

- [PMC] Hardware detects the Deep Sleep (LP0) wake-up condition
- [PMC] If configured, the PMC removes DPD enable for I/Os (see the “LP0 exit” section for details)
- [SW] Remove the DPD enable of remaining I/Os
- [SW] Clears the DPD sample bit
- [SW] Clears the DPD enable bit
  - I/O control can be sequenced back to the controlling block once software has initialized the core block to drive outputs to the same idle state they maintained before entering DPD.

Notes:

- *DPD enable is cleared by software only during LP0 > ACTIVE transitions. It has to stay asserted during deep sleep states.*
- *PMC_IO_DPDx_STATUS registers are updated to match the requests in the PMC_IO_DPDx_REQ register.*

The PMC also contains a software programmable register (PMC_IO_DPD*_REQ), with one bit per I/O “group”. Each bit disables internal logic inside the I/O buffer that would otherwise consume power when the I/O power is OFF. Each bit should be set by software before shutting off the corresponding I/O power. Conversely, each bit should be reset after transitioning back the I/O voltage to ON (and before enabling the set of interfaces using the corresponding I/O rail).

DPD mode for an I/O port can be entered independent of deep sleep state; however, in the LP0 state, the PMC automatically enables DPD mode. For regular LP0 mode, all pads will enter/exit DPD at the same time.

The following DPD domains do not have mini pad macros or do not drive state out during deep power down mode:

- MIPI_BIAS
- PEX_BIAS
- PEX_CLK1
- PEX_CLK2
- COMP
- POP_VTTGEN
- DISC_VTTGEN
- USB0
- USB1
- USB2
- USB_BIAS
- HSIC
- HDMI

- DDR_ADDR_CMD
- DISC_ADDR_CMD
- DDR_DATA
- POP_CLK

For the above domains, the sequence of entering and leaving DPD mode does not require sampling.

> ***Note:*** *Only one sample signal exists to perform sampling while entering DPD mode. This means that all interfaces will be sampled at the same time. Sequence of multiple DPD groups requires keeping all interfaces (already in DPD mode) in idle.*

12.4.16 Clock Control Logic

Tegra X1 devices support enabling an external oscillator to run in Deep Sleep (LP0) mode. It is combined with the ability to output clock (CLK_OUT) which can be extended outside deep sleep. See the PMC_OSC_EDPD_OVER and PMC_CLK_OUT_CNTRL registers for register descriptions.

There are two functions embedded in this feature:

- Programmable option of keeping the oscillator ON during DPD mode
- For low-cost systems, the ability to output the clock on aud_mclk and touch_clk pins.

> ***Note:*** *AUD_MCLK, EXTPHERIPH, and TOUCH_CLK are different names for the same pins. They are interchangeable.*

Programmable option of keeping oscillator ON during DPD mode

The OSC_CTRL_SELECT bit in the PMC_OSC_EDPD_OVER register configures whether or not the PMC starts controlling the external oscillator. Setting the EN bit to 0 (disabling the oscillator) should only be used during deep power down mode with automatic enabling on leaving deep sleep (this is to avoid system lockup). Based on PMC_OSC_EDPD_OVER setup, the external oscillator can be controlled as follows:

- Completely controlled by the CAR, entering deep power down mode on deep sleep (shutting down oscillator)
- Controlled by the PMC, entering deep power down mode on LP0
- Controlled by the PMC, not entering deep power down mode, but the oscillator output is disabled (used to accelerate warm boot time)
- Controlled by the PMC, not entering deep power down mode, the oscillator output enabled – used for clock out feature.

For low-cost systems ability to output clock on aud_mclk and touch_clk pins

aud_mclk and touch_clk are the OSC clock outputs from Tegra X1. Tegra X1 processors do not support external clock request inputs.

12.4.17 DSI Graceful Exit from Deep Sleep

This section describes how to reset the DSI logic in order to drive the idle state on the DSI pads. Follow the sequences below when entering and exiting deep sleep.

The PMC_DSI_SEL_DPD register is used to enable sel_dpd control.

Entering Deep Sleep

1. DSI sequences to move DSI brick to idle state
2. Software writes to PMC to take over sel_dpd on DSI brick pad.

3. The PMC sets sel_dpd to the brick.
4. As a result, the brick continues driving the deep sleep (LP0) state.
5. When real DPD is set, the brick continues driving deep sleep state

Exiting Deep Sleep

1. The PMC continues driving deep sleep through sel_dpd
2. Reset applied to chip – DSI resets
3. After reset is removed, software programs DSI to sequence to idle (the PMC still drives the brick)
4. Software configures the PMC to remove sel_dpd

Additionally, since control might be applied to both DSI pads – dsi, and csi_b, the PMC snoops csib_mode to decide if it should control pad csi_b when the pad serves in DSI mode.

12.4.18 Resets

The PMC receives the primary chip reset (from the SYS_RESET_N_ pad) and generates various resets for itself, the RTC, the CAR, etc. From the PMC provided reset, the CAR unit generates resets for most of the units in the chip.

In addition to chip reset, the PMC receives other events (thermal, WDT, SW, deep sleep wake), which also result in variants of the system reset. The cause of reset is captured in the PMC_RST_STATUS register.

12.4.18.1 Reset due to Thermal Trigger (Thermtrip)

The PMC can be enabled (see the PMC_SENSOR_CTRL register) to monitor the thermal trigger signal which is asserted by the SOC_therm unit when temperature goes above “thermal trip”.

The status bit (PMC_RST_STATUS) will be set to indicate that thermal trigger event has happened. If the PMC is entering deep sleep while thermtrip triggers, the thermtrip reset as will not happen (to avoid destruction of PMC state). However, process of entering deep sleep will cause reset at few cycles later.

When thermal trigger is asserted, the PMC resets the *chip*, but keeps the cause of reset (in the PMC_RST_STATUS register) and retains contents of scratch registers (including scratch0). Architecturally, the reset triggered by thermal trigger results in cold boot with the PMC retaining the information (in the PMC_RST_STATUS register) about the cause of cold boot. The behavior of thermal-triggered reset is as follows:

- The PMC receives thermal trigger
- The PMC sets the status bit
- If PMC_SENSOR_CTRL[ENABLE_RST] is set, then everything is reset except the status register (assert pmc2car_reset, pmc2rtc_reset, pmc2kmc_reset)
- De-assert resets

As a result of this reset, the system reboots (more like cold boot). During this reboot, the Boot ROM reads the cause of reset, and, if it was a thermtrip caused reboot, the Boot ROM performs a *system* reset or system shutdown via the PMIC or GPIO (based on the command in the scratch registers).

12.4.18.2 Direct Shutdown on thermtrip

The PMC optionally asserts SHUTDOWN pin to the off-chip PMIC when a thermtrip alert triggers. The PMIC treats the SHUTDOWN sideband as a failsafe trigger for shutting the system down, following which the user has to manually turn the system on by pressing the power button or equivalent inputs. The SHUTDOWN pin (formerly RESET_OUT_N) supports this feature. The PMC provides a configuration bit PMC_RST_CONFIG_THERMTRIP_EN to enable the failsafe shutdown option. System software can choose to enable failsafe shutdown or continue with the Boot ROM-based shutdown solution. Setting PMC_SENSOR_CTRL_ENABLE_RST without setting THERMTRIP_EN causes the PMC to work in the legacy mode. When THERMTRIP_EN is set, the PMC asserts the internal reset when it asserts SHUTDOWN but does not de-assert the internal

reset when the source of thermtrip is cleared in hardware. The PMC continues to power-gate CPU partitions on thermtrip alert as in previous Tegra devices, regardless of direct shutdown being enabled.

SHUTDOWN is always an active low signal from the Tegra X1 perspective. This pin is driven low only when the Tegra X1 device wants to shut down the system. At all other times, this output is tri-stated. This flexibility allows other external platform components to assert the shutdown pin to the PMIC.

The SHUTDOWN pin state is not affected by any internal system reset event. The pin, when asserted, reverts to its default only when external chip reset gets asserted.

Note: *The SHUTDOWN output is always treated as an active LOW signal, and the platform is expected to enable appropriate external pull ups on this signals. If the PMIC supports an OTP option to choose the polarity of the shutdown input, it is critical that this setting is configured to enable ACTIVE LOW operation.*

The PMIC is expected to handle SHUTDOWN as a failsafe mechanism and ensure that it is not overridden by any other input to the PMIC from the system. The PMIC maintains a status of the cause for system shutdown and software would have to read the status from PMIC. At the end of a direct shutdown event, the RST_SOURCE field in the PMC_RST_STATUS register reads as POR. The PMIC requires the SHUTDOWN signal to be kept asserted for a minimum debounce period of 244 us (8 cycles of 32 KHz clock). This period is programmable in the SHDN_ASSERT_PULSE_WIDTH counter. The counter runs at 32kHz clock and gets reset only by external chip reset.

If PMC_SENSOR_CTRL_ENABLE_RST is set, Boot ROM may restart and launch PMIC commands during the shutdown process. To prevent this from occurring when direct shutdown is enabled, THERMTRIP_EN should override SENSOR_CTRL_ENABLE_RST.

12.4.18.3 Reset due to Watchdog Timer (WDT)

If the WDT is enabled (by Boot ROM via fuse bit setting), then at the expiry of the WDT, a watchdog reset is asserted. The PMC monitors this WDT reset signal.

If a WDT reset is asserted then the PMC resets chip similar to thermtrip reset (as described in the previous section), and stores the information about the cause of reset in the PMC_RST_STATUS register.

Note: *Refer to Chapter 8: Timers for the WDT programming model.*

12.4.19 Clamping

When a partition is power gated OFF, all signals leaving that partition are clamped to their idle value.

Applying clamping presents no problems, because all blocks into the partition are powered OFF and assumed to be in reset prior to the power gate transition.

Removing the clamping is more complex because Tegra X1 devices use a synchronous reset strategy, so the correct sequence is the following:

- Restore power, reset and clamping are both active at that time
- Restore clocks, so that reset conditions propagate
- Remove clamping
- Remove reset

For maximum flexibility, removing the clamping can be controlled by software. Writing to a trigger register removes the clamping for the identified set of partitions. This does not work for Suspend mode exit, where the CPU must be restarted by hardware only.

In Suspend mode exit, there is an interlock between the Clock And Reset (CAR) block and the PMC, so that the correct sequence is performed. The CAR indicates to the PMC when the CPU clamping may be removed. This signal is asserted after the clock to CPU is restarted. The reset to CPU will only be removed after a known delay following the request to remove the clamping. The PMC removes the CPU clamping as soon as it receives the request to do so. This is similar to the interlock between the PMC and flow controller, except that this is not a full handshake.

12.4.20 Scratch Registers

PMC provides a number of scratch, secure scratch and bond out registers. The scratch registers are used to save some of the system context information during LP0.

These registers are implemented as latch-array with the exception of SCRATCH_0 register. 120 of these registers can be used as secure registers in Tegra X1.

12.4.20.1 Secure Registers

Of the scratch registers, 24 are independently secure read/write registers (PMC_SECURE_SCRATCH*). From PMC perspective, these are general purpose secure read/write registers (except Secure Registers 4-7 which are used by SE).

12.4.20.2 Access Restrictions of PMC Registers

Certain registers in the PMC can be accessed only in the TrustZone® secure mode (PNS=0). Following table summarizes these registers.

Register	Description	PNS Bit Usage
DPD_ENABLE[1]	TSC multiplier enable	Only TrustZone Write is allowed when PMC_SEC_DISABLE.TSC_NS_WRITE is set.
PMC_FUSE_CONTROL[17:16], [9:8]	PS18 latch controls for KFUSE/FUSE	Only TrustZone Write is allowed when PMC_SEC_DISABLE.PS18_NS_WRITE is set.
PMC_CRYPTO_OP[0]	Crypto Engine Disable.	When in secure_boot_mode, this register can be written to any value regardless of secure mode; When not in secure_boot_mode, only TrustZone secure request can write this register to 1
CNTCR	TSC Counter Control Register	Can be accessed only when PNS =0
CNTSR	Counter Status Register	Can be accessed only when PNS =0
CNTCV0	Counter Count Value[31:0] Register	Can be written only when PNS =0
CNTCV1	Counter Count Value[63:32] Register	Can be written only when PNS =0
CNTSR	Counter Status register	Read Only. Can be read only when PNS = 0
CNTFID0	Frequency table entry register	TrustZone READ. Write Once.
CNTFID1	Frequency table end marker	TrustZone Read only.
COUNTERID[0-11]	Counter ID registers	TrustZone Read, 5 to 7 are read only. Others can be WO.

12.4.21 LED Blinking

PMC provides the control for blinking LED including in Deep Sleep mode. The blinking control is a PWM signal.

To generate a PWM signal, PMC contains a counter with two programmable values indicating the On and Off periods (in multiples of 16 cycles of the 32.768 kHz clock). The counter is 16 bits long, for a maximum ON or OFF period of 2^{16} * 16 / 32.768 10^3 or about 16 seconds.

DATA_ON/DATA_OFF calculation:

DATA_ON time: (DATA_ON<<4) * 30.51 us + 30.51 us.

DATA_OFF time: (DATA_OFF<<4) * 30.51 us + 30.51 us.

Programmed value of DATA_ON=0 in APBDEV_PMC_BLINK_TIMER_0 will result in 1 Ton i.e., LED output will be high for at least 1 clock cycle. So the range for DATA_ON is 30.51 us to 16 seconds.

The programmed value of DATA_OFF=0 in APBDEV_PMC_BLINK_TIMER_0 will result in 1 Toff i.e., LED output will be low for at least 1 clock cycle. So the range for DATA_OFF is 30.51 us to 32 seconds

APBDEV_PMC_BLINK_TIMER register can be programmed only if the BLINK_EN in APBDEV_PMC_CNTRL_0 register is set to 0. The following programming guideline should be followed for programming the BLINK registers.

Programming guidelines:

1. Set BLINK_EN=0 in APBDEV_PMC_CNTRL_0.
2. Wait for a minimum of 2 32KHz cycles.
3. Update values in APBDEV_PMC_BLINK_TIMER_0.
4. Wait for a minimum of 2 32KHz cycles.
5. Set BLINK_EN=1 in APBDEV_PMC_CNTRL_0.

12.4.22 PLL Controls to Accelerate WB0

The controls are added for PLL (PLLP, PPM, and PLLU) override during warm boot 0 (WB0). The PMC register (PMC_PLL{P,M}_WB0_OVERRIDE) can be configured to accelerate WB0 (warm boot) process. From a usage perspective, PLLU does not need to be powered up (by the PMC) at deep sleep.

12.4.23 Pinmuxing

Some of the signals controlled by the PMC may not be required in certain customer designs, especially:

- The system clock may not support an enable function, so the system clock enable (SYS_CLK_REQ) is not used.
- The system may not require an LED active in Deep Sleep, so the power LED is not used.

It is important to allow the corresponding balls to be reused for other purposes via pinmuxing. This is not directly a responsibility of the PMC but the correct pinmuxing must be present. Tegra X1 devices provide a set of ownership registers that control if the RTC logic (PMC) has control of pins with multiple uses (PMC or typically GPIO), some of which are not controlled by the RTC logic. The ownership bit controls a final stage of muxing on top of the more general pinmuxing stage.

12.4.24 APB Access

The APB access logic is complicated by the need to not unduly block the bus for extended periods of time even when accessing registers that are logically in the 32 kHz domain. The following principles are used to avoid any delay when accessing registers logically in the 32 kHz domain:

- Write operations always take place in the APB clock domain; i.e., the corresponding registers are placed in the APB clock domain and passed as wires to the 32 kHz domain where they are used without further synchronization. This only works because values passed in this manner are considered essentially static. There is an insignificant probability that the 32 kHz logic sees an intermediate value of a multiple bit field, but an enumeration of the affected fields shows that this cannot result in any significant problem at the system level.
- Read operations are to shadow registers in the APB clock domain. The shadow registers continuously reflect the values of the equivalent registers found in the 32 kHz clock domain. Only registers reflecting status present in the 32 kHz domain are affected.

12.5 Register Definitions for the PMC

To speed up operation, the PMC register file operates in the local peripheral interface bus domain (APB) rather than in the 32 kHz clock domain used for PMC processing.

Registers in the PMC control entering/exiting Deep Sleep/Suspend mode, power detect, and I/O power functions. They also control CORE_PWR_REQ, SYS_CLK_REQ, and LED_BLINK pins.

The following registers should be programmed/read for different power events in order for the PMC to function properly.

> ***Note:*** *The APBDEV_PMC_NO_IOPOWER register contains control bits that are used to electrically isolate in-bound paths (for example, signals entering the core voltage domain from I/O power domain) in pads, when their I/O power supply (or VDDP) is powered OFF. Before an I/O rail is powered off, this bit must be set to HIGH. Similarly after the I/O rail is powered UP, this bit needs to be cleared to the LOW state so that the pad can be used for functional purposes.*

BEFORE/ON ENTERING DEEP SLEEP MODE

- PMC Control Register (bits PWRREQ_POLARITY, PWRREQ_OE, SYSCLK_POLARITY,SYSCLK_OE, LATCHWAKE_EN)
- WAKE_MASK
- WAKE_LVL
- DPD_PADS_ORIDE (for required overrides)
- PWRGOOD_TIMER
- DPD_SAMPLE
- DPD_ENABLE

AFTER WAKE-UP FROM DEEP SLEEP

- WAKE_STATUS
- SW_WAKE_STATUS
- DPD_ENABLE
- PMC Control Register (bit LATCHWAKE_EN)

BEFORE/ON POWERING DOWN PARTITIONS

- PWRGATE_STATUS
- PWRGATE_TIMER_OFF (for power down)
- PWRGATE_TIMER_ON (for power up). This has been deprecated.
- PWRGATE_TOGGLE
- REMOVE_CLAMPING_CMD (for power up)

FOR BLINK

- BLINK_TIMER
- PMC Control Register (bit BLINK_EN)
- DPD_PADS_ORIDE (for blink field)

All other operations require single register access.

12.6 PMC Registers

Refer to Section 1.4: Reading Register Tables in the Introduction section for the register table protocol as well as recommendations for accessing registers.

12.6.1 APBDEV_PMC_CNTRL_0

This register controls the clock to the RTC, and the reset to the CAR and RTC. It also manages polarity and output enable of the sys_clk_req and core_pwr_req pins. At reset, both are disabled since the PMIC properties are unknown.

Auxiliary functions include enabling of blinking functions, side-effect option, and software wake-up latching.

The deep sleep (LP0) entry is to be triggered by the PMC side-effect option. Software needs to configure the PMC for the side-effect option before triggering the power off of last CPU. If the side-effect option is set, then the PMC would initiate deep sleep in the following cases:

- A power-off request for the CPU rail will lead to CPU rail power-off followed by LP0 entry.
- A power-gating request for cluster1 non-CPU (i.e., C1NC) will lead to power-gating of the C1NC followed by LP0 entry

PMC Control Register

Offset: 0x0 | Read/Write: R/W | Reset: 0x00410a00 (0bxxxxxxxxx10000010000101000000000)

Bit	Reset	Description
22	0x1	SHUTDOWN_OE: Enable shutdown pad 0 = DISABLE 1 = ENABLE
21:20	0x0	CPUPWRGOOD_SEL: CPUPWRGOOD pin select. There are 4 potential source pins (soc_therm_oc{1,2,3,4}) used as PWRGOOD. This field needs to be programmed (at boot) based on which pin is used as PWRGOOD. 0 = SOC_THERM_OC1 (default) 1 = SOC_THERM_OC2 2 = SOC_THERM_OC3 3 = SOC_THERM_OC4
19	0x0	CPUPWRGOOD_EN:CPU_PWR_GOOD (From PMIC to PMC) signal is enabled. 0 = DISABLE 1 = ENABLE
18	0x0	FUSE_OVERRIDE: Fuse override 0 = DISABLE 1 = ENABLE
17	0x0	INTR_POLARITY: Inverts INTR polarity 0 = DISABLE 1 = ENABLE
16	0x1	CPUPWRREQ_OE: Power request output enable. Resets to tri-state 0 = DISABLE 1 = ENABLE
15	0x0	CPUPWRREQ_POLARITY: Inverts power request polarity 0 = NORMAL 1 = INVERT
14	0x0	SIDE_EFFECT_LP0: When set, causes the side effect of entering deep sleep after powering down the CPU 0 = DISABLE 1 = ENABLE
13	0x0	AOINIT: AO initialized purely software diagnostic and interpretation 0 = NOTDONE 1 = DONE
12	0x0	PWRGATE_DIS: Disable power gating - global override, will override function of PWRGATE_TOGGLE register. All partitions will stay enabled. **Note**: Only write to this bit when CRAIL is on. 0 = DISABLE 1 = ENABLE
11	0x1	SYSCLK_OE: Enables output of system enable clock - works only if the SYS_CLK field in DPD_PADS_ORIDE is set to 1. 0 = DISABLE 1 = ENABLE
10	0x0	SYSCLK_POLARITY: Inverts SYS_CLK_REQ enable polarity 0 = NORMAL 1 = INVERT

Bit	Reset	Description
9	0x1	PWRREQ_OE: CORE_PWR_REQ output enable. Resets to tristate 0 = DISABLE 1 = ENABLE
8	0x0	PWRREQ_POLARITY: Inverts CORE_PWR_REQ polarity 0 = NORMAL 1 = INVERT
7	0x0	BLINK_EN: Enables blinking counter and blink output works only if the BLINK field in DPD_PADS_ORIDE is set to 1. 0 = DISABLE 1 = ENABLE
6	0x0	GLITCHDET_DIS: Reserved
5	0x0	LATCHWAKE_EN: Enables latching wakeup events - stops latching on transition from 1 to 0 (sequence - set to 1,set to 0) 0 = DISABLE 1 = ENABLE
4	0x0	MAIN_RST: Resets everything but scratch 0 and reset status. 0 = DISABLE 1 = ENABLE
3	0x0	KBC_RST: Reserved
2	0x0	RTC_RST: Software reset to RTC. 0 = DISABLE 1 = ENABLE
1	0x0	RTC_CLK_DIS: Disable 32 KHz clock to RTC. 0 = DISABLE 1 = ENABLE
0	0x0	KBC_CLK_DIS: Reserved

12.6.2 APBDEV_PMC_SEC_DISABLE_0

This register disables access (read/write to secure scratch registers). Once writes are disabled, secure registers cannot be written until power on reset or reset when exiting Deep Sleep mode.

Once reads are disabled, reads from scratch registers will return 0 until power on reset or reset when exiting Deep Sleep mode.

Single register can be disabled for reads/writes; bits 0 and 1 have an overwrite function.

Secure Register Disable

Offset: 0x4 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxx00000000000000000000000)

Bit	Reset	Description
22	0x0	PS18_NS_WRITE: Non-secure (i.e., non-TrustZone) write-disable for PS18_SET/CLEAR for Fuse/Kfuse 0 = OFF 1 = ON
21	0x0	TSC_NS_WRITE: Non-secure (i.e., non-TrustZone) write-disable for the PMC_TSC_MULT register and the PMC_DPD_ENABLE[TSC_MULT_EN] register bit. 0: Non-secure or secure can write. 1: Only secure can write. This bit is write-once only. Once it is set to '1', it remains '1' until reset by deep sleep or system reset. 0 = OFF 1 = ON
20	0x0	AMAP_WRITE: Disable writes to the PMC_GLB_AMAP_CFG register 0 = OFF 1 = ON
19	0x0	READ7: Disable reads from secure register 7 0 = OFF 1 = ON

Bit	Reset	Description
18	0x0	WRITE7: Disable writes to secure register 7 0 = OFF 1 = ON
17	0x0	READ6: Disable reads from secure register 6 0 = OFF 1 = ON
16	0x0	WRITE6: Disable writes to secure register 6 0 = OFF 1 = ON
15	0x0	READ5: Disable reads from secure register 5 0 = OFF 1 = ON
14	0x0	WRITE5: Disable writes to secure register 5 0 = OFF 1 = ON
13	0x0	READ4: Disable reads from secure register 4 0 = OFF 1 = ON
12	0x0	WRITE4: Disable writes to secure register 4 0 = OFF 1 = ON
11	0x0	READ3: Disable reads from secure register 3 0 = OFF 1 = ON
10	0x0	WRITE3: Disable writes to secure register 3 0 = OFF 1 = ON
9	0x0	READ2: Disable reads from secure register 2 0 = OFF 1 = ON
8	0x0	WRITE2: Disable writes to secure register 2 0 = OFF 1 = ON
7	0x0	READ1: Disable reads from secure register 1 0 = OFF 1 = ON
6	0x0	WRITE1: Disable writes to secure register 1 0 = OFF 1 = ON
5	0x0	READ0: Disable reads from secure register 0 0 = OFF 1 = ON
4	0x0	WRITE0: Disable writes to secure register 0 0 = OFF 1 = ON
3:2	0x0	NOT_USED: legacy - redundant - not used
1	0x0	READ: Disable reads from secure registers. This global disable bit is only for secure scratch registers 0 to 23. 0 = OFF 1 = ON
0	0x0	WRITE: Disable writes to secure registers. This global disable bit is only for secure scratch registers 0 to 23. 0 = OFF 1 = ON

12.6.3 APBDEV_PMC_PMC_SWRST_0

Kept for binary code compatibility only. Does not do anything.

Register Write which Resets PMC Only

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	RST: Software reset to the PMC only 0 = DISABLE 1 = ENABLE

12.6.4 APBDEV_PMC_WAKE_MASK_0

The APBDEV_PMC_WAKE registers handle wake events whose number is less than or equal to 32. For wake events whose number is greater than 32, refer to the APBDEV_PMC_WAKE2 registers below.

Current pin assignments wake_mask, wake_status, sw_wake_status, and wake levels:

- WAKE_STATUS[0] = pex_wake_n_IB (wake event 0)
- WAKE_STATUS[1] = gpio_pa6_IB (wake event 1)
- WAKE_STATUS[2] = qspi_cs_n_IB (wake event 2)
- WAKE_STATUS[3] = spi2_mosi_IB (wake event 3)
- WAKE_STATUS[4] = gpio_pe6_IB (wake event 4)
- WAKE_STATUS[5] = gpio_pe7_IB (wake event 5)
- WAKE_STATUS[6] = uart2_cts_IB (wake event 6)
- WAKE_STATUS[7] = uart3_cts_IB (wake event 7)
- WAKE_STATUS[8] = wifi_wake_ap_IB (wake event 8)
- WAKE_STATUS[9] = aotag2pmc_wake_event (wake event 9)
- WAKE_STATUS[10] = gpio_ph6_IB (wake event 10)
- WAKE_STATUS[11] = nfc_int_IB (wake event 11)
- WAKE_STATUS[12] = gen1_i2c_sda_IB (wake event 12)
- WAKE_STATUS[13] = gen2_i2c_sda_IB (wake event 13)
- WAKE_STATUS[14] = gpio_pk4_IB (wake event 14)
- WAKE_STATUS[15] = gpio_pk6_IB (wake event 15)
- WAKE_STATUS[16] = rtc_irq (wake event 16)
- WAKE_STATUS[17] = sdmmc1_dat1_IB (wake event 17)
- WAKE_STATUS[18] = sdmmc2_dat1_IB (wake event 18)
- WAKE_STATUS[19] = hdmi_cec (wake event 19)
- WAKE_STATUS[20] = gen3_i2c_sda (wake event 20)
- WAKE_STATUS[21] = gpio_pl1_IB (wake event 21)
- WAKE_STATUS[22] = CLK32K_OUT_IB (wake event 22)
- WAKE_STATUS[23] = pwr_i2c_sda_IB (wake event 23)
- WAKE_STATUS[24] = button_power_on_IB (wake event 24)
- WAKE_STATUS[25] = button_vol_up_IB (wake event 25)
- WAKE_STATUS[26] = button_vol_down_IB (wake event 26)
- WAKE_STATUS[27] = button_slide_sw_IB (wake event 27)
- WAKE_STATUS[28] = button_home_IB (wake event 28)

This register masks which event can cause a wake-up from Deep Sleep mode. It has to be set up before entering Deep Sleep mode. It works in conjunction with the WAKE_LVL register.

Only enabled events at the proper wake_lvl will cause exit from Deep Sleep mode.

PMC Wake-up Event Mask

Offset: 0xc │ Read/Write: R/W │ Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	EVENT_RES2: general wake 0 = DISABLE 1 = ENABLE
30	0x0	EVENT_RES1: 0 = DISABLE 1 = ENABLE
29	0x0	EVENT_RES4: 0 = DISABLE 1 = ENABLE
28:23	0x0	EVENT_RES: 0 = DISABLE 1 = ENABLE
22:19	0x0	EVENT_1: 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
18	0x0	EVENT_RES3: 0 = DISABLE 1 = ENABLE
17	0x0	KBC: Reserved
16	0x0	RTC: RTC wake enable 0 = DISABLE 1 = ENABLE
15:0	0x0	EVENT: pin 0-15 wake enable 0 = DISABLE 1 = ENABLE

12.6.5 APBDEV_PMC_WAKE_LVL_0

This register sets the active level for the wake event. It will cause an exit from Deep Sleep mode if the input signal level matches the level set in this register and WAKE_MASK is set for the event to 1.

PMC Wake Level

Offset: 0x10 │ Read/Write: R/W │ Reset: 0xff9fffff (0b11111111100111111111111111111111)

Bit	Reset	Description
31	0x1	EVENT_RES2: 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
30	0x1	EVENT_RES1: 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
29	0x1	EVENT_RES4: 1 to 0 pulse should be detected as wake 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
28:23	0x3f	EVENT_RES: 0 = ACTIVE_LOW 1 = ACTIVE_HIGH

Bit	Reset	Description
22:19	0x3	EVENT_1: 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
18	0x1	EVENT_RES3: Power interrupt - permanently tied to bit 18 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
17	0x1	RESERVED: This bit is reserved
16	0x1	RTC: RTC wake level 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
15:0	0xffff	EVENT: Pin 0-15 wake level 0 = ACTIVE_LOW 1 = ACTIVE_HIGH

12.6.6 APBDEV_PM

This register stores the status of the wake events. The event will be set if the level matches and is not masked.

A write will reset the set wake event.

PMC Wake Status

Offset: 0x14 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	EVENT_RES2: 0 = NOT_SET 1 = SET
30	0x0	EVENT_RES1: 0 = NOT_SET 1 = SET
29	0x0	EVENT_RES4: 0 = NOT_SET 1 = SET
28:23	0x0	EVENT_RES: 0 = NOT_SET 1 = SET
22:19	0x0	EVENT_1: 0 = NOT_SET 1 = SET

17	0x0	RESERVED: This bit is reserved
16	0x0	RTC: RTC wake 0 = NOT_SET 1 = SET
15:0	0x0	EVENT: pin 0-15 wake 0 = NOT_SET 1 = SET

12.6.7 APBDEV_PMC_SW_WAKE_STATUS_0

This register stores status of the wake events. Latching of the events in software wake status is enabled by the PMC_CNTRL register bit LATCHWAKE_EN.

Latching will stop at a 1-to-0 transition on this bit. An event will be set if the level matches. Masking does not affect this register. A write will reset the set wake events.

PMC Software Wake Status

Offset: 0x18 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description

16	0x0	RTC: RTC wake 0 = DISABLE 1 = ENABLE
15:0	0x0	EVENT: Pin 0-15 wake 0 = DISABLE 1 = ENABLE

12.6.8 APBDEV_PMC_DPD_PADS_ORIDE_0

This register enables overriding values from pinmux with values driven by the PMC (sys_clk_req, blink).

If a bit is set to 1, the associated I/O will drive the direct value from the PMC, not the pinmux value. During Deep Sleep mode, the pads with the bit set to 1 will not be in Deep Power Down mode. It will not drive data from mini pad macros stored during sample cycle, but direct data from the PMC.

> ***Note:*** *This register has to be set before entering Deep Sleep mode.*

DPD Pads Override

Offset: 0x1c | Read/Write: R/W | Reset: 0x00200000 (0b00000000001000000000000000000000)

Bit	Reset	Description
31:22	0x0	RESERVED_2: This bit is reserved

Bit	Reset	Description
21	0x1	SYS_CLK: DEFUNCT: override DPD idle state of sys_clk_req pad. sys_clk_req pad is neither pinmuxed nor used as GPIO. DPD_IO[1:0], SEL_DPD, E_DPD controls are tied to "0" for this pad. A and EN for this pad goes directly from PMC to pads. DPD_PADS_ORIDE bit is not needed for this. 0 = DISABLE 1 = ENABLE
20	0x0	BLINK: Override DPD idle state with blink output 0 = DISABLE 1 = ENABLE
19:0	0x0	RESERVED_1: This bit is reserved

12.6.9 APBDEV_PMC_DPD_SAMPLE_0

Setting this register will trigger sampling pads data and direction in which the pad will be driven during Deep Sleep mode.

Before writing to this register, all interfaces going to pads must be set to the ideal "idle" mode, which is expected to be driven by pads when the Tegra X1 chip enters Deep Sleep.

DPS Power Down Sample has to precede Deep Power Down Enable write. The DPD sample should not be deasserted until the transition from Deep Sleep to WB0.

This affects only for MPIO pads.

Note: *Only one sample signal exists to perform sampling while entering DPD mode. Thus all interfaces are sampled at the same time. The sequence of multiple DPD groups requires keeping all interfaces (already in DPD mode) in idle.*

Deep Power Down Sample

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	ON: Sets the sampling of pads value 0 = DISABLE 1 = ENABLE

12.6.10 APBDEV_PMC_DPD_ENABLE_0

Setting this register will trigger entering Deep Sleep state. It must be preceded by a DPD_SAMPLE write.

Will cause request for shutting down the system clock and the core req power. Puts the PLLs and I/Os in Deep Power Down mode. Will cut off (clamp) all signals going from core power to AO and pads.

If none of the wake-up events is set, only power-on reset can re-enable access to the chip.

After servicing of the wake-up event is completed, the register should be set back to 0 to complete a Deep Sleep cycle.

Deep Power Down Enable

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	TSC_MULT_EN: TSC multiplier enable. 0: DISABLE (i.e., counter runs at oscillator clock and increments by 1 every clock cycle). 1: ENABLE (i.e., counter runs at 32 kHz and increments by TSC_MULT_VALUE every clock cycle).0 = DISABLE 1 = ENABLE
0	0x0	ON: Sets sampling of pads value 0 = DISABLE 1 = ENABLE

12.6.11 APBDEV_PMC_PWRGATE_TIMER_OFF_0

Specifies the number of APB cycles after which the rail line goes off (turns the power to part of power-gated partition). Each rail controls part of the powered partition. This register should be set before the write to Power Gate Toggle. Shared between all power partitions.

Power Gate Timer Off Register

Offset: 0x28 | Read/Write: R/W | Reset: 0xedcba987 (0b11101101110010111010100110000111)

Bit	Reset	Description

0	X	CRAIL: Clamp status of CPU Rail 0 = DISABLE 1 = ENABLE

12.6.13 APBDEV_PMC_PWRGATE_TOGGLE_0

Write to this register will turn power on/off to the specified power-gated partition. Only one partition is turned on/off at a time.

PWRGATE_STATUS should be read to determine the state of the partition before writing to this register.

Turning the partition off will cause automatic clamping of all signals generated by the power-gated partition being turned off. Before the partition is turned off, all clocks to the partition should be stopped, and the reset to the partition should be asserted.

Turning the partition on will not remove clamping. Clamping is removed only after a REMOVE_CLAMPING_CMD write.

The user must allow a minimum 20 APB clock cycles between consecutive partition Power-Gate Toggle requests.

The role of the START bit has changed from prior Tegra devices. The START bit is cleared by hardware when the PMC accepts the request to power-gate or unpower-gate the partition. So in order to power-gate/unpower-gate a partition, software needs to do the following:

- Check to see if the partition is already in the correct state, by looking at the PWRGATE_STATUS register.
- If the partition is not in the correct state, software reads the PWRGATE_TOGGLE register to see if the START bit is 0.
- If the START bit is not 0, software polls until the start bit is set to 0.
- Then program the PWRGATE_TOGGLE register with the START bit set to 1 and choose the required partition to be power-gated.

- Ideally, software can poll to check the START bit going back to 0, which indicates that the PMC has accepted the request, and then poll the STATUS register to make sure the required partition is power-gated/unpower-gated.

Power Gate Toggle

Offset: 0x30 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxx00000)

Bit	Reset	Description
8	0x0	START: Start power down/up 0 = DISABLE 1 = ENABLE
4:0	0x0	PARTID: ID of the partition to be toggled 0 = CRAIL 2 = Video Encode 3 = PCX 6 = MPEG Encode 8 = SAX 9 = CE1 10 = CE2 11 = CE3 14 = CE0 15 = C0NC 17 = SOR 18 = DIS 19 = DISB 20 = XUSBA 21 = XUSBB 22 = XUSBC 23 = VIC 24 = IRAM 25 = NVDEC 26 = NVJPG 27 = AUD 28 = DFD 29 = VE2

12.6.14 APBDEV_PMC_REMOVE_CLAMPING_CMD_0

This is a bitmap with one bit per power partition controller by the PMC.

When written to 1b, the PMC removes the clamp signals to the corresponding partition. If the partition is not powered on, the register write will be ignored.

The bit is automatically reset to 0b when the clamping has been removed. Software is responsible for writing to this register at the correct time, that is, when the clocks are started but the blocks in that partition are still held in reset.

Remove Clamping

Offset: 0x34 | Read/Write: R/W | Reset: 0x00000000 (0bxx00000000000000000x00000x0x0x0x0)

12.6.16 APBDEV_PMC_PWRGOOD_TIMER_0

This register programs the length of the wake-up reset, asserted after wake-up from Deep Sleep. This register should be set before entering Deep Sleep mode.

Programmed values depend on the properties of the PMIC.

Timer value x 30.51 µs = reset pulse length

Power Good Timer

Offset: 0x3c │ Read/Write: R/W │ Reset: 0x003f007f (0bxxxxxxxx00111111000000001111111)

Bit	Reset	Description
23:16	0x3f	OSC_PREPWR: OSC clock stabilization timer prior to SoC rail pwr-req assertion. The timer value is 4*OSC_PREPWR+1 number of 32.768 kHz clock cycles; that is, the timer value is (OSC_PREPWR*122.07)+30.518 µs.
15:8	0x0	OSC_POSTPWR: OSC clock stabilization timer after SoC rail power is stabilized. The timer value is 4*OSC_POSTPWR+1 number of 32.768 kHz clock cycles; that is, the timer value is (OSC_POSTPWR*122.07)+30.518 µs.
7:0	0x7f	PWRGOOD: SoC rail power-on stabilization timer. The timer value is PWRGOOD+1 number of 32.768 kHz clock cycles; that is, the timer value is (PWRGOOD*30.52)+30.518 µs.

12.6.17 APBDEV_PMC_BLINK_TIMER_0

Will output value to pad only if the PMC Control register has BLINK_EN set and DPD_PADS_ORIDE has blink bit set.

Setting bit 15 to 0 will output 32 kHz clock (the registers above still have to be set)

- (On time DATA_ON * 16) x 30.51 µs
- (Off time DATA_OFF * 16) x 30.51 µs.

Blinker Timer for External Blinker

Offset: 0x40 │ Read/Write: R/W │ Reset: 0xffffffff (0b11111111111111111111111111111111)

Bit	Reset	Description
31:16	0xffff	DATA_OFF: Time off
15	0x1	FORCE_BLINK: set to 0 for 32 KHz clock
14:0	0x7fff	DATA_ON: Time on

12.6.18 APBDEV_PMC_NO_IOPOWER_0

The APBDEV_PMC_NO_IOPOWER register contains control bits that are used to electrically isolate in-bound paths (for example, signals entering the core voltage domain from I/O power domain) in pads, when their I/O power supply (or VDDP) is powered OFF. Before an I/O rail is powered off, this bit must be set to HIGH. Similarly, after the I/O rail is powered UP, this bit needs to be cleared to the LOW state so that the pad can be used for functional purposes.

No I/O Power Register

Offset: 0x44 │ Read/Write: R/W │ Reset: 0x00010080 (0bxxxxxx00000000x1x000000x1x0xx0x0)

Bit	Reset	Description

0	0x0	SYS: rail AO I/Os. SYS rail is a pre-boot rail that works without any programming intervention 0 = DISABLE 1 = ENABLE

12.6.19 APBDEV_PMC_PWR_DET_0

Active high, sets power detection for nine power rails only. - MIPI does not have power detect.

The proper sequence for turning on power detects:

- Write 1 to PWR_DET register for fields requiring power detect
- Allow for 3 µs delay (in APB clock cycles)
- Write 1 to PWR_DET_LATCH

For turning PWR_DET off:

- Write 0 to PWR_DET_LATCH
- No delay is necessary
- Write 0 to PWR_DET

Power Detect

1	0x1	EMMC: GMI pins 0 = E_12V 1 = E_18V
0	0x1	VAL: DVI pins 0 = E_12V 1 = E_18V

12.6.60 APBDEV_PMC_USB_DEBOUNCE_DEL_0

Determines number of 32 kHz clock cycles to debounce USB signal events.

Note: *The programmed debounce values must be greater than 1.*

Reset values are for Cold Hardware Reset only.

Offset: 0xec │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxx00000000000000000000000)

Bit	Reset	Description
23:20	0x0	UHSIC_LINE_DEB_CNT: Number of 32 kHz debounce cycles for UHSIC port 0
19:16	0x0	UTMIP_LINE_DEB_CNT: Number of 32 kHz debounce cycles for UTMIP port 0

Bit	Reset	Description
15:0	0x0	VAL: Debounce period for ID and VBUS events on all USB ports.

12.6.61 APBDEV_PMC_USB_AO_0

Power downs for various USB features controlled by the PMC.

Each UTMIP has the following power downs for features that can lead to wake-up events.

- USBOP_VAL_PD: Power down for D+ value detector (I/O pad)
- USBON_VAL_PD: Power down for D- value detector (I/O pad)
- ID_PD: Power down for ID detector (bias pad)
- VBUS_WAKEUP_PD: Power down for VBUS detector (bias pad)

Each UHSIC port has the following power downs for features that can lead to wake-up events:

- STROBE_VAL_PD: Power down for STROBE VALUE detector
- DATA_VAL_PD: Power down for DATA VALUE detector

Note: *These HSIC pins have not been added to the pad yet.*

Line Debounce Periods for UTMIP and HSIC PORTS

12.6.62 APBDEV_PMC_CRYPTO_OP_0

A complete solution requires a "semi-sticky" bit in the always-on domain. The Boot ROM would clear this semi-sticky bit for cold boots, but use its value to propagate the crypto-disable flag across deep sleep. (The Boot ROM always requires crypto functionality, so a pure hardware solution probably isn't reasonable.)

The Boot ROM would be able to clear (to zero) and read the sticky bit, but outside the Boot ROM users would only be able to set (to one) and read the sticky bit. On cold boot, the Boot ROM would always clear the stick bit. On WB0, the Boot ROM would read the sticky bit and copy it's setting to the crypto disable flag.

Crypto Engine Disable Sticky Bit

Offset: 0xf4 │ Read/Write: R/W │ Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	0x1	VAL: Disabled by default 0 = ENABLE 1 = DISABLE

12.6.63 APBDEV_PMC_PLLP_WB0_OVERRIDE_0

Master control for all WB0 PLL overrides.

Offset: 0xf8 │ Read/Write: R/W │ Reset: 0x00018000 (0bxxxxxxxxxxxxxxx11000000000000000)

Bit	Reset	Description
16	0x1	PLLP_IDDQ: Enabling during LP0 exit, PMC should program IDDQ bit

Offset: 0x158 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	BREAD: disable read from bond out secure registers 0 = OFF 1 = ON
0	0x0	BWRITE: disable write to bond out secure registers 0 = OFF 1 = ON

12.6.88 APBDEV_PMC_GATE_0

This register is used for software controlled synchronization between APB domain and the 32 kHz domain. Software is expected to set the GAKE_WAKE/GATE_DBNS field high to cut the 32 kHz gated clock before updating WAKE_LVL, AUTO_WAKE_LVL, WAKE_MASK and USB_DEBOUNCE_DEL registers. After these registers have been written the GATE_WAKE/GATE_DBNS bit should be written back to '0' to enable the 32 kHz gated clock.

This gates the 32 kHz clock to just the flops that store the above fields.

Offset: 0x15c │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	GATE_DBNS: 0 = OFF 1 = ON
0	0x0	GATE_WAKE: 0 = OFF 1 = ON

12.6.89 APBDEV_PMC_WAKE2_MASK_0

Auto-wake is not present for wake2 events in Tegra X1 devices.

The APBDEV_PMC_WAKE2 registers handle wake events whose number exceeds 32. For wake events whose number is less than or equal to 32, refer to the APBDEV_PMC_WAKE registers above.

Offset: 0x160 │ Read/Write: R/W │ Reset: 0x00000000 (0b00000000000000000000000000000000)

12.6.92 APBDEV_PMC_SW_WAKE2_STATUS_0

This register stores the status of the wake events. Latching of the events in software wake status is enabled by the PMC_CNTRL register bit LATCHWAKE_EN. Latching will stop at a 1-to-0 transition on this bit.

An event is set if the level matches. Masking does not affect this register. Writes will reset the set wake events.

PMC Software Wake Status

Offset: 0x16c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
0	0x0	EN: when set to 1, sets the EDPD to PCX (PLL toggle) 0 = OFF 1 = ON

12.6.106 APBDEV_PMC_OSC_EDPD_OVER_0

This register can be programmed to keep the oscillator ON during LP0 mode. It cuts the latency time on LP0 wake if the oscillator pad does not have to be restarted.

When the oscillator pad is on, during LP0 mode, DSPARE, duty, strength, and bypass are controlled by the fields below.

The oscillator can be in one in four modes during LP0 - in DPD, not in DPD but not enabled, running, or running only when an external request is active.

Offset: 0x1a4 │ Read/Write: R/W │ Reset: 0x0000007e (0bxxxxxxxx00000000000000001111110)

Bit	Reset	Description
23	0x0	CLK_OK: Crystal oscillator clk_ok signal 0 = DISABLE 1 = ENABLE
22	0x0	OSC_CTRL_SELECT: select whether the CAR OSC_CTRL or the PMC OSC_CTRL_OVER affects the oscillator cell. This bit should always be "1" in LP0. 0 = CAR 1 = PMC
21:20	0x0	XO_LP0_MODE: control the behavior of the oscillator during LP0 (assuming OSC_CTRL_SELECT is set to PMC during LP0). Put the oscillator in DPD mode during LP0, bypass DPD, but do not enable the oscillator during LP0, force the oscillator to run during LP0, or run the oscillator when requested by an external clock request pin 0 = DPD. 1 = OFF 2 = ON 3 = EXT_REQ
19:12	0x0	OSCFI_SPARE: Crystal oscillator spare register control.
11:7	0x0	XODS: Crystal oscillator duty cycle control.
6:1	0x3f	XOFS: Crystal oscillator drive strength control.
0	0x0	XOBP: DEFUNCT. Crystal oscillator bypass enable (1 = enable bypass).

12.6.107 APBDEV_PMC_CLK_OUT_CNTRL_0

This register controls 3 clock outputs of the Tegra X1 chip. Each of the clock outputs can be in 1 of 4 modes: not running, running when request is active high, running when request is active low, or always running. The clock output when not running can be tri-stated, high, or low.

The clock source might be from the CAR unit (not available when in LP0 mode), osc, osc_div2, or osc_div4.

The clock source switching on dap_mclk1_out, clk3_out and clk2_out is not glitch free. If dpd_override is not set before entering LP0, the selected clock source will get latched to “0” or “1” in LP0 (which is not glitch free).dpd_override can be “0” only when external device does not need clock in LP0, and it should be in reset before PMC_SAMPLE bit is written by LP0 entry code.

The clock source should only be switched when the pad output is not being used by an external device.

When an external device requests for a clock, the first few clocks should not be used by the external device.

Offset: 0x1a8 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxx00000000000000000000000)

12.6.109 APBDEV_PMC_SENSOR_CTRL_0

For sensor shutdown and control.

The sensor control register defines chip behavior when a sensor request is triggered. It can power-gate down all CPUs if enabled. It can trigger a reset (will cause a CPU power request to go down and power-gates down all CPUs)

IMPORTANT-- to preserve RAM content, any reads/writes to scratch registers will be blocked after a sensor triggered reset.

Software must reset BLOCK_SCRATCH_WRITE to enable writes to scratch registers.

Offset: 0x1b0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2	0x0	BLOCK_SCRATCH_WRITE: Reset by user, set by the PMC when entering sensor reset 0 = OFF 1 = ON
1	0x0	ENABLE_RST: Enables reset on sensor going up. 0 = OFF 1 = ON
0	0x0	ENABLE_PG: Power gates CPUs on temperature sensor going up. 0 = OFF 1 = ON

12.6.110 APBDEV_PMC_RST_STATUS_0

Simplified Reset and Reset Source

Offset: 0x1b4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2:0	0x0	RST_SOURCE: Source of reset 0 = POR 1 = WATCHDOG 2 = SENSOR 3 = SW_MAIN 4 = LP0 5 = AOTAG

12.6.111 APBDEV_PMC_IO_DPD_REQ_0

Puts I/O rails in or out of DPD mode, even though the chip is not in LP0. Multiple bits are allowed to be set at the same time. No new operation will be triggered until previous one completes. Consecutive operations issued by completion time of first one will be dropped. The register is still updated.

Setting IO_DPD_REQ should be preceded by writing to the DPD_SAMPLE registers (to enable a snapshot of data to be driven) and the SEL_DPD_TIM register. SEL_DPD_TIM is set to a safe value, but it can be lowered if SYS clock is slower (a minimum of 200 ns is required).

Note: *Only one sample signal exists to perform sampling while entering DPD mode. Thus all interfaces are sampled at the same time. The sequence of multiple DPD groups requires keeping all interfaces (already in DPD mode) in idle.*

After writing to IO_DPD_REQ register, software should wait for some time before writing to the IO_DPD2_REQ/IO_DPD3_REQ registers because the same state machine is used for both registers. There is a timing relationship between sel_dpd assertion to e_dpd assertion (similarly sel_dpd deassertion to e_dpd deassertion). This is controlled by a programmable timer (SEL_DPD_TIM register) in PMC. When IO_DPD_REQ register is written, sel_dpd of the corresponding pads get asserted and after the SEL_DPD_TIM delay expiry, e_dpd gets asserted. The state machine goes to idle only after this. So, the time between writes to the IO_DPD_REQ and IO_DPD2_REQ register should be - APB clock frequency multiplied by (SEL_DPD_TIM value plus few APB clocks), for example, APB clock frequency * (SEL_DPD_TIM + 5) The same delay is applicable before software reads the IO_DPD*_STATUS register after the corresponding IO_DPD*_REQ register is written.

DPD Request

0	0x0	SET_DSIA: 0 = OFF 1 = ON

12.6.121 APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0

PMC trigger events for the UTMIP ports as well as the UHSIC port. Sleep walk clearing returns the walk pointer to 00, the first entry in a USB line walk. This is the only way to return a pointer to 0.

Pad configuration captures a set of FLLS parameters prior to resting the port so their value can be retained in deep sleep.

The trigger should only happen on the fields that are set to TRIG (1) when writing. The returned read value should always be all NULL fields.

The FORCE_WALK bits trigger a SLEEP.

Any value read back should be 0.

Triggers for USB Ports

Offset: 0x1ec │ Read/Write: R/W │ Reset: 0x000XXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

12.6.123 APBDEV_PMC_UTMIP_TERM_PAD_CFG_0

Set of termination configuration values for USB I/O pads under DPD mode. These configuration values are programmed, not captured, at a time prior to entering DPD. Capturing them would be complex because it would require costly synchronizers as well as some logic. The range for RCTRL and TCTRL is 0 to 16.

These values need to be converted to a thermal encoding (only one 0 to 1 transition allowed in the word from MSB to LSB). For example:

0 - 0000_0000_0000_0000

1 - 0000_0000_0000_0001

2 - 0000_0000_0000_0011

...

15 - 0111_1111_1111_1111

16 - 1111_1111_1111_1111

I/O Termination Configuration for all UTMIP Ports

Offset: 0x1f8 │ Read/Write: R/W │ Reset: 0x00041041 (0bxxxxxxxxxxxxxx1000001000001000001)

Bit	Reset	Description
18:13	0x20	TCTRL_SW_VAL: Software override for tctrl.
12:7	0x20	TCTRL_VAL: HS termination calibration value
6:1	0x20	PCTRL_VAL: 1.5kOhm pull up calibration value
0	0x1	TERM_SEL: Auto termination enable

12.6.124 APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0

Register that configures the value of the line that could cause a wake-up event.

- ANY -- signifies any line change DM EDGE or DP EDGE for UTMIP.
- NONE -- signifies no wakeup possible.

One can use the two most significant bits (3:2) of the WAKE_VAL to 4x1 select whether:

- 00: Check both bits for value on two LSB (1:0).
- 01: Check bit DM (or strobe for HSIC) against bit 0
- 10: Check bit DP (or DATA for HSIC) against bit 1
- 11: Check for edge on DP against bit 1, edge on DM against bit 0

12.6.125 APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0

This register determines when sleep walking should take effect: upon a specific GPIO event, on any wake event, or on a line value change.

It is also possible to force a sleep walk; see register UTMIP_UHSIC_TRIGGERS to force the event.

Sleep Walk Sequence Enables

Offset: 0x200 │ Read/Write: R/W │ Reset: 0x00000000 (0b00000000000000000000000000000000)

12.6.126 APBDEV_PMC_UTMIP_SLEEPWALK_P0_0

These registers hold the sequence of control values to the UTMIP pads on the four consecutive cycles of a walk. The pad pins that are controlled are:

- MASTER_USBOP_RPD
- MASTER_USBON_RPD
- MASTER_USBOP_RPU
- MASTER_USBON_RPU
- MASTER_AP
- MASTER_AN
- MASTER_HIGHZ

For the walk to take effect at the pad, the MASTER_ENABLE pin must be set high in the config register. Otherwise the pad will ignore the values.

If no walk is enabled or forced, then the walk pointer remains stuck on phase A. The walk pointer should use a 2 bit Gray code so that Phase A is 00, Phase B is 01, Phase C is 11, and Phase D is 10. Once Phase D is reached, only a reset of the phase pointer can bring it back to Phase A.

Four phases should be sufficient to handle most wake-up events.

Signaling Sequence for UTMIP Port 0 Wakeup

12.6.129 APBDEV_PMC_UHSIC_SLEEPWALK_P0_0

These registers hold the sequence of control values to the UTMIP pads on the four consecutive cycles of a walk. The pad pins that are controlled are:

- STROBE_RPD
- DATA_RPD
- STROBE_RPU
- DATA_RPU

At this time there are no STROBE, DATA ports that should be driven by the host. So these outputs from the module should be left unconnected until a time that departure may be implemented.

Signaling Sequence for UHSIC Port 0 Wakeup

Offset: 0x210 │ Read/Write: R/W │ Reset: 0x16161616 (0b00010110000101100001011000010110)

12.6.131 APBDEV_PMC_UTMIP_UHSIC_FAKE_0

Instead of using the pad value for USBOP_VAL, USBON_VAL, STROBE_VAL, DATA_VAL, VBUS_WAKEUP, ID from the UTMIP and HSIC pads, force a 2x1 mux at the input of the PMC pad macro when fake values are enabled. This could the useful feature of putting a line at rest when needed. It also has important debug merits. This mux should be placed in front of the NP synchronizer for these signals (saved power on the synchronizer). This will have to be waived in our sync checks.

Fake the Line Value for the PMC Pad Macro

Offset: 0x218 | Read/Write: R/W | Reset: 0x01111111 (0bxxxx00010001000100010001000100010001)

12.6.153 APBDEV_PMC_UTMIP_BIAS_MASTER_CNTRL_0

Offset: 0x270 | Read/Write: R/W | Reset: 0x0000000d (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1101)

Bit	Reset	Description
3	0x1	UTMIP_BIAS_MASTER_AWAKE_AND: When not PROGRAMMABLE and E_DPD=0, AND the MASTER_ENABLE of all IO ports for bias cell. If not AND or OR, force to 0.
2	0x1	UTMIP_BIAS_MASTER_AWAKE_OR: When not PROGRAMMABLE and E_DPD=0, OR the MASTER_ENABLE of all IO ports for bias cell
1	0x0	UTMIP_BIAS_MASTER_PROG_VAL: When PROGRAMMABLE, this is the value to program too
0	0x1	UTMIP_BIAS_MASTER_PROG_CTRL: MASTER_ENABLE pin uses a programmable value on BIAS pad, at all times

12.6.154 APBDEV_PMC_UTMIP_MASTER_CONFIG_0

MASTER_CONFIG selects the MASTER function's mode of operation, in this case:

- 0 for 500 µA usage
- 1 for smaller current usage when driving.

Offset: 0x274 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	UTMIP_PWR_P3: enables UTMIP p3 low power mode
3	0x0	UHSIC_PWR_P0: enables UHSIC p0 low power mode
2	0x0	UTMIP_PWR_P2: enables UTMIP p2 low power mode
1	0x0	UTMIP_PWR_P1: enables UTMIP p1 low power mode
0	0x0	UTMIP_PWR_P0: enables UTMIP p0 low power mode

12.6.155 APBDEV_PMC_TD_PWRGATE_INTER_PART_TIMER_0

TD Power-Gating Timing Between Partition Power-Gating

Offset: 0x278 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1111)

Bit	Reset	Description
3:0	0xf	DATA: timing between consecutive partitions

12.6.156 APBDEV_PMC_UTMIP_UHSIC2_TRIGGERS_0

PMC trigger events for the UTMIP ports as well as the UHSIC port. Sleep walk clearing returns the walk pointer to 00, the first entry in a USB line walk. This is the only way to return a pointer to 0.

Pad configuration capture a set of FLLS parameters prior to resting the port so their value can be retained in deep sleep.

The trigger should only happen on the fields that are set to TRIG (1) when writing. Returned read value should always be all NULL fields. The FORCE_WALK bits trigger a SLEEP

This does not need to be a real register, so it should not consume much area. Any value read back should be 0.

Triggers for USB Ports

Offset: 0x27c │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
3	X	UHSIC_CLR_WAKE_ALARM_P1: Clear wake event for UHSIC port 0 0 = NULL 1 = TRIG
2	X	UHSIC_FORCE_WALK_P1: Force pointer walk for UHSIC port 0 0 = NULL 1 = TRIG
1	X	UHSIC_RESERVED_P1: Reserved for UHSIC port 0 0 = NULL 1 = TRIG
0	X	UHSIC_CLR_WALK_PTR_P1: Clear sleep walk pointer for UHSIC port 1 0 = NULL 1 = TRIG

12.6.157 APBDEV_PMC_UTMIP_UHSIC2_SAVED_STATE_0

Save some critical information about USB port prior to entering DPD in a suspend state.

SPEED:

- HS: Suspend DPD was entered from a high speed mode, restore high speed at DPD exit
- FS: Suspend DPD was entered from a full speed mode, restore full speed at DPD exit
- LS: Suspend DPD was entered from a low speed mode, restore low speed at DPD exit
- RST: Reset Port, Hardware reset or DPD was not entered suspended bus, Reset and Re-enumerate port

SCRATCH -- Save other critical information about the port, software choice. Reset value should read 0x0F0F0F0F, reset should occur on Cold Hardware Reset only

Saved DPD State for all UTMIP and UHSIC Ports

Offset: 0x280 │ Read/Write: R/W │ Reset: 0x00000f07 (0bxxxxxxxxxxxxxxxx0000111100000111)

Bit	Reset	Description

0	0x1	UHSIC_MODE_P1: UHSIC Speed prior to DPD 0 = HS 1 = RST

12.6.158 APBDEV_PMC_UTMIP_UHSIC2_SLEEP_CFG_0

This register configures the value of the line that could cause a wake-up event.

- ANY: signifies any line change DM EDGE or DP EDGE for UTMIP.
- NONE: signifies no wake-up possible.

One can use the two most significant bits (3:2) of the WAKE_VAL to 4x1 select whether:

- 00: Check both bits for value on two LSB (1:0).
- 01: Check bit DM (or strobe for HSIC) against bit 0
- 10: Check bit DP (or DATA for HSIC) against bit 1
- 11: Check for edge on DP against bit 1, edge on DM against bit 0

Sleep Walk Sequence Enables

Offset: 0x284 | Read/Write: R/W | Reset: 0x000000c0 (0bxxxxxxxxxxxxxxxxxxxxxxxxx11000000)

Bit	Reset	Description

4:0	0x0	UHSIC_DESIGNATED_GPIO_P1: GPIO Number associated with UHSIC P1

12.6.160 APBDEV_PMC_UHSIC2_SLEEPWALK_P1_0

This register holds the sequence of control values to the UTMIP pads on the four consecutive cycles of a walk. The pad pins that are controlled are:

- STROBE_RPD
- DATA_RPD
- STROBE_RPU
- DATA_RPU

At this time there are no STROBE, DATA ports that should be driven by the host. So these outputs from the module should be left dangling (unconnected) until a time that feature may be implemented.

Signaling Sequence for UHSIC Port 0 Wakeup

Offset: 0x28c │ Read/Write: R/W │ Reset: 0x06060606 (0b00000110000001100000011000000110)

12.6.161 APBDEV_PMC_UTMIP_UHSIC2_STATUS_0

Read-only register that provides current walk pointer information as well as the line value.

Status of UTMIP UHSIC Wakeup Circuitry

Offset: 0x290 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
4	X	UHSIC_WAKE_ALARM_P1: A wake event occurred on UHSIC port 1
3	X	DATA_VAL_P1: Value of DATA line detector for UHSIC port 1
2	X	STROBE_VAL_P1: Value of STROBE line detector for UHSIC port 1
1:0	X	UHSIC_WALK_PTR_P1: Walk pointer for UHSIC port 0

12.6.162 APBDEV_PMC_UTMIP_UHSIC2_FAKE_0

Instead of using the pad value for USBOP_VAL, USBON_VAL, STROBE_VAL, DATA_VAL, VBUS_WAKEUP, ID from the UTMIP and HSIC pads, force a 2x1 mux at the input of the PMC pad macro when fake values are enabled. This could the useful feature of putting a line at rest when needed. It also has important debug merits. This mux should be placed in front of the NP synchronizer for these signals (saved power on the synchronizer). This will have to be waived in our sync checks.

Fake the Line Value for the PMC Pad Macro

1	0x1	CE1:CE1 VVDD partition sensing override.
0	0x1	CE0:CE0 VVDD partition sensing override.

12.6.172 APBDEV_PMC_GLB_AMAP_CFG_0

This register configures some of the address apertures (in CCPLEX-AXD) to be MMIO or DRAM. Each bit is used to configurable one of the address aperture. For each bit 0=>MMIO and 1=>DRAM.

By default, all configurable apertures are MMIO address space. But they can be configured (at boot time) to be DRAM by programming this register. This register can be write-disabled (by the PMC_SEC_DISABLE register). The bits of this register are used as follows.

GLB_AMAP_CFG

12.6.254 APBDEV_PMC_CNTRL2_0

Wake interrupt and LP0BB Controls

Any write to CNTRL2 register with LP0_STS bit “0” will clear LP0_STS. To program any field of this register in LP0BB, set the LP0_STS bit of the write data to “1” so that LP0_STS register does not get cleared unintentionally. Note that writing 1 to LP0_STS has no impact. The LP0_STS bit cannot be set by software. It can only be cleared by software.

Offset: 0x440 | Read/Write: R/W | Reset: 0x00000XXX (0bxxxxxxxxxxxxxxxxxx0x0000xxxxxxxx1)

Bit	Reset	Description
14	0x0	ALLOW_PULSE_WAKE:Allows pulse wakes in case of debounce events and/or USB events. 0 = DISABLE 1 = ENABLE
12	0x0	HOLD_CKE_LOW_EN: Defunct. Enable for the PMC to assert CKE low 0 = DISABLE 1 = ENABLE
11	0x0	SYSCLK_DATA: SYS_CLK_REQ data value. This is used when SYSCLK_ORRIDE is set to '1'
10	0x0	SYSCLK_ORRIDE: SYS_CLK_REQ data override mux control 0: data is driven by hardware 1: data is driven by SYSCLK_DATA 0 = DISABLE 1 = ENABLE
9	0x0	WAKE_DET_EN: When this bit is set, then LP0 wake events mechanism is enabled to detect wake-events The following programming sequence is needed before setting WAKE_DET_EN bit if S/W wants to reprogram PMC_WAKE*_MASK/LVL registers. PMC_WAKE*_MASK/LVL registers should only be changed when WAKE_DET_EN is cleared. Programming sequence for WAKE_DET_EN and PMC_WAKE*_MASK/LVL registers: 1. WAKE_DET_EN should be "0" or cleared.2. Program WAKE_LVL registers. Wait for some time (>2 32kHz ticks) for it to stabilize. This step can be skipped if we want to use default value of WAKE_LVL register.3. Program WAKE_MASK registers.4. Set WAKE_DET_EN 0 = DISABLE 1 = ENABLE
8:1	X	RESERVED: Reserved

Bit	Reset	Description
0	0x1	WAKE_INT_EN: When this bit is set, then LP0 wake events are used to generate a WakeInterrupt interrupt. 0 = DISABLE 1 = ENABLE

12.6.264 APBDEV_PMC_DIRECT_THERMTRIP_CFG_0

Offset: 0x474 | Read/Write: R/W | Reset: 0x00000010 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx010000)

Bit	Reset	Description
5	0x0	THERMTRIP_LOCK: When set to 1, locks THERMTRIP_EN and AOTAG THERMTRIP threshold. This lock bit is expected to write-lock all register bits that can disable or sabotage direct shutdown. Write-once Updated by secure software after setting all direct shutdown thermtrip related registers. 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
4	0x1	THERMTRIP_EN: When this bit is set, then PMC will assert SHUTDOWN sideband to PMIC on a thermal sensor reset event. The system will then be shutdown directly by PMIC instead of causing a shutdown through Boot ROM. This configuration bit will be cleared only by an external reset. The thermal sensor reset request can come from SOC_therm or from the internal AOTAG in PMC. SOC_therm will not be able to send a reset request while in LP0 or LP0BB. The internal AOTAG will be capable of sending a thermtrip alert in LP0 or LP0BB. This field overrides PMC_SENSOR_CTRL_ENABLE_RST. 0 = DISABLE 1 = ENABLE
3:0	0x0	SHDN_ASSERT_PULSE_WIDTH: SHUTDOWN pin, once asserted by PMC, remains asserted for the programmed number of 32K clock cycles. This field is cleared by external reset only

Bit	Reset	Description
29:15	0xff	HOT_SET: Hot indicator set threshold
14:0	0xfa	HOT_RESET: Hot indicator reset threshold

12.6.270 APBDEV_PMC_AOTAG_THRESH2_CFG_0

Offset: 0x48c | Read/Write: R/W | Reset: 0x00000005 (0bxx00000000000000000000000000101)

Bit	Reset	Description
29:15	0x0	COLD_SET: Cold indicator set threshold
14:0	0x5	COLD_RESET: Cold indicator reset threshold

12.6.271 APBDEV_PMC_AOTAG_THRESH3_CFG_0

Offset: 0x490 | Read/Write: R/W | Reset: 0x000000fa (0bxxxxxxxxxxxxxxxxxx000000011111010)

Bit	Reset	Description
14:0	0xfa	THERMTRIP_SET: Thermtrip indicator set threshold

12.6.272 APBDEV_PMC_AOTAG_STATUS_0

Offset: 0x494 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
2	X	THERMTRIP: Write to PMC_TAG_STATUS resets this field to 0. The thermtrip reset status is also temporarily captured in PMC_RST_STATUS register in case thermtrip solution uses Boot ROM to reset the chip. 0 = NOTSET 1 = SET
1	X	TEMP_LOW: Write to PMC_TAG_STATUS resets this field to 0 0 = NOTSET 1 = SET
0	X	TEMP_HIGH: Write to PMC_TAG_STATUS resets this field to 0 0 = NOTSET 1 = SET

12.6.273 APBDEV_PMC_AOTAG_SECURITY_0

Offset: 0x498 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3	0x0	WR_LOCK_ALL: Write lock all PMC_AOTAG registers. Cleared by power-on reset.
2	0x0	WR_LOCK_HOT_THRESHOLD: Write lock PMC_AOTAG_THRESH1_CFG. Cleared by power-on reset.
1	0x0	WR_LOCK_COLD_THRESHOLD: Write lock PMC_AOTAG_THRESH2_CFG. Cleared by power-on reset.
0	0x0	WR_LOCK_THERMTRIP: Write lock PMC_AOTAG_THRESH3_CFG. Cleared by power-on reset. Also write locks all other thermtrip related registers in the system.

12.6.274 APBDEV_PMC_TSENSOR_CONFIG0_0

Offset: 0x49c | Read/Write: R/W | Reset: 0x00000001 (0b00000000000000000000000000000001)

Bit	Reset	Description
31:28	0x0	RESERVED_1:Reserved
27:8	0x0	TALL: M count. Time in tsensor_clk for full capture cycle. To reduce power, its value should be at least 100 times larger than TSAMPLE.

Bit	Reset	Description
7:6	0x0	RESERVED_2:Reserved
5	0x0	STATUS_CLR: Clears MIN/MAX statistics. Clears MIN/MAX statistics. Write 1 to clear. Readback always is 0.
4	0x0	TCALC_OVERFLOW: add operation overflow. sticky bit, Indicates that overflow happened during temperature conversion. Never should happen. Used to verify that coefficients don't cause overflow. Cleared by writing 1 to this bit.
3	0x0	OVERFLOW: 14 bit overflow. sticky bit. Set if capture counter overflows 14 bits used for temperature translation. Cleared by writing 1 to this bit.
2	0x0	CPTR_OVERFLOW: capture overflow. sticky bit. Set if capture counter overflows during the capture. Cleared by writing 1 to this bit
1	0x0	RO_SEL: ring oscillator select. selects between Temperature and Voltage output for the capture, 0 = TS_OSC_OUT, 1 = VS_OSC_OUT. This bit should always be set to 0 in the PMC_AOTAG instance of this register
0	0x1	STOP: sensor stop. Disables the sensor from taking any reading, stops the ring oscillators. set this bit to 1 to stop the sensor from taking measurements, set to 0 to start taking measurements. Should be set by SW if VDD_RTC ever goes below the TSOSC Vddmin. In PMC_AOTAG this bit is redundant to the general AOTAG enable bit.

12.6.275 APBDEV_PMC_TSENSOR_CONFIG1_0

Offset: 0x4a0 | Read/Write: R/W | Reset: 0x00000000 (0b0x000000xxx000000xxxxx0000000000)

Bit	Reset	Description
31	0x0	TEMP_ENABLE: temperature enable. Enables temperature translation if set. If cleared, corresponding temperature is forced to read 0C. This bit should be set to 1 before enabling PMC_AOTAG in normal operation.
29:24	0x0	TEN_COUNT: time between en and capture
20:15	0x0	TIDDQ_EN: time between iddq and en
9:0	0x0	TSAMPLE: N count

12.7 PMC Counter 0 Registers

Refer to Section 1.4: Reading Register Tables in the Introduction section for the register table protocol as well as recommendations for accessing registers.

12.7.1 SYSCTR0_CNTCR_0

The control registers are read/written by secure accesses only except the CNTFID0 and COUNTERID11-0 registers, which can be written only once by secure or non-secure access.

The CNTFID0 and COUNTERID11-0 registers are read-only; however, to initialize them at boot (by the ARM7 or main CPU), they are defined as write once.

A non-secure write to the control registers is ignored. A non-secure read to the control registers returns all 1s.

Counter Control Register

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxx00)

Bit	Reset	Description
8	0x0	FCREQ: Requested frequency modes table entry. This bit is not used.
1	0x0	HDBG: Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter or not. 0: System counter ignores Halt-on-debug.1: Asserted Halt-on-debug signal halts the system counter update. 0 = DISABLE 1 = ENABLE
0	0x0	EN: Enables the counter. When this bit is written to '1', then the TSC is loaded with the CNTCVx register's value, and starts incrementing from that value. When this bit is written to '0', the TSC halts counting and stays at that value. 0: System counter disabled 1: System counter enabled. 0 = DISABLE 1 = ENABLE

12.7.2 SYSCTR0_CNTSR_0

Counter Status Register

Offset: 0x4 | Read/Write: RO | Reset: 0x00000X0X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
8	X	FCREQ: Frequency change acknowledge. This bit is a copy of the value of the CNTCR[FCREQ] bit.
1	X	HDBG: Indicates whether or not the counter is halted because the Halt-on-Debug signal is asserted: 0: Counter is not halted. 1: Counter is halted. 0 = DISABLE 1 = ENABLE
0	X	RESERVED: Reserved, no impact.

12.7.3 SYSCTR0_CNTCV0_0

Counter Count Value [31:0] Register

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	CV: Counter value [31:0]. A read of this register provides the TSC[31:0] value at the time of the read. When CNTCR[EN]=0, a write to this register is used to initialize the TSC[31:0] value. When CNTCR[EN]=1, a write to this register has an unpredictable behavior.

12.7.4 SYSCTR0_CNTCV1_0

Counter Count Value[63:32] Register

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	CV: Counter value [63:32]. A read of this register provides the TSC[63:32] value at the time of the read. When CNTCR[EN]=0, a write to this register is used to initialize the TSC[63:32] value. When CNTCR[EN]=1, a write to this register has an unpredictable behavior.

12.7.5 SYSCTR0_CNTFID0_0

Frequency Table Entry Register

Offset: 0x20 | Read/Write: R/W | Reset: 0x00b71b00 (0b00000000101101110001101100000000)

Bit	Reset	Description
31:0	0xb71b00	FV: Counter frequency value in Hz. The default is set to 12 MHz. This register can be written only once.

12.7.6 SYSCTR0_CNTFID1_0

Frequency Table End Marker

Offset: 0x24 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	FV: Counter frequency value end marker (all 0s, read-only).

12.7.7 SYSCTR0_COUNTERID4_0

The COUNTERID11-0 registers are read-only; however, to initialize them at boot (by the ARM7™ or main CPU), they are defined as write once.

Offset: 0xfd0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Peripheral ID value

Bit	Reset	Description
7:0	0x0	VALUE: Component ID value

12.7.18 SYSCTR0_COUNTERID11_0

Offset: 0xffc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Component ID value

12.8 PMC Counter 1 Registers

Refer to Section 1.4: Reading Register Tables in the Introduction section for the register table protocol as well as recommendations for accessing registers.

The status registers are some control registers readable via the CNTReadBase base address by secure or non-secure accesses.

These are the same physical registers that are described in the Control Register section.

12.8.1 SYSCTR1_CNTCV0_0

Counter Count Value [31:0] Register

Offset: 0x8 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	CV: Counter value [31:0]

12.8.2 SYSCTR1_CNTCV1_0

Counter Count Value [63:32] Register

Offset: 0xc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	CV: Counter value [63:32]

12.8.3 SYSCTR1_COUNTERID4_0

Offset: 0xfd0 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Peripheral ID value.

12.8.4 SYSCTR1_COUNTERID5_0

Offset: 0xfd4 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	RESERVED: Reserved. A read will return all 0s.

12.8.5 SYSCTR1_COUNTERID6_0

Offset: 0xfd8 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	RESERVED: Reserved. A read will return all 0s.

12.8.6 SYSCTR1_COUNTERID7_0

Offset: 0xfdc | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	RESERVED: Reserved. A read will return all 0s.

12.8.7 SYSCTR1_COUNTERID0_0

Offset: 0xfe0 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Peripheral ID value

12.8.8 SYSCTR1_COUNTERID1_0

Offset: 0xfe4 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description

Bit	Reset	Description
7:0	X	VALUE: Component ID value

12.8.13 SYSCTR1_COUNTERID10_0

Offset: 0xff8 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Component ID value

12.8.14 SYSCTR1_COUNTERID11_0

Offset: 0xffc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Component ID value

12.9 Secure Boot Registers

12.9.1 SB_CSR_0

Secure Boot Control Status Register

Offset: 0x0 | Read/Write: R/W | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxx000000000000xx01)

Bit	R/W	Reset	Description
15:12	RW	0x0	COT_FAIL_COUNT: Chain-of-Trust Fail Count
11:8	RW	0x0	SWDM_FAIL_COUNT: Secure Watchdog Monitor fail Count
7	RW	0x0	SWDM_ENABLE: Secure Watchdog Monitor Enable 1 = ENABLE 0 = DISABLE
6	RW	0x0	HANG: Secure Boot Hang 1 = ENABLE 0 = DISABLE
5	RW	0x0	RESERVED_1: Reserved
4	RW	0x0	PIROM_DISABLE: Protected iROM Disable 0 = ENABLE 1 = DISABLE
3:2	RO	X	Rsrvd_31: Reserved
1	RW	0x0	NS_RST_VEC_WR_DIS: Non-secure reset vector write disable 0 = ENABLE 1 = DISABLE
0	RW	0x1	SECURE_BOOT_FLAG: 1 = Booted into Secure Mode 1 = ENABLE 0 = DISABLE

12.9.2 SB_PIROM_START_0

This specifies the offset from the start of the Boot ROM to the protected Region. This register is only programmable while in Secure_Mode (SECURE_BOOT_FLAG above == 1)

The lower 7 bits (6:0) are not significant and are assumed to be zero.

Secure Boot Protected ROM Start

Offset: 0x4 | Read/Write: R/W | Reset: 0x00001000 (0b00000000000000000001000000000000)

Bit	Reset	Description
31:0	0x1000	PROTECTED_ROM_START: PROTECTED_ROM_START

12.9.3 SB_PFCFG_0

Secure Boot Processor Feature Configuration Register

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxx000000000xxx00000xx00xxxx)

Bit	Reset	Description
24:16	0x0	RESERVED_2: Reserved

12.9.12 SB_AA64_RESET_LOW_0

Two secure boot registers control the AA64 reset behavior of the ARM Cortex-A57, called AA64_RESET_.

For security reasons, these two registers have a protection similar to the AA32 CPU reset vector, including sharing the same sticky bit as AA32 CPU reset. When the sticky bit is set, all these registers become TrustZone secure for write accesses; i.e., they can only be modified by secure writes.

Offset: 0x30 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

CHAPTER 13: BOOT PROCESS

13.1 TSense Reset Handler

The TSense reset is handled at the beginning of the Boot ROM secure ROM entry. The PLLP and PMC clocks are available for this reset.

The SCRATCH54 and SCRATCH55 registers deal with PMIC board-specific support (these are defined in Chapter 12: Power Management Controller). The PMIC driver configures them. The I^2C controller is used to communicate to the PMIC.

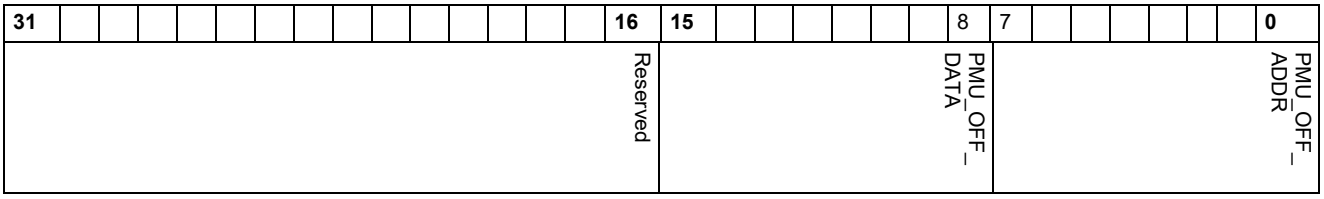
13.1.1 Scratch Registers

The SCRATCH54 and SCRATCH55 registers are used in the TSense reset handler in I2C mode.

Note: *The Reserved bits must be set to 0.*

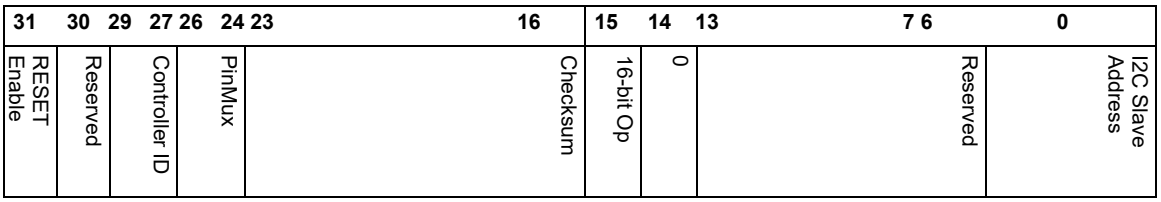
13.1.1.1 SCRATCH54 (PMIC Scratch Register A)

In I2C mode, the SCRATCH54 register bits are configured as shown below.



13.1.1.2 SCRATCH55 (PMIC Scratch Register B)

In I2C mode, the SCRATCH55 register bits are configured as shown below.



13.1.2 Pinmux Support

All Standard I^2C pinmux signals are supported as shown for the three configurations below. Mixed pinmux configurations are not supported; for example, GEN1_I2C_SCL -> I2C1_CLK, SPDIF_IN -> I2C1_DAT is not supported. The I^2C peripheral clock is targeted at 100 kHz (Standard mode). The Controller ID and PinMux columns in the following table are from the SCRATCH55 register.

Table 39: Supported I^2C Pinmux Signals

I2C Controller	Controller ID	I2C Signals	Config 1	Config 2	Config 3
			PinMux = 0	PinMux = 1	PinMux = 2
I2C_1	0	I2C1_CLK	GEN1_I2C_SCL	SPDIF_OUT	SPI2_CS1_N
		I2C1_DAT	GEN1_I2C_SDA	SPDIF_IN	SPI2_CS2_N
I2C_2	1	I2C2_CLK	GEN2_I2C_SCL	-	-
		I2C2_DAT	GEN2_I2C_SDA	-	-

Table 39: Supported I²C Pinmux Signals

I2C Controller	Controller ID	I2C Signals	Config 1	Config 2	Config 3
			PinMux = 0	PinMux = 1	PinMux = 2
I2C_3	2	I2C3_CLK	SDMMC4_CMD	CAM_I2C_SCL	-
		I2C3_DAT	SDMMC4_DAT4	CAM_I2C_SDA	-
I2C_4	3	I2C4_CLK	DDC_SCL	-	-
		I2C4_DAT	DDC_SDA	-	-
I2C_PMU	4	I2CPMU_CLK	PWR_I2C_SCL	-	-
		I2CPMU_DAT	PWR_I2C_SDA	-	-

13.1.3 Checksum Calculation

Every byte in the SCRATCH54 and SCRATCH55 registers must add to 0. The two scratch registers contain 8 bytes total.

To calculate the checksum:

- Write 0 to the 8-bit checksum byte
- Add bytes 0 through 7 where: sum = ~sum+1 (2's complement of sum)
- Write sum to the 8-bit checksum byte.

13.2 Boot ROM Fuses and Straps

IROM Patches, OTP information, and various keys and chip feature configurations are stored in fuses. Refer to Chapter 14: Fuses in this document for more information on fuses.

Straps are used to easily configure certain boot-related information such as boot mode, boot media, and DRAM configuration selection from the BCT.

Table 40: Boot ROM Related Fuses

Number of Bits	Location	Function	Values / Notes
1	FUSE_SECURITY_MODE	OdmMode and JTAG disable	Boolean
128	FUSE_PRIVATE_KEY0 FUSE_PRIVATE_KEY1 FUSE_PRIVATE_KEY2 FUSE_PRIVATE_KEY3	Secure Boot Key (SBK)	128-bit AES key
32	FUSE_PRIVATE_KEY4	Device Key (DK)	32-bit key
14	FUSE_BOOT_DEVICE_INFO [13:0]	Boot Device Config	See below
3	FUSE_RESERVED_SW[2:0]	Boot Device Select	0x0 = eMMC 0x1 = SPI 0x2 = SATA 0x3 = Reserved 0x4 = Reserved 0x5 = Reserved 0x6 = Reserved 0x7 = Reserved
1	FUSE_RESERVED_SW[3]	Skip Device Selection straps	Boolean
8	FUSE_SKU_INFO[7:0]	SKU	Only [3:0] actually used in the Boot ROM

Table 40: Boot ROM Related Fuses

Number of Bits	Location	Function	Values / Notes
4	FUSE_RESERVED_SW[7]	USB Controller select for RCM	[0] = USB 2.0 controller [1] = XUSB controller Note: Either choice is still at USB2.0 speeds.
	FUSE_ENABLE_2_BUTTON_RCM	Forced RCM	If this fuse is burned, both the VOLUME_UP and HOME button have to be pressed during cold-boot starting process to activate Forced RCM. If the fuse is not burned, only the VOLUME_UP button has to be pressed to activate Forced RCM.
	FUSE_RESERVED_SW[5]	ENABLE_WATCHDOG	ENABLE_WATCHDOG = 1 enables watchdog. This fuse should be set to 1 for ODM mode only
	FUSE_RESERVED_SW[4]	SW Reserved	ENABLE_CHARGER_DETECT
256	FUSE_PUBLIC_KEY0	Public key hash	SHA-256 (256 bits) hash of public key modulus
	FUSE_PUBLIC_KEY1		
	FUSE_PUBLIC_KEY2		
	FUSE_PUBLIC_KEY3		
	FUSE_PUBLIC_KEY4		
	FUSE_PUBLIC_KEY5		
	FUSE_PUBLIC_KEY6		
	FUSE_PUBLIC_KEY7		
1	FUSE_PKC_DISABLE	PKC disable control	Not-zero = PKC disable
4	FUSE_SECURE_PROVISION_INDEX	Factory Secure Provisioning Anti-Cloning Key Number	Burned by NVIDIA; Only 15 possible values from index 1 to 15;
2	FUSE_SECURE_PROVISION_INFO	Factory Secure Provisioning control bits	[0] is hide bit; [1] is test_part bit.

Table 41: Fuse Boot Device Information

Device	Fuse Bits	Description	Values
eMMC	13	Reserved	Ignored; set to 0x0
	12:10	MultiPage support	0x0 = default Single page read (512 Bytes)
			0x1 = Multi 2 page read (1024 Bytes)
			0x2 = Multi 4 page read (2048 Bytes)
			0x3 = Multi 8 page read (4096 Bytes)
			0x4 = Multi 16 page read (8192 Bytes)
			0x5 – 0x7 = Reserved
	9:6	Clock Divider PLLP clock @ 408 MHz (Can be SDR or DDR. Select via the DDR Mode Selection bit.)	0x0 = Default clock divider 16 (clock @25.5 MHz)
			0x1 = Clock divider 8 (clock @ 51 MHz)
			0x2 = Clock divider 2.5 (clock @ 163.2 MHz)
			Reserved
			Reserved
			Reserved
			Reserved

			0x2 = SATA	
			0x4 = Reserved	
			0x5 = Reserved	
			0x6 = Reserved	
			0x7 = Reserved	

CHAPTER 14: HOST SUBSYSTEM

The host controller (referred to as Host1x) provides a sophisticated programming and control interface to various graphic and video engines, and display. In addition to Host1x's control interfaces with these units, it also has a slave (IP) interface to the ARM7 crossbar (xbar), TSEC, and a direct memory interface to fetch command structures from system memory. Commands are either gathered from a push buffer in memory or provided directly by the CPU, and then supplied to the clients behind Host1x via Host1x channels. The channels also provide a means of synchronization between software and any individual block or amongst the blocks themselves via hardware Sync Point signals (syncpts).

14.1 Glossary

Term	Definition
CDMA	The command DMA. It is responsible for reading commands from memory and supplying them to all channels. It starts from the address in the channel's DMASTART register and continues until it reaches the address in the channel's DMAPUT register.
Channel	A piece of hardware that provides a programming interface to one or more classes. A channel contains a sequence of commands embodied in a command FIFO. This sequence of commands can also be thought of as a thread of execution and of a single context. There exists only one sequence of commands or context per channel. That is to say, there is no hardware-managed context switching within a single channel.
Channel Commands	Entries in the command FIFO. Commands take a common form interpretable by Host and are used for 3 main functions: controlling class ownership and class virtualization of the channel; command expansion via gather commands; and issuing class methods.
Channel switch	A transfer of ownership of a client from one channel to another; a type of context switch. Sometimes a source of confusion, this is not a transfer of ownership of a channel, but of a client. This is the preferred narrowed nomenclature to context switch in order to avoid confusion.
Class	An abstraction of a client, device, or resource. It is a collection of methods. A class can only be owned by multiple channels, but only one channel may actively be using any class, which is known as a channel's working class. The transfer of working class from one channel to another is known as a context switch, which is managed by Host.
Class ID	A unique tag corresponding to each class.
Class method	A method that belongs to an unspecified class.
Class switch	A change in the current in the active class of a client; a type of context switch. In the event that a class switch also involves a channel switch, channel switch is the preferred declaration.
Client, device, resource	A piece of hardware that resides behind Host, connected via the HRD and HRW buses. Client is the preferred terminology for this document. Generally mapped one-to-one with a class, although this is not a strict requirement.
Command FIFO	Holds channel commands supplied by the CDMA or PIO accesses. It is stalled by synchronization methods, back pressure from its destination client, or ownership of the destination client by a different channel
Context switch	A Host event where it facilitates a client's state transition. A context switch is either a channel switch or a class switch.

Term	Definition
Direct register access	Access to a client initiated by the CPU. If a channel and the CPU initiate a data transaction to the same client at the same time, the CPU gets priority. Direct register accesses are orthogonal to channels in regards to client ownership.
DMAGET register	Holds the current address of the CDMA. One exists per channel.
DMAPUT register	Holds the end address of a command stream in memory. One exists per channel.
DMASTART register	Holds the start address of a command stream in memory. One exists per channel.
Gather	A channel command to gather contiguous chunks of memory and inserts it into the command stream.
Host Master	General term to indicate an entity that can control Host. The current list is the CPU, BPMP-Lite, and TSEC.
Host method	A method that belongs to the Host class.
Increment	A channel command that specifies an offset and a count. Increment works like nonincrement, except the offset is incremented by one on each on each write.
Indirect register access	Access to a client initiated by the CPU, but requires two Host register accesses. This is deprecated in the SOC version of the host; it comes from the companion-chip mode where fixed-latency interfaces to the CPU may exist. Like direct register accesses, indirect takes priority over channel transactions. Indirect register accesses must be tied a channel because they require a read return FIFO.
Mask	A channel command that specifies an offset and a mask. A mask command works much like increment and non-increment, except the offsets are calculated by looking at the bits set in the mask. The bit position indicates the relative offset from the specified offset in the command. Mask expects the number of words to follow to be equal to the number of bits set in the mask.
Method	An operation on a class. The most common example is a single register write.
Nonincrement	A channel command that specifies an offset and a count. The offset specifies a method in the current class and the count indicates the number of subsequent words to be written at that offset.
Push buffer	A set of commands residing contiguously in memory. It is a communication method between the processor and Host. Commands are placed at the end of the buffer and a pointer is updated in Host.
SetClass	A channel command that takes a class ID as an argument. SetClass is the sole means to indicate the current virtualization of the channel. It also the sole means that a channel can acquire ownership of a class. Subsequent channel commands are directed towards this class.
Sync Point (Syncpt)	A counter used for synchronization. Every time a specified event occurs, the counter is incremented. A channel can wait until the syncpt attains a specified value, or an interrupt can be generated when a specified value is reached.
Teardown	Can be either a module or channel teardown. Essentially, it means all links and references within Host between the specified module or the specified channel are removed and reset.
Tick Count	Running count of the Host clock after it has been enabled.
WAIT	A host method that takes a single vector argument. It is used in conjunction with syncpt. A WAIT stalls the command FIFO until the supplied vector intersects the RAISE register at all.

14.2 Features

The key features of the Host1x controller are summarized below:

- 14 Channels
- 192 Sync Points
- 64 Syncpt Base Registers
- 32-bit Syncpt Comparison
- 32-bit Timeout register
- Stall and transfer counters
- Unit Activity Monitor (ACTMON): NVENC, VIC, NVDEC, and NVJPG
- Master clients: Crossbar and TSEC
- TZ secure bit In MMIO path
- Master Interface protocol: Native Crossbar
- Client Interface protocol: Hwr/Hrd
- 32-bit Host1x2MC address

14.2.1 Class Based Programming

GPUs support a programming interface that is based on writing to offsets within a “class” that implements a function, rather than to specific register offsets and formats.

By using “class” interface register offsets/formats need not to remain fixed so there is nothing chip specific in the API. This will allow both hardware flexibility and software driver compatibility.

14.2.2 Command Buffer DMA

To maximize the Host1x bandwidth, it is important to burst as many write cycles as possible, which requires the processor to first combine writes. The write buffering typically requires sequential offsets to be written and also may not follow strict programming order. The CPU will first store this buffered data directly to memory and then program the Host1x engine to DMA it.

14.2.3 Multiple Channels

A channel is a thread of execution within Host1x. Similar to a multithreaded CPU, a channel helps defining a context that can be used to allow multiple users of the Host1x and plays a role in context switching.

A channel switch does not always require a client module context switch. There will be a state change within the Host1x, but if channels have non-overlapping usage (e.g., possibly a VIC channel and NVENC encode channel), there may be no need to context switch any Host1x client module.

14.3 Hardware Features

14.3.1 Channels

The Tegra® X1 processor has 14 Host1x channels. Each channel has a set of registers and a command FIFO. Each channel can be associated with one or more Host1x clients. The channel is the primary means of delivering commands to clients, which is described in Section 14.6: Host1x Programming Model.

14.3.1.1 Channel Registers

Channel registers are broken into two functional groups: one grouping is associated with the command FIFO and command delivery to clients; the other grouping is associated with register and memory access.

CDMA Registers

- **HOST1X_CHANNEL_DMASTART_0:** This register triggers a DMA fetch from memory for this channel, if PUT register does not equal the GET register.
- **HOST1X_CHANNEL_DMAPUT_0:** This register triggers a DMA fetch from memory for this channel, if the PUT register does not equal the GET register. This address is relative to the DMASTART base address. It does not support byte writes. All 4-byte data needs to be programmed.
- **HOST1X_CHANNEL_DMAGET_0:** This register tracks the MC offset, which DMA engine has read. It gets incremented as entries are loaded from the channels command buffer into the FIFO. This address is relative to the DMASTART base address.
- **HOST1X_CHANNEL_DMAEND_0:** This is the boundary of illegal addresses (either at the end of the push buffer or at the end of physical memory). This is designed to prevent DMA from prefetching illegal addresses. If DMA reaches this address before seeing a RESTART, it will stop. This would be a software error condition.
- **HOST1X_CHANNEL_DMACTRL_0:** The various fields of DMA control register are described as below:
  - **DMAGETRST**: Reset GET pointer to '0'. Useful for cleaning up crashed channels. DMAGET value is not updated instantly. It takes 4 cycles between programming of reset and valid DMAGET.
  - **DMAGETINIT**: Reset GET pointer to the value of DMAPUT when DMAGETRST is asserted.
  - **DMASTOP**: Stop DMA from fetching on this channel.

Note: *A Command DMA channel needs to be enabled for PIO-gather to work.*

Access Registers

- **HOST1X_CHANNEL_INDOFF_0 and HOST1X_CHANNEL_INDOFF2_0:** The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET value is increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA. The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use INDOFF2 to set the offset while still using INDOFF to set other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases.
- For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.
- **HOST1X_CHANNEL_INDCNT_0:** Indirect register access count used to trigger indirect reads. Holds the number of registers/memory locations that will be read out. Channels should not request more than there is space available in their output FIFO. For indirect frame buffer reads, each channel cannot issue more than NV_HOST1X_MAX_IND_FB_READS at once. The read data must return and be written into the per-channel output FIFO before any additional reads can be issued.
- **HOST1X_CHANNEL_INDDATA_0:** This register, when written, writes to the data to the INDOFFSET in INDOFF. For reads, a REGFNUMEMPTY number of 32-bit values can be read before needing to poll FIFOSTAT again. The per-channel output FIFO (OUTFENTRIES) is readable via this offset. A read of INDDATA will pop an entry off of the per-channel output FIFO.
- **HOST1X_CHANNEL_CMDSWAP_0:** Command swap control. Affects swapping on writes to the PIO region and the frame-buffer buffered memory write region.
- **HOST1X_CHANNEL_FIFOSTAT_0:** CFNUMEMPTY is the number of free slots available in the per-channel command FIFO (needed for PIO or polling for completion of a wait).

14.3.1.2 Channel Command FIFO

The command FIFO is loaded either the CDMA or via PIO access. PIO is mainly used for debug purposes, but it allows a Host1x master to fill the command FIFO with channel commands by writing into “command FIFO” region of the channel's address space. PIO Command FIFO accesses should not be issued while a “Gather” process is busy.

A command FIFO has a set of registers that point to a location in memory where a sequence of channel commands resides. This sequence of commands is generally referred to as a “Push-buffer”.

A Host1x master can write either to DMAPUT or DMASTART register to trigger command fetching by the CDMA. DMASTART indicates where to start fetching, and DMAPUT indicates where to stop. DMAGET is a read-only reference to the present location of the command FIFO; it is incremented when the command is popped from the command FIFO. DMAPUT and DMAGET are relative addresses to DMASTART.

DMAEND provides an upper boundary to prevent the CDMA from fetching illegal addresses; fetching will cease when DMAGET equals DMAEND.

The command FIFO can be halted by writing the DMASTOP field in the Dmactrl register. Dmactrl also provides a mechanism to reset the DMAGET pointer (*Dmagetrst* field) to either 0 or to the value of DMAPUT (Dmainitget field).

14.3.1.3 Channel Commands

Channel commands can be split into two categories:

- **Class commands:** A class command is a mechanism to communicate a class write to a client. The channel must have an active class when processing class commands. The active class is set by a SETCL (SetClass) command.
- **DMA commands:** DMA commands control what is being fetched. They are processed at the top of the command FIFO while class commands are processed at the bottom of the command FIFO. This is because DMA commands change the command stream and must be processed before entering the FIFO.

Offsets in class commands are relative to the active class' base as they are limited to only the methods in the active class.

Channel Commands

- **SETCL (SetClass)** – A channel command that takes a class ID as an argument. SetClass is the sole means to indicate the current virtualization of the channel. It also means that a channel can acquire ownership of a class. Subsequent channel commands are directed towards this class.
- **NONINCR (NonIncrement) –** Takes an offset and count as arguments. There will be <count> data following this class command that will be written to the specified offset. Nonincrement indicates that the offset will not be incremented per data write.
- **INCR (Increment) –** Takes an offset and count as arguments. There will be <count> data following this command that will be written starting at the specified offset. The offset is incremented after each write.
- **MASK (Mask) –** Takes an offset and count as arguments. The number of data to write after the command is equal to the number of set bits in the count. Each data is written to the specified offset plus the next active bit location. For example, a count equal to 0x5 would have 2 data that are written to (offset+0) and (offset+2).
- **IMM (Immediate) –** Takes an offset and 16-bit data as arguments. The 16-bit data is written to the offset.

DMA Commands

- **RESTART (Restart or Jump) –** This command specifies an offset relative to DMASTAT. The next command fetched will be from (DMASTART + offset).
- **GATHER** – Command comprises 2 words and has arguments: offset, insert, type, count, and address. When GATHER is processed, <count> data is fetched from the address and inserted into the command stream. If the <insert> argument is enabled, it will insert either an INCR or NONINCR opcode preceding the fetched data, which is specified by <type>.

DMA commands do not need an active class, but often are processed when an active class exists. In the case of GATHER, if <insert> is enabled, there must be an active class.

14.3.1.4 Channel Control

Channel status and control resides in the synchronous register space of the Host1x address map. These registers are aliased in each channel's space. The details of these registers are as below:

- **CH<0..n>_STATUS:** Status includes client ownership and whether the channel is blocked or not (n is the number of channels – 1).
- **CH_TEARDOWN:** Using this register each channel can be reset, which is referred to as a teardown. This means all channel states are cleared and all client and class ownerships are relinquished.
- **MOD_TEARDOWN:** Similar to channel teardown, there exists a mechanism to reset modules. Setting this register can clear all states associated with a given client/module.
- **<client>_STATUS**: This register indicates the client's currently active class.

14.3.2 Host1x Class

Host1x has its own class that can be executed from the command FIFO. It is comprised of methods to access client registers as well as methods to control channel flow.

14.3.2.1 INDOFF

The following Host1x methods operate identically to the channel registers used for indirect access. Refer to Section 14.8: Host Channel Registers and Section 14.4.7: Indirect Register Access.

- INDOFF
- INDOFF2
- INDCTRL
- INDDATA

INDCNT is absent from the list above. In Host1x master-initiated indirect register reads, INDCNT is written to trigger the read. Conversely, reads from the command FIFO are trigged by a write to INDDATA. Reads issued from the command FIFO are returned to the channel's register return FIFO (return_FIFO).

14.3.2.2 DELAY_USEC

Delay_Usec stalls the command FIFO for the number of microseconds specified. This command has no impact on indirect register accesses if **not** initiated from the command FIFO. The microsecond period is calculated based on setting in the Usec_Clk register. The Usec_Clk register is programmed on the basis of Host1x clock; for example, if the host clock is 250 MHz, then this register should be programmed to a value of 250.

14.3.2.3 TICKCOUNT

Tickcount_Hi, Tickcount_Lo, and Tickctrl can also be controlled from the command FIFO. Their operation is identical whether controlled from the command FIFO or a Host1x master.

14.3.2.4 INCR_SYNCPT

All Host1x modules, including the Host1x itself, implement the Incr_Syncpt class.

Incr_Syncpt <Cond> <Indx>

For the Host1x, this method immediately increments Syncpt[Indx] irrespective of the cond.

14.3.2.5 WAIT_SYNCPT

Wait on syncpt – the command dispatch will stall until the syncpt counter pointed by the index field reaches the threshold value specified in the Thresh field:-

Wait_Syncpt <Indx> <Thresh>

The channel will wait until the following is true:

Syncpt[Indx][15:0] >= Thresh[15:0]

where the “>=” takes into account wrapping (see “Section 14.3.5: Sync Points (SYNCPTs)” for more information on wrapping). More specifically, the channel will wait until:

((Syncpt[indx] – thresh) & (1 << 15))!= 0

14.3.2.6 WAIT_SYNCPT_BASE

This method uses Syncpt Base registers to calculate threshold value for channel wait operation. The syncpt index, base index and also optional offset will be a part of Wait_Syncpt_Base command:-

Wait_Syncpt_Base <Indx> <Base_Indx> <Offset>

The channel will wait until the following is true:

Syncpt[Indx][15:0] >= (Syncpt_Base[Base_Indx] + Offset)[15:0]

Where the “>=” takes into account wrapping. See Section 14.3.5: Sync Points (SYNCPTs) for more information on wrapping.

14.3.2.7 WAIT_SYNCPT_INCR

Wait until syncpt increments:

Wait_Syncpt_Incr <Indx>

The channel will stall until Syncpt[Indx] is incremented. This wait method is not recommended.

14.3.2.8 LOAD_SYNCPT_BASE

Load a new value into the Syncpt_Base register:

load_syncpt_base <base_indx> <value>

Syncpt_Base[Base_Indx] will be loaded with <Value>.

14.3.2.9 INCR_SYNCPT_BASE

Add an offset to the value in the Syncpt_Base register:

Incr_Syncpt_Base <Base_Indx> <Offset>

The following operation will be done:

Syncpt_Base[Base_Indx] += Offset

14.3.2.10 STALLCOUNT

STALLCOUNT_HI, STALLCOUNT_LO, and STALLCTRL are methods to control “stall counters” through the command FIFO. Details of stall counters are given later in this document.

14.3.2.11 XFERCOUNT

Channel_Xfer_Hi, Channel_Xfer_Lo, and Xferctrl are methods to control “xfer counters” through the command FIFO.

14.3.2.12 32-Bit Sync Point Comparison Methods

Five methods are used for 32-bit sync point comparison. Software should send these commands using the following format:

LOAD_SYNCPT_PAYLOAD_32, <other_command>

where <other_command> is one of the following::

- WAIT_SYNCPT_32
- WAIT_SYNCPT_BASE_32,
- LOAD_SYNCPT_BASE_32,

- INCR_SYNCPT_BASE_32

LOAD_SYNCPT_PAYLOAD_32 <Payload(32)>

This method loads a 32-bit value into the corresponding channel's Channel_Syncpt_Payload register:

Channel_Syncpt_Payload[31:0]= <Payload(32)>

WAIT_SYNCPT_32 <Indx(8)>

This method stalls the current channel until following condition is true:-

(SYNCPT [<indx>][31:0] - PAYLOAD[31:0]) & 0x80000000) == 0

Here the Payload value is taken from Channel_Syncpt_Payload of the current channel.

This is essentially a wrapping stall until ((SYNCPT [<indx>][31:0] >= PAYLOAD[31:0])

WAIT_SYNCPT_BASE_32 <Indx(8)> <Base_Indx(8)>:

This method stalls the current channel until following condition is true:-

((Syncpt [<Indx>][31:0] - (Payload[31:0] + Syncpt_Base[<Base_Indx>][31:0]) & 0x80000000) == 0

Here the Payload value is taken from Channel_Syncpt_Payload register of the current channel.

This is essentially a wrapping:-

stall until ((Syncpt [<Indx>][31:0] >= (Payload[31:0] + Syncpt_Base[<Base_Indx>][31:0]))

LOAD_SYNCPT_BASE_32 <Base_Indx(8)>

This method copies the value from the current channel's Channel_Syncpt_Payload register into the Syncpt_Base register specified through the Base_Indx field:-

Syncpt_Base[<Base_Indx>][31:0] = Channel_Syncpt_Payload[31:0]

INCR_SYNCPT_BASE_32 <Base_Indx(8)>

This method adds the value of the current channel's Channel_Syncpt_Payload register into the Syncpt_Base register specified through Base_Indx:-

Syncpt_Base[<Base_Indx>][31:0] += Channel_Syncpt_Payload[31:0]

14.3.3 Context Switching

Context management of Host1x 1x-based modules will be completely under software control (there will be no automatic context switching done by hardware). This mean a module will never produce a context switch interrupt, it will always operate in auto-acknowledge mode.

14.3.4 Behavior of SetClass

The SetClass does not mean implicit acquisition of a module’s ownership. It is possible to send commands simultaneously from more than one channel to the same module. If exclusive ownership of a module is required for software correctness, then acquire_mlock and release_mlock opcodes should be used, which acquire and release the MLOCKn semaphore bits. An acquire_mlock that fails will cause that channel's commands to stall until it wins subsequent MLOCK arbitration (arbitrations happen with each release_mlock).

Here is the summary of SetClass behavior:

- SetClass simply instructs the channel hardware which module and context to use for the following commands.
- If multiple channels write simultaneously to the same class ID, and no MLOCKs are used, then the actual commands are interleaved in round-robin fashion (one command per channel).

- If multiple channels write simultaneously to different class IDs in the same hardware module (and no MLOCKs are used), then the actual commands are interleaved, but in blocks of N-cycle bursts (each burst of commands must be preceded with a CTXSW to the module giving the new context ID).

  N in this case is programmable number configured through Ctxsw_Timeout_Cfg register.

14.3.5 Sync Points (SYNCPTs)

A Sync point is a mechanism to synchronize between software and Host1x clients and also in between Host1x clients. This is implemented as 32-bit counters which are incremented by 1 whenever some predestinated condition (or event) occurs. When a counter reaches its maximum value, it wraps back to zero on the next increment.

Tegra X1 processors have 192 sync points. Sync points are not permanently associated with a channel; sync point allocation is done by software during initialization time.

There are two basic ways for sync point increments: -

- When a CPU writes an index to the Host1x's "syncpt_cpu_incr" register.
- When a Host1x client has received an "incr_syncpt" method and the condition specified by this method has become true.

Synchronization using sync points can be done in the following ways:

- A CPU can be interrupted when a sync point reaches a pre-specified value.
- A Host1x channel can have "wait" commands so that channel will wait for a pre-specified sync point value.

Sync points are normally not reset, but can wrap -- the comparison takes into account the possibility of wrapping.

Note: *Sync point wrapping works only if (Syncpt value - Syncpt Threshold) <= $2^{(syncpt\_width-1)}$. For 16-bit syncpt comparisons, the difference should be less than or equal to 32768. Software must take care of wrapping issues. For 32-bit comparisons, the difference should be less than or equal to 2,147,483,648, Because of the large value, software will not see any wrapping issues.*

All Host1x clients (e.g., VI) implement the following increment syncpt method:

Incr_Syncpt <Condition> <Index>

The Host1x client would receive the "Incr_Syncpt" method and store the index for each condition. Whenever the "condition" event occurs, the client would return the index back to Host1x.

14.3.5.1 Client Model for Syncpt Behavior

Software Programming Model

The basic programming model that software will follow is:

Each module will be programmed to do a unit of work (an operation) by Host1x using CDMA and push buffers.

Examples of an operation include:

- BLT (VIC)
- Draw a set of triangles (GPU)
- Encode a single frame (NVENC).

If nothing else is programmed, then module will go idle until Host1x sends commands to start another operation (no continuous mode).To do its operation, a module reads data from memory and writes the results to memory. Modules interact with each other using memory buffers: one module is the producer of data, and another is the consumer of that data.

There are exceptions to this model which we will discuss in detail later, but should be mentioned here. The exceptions include VI and DISPLAY which work in continuous mode (they continue to process data without the need of additional Host1x programming).

Basic Synchronization

There are two basic needs for synchronization: management of memory buffers and timing of control register writes.

Memory buffers used to pass data from one module to the next use a producer/consumer model with circular buffers. To prevent buffer underflow and overflow, synchronization needs to be done in both directions:

- The consumer cannot read until the producer is done writing (and the writes are committed to memory).
- The producer cannot reuse an output buffer (i.e., write to buffer) until the consumer is done reading the buffer.

Thus, the synchronization events required for memory buffers are:

- The module has completed all reads from the buffer.
- The module has completed all writes to the buffer (and they are committed by the memory controller).

To understand the requirements for timing the writes to control registers, a typical sequence is provided below:

1. reg wr for operation A
2. reg wr for operation A
3. reg wr (trigger) for operation A
4. reg wr for operation B
5. reg wr for operation B
6. reg wr (trigger) for operation B

If no WAIT method is placed between the trigger for A and the first register write for B, then in the worst case, corruption of operation A may occur because the new value of the control register is used before operation A is done. For modules that protect against this corruption, there is still the undesirable behavior of the module delaying the register write and subsequently causing back pressure on the Host1x write bus. If we wish to allow direct register reads to be used by ISRs they will happen asynchronously to the channel command writes, so one must ensure that the Host1x bus does not stall for significant periods of time.

For synchronizing writes to control register, a safe time to start writing register for the next operation is defined to be when:

- No corruption will occur for previous operations.
- No stall of the HWRBUS bus will result.

14.3.5.2 Standard Set of Incr_Syncpt Conditions

The following values of the “incr_syncpt cond” field are predefined:

- **0** (Immediate): Return indx to Host1x immediately (used by software push-buffer allocation and helpful for debug).
- **1** (Op_Done): Return indx to Host1x when all previously triggered operations have completed and their writes to memory are committed.
- **2** (Rd_Done): Return indx to Host1x when all previously triggered operations have completed their reads from memory.
- **3** (Reg_Wr_Safe): Return indx to Host1x when it is safe to program registers for the next operation. Safe means no corruption to previous operations and no stalling of Host1x write bus will occur.

There are special cases which would require use of additional condition values. Some modules have multiple read buffers condition = 2 (all reads done) would mean all reads to all buffers done, but it might be useful to software to know when reads are done to a specific input buffer. For some modules, e.g., VI, there are different safe times to update different sets of registers, so condition = 3 will need several variations (one for each "safe time"). If a module can have two operations happening at one time

(as in VI), then special considerations will need to be made for these cases: either two separate Incr_Syncpt methods or one Incr_Syncpt method with many special conditions.

For some modules, one condition can replace another if the two conditions always happen within a short period of time of each other. Then the condition that always happens last can be used for both.

14.3.5.3 Continuous Mode — Display and VI

For each display, software wants a free-running syncpt increment on every display “Vsync”. The most appropriate implementation of this is to have an additional register which has “Enable” and “Indx” fields to control the increment of syncpt on every “Vsync” event. If enable is set, then on every “Vsync”, display would return this “Indx” back to Host1x.

A similar situation exists for VI, where besides a set of conditions for the “Incr_Syncpt” method, it would also need a register with “Enable” and “Indx” which would control the incrementing of a syncpt on every camera “Vsync”.

Host1x clients will implement the logic associated with these registers. When this continuous mode is enabled, the client should set a pending bit for when the condition occurs. When the pending bit is set, the client will arbitrate for the hrd_<client>2host1x bus and if selected it will send “Indx” tagged with “Syncpt type” on hrd_ bus. After successfully sending the indx on hrd bus, the client will clear the pending bit.

One of the issues for continuous operation of VI is that not all modes of operation allow the consumer of their output buffers to signal back pressure when the consumer has fallen behind in reading. To alleviate this problem, VI has registers which, when written to, signal that the reading of one buffer has completed.

See Table 44 for a list of the Host1x clients.

14.3.5.4 Allowing Multiple Pending INCR_SYNCPTS

Clients can have multiple pending syncpts which are queued into the client’s syncpt FIFOs, which are dedicated ones for each syncpt conditions.

The behavior of these syncpt FIFOs is controlled by an “Incr_Syncpt_Cntrl” register in client’s register space:

INCR_SYNCPT_CNTRL< No_Stall>< Soft_Reset>

- No_Stall:

  If this bit is 1 and an Incr_Syncpt method is received but the syncpt FIFO for that condition is full, then this method will be dropped and the Incr_Syncpt_Error[Cond] bit will be set.

  If this bit is 0, then instead of dropping next method in case of a syncpt FIFO full condition, the client will just stall the host interface.

- Soft_Reset:

  if Soft_Reset is set, then all internal states of the client syncpt block will be reset. To do a soft reset, first set Soft_Reset of all Host1x clients affected, then clear all Soft_Resets.

INCR_SYNCPT_ERROR<Cond_Status>

This register stores error status in case of above mentioned syncpt FIFO full condition.

14.3.5.5 32-bit Sync Point Comparison

In Tegra 3 and previous chips, sync point counters were implemented as 32-bit registers but comparison takes into account 16-bit value only. In Tegra X1 devices, sync point comparison is extended to 32 bits. To support this feature, Host1x has the following changes:-

Host1x 32-Bit Registers

The following registers are extended to 32 bits:

- Syncpoint base register [Host1x 1x_Sync_Syncpt_Base]

- Syncpt Threshold register [Host1x 1x_Sync_Syncpt_Int_Thresh]

The following 32-bit register stores the payload value required in syncpt methods:

- Channel_Syncpt_Payload[31:0]

Host1x Method Changes

To support 32-bit syncpt comparisons, new Host1x methods have been introduced and are described later in this document.

14.4 Unit Description

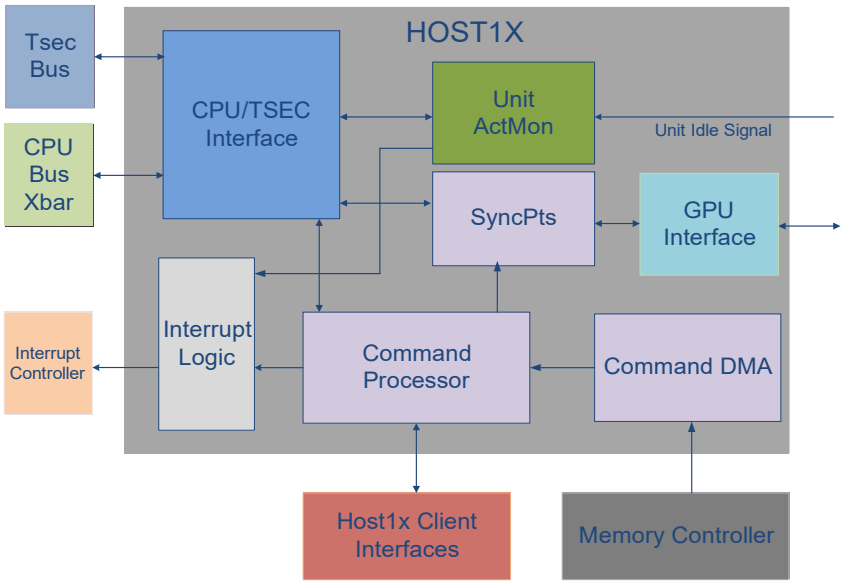
Host1x has a master client interface with the CPU Xbar bus and also a TSEC unit to receive CPU/TSEC read/write commands. The incoming commands are either processed inside Host1x if they are Host1x specific or routed to clients.

Host1x has a point-to-point interface with its clients using HWR/HRD buses, which are used for sending requests and accepting responses from clients.

There is a memory controller interface to fetch Push-Buffer commands from memory through the “Command DMA” unit. The incoming Push-Buffer commands are processed inside “Command Processor” and afterwards either consumed inside Host1x or it will generate tractions to client interface. There is an internal “syncpt” unit which is used to synchronize between Host1x clients and also between software.

There is a “Unit ActMon” block to monitor activities of Host1x clients. The ActMon statistics are used by software for power management.

Figure 23: Host1x Top-Level Block Diagram

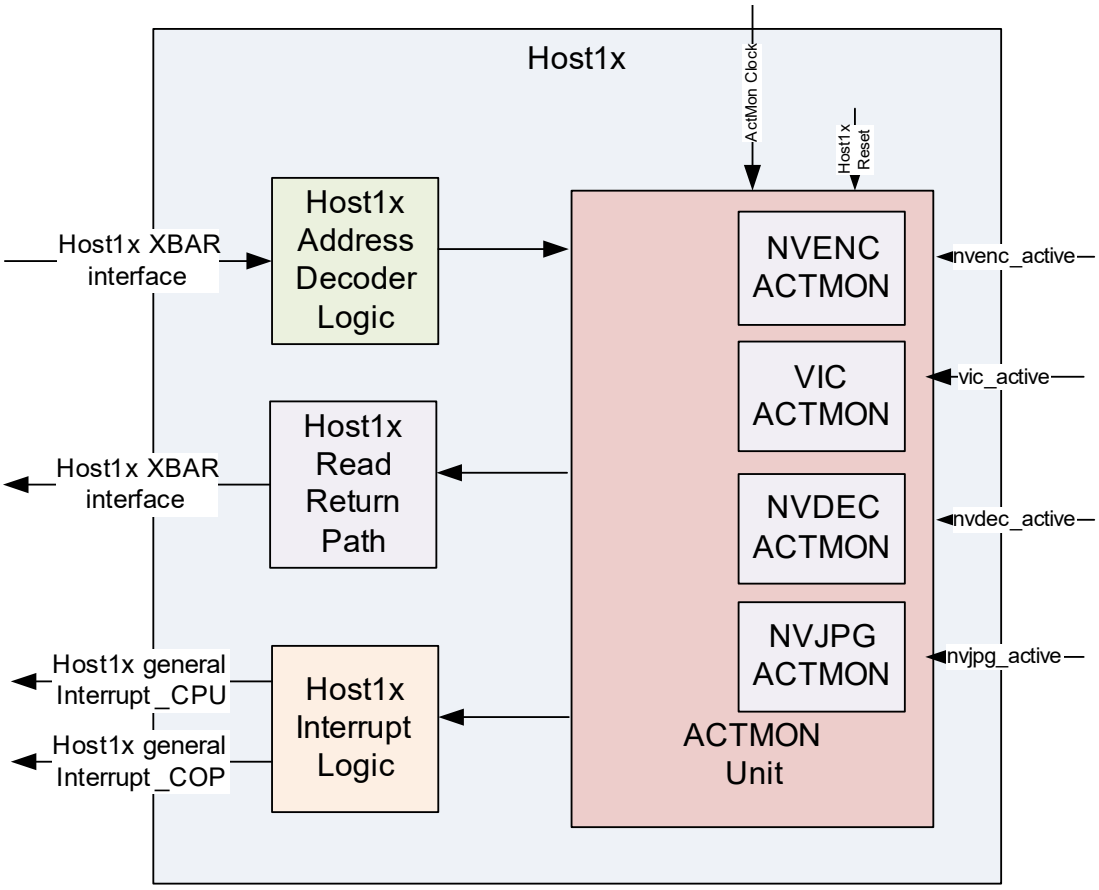


14.4.1 Activity Monitor

The Host1x unit implements 32-bit activity monitor (ACTMON) counters to monitor the idleness of the NVENC/VIC units.

The NVENC/VIC units send active information to Host1x through the same “active” signal (which is a level signal). The ACTMON block provides averaging, watermark detection, and interrupt functionality similar to the central activity monitors. The Host1x driver manages these monitors.

Figure 24: ACTMON Interface



The clock for the ACTMON unit is a low-frequency (10 MHz ~ 50 MHz), non gateable clock.

There is 1 interrupt status bit (per NVENC/VIC/NVDEC/NVJPG ACTMON interrupt) in Host1x, which is set by the actmon_intr_set_msenc/nvenc/nvdec/nvjpg/vic signals and cleared by software. Also there are corresponding interrupt mask bits for these interrupt lines to enable/disable interrupts.

The ACTMON register accesses are handled by the ACTMON itself. The Host1x will forward the access control/address/data signal to the ACTMON unit.

The ACTMON registers are a part of Host1x register space.

14.4.2 Filtering Out Kernel Commands from the Gather Buffer

This feature maintains user mode driver versus kernel driver protection. The host1x kernel driver sets up mode bits, which need to be protected from the user mode driver, so that driver cannot directly break the kernel.

Host1x checks the incoming commands from the gather buffer. If it contains the SetClass kernel mode command, then Host1x should drop these commands and raise an “Invalid Gbuffer cmd” interrupt to software. Software will read the interrupt status register to detect the channel that received the invalid gbuffer command. That particular channel needs to be restarted through the “channel teardown” mechanism.

- HOST1X_SYNC_HINTSTATUS_EXT1_0[0:11]

  Bit (i):-ch(i)_Invalid_gbuffer_cmd_int_status

  Where i = 0..11
- HOST1X_SYNC_HINTMASK_EXT1_0[0:11]

  Bit (i):- ch(i)_Invalid_gbuffer_cmd _int_mask

  Where i = 0..11

There might be some cases where a channel can still see setClass, for example, context switching. For those channels this feature must be disabled. This feature is controlled through CHANNELCTRL for each channel:

CHANNELCTRL[2]

- 0: disable filtering of kernel command(setClass).
- 1: enable filtering of kernel command(setClass).

14.4.3 Timeout Mechanism

Host1x has a mechanism to generate an interrupt for unserviced CPU read/write requests, which is controlled through a timeout register (HOST1X 1x_IP_TIMEOUT). Host1x generates a timeout Interrupt, and a violating address is stored in the following registers:

- IP_READ_TIMEOUT_ADDR
- IP_WRITE_TIMEOUT_ADDR

The width of the timeout register is 32 bits to provide a timeout value of ~19 seconds.

The TSEC master client interface also uses this mechanism to generate a timeout interrupt to CPU in case of illegal read/write access. The HINTSTATUS_EXT register has been modified to indicate if the timeout is from native CPU access or TSEC access.

Also in case of a TSEC read timeout, the returned response packet will have an additional bit (tsec2host1x 1x_iprdata_timeout) to indicate a timeout error.

HINTSTATUS[Timeout_source=bit10] =

- 0 Timeout from TSEC access.
- 1 Timeout from XBAR access.

The current scheme saves only the last timeout address in case of multiple timeout happens before clearing the timeout interrupt by software.

14.4.4 Performance Statistics Counters

Host1x has performance counters for profiling, which can be enabled independent of push-buffer commands. Host1x needs the following statistics per channel:

- Total clocks
- Clocks stalled waiting for syncpt
- Clocks transferring data

14.4.4.1 Tick Counter

Each channel has its own 64-bit tick counter that is incremented on each Host1x clock, given that it is enabled. TICKCTRL enables and disables the tick counter.

The 32-bit TICKCOUNT_LO and TICKCOUNT_HI registers can be written to initialize the tick counter. Reads of these registers return the tick count. TICKCOUNT_LO stores the lower 32 bits, and TICKCOUNT_HI stores the upper 32 bits. TICKCOUNT_HI is calculated as follows:

```
if (TICKCOUNT_LO == 0xFFFF_FFFF && TICKCTRL == enable) TICKCOUNT_HI++;
```

14.4.4.2 Channel Stall Counter

The 64-bit CHANNEL_STALL counter per channel, when enabled, is incremented on each clock cycle if that particular channel is waiting for syncpt.

The following registers control this counter:

- STALLCTRL: This 1-bit register enables/disables the CHANNEL_STALL counter.
- STALLCOUNT_LO: This 32-bit register initializes the lower 32 bits of the CHANNEL_STALL counter.
- STALLCOUNT_HI: This 32-bit register initializes the upper 32 bits of the CHANNEL_STALL counter.

The following Host1x class methods are used to program this counter:

- STALLCOUNT_HI: This method initializes the high 32 bits of the tick count value in the CHANNEL_STALL counter.
- STALLCOUNT_LO: This method initializes the low 32 bits of the tick count value in the CHANNEL_STALL counter.
- STALLCTRL: This method enables/disables the CHANNEL_STALL counter.

14.4.4.3 Channel Xfer Counter

There is a 64-bit CHANNEL_XFER counter per channel to measure the data transfer interval per channel. This counter is incremented at each clock cycle, if the channel is not idle (busy in fetching channel commands).

The following registers are used to initialize this counter:

- XFERCTRL: This 1-bit register enables/disables the CHANNEL_XFER counter.
- CHANNEL_XFER_LO[31:0]: This 32-bit register initializes the lower 32 bits of the CHANNEL_XFER counter.
- CHANNEL_XFER_HI[31:0]: This 32-bit register initializes the lower 32 bits of the CHANNEL_XFER counter.

The following Host1x class methods are used to program this counter:

- CHANNEL_XFER_HI: This method initializes the high 32 bits of the tick count value in the CHANNEL_XFER counter.
- CHANNEL_XFER_LO: This method initializes the low 32 bits of the tick count value in the CHANNEL_XFER counter.
- XFERCTRL: This method enables/disables the CHANNEL_XFER counter.

Note: *Counter operations are identical irrespective of whether they are controlled through registers or other methods.*

14.4.5 TZ Non-Secure Bit for the Display Engine

To support programming of a Host1x client (display engines) in TZ (Trust Zone) mode through direct register access, the Host1x needs to transfer a TZ non-secure bit from the CPU to the display and VI engines.

The following table describes the behavior of TZ non-secure signal to clients.

Table 43: Behavior of TZ Non-Secure Signal

Access-Mode	CPU TZ NS bit	TZ Non-Secure Bit to Client
Direct MMIO access (read/write)	0	0
Direct MMIO access (read/write)	1	1
Indirect MMIO access (read/write)[a]	0	X
Indirect MMIO access (read/write)	1	1
Push-buffer access (write) (DMA/PIO)	X	1
Push-buffer access (Indirect reads) (DMA/PIO)	X	1

a. This mode is not supported for “secure access”, The CPU has to use only “direct access” in “secure mode”.

14.4.6 Interrupts

Host1x has following types of interrupts:

14.4.6.1 Host1x Client Interrupt

Host1x is the collection point for all of its clients interrupts. Also it has control over those using status and mask registers with fields for each client. These client interrupts are forwarded to the central interrupt controller unit, individually through per client interrupt lines.

14.4.6.2 Host1x Interrupts

Host1x -specific interrupts are specified through the HOST1X_SYNC_HINTSTATUS_0 register while additional interrupts have been specified through the HOST1X_SYNC_HINTSTATUS_EXT_0 register (see Registers below). Each Host1x interrupt also has a corresponding mask. An interrupt is cleared by writing a 1 to the corresponding bit.

14.4.6.3 Host1x Syncpt Interrupts

Host1x can generate a syncpt interrupt upon reaching a threshold value by syncpt registers. It can also generate an interrupt to either CPU (referred to as CPU0 below) or BPMP-Lite (referred to as CPU1 below).

An interrupt is routed to cpuN when:

> (SYNCPT[indx] >= SYNCPT_INT_THRESH[indx]) && (SYNCPT_THRESH_INT_MASK[indx] == cpuN)
>
> The comparison takes wrapping into account. See Section 14.3.5: Sync Points (SYNCPTs)for more information on wrapping.

The status is sticky and is PENDING until cleared. Write 1's to clear.

14.4.7 Indirect Register Access

Host1x provides indirect register access to all its clients. An indirect register access involves multiple steps and requires a channel for the read return data. All registers required for indirect accesses reside in a channel.

Writes involve two Host1x register writes in the owning channel's space; the first write indicates the address (INDOFF, or INDOFF2 and INDCTRL), and the second indicates the data (INDDATA).

Reads involve two direct Host1x writes, the first indicates the address (again INDOFF, or INDOFF2 and INDCTRL), and the second indicates the number of reads (INDCNT). It also requires an indeterminable number of direct Host1x reads to the read return FIFO status register followed by a read to the read return FIFO.

- INDOFF
- INDOFF2
- INDCTRL
- INDDATA
- INDCNT

Pitfalls — Indirect accesses require a software mutex to ensure that no other software threads access the indirect registers while issuing the access (since the series of accesses is non-atomic). Indirect reads can only issue counts less than the read return FIFO size to prevent a deadlock – too many read requests can block popping of the read return FIFO. This restriction may be even tighter. All module accesses must also be tied to a channel.

In case an indirect write is sent, software must check whether the previous indirect write is through using an immediate sync increment command to the client.

14.4.8 Direct Register Access

All clients under Host1x have 256KB of address space, which originates from the space specified by indirect offset register (INDOFF). Host1x's client address map is dictated by its client's module IDs; these IDs are used in INDOFF to specify the target module of the register access. A client's address in the Host1x space is calculated as:

> address = direct_access_base_address (0x54000000) + (module_id << 18) + 4 * register_offset

Only one pending read per interface can exist. Reads are returned from the client when the client is ready. There are no latency restrictions.

Indirect versus Direct — a pitfall of direct addressing is variable latency of Host1x's clients. While this has no impact on writes, the CPU is blocked until the read returns rendering the CPU idle during that time.

14.4.9 Host Clients

The following table lists the clients that are accessed via Host1x with their module (client) ID, which is used to determine addresses for direct addressing.

Table 44: Host1x Clients

Client	ID
Host1x	0x0
DPAUX1	0x1
VI	0x2
TSEC1	0x4
Display A	0x8
Display B	0x9
SOR1	0xa
DSI	0xc
VIC	0xd
NVJPG	0xe
CSI	0xf
DSIB	0x10
NVDEC	0x12
NVENC	0x13
TSEC	0x14
SOR	0x15
DPAUX	0x17
ISP	0x18
ISPB	0x1a
VII2C	0x1b

14.4.10 Class IDs

The following table lists the class IDs.

Table 45: Host1x Class IDs

Class	ID
NV_HOST1X_CLASS_ID	0x01
NV_VIDEO_ENCODE_NVENC_CLASS_ID	0x21
NV_VIDEO_STREAMING_VI_CLASS_ID	0x30
NV_VIDEO_STREAMING_ISP_CLASS_ID	0x32
NV_VIDEO_STREAMING_ISPB_CLASS_ID	0x34
NV_GRAPHICS_VIC_CLASS_ID	0x5D

14.4.11 Host Address Space

Each channel is allocated 16KB of space, and they are aligned contiguously at the top of the Host's address space. A channel's space consists of channel registers, the command FIFO, and an aliased frame buffer region, which are unique per channel. The rest of the space consists of asynchronous, synchronous and read DMA registers, which are aliased in each channel – there exists only one copy.

14.4.11.1 Channel Map

The following table gives offsets from the channel base address for different sets of registers available to each channel.

Table 46: Host1x Channel Map

0x0000	Channel Registers	
0x0600	RDMA Registers	
0x0800	Command FIFO	
0x1000	Frame Buffer	
0x2000-0x20FF	Unit ACTMON Registers	ACTMON1(NVENC) = 0x2000 – 0x203F
		ACTMON2 (VIC) =0x2040 – 0x207F
		ACTMONRSVD =0x2080 – 0x20FF
0x2100*	Synchronous Registers	
0x3FFF	Bottom	

* 0x2100 is the synchronous registers base (HOST1X_CHANNEL_SYNC_REG_BASE)

14.4.11.2 Host1x Map

The following table shows the Host1x addresses for the CPU. Channels start at the lowest addresses and are aligned contiguously. Direct access to Host clients starts at 5400_0000, but this is configurable through a BAR register.

Table 47: Host1x Map

Address Range	Channel
5000_0000-5000_3FFF	Channel 0 (16KB)
5000_4000-5000_7FFF	Channel 1 (16KB)
5000_8000-5000_BFFF	Channel 2 (16KB)
5000_E000-5001_2FFF	Channel 3 (16KB)
5001_3000-5001_6FFF	Channel 4 (16KB)
5001_7000-5001_AFFF	Channel 5 (16KB)
5001_B000-5001_BFFF	Channel 6 (16KB)
5001_C000-5001_FFFF	Channel 7 (16KB)
5002_0000-5002_3FFF	Channel 8 (16KB)
5002_4000-5002_7FFF	Channel 9 (16KB)
5002_8000-5002_BFFF	Channel 10 (16KB)
5002_C000-5002_FFFF	Channel 11 (16KB)

14.5 Performance

14.5.1 Key Use Cases

Command throughput must be sufficient when all channels are active, the CDMA is active, and spooling is active.

14.5.2 Latency Targets

Direct read latency must be under 1 ms. Clients that cannot guarantee that a read will return in under 1 ms must not be read directly but indirectly.

14.5.3 Bandwidth Targets

As Host1x unit is used only for sending control commands to clients and usually at the frame interval.

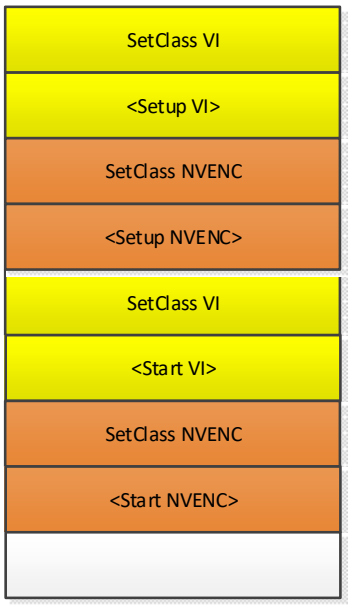
As these control commands are short (~200 to 300 words maximum), it is expected that the bandwidth requirement on each client should be less than 1MB/s, whereas the maximum available bandwidth per client on the HWR bus will be (206*4B)/12 =68MB/s at 206 MHz Host1x clock. The minimum bandwidth on the HWR bus per client is 33.34 MB/s at 100 MHz clock which should easily meet the client requirement.

14.6 Host1x Programming Model

The Host programming models resides on top of the concept of channels. A channel provides the means for software to supply an ordered sequence of commands to one or more classes. There are no restrictions on how many classes a channel may own or how often it can switch between classes, but it can only operate on one class at a time (known as the working class) and one command at a time. A stalled channel does not allow any commands to proceed from any class – there is a strict ordering of commands. A channel starts processing commands simply when commands are present, either supplied by the CPU or gathered from memory. A channel can be stopped explicitly by a CPU write to channel state.

A single channel owning multiple classes and clients:

Figure 25: Single Channel Example



14.6.1 Concurrency

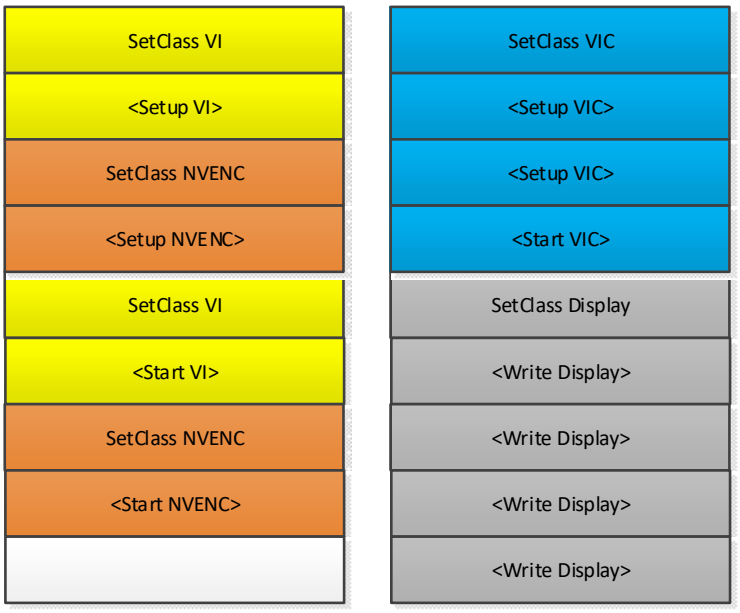
Channels operate in parallel and are unhindered by one another except in two specific cases:

- Synchronization points

- Class contention

The following figure depicts such concurrency.

Figure 26: Channel Concurrency Example



In the example above, no channel is blocked by another at any time so both can work concurrently. Care must be taken when assigning clients to channels. Channel concurrency as well as channel throughput is crucial for performance. For example, a client that is event-driven with a low latency requirement should exist in its own channel. Conversely, two clients that must be steadily supplied with commands could possibly coexist in the same channel given that their synchronization points are not conflicting (if they have any real synchronization points at all). Clients that operate sequentially on the same piece of data can easily reside in the same channel.

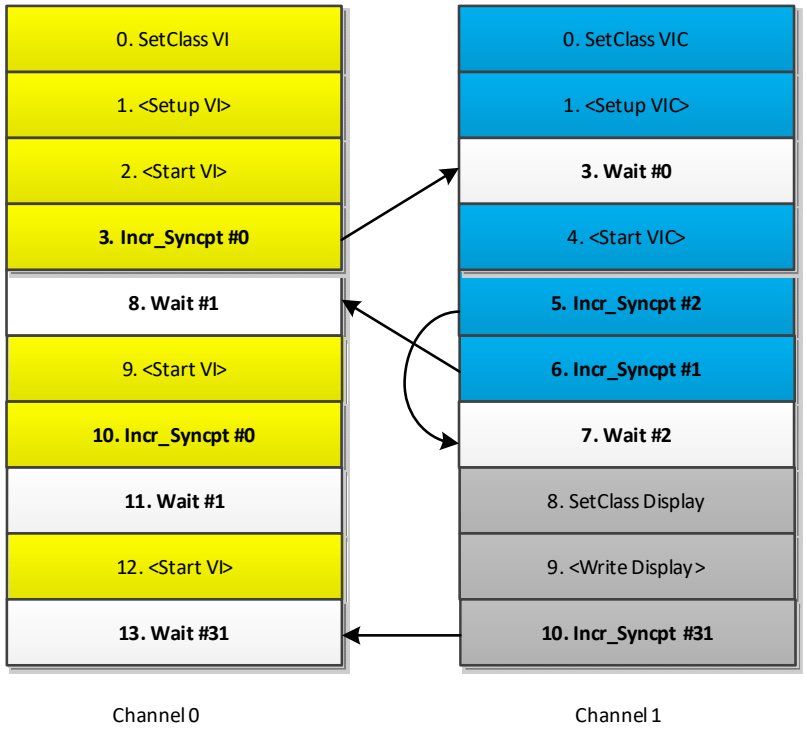
Clients with low-latency requirements like described in the first example above should possibly be moved to a PIO programming model and away from a channel-based model.

14.6.2 Synchronization

There are 192 total synchronization points (syncpts). Similar to semaphores, syncpt methods are issued to clients, mentioning syncpt counter index and returning condition. Any channel can be made to wait on a syncpt value of a particular syncpt index through Host1x “wait” method. Once the syncpt method is received by clients, based on syncpt condition, they will return a syncpt index back to Host1x. On receiving a syncpt index from the client, Host1x will increment that particular syncpt counter.

The following simple example below details how syncpts and waits allow for synchronization. The arrows simply indicate channel dependencies, which channel is waiting for syncpt increment from other channel.

Figure 27: Channel Synchronization Example



14.6.3 Progress Status

Channel progress is monitored through two means – GET and syncpts. GET is a channel state that indicates the address of the last command that has executed in the channel. GET is the same as DMAGET.

Syncpts are counter registers that are incremented when specified events occur (e.g., after the completion of each operation done by a module). The 32-bit syncpt values typically are monotonically increasing and can be used for in channel waits and out-of-channel interrupts.

The GET and syncpt registers can also be read directly (out-of-band) by the CPU.

14.6.4 Syncpt Base Register Use Case

The syncpt base registers are modified through LOAD_SYNCPT_BASE_32 or INCR_SYNCPT_BASE_32 methods and are used with the WAIT_SYNCPT_BASE_32 method.

This mechanism is useful when software wants to wait for a particular syncpt increment, but software does not know the absolute value of the sync point register until later.

The "future-value" of a sync point is the value that the syncpt register contains right after a particular increment has occurred.

Consider this example:

In this example, time increases downward (later (lower) lines are ahead in time).

Software "knows" the syncpointA future-value equals N at this point; software "knows" the baseA future-value equals N at this point.

1. command1
2. increment syncpointA to N+1
3. command2
4. increment syncpointA to N+2
5. command3

6. wait until command1 is done (syncpoint == N+1)
7. command4
8. wait until command2 is done (syncpoint == N+2)
9. command5

If software actually DOES know the value of N then regular WAIT_SYNCPT works fine here. However, the user space software driver (which is creating this list of commands) does not know what the value N is until after these commands (1-9) are all flushed to the kernel space driver.

The kernel space driver receives packets of commands from many different user space processes. When it receives a packet of commands it queues those commands (i.e., writes the Host1x PUT pointer). It also keeps track of all increments that have occurred in all commands that have been queued so far. The "future-value" of each sync point is simply the total number of increments that have occurred since the beginning of time (actually "beginning of time" is really the point in time where the kernel space driver was initialized and reset all the syncpt registers to 0).

So when the kernel space driver queues these commands (1-9), it knows the value N (i.e., the sum of all increments since the beginning of time). It can pass this back to the user space driver. But the user space driver does not know how many increments will be queued before commands 1-9 are queued because any other process can queue commands (including increments) at any time (e.g., after the user space driver has written commands 2 and 4 to the buffer, but before those commands have been queued by the kernel driver).

To solve this, we add a command at the end of each packet that increments the base register the same number of times as the sync point was incremented:

10. baseA += 2

This means that, at the start of any packet of commands, the future value of syncpointA and the future value of baseA are always the same. So command 6 can be:

WAIT_SYNCPT_BASE syncpt=A base=A offset=1

and command 8 can be:

WAIT_SYNCPT_BASE syncpt=A base=A offset=2

Note: *Software never writes a new value to the syncpointA or baseA register except when the kernel driver is initialized (e.g., when the system boots). After that only the syncpoint register is incremented and only the base register is added to. All of this depends on all software that creates cooperating command buffers. Software has this policy (e.g., the user space driver always tells the kernel driver how many increments are contained in each packet of commands).*

14.6.5 Indirect/Direct Register Addressing Scheme

The indirect addressing scheme works as follows:

- An address is decoded and either routed to a channel register or to a synchronous register
- A write to INDCNT or INDDATA triggers a register access to the register specified in INDOFF
- A transaction is created and pushed into the REGF FIFO. The owning channel is specified by which INDCNT or INDDATA is written. The client and offset are specified in INDOFF.
- The transaction is routed to the target client over the HWR bus.
- If the access is a write, the transaction is complete. In the case of a read, the processor polls the channel's read return FIFO status (FIFOSTAT), waiting for a nonempty FIFO.
- The client returns the read to the channel's return FIFO.
- The processor reads INDDATA register of that particular channel to pops data from the return FIFO.

Direct addressing uses the same flow with some adjustments:

- An address is decoded and either routed to a channel register, a synchronous register, or a client
- This step is nonexistent; direct accesses do not require a trigger.
- In the case of a client decode, a transaction is created and pushed into a FIFO called REGF. The owning channel is specified as CPU_READ_RETURN_TAG. The client and offset are indicated by the address: the client is created by shifting the address down by 18; the offset is simply the lower 18 bits.
- The transaction is routed to the target client over the HWR bus. If the access is a write, the transaction is complete.
- In case of a read, client returns the read data and channel ID in the returned packet indicates its destination, be it interface or a channel's return FIFO. If the channel is 0-8, it is an indirect read and returned to the indicated channel. If the channel matches CPU_READ_RETURN_TAG(0xf), the data is returned to the IP interface.

Currently, there is support for only one pending read per interface.

14.7 Host Channel Opcodes

This section provides the format of opcodes that can be sent through the command FIFO.

HCFCMD

Generic command FIFO packet (contains fields common to all opcodes) and is used for initial decode. All command FIFO packets are multiples of 32 bits.

HCFSETCL

The SetClass opcode specifies which class is being referenced (may cause rerouting of subsequent methods/data). In addition to switching classes, the opcode allows some methods to be programmed on the switch similar to an HCFMASK opcode.

HCFINCR

The Incrementing opcode indicates the offset should be incremented for each data that is part of the packet. The count argument indicates how many 32-bit values are following. If channel protect is enabled, the host should prevent a channel switch from occurring at the end of this command packet.

HCFNONINCR

The Non-Incrementing opcode indicates the same offset should be sent for each data that is part of the packet. The count argument indicates how many 32-bit values are following. If channel protect is enabled, the host should prevent a channel switch from occurring at the end of this command packet.

HCFMASK

The Mask opcode, from the starting offset, generates offsets based on where the bits are set in the mask. The host expects the amount of data following to equal the number of bits set. If channel protect is enabled, the host should prevent a channel switch from occurring at the end of this command packet.

HCFIMM

The Immediate opcode indicates the offset and data are contained in the same 32-bit data. Only the lowest 16 bits of data are sent to the module (IMMDATA). The upper 16 bits are zeroed out.

HCFRESTART

The Restart opcode is specific to DMA operation and causes the host to set DMAGET to (ADDRESS << 4), so the next command fetch will be from (DMASTART + DMAGET).

In legacy chips, bits 27:0 were not decoded and assumed to be 0's (allowing only simply wrapping of GET back to the top of the command buffer). ADDRESS can be 0 for compatible RESTARTs or non-zero acting as a JUMP.

Note that the jump address granularity is 16 bytes, since the bottom 4 bits cannot be specified.

HCFGATHER

The Gather opcode allows contiguous portions of memory to be fetched and placed in line with the command stream, replacing the two words of the gather command. It optionally can put an incrementing or non-incrementing opcode in the stream ahead of the gathered data. This allows for the gathered data to be a pure data stream and not be required to have host opcodes inside.

HCFCHDONE

This opcode indicates to the command processor that the current channel is done processing for now and is willing to give up any of its owned modules to other channels that need them.

14.8 Host Channel Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

Registers of the Host1x clients can have two offsets shown:

- "Offset" which is the Host1x offset, these generally increment by 1.
- "Byte Offset" which is the direct addressing offset for the processors, these generally increment by 4.

Other controllers in the Tegra SOC have a single "Offset", which is the same as the "Byte Offset" and used for direct addressing for the processors.

14.8.1 HOST1X_CHANNEL_FIFOSTAT_0

CFNUMEMPTY is the number of free slots available in the per-channel command. A FIFO is needed for PIO or polling for completion of a wait.

Offset: 0x0 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	INDRDY: Indicates that INDCOUNT==0, so it should be OK to issue another read
28:24	X	OUTFENTRIES: Number of entries available for reading in this channel's output FIFO
20:16	X	REGFNUMEMPTY: Register write/read FIFO free count
12	X	CFGATHER: Indicates whether GATHER is active. If a GATHER command issued via PIO, software must wait for the GATHER to be IDLE before issuing another command. 0 = IDLE 1 = BUSY
11	X	CFEMPTY: Indicates whether the command FIFO is empty or not 0 = NOTEMPTY 1 = EMPTY
10:0	X	CFNUMEMPTY: Command FIFO free count

14.8.2 HOST1X_CHANNEL_INDOFF_0

The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA.

The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use INDOFF2 to set the offset while still using INDOFF to set the other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases. For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.

Indirect frame buffer writes are STRONGLY DISCOURAGED. There are better ways to write to memory (direct and through the channel memory map) and there is limited flow control in the host. It is very easy to get into trouble with indirect frame buffer writes.

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	AUTOINC: Auto increment of read/write address 0 = DISABLE 1 = ENABLE
30	X	ACCTYPE: Access type: indirect register or indirect frame buffer 0 = REG 1 = FB
29	X	BUF32B: Buffer up 32 bits of register data before sending it. Otherwise, register writes will be sent as soon as they are received. Does not support byte writes in 16-bit host. Does not affect frame buffer writes. 0 = NOBUF 1 = BUF
28:27	X	INDSWAP: Indirect frame buffer access swap control. 00 = No byte swap 01 = 16-bit byte swap ([31:0] -> {[23:16],[31:24],[7:0],[15:8]}) 10 = 32-bit byte swap ([31:0] -> {[7:0],[15:8],[23:16],[31:24]}) 11 = 32-bit word swap ([31:0] -> {[15:8],[7:0],[31:24],[23:16]}) 0 = NONE 1 = BYTE16 2 = BYTE32 3 = WORD32
25:18	X	INDMODID: ACCTYPE=REG: Register module ID. This field should not be programmed to equal the module_id of Host1x 0 = HOST1X 1 = DPAUX1 2 = VI 4 = TSECB 8 = DISPLAY 9 = DISPLAYB 11 = TVO 12 = DSI 13 = VIC 14 = NVJPG 16 = DSIB 18 = NVDEC 19 = NVENC 20 = TSEC 21 = SOR 22 = SOR1 23 = DPAUX 24 = ISP 26 = ISPB VII2C
25:2	X	INDOFFSET: ACCTYPE=FB: frame buffer address
17:2	X	INDROFFSET: ACCTYPE=REG: register offset ([15:0])
0	X	INDOFFUPD: Optionally disable the update of INDOFFSET when writing this register 0 = UPDATE 1 = NO_UPDATE

14.8.3 HOST1X_CHANNEL_INDCNT_0

Indirect Register Access Count

Used to trigger indirect reads. Holds the number of registers/memory locations that will be read out. Channels should not request more than there is space available in their output FIFO. Only the protected channel should make liberal use of this feature for speeding up context switching.

For indirect frame buffer reads, each channel cannot issue more than NV_HOST1X_MAX_IND_FB_READS at once. The read data must return and be written into the per-channel output FIFO before any additional reads can be issued.

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	INDCOUNT

14.8.4 HOST1X_CHANNEL_INDDATA_0

This register, when written, writes to the data to the INDOFFSET in INDOFF. For reads, a REGFNUMEMPTY number of 32-bit values can be read before needing to poll FIFOSTAT again. The per-channel output FIFO (OUTFENTRIES) is readable via this offset. A read of INDDATA will pop an entry off of the per-channel output FIFO.

Offset: 0xc │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	INDDATA: read or write data

14.8.5 HOST1X_CHANNEL_RAISE_0

The general-purpose channels have DMA and RAISE/REFCOUNT functionality.

Any raise values returned from a client module are converted to vectors and update the per-channel raise register. The RAISE vector is also writable by the CPU. Any bits set in the RAISE field when written will be set in the RAISE register, allowing any pending WAITs to continue.

Offset: 0x10 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:2	X	RAISE: This channel's RAISE vector

14.8.6 HOST1X_CHANNEL_DMASTART_0

This register triggers a DMA fetch from the frame buffer for this channel, if the Put register does not equal the DMA Get register.

Offset: 0x14 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:2	X	DMASTART: cmdbuf frame buffer offset

14.8.7 HOST1X_CHANNEL_DMAPUT_0

This register triggers a DMA fetch from the frame buffer for this channel, if the PUT register does not equal the GET register. This address is relative to the DMASTART base address. Does not support byte writes. All 4-byte data need to be programmed.

Offset: 0x18 │ Read/Write: R/W │ Reset: 0x00000000 (0b00000000000000000000000000000xx)

Bit	Reset	Description
31:2	0x0	DMAPUT: cmdbuf frame buffer offset

14.8.8 HOST1X_CHANNEL_DMAGET_0

This register tracks the frame-buffer offset the DMA engine has read up to (incremented as entries are loaded from the channels command buffer into the FIFO). This address is relative to the DMASTART base address.

Offset: 0x1c │ Read/Write: RO │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:2	X	DMAGET: cmdbuf frame buffer offset

14.8.9 HOST1X_CHANNEL_DMAEND_0

The boundary of illegal addresses (either end of push-buffer or end of physical memory). This is designed to prevent DMA from prefetching illegal addresses. If DMA reaches this address before seeing a RESTART, it will stop. This would be a software error condition.

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:2	X	DMAEND: cmdbuf frame buffer offset

14.8.10 HOST1X_CHANNEL_DMACTRL_0

DMA Control Register

DMAGETRST: Reset GET pointer to '0'. Useful for cleaning up crashed channels. DMAGET is not updated instantly. Takes 4 cycles between programming of reset and a valid DMAGET.

DMAGETINIT: Reset the GET pointer to the value of DMAPUT when DMAGETRST is asserted.

DMASTOP: Stop DMA from fetching on this channel.

Note: *A Command DMA channel needs to be enabled for PIO-gather to work.*

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx001)

Bit	Reset	Description
2	0x0	DMAINITGET: Reset GET pointer to the value of DMAPUT when DMAGETRST is asserted. 0 = DISABLE 1 = ENABLE
1	0x0	DMAGETRST: Reset GET pointer to '0'. Useful for cleaning up crashed channels. 0 = DISABLE 1 = ENABLE
0	0x1	DMASTOP: Stop DMA from fetching on this channel. NOTE: a Command DMA channel needs to be enabled for PIO gather to work. 0 = RUN 1 = STOP

14.8.11 HOST1X_CHANNEL_INDOFF2_0

The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA.

The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use INDOFF2 to set the offset while still using INDOFF to set the other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases. For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.

Indirect frame-buffer writes are STRONGLY DISCOURAGED. There are better ways to write to memory (direct and through the channel memory map) and there is limited flow control in the host. It is very easy to get into trouble with indirect frame-buffer writes.

Offset: 0x8c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

14.9 Host SYNC Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

14.9.1 HOST1X_SYNC_INTSTATUS_0

INTSTATUS - interrupt status contains the interrupt status for all of the client modules. These status bits are only status. Writing '1' to them will not clear them. Software must clear the interrupt in the appropriate module, which should be reflected here.

Offset: 0x0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	SYNCPT_CPU1_INT: set if SYNCPT_CPU1_INTSTATUS has a pending interrupt 0 = NOT_PENDING 1 = PENDING
30	X	SYNCPT_CPU0_INT: set if SYNCPT_CPU0_INTSTATUS has a pending interrupt 0 = NOT_PENDING 1 = PENDING
27	X	VII2C_INT: 0 = NOT_PENDING 1 = PENDING
26	X	ISPB_INT: 0 = NOT_PENDING 1 = PENDING
24	X	ISP_INT: 0 = NOT_PENDING 1 = PENDING
23	X	DPAUX_INT: 0 = NOT_PENDING 1 = PENDING
22	X	SOR1_INT: 0 = NOT_PENDING 1 = PENDING
21	X	SOR_INT: 0 = NOT_PENDING 1 = PENDING
20	X	TSEC_INT: 0 = NOT_PENDING 1 = PENDING
19	X	NVENC_INT: 0 = NOT_PENDING 1 = PENDING
18	X	NVDEC_INT: 0 = NOT_PENDING 1 = PENDING
16	X	DSIB_INT: 0 = NOT_PENDING 1 = PENDING
14	X	NVJPG_INT: 0 = NOT_PENDING 1 = PENDING
13	X	VIC_INT: 0 = NOT_PENDING 1 = PENDING
12	X	DSI_INT: 0 = NOT_PENDING 1 = PENDING
9	X	DISPLAYB_INT: 0 = NOT_PENDING 1 = PENDING
8	X	DISPLAY_INT: 0 = NOT_PENDING 1 = PENDING

Bit	Reset	Description
4	X	TSECB_INT: 0 = NOT_PENDING 1 = PENDING
2	X	VI_INT: 0 = NOT_PENDING 1 = PENDING
1	X	DPAUX1_INT: 0 = NOT_PENDING 1 = PENDING
0	X	HOST_INT: 0 = NOT_PENDING 1 = PENDING

14.9.2 HOST1X_SYNC_INTMASK_0

Contains a master interrupt mask for all interrupt signals. If the interface's MASK_ALL bit is disabled, no interrupts will be triggered on that interface. This applies to only the non-syncpt interrupts.

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000010 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1xx00)

Bit	Reset	Description
4	0x1	CPU_TZ_ILLEGAL_TZ_ACCESS_MASK: 0 = DISABLE 1 = ENABLE
1	0x0	CPU1_INT_MASK_ALL: 0 = DISABLE 1 = ENABLE
0	0x0	CPU0_INT_MASK_ALL: 0 = DISABLE 1 = ENABLE

14.9.3 HOST1X_SYNC_INTC0MASK_0

INTC0MASK - Interrupt Mask for CPU0

Contains the interrupt mask bits for all of the client modules. If the INT_MASK is ENABLED for a particular module, the modules INT bit from INTSTATUS contributes to CPU0's interrupt signal.

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxx00x0000000x0x000xx00xxx0x000)

Bit	Reset	Description
27	0x0	VII2C_INT_C0MASK: 0 = DISABLE 1 = ENABLE
26	0x0	ISPB_INT_C0MASK: 0 = DISABLE 1 = ENABLE
24	0x0	ISP_INT_C0MASK: 0 = DISABLE 1 = ENABLE
23	0x0	DPAUX_INT_C0MASK: 0 = DISABLE 1 = ENABLE
22	0x0	SOR1_INT_C0MASK: 0 = DISABLE 1 = ENABLE
21	0x0	SOR_INT_C0MASK: 0 = DISABLE 1 = ENABLE
20	0x0	TSEC_INT_C0MASK: 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
19	0x0	NVENC_INT_C0MASK: 0 = DISABLE 1 = ENABLE
18	0x0	NVDEC_INT_C0MASK: 0 = DISABLE 1 = ENABLE
16	0x0	DSIB_INT_C0MASK: 0 = DISABLE 1 = ENABLE
14	0x0	NVJPG_INT_C0MASK: 0 = DISABLE 1 = ENABLE
13	0x0	VIC_INT_C0MASK: 0 = DISABLE 1 = ENABLE

14.9.9 HOST1X_SYNC_CF_SETUPDONE_0

Write to this register to trigger an update of the FIFO pointers. **ONLY DO THIS WHEN THE FIFO IS EMPTY.**

Offset: 0xa0 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	CF_SETUPDONE: Dummy bit

14.9.10 HOST1X_SYNC_CMDPROC_CTRL_0

Offset: 0xa4 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0xx00x)

Bit	Reset	Description
5	0x0	INTFC_CLKEN_OVR
2	0x0	GATHER_PARSE_DISABLED
1	0x0	DROP_ILLEGAL_OPCODES

14.9.11 HOST1X_SYNC_CMDPROC_STAT_0

Offset: 0xa8 │ Read/Write: RO │ Reset: 0x0000XXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
13:0	X	ILLEGAL_OPCODE

14.9.12 HOST1X_SYNC_CMDPROC_STOP_0

CH*_CMDPROC_STOP stops issuing commands from the command FIFO. This is useful to stop other channels when a channel teardown is needed to prevent unwanted traffic from happening at the same time.

Offset: 0xac │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxx00000000000000)

Bit	Reset	Description
13	0x0	CH13_CMDPROC_STOP: 0 = RUN 1 = STOP
12	0x0	CH12_CMDPROC_STOP: 0 = RUN 1 = STOP
11	0x0	CH11_CMDPROC_STOP: 0 = RUN 1 = STOP
10	0x0	CH10_CMDPROC_STOP: 0 = RUN 1 = STOP
9	0x0	CH9_CMDPROC_STOP: 0 = RUN 1 = STOP
8	0x0	CH8_CMDPROC_STOP: 0 = RUN 1 = STOP
7	0x0	CH7_CMDPROC_STOP: 0 = RUN 1 = STOP
6	0x0	CH6_CMDPROC_STOP: 0 = RUN 1 = STOP
5	0x0	CH5_CMDPROC_STOP: 0 = RUN 1 = STOP
4	0x0	CH4_CMDPROC_STOP: 0 = RUN 1 = STOP
3	0x0	CH3_CMDPROC_STOP: 0 = RUN 1 = STOP
2	0x0	CH2_CMDPROC_STOP: 0 = RUN 1 = STOP
1	0x0	CH1_CMDPROC_STOP: 0 = RUN 1 = STOP
0	0x0	CH0_CMDPROC_STOP: 0 = RUN 1 = STOP

14.9.13 HOST1X_SYNC_CH_TEARDOWN_0

Channel teardown register. Tells the hardware that a channel has gone away. Will reset that channel's command FIFO and release any locks it has in the arbiter. Will NOT reset that channel's output FIFO, which can be emptied by reading out all remaining entries.

This is a write-only register. A read of this register will yield all 0s.

Offset: 0xb0 | Read/Write: W | Reset: 0x0000XXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
13	X	CH13_TEARDOWN: 0 = NO_ACTION 1 = TEARDOWN
12	X	CH12_TEARDOWN: 0 = NO_ACTION 1 = TEARDOWN
11	X	CH11_TEARDOWN: 0 = NO_ACTION 1 = TEARDOWN
10	X	CH10_TEARDOWN: 0 = NO_ACTION 1 = TEARDOWN

0	X	CH0_TEARDOWN: 0 = NO_ACTION 1 = TEARDOWN

14.9.14 HOST1X_SYNC_MOD_TEARDOWN_0

Module teardown register. If a module is reset, the host needs to reset its state with respect to which channels own that module. Whenever a module is reset, the corresponding teardown bit in this register should be written. Module teardown will only work if the command FIFO and command processor are in a good state (the FIFO is empty of traffic for that channel and the command processor is at an opcode boundary). If an entire channel needs to be reset, the CH_TEARDOWN register should be used instead.

Offset: 0xb4 | Read/Write: R/W | Reset: 0x0XXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
27	X	VII2C_TEARDOWN: 0 = NO_ACTION 1 = TEARDOWN

14.9.34 HOST1X_SYNC_USEC_CLK_0

Number of host clocks needed to make a microsecond. Used for the DELAY host method. For example, if the host clock is 250 MHz, this register should be programmed to 250. If the host clock is 150 MHz, this register should be programmed to 150.

Offset: 0x1a4 | Read/Write: R/W | Reset: 0x0000015e (0bxxxxxxxxxxxxxxxxxxxx000101011110)

Bit	Reset	Description
11:0	0x15e	USEC_CLKS

14.9.35 HOST1X_SYNC_CTXSW_TIMEOUT_CFG_0

When a channel writes to a new class on a client, it generates a context switch. To keep from continually switching contexts if channels are addressing the same client, this register is used, so that the Host1x does not switch until the channel has either received WAIT_CTXSW_CNT clocks before switching or the channel stops targeting the particular client. If two channels are accessing two classes of a client, to guarantee a channel sending multiple commands for a class, this register can be used.

Offset: 0x1a8 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxx00001111)

Bit	Reset	Description
7:0	0xf	WAIT_CTXSW_CNT: Number of cycles to wait

14.9.36 HOST1X_SYNC_INDREG_DMA_CTRL_0

Enable use of DMA engine to move data from indirect register interface to memory. ATTN_LVL controls flow between host and DMA. DMA will not start a transfer until the set number of slots are full:

- 00 = 1 slot
- 01 = 4 slots
- 10 = 8 slots

Offset: 0x1ac | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx000x0000)

Bit	Reset	Description
7	0x0	AHBDMA_ENABLE: Enable generation of request to DMA engine 0 = DISABLE 1 = ENABLE

14.9.38 HOST1X_SYNC_CDMA_ASM_TIMEOUT_0

Timeout value determines how long the assembly logic will wait before it flushes data from the data FIFO to avoid head-of-line blocking.

Note: *Do not use a value of zero -- causes immediate flushing so no forward progress is made.*

Offset: 0x1b4 | Read/Write: R/W | Reset: 0x00000404 (0bxxxxxxxxxxxxxxxxxxxx00100xxx00100)

Bit	Reset	Description
12:8	0x4	CDMA_ASM_GFIFO_TIMEOUT
4:0	0x4	CDMA_ASM_DFIFO_TIMEOUT

14.9.39 HOST1X_SYNC_CDMA_MISC_0

CDMA_DELAY_PUT

Delay put_addr updates. This can potentially increase MC performance slightly by gathering multiple consecutive put_addr updates into 1 update, which reduces the amount of requests to the MC. In addition, it can be used to cover a race condition where a write to memory has not completed before CDMA starts fetching the data. But in this case, the counter has to be set to a high value, which *will* affect performance.

CDMA_SIMPLE_PREFETCH

Reduce per-channel requests to 1 every 3 cycles. This can reduce performance in 2 ways:

- The memory request FIFO will fill up slightly slower, but the impact will be minimal.
- It will cause the channel arbiter to switch to other channels when they have a request available, which will reduce locality. On the plus side, it has much less nasty corner cases.

CDMA_PUT_SYNC_DISABLE

CDMA_EN_STATS

Enable statistics counters.

- - Count the number of 128-bit words fetched by CDMA
- - Count the number of 128-bit words thrown away by CDMA

This allows us to get an idea how efficient the CDMA really is when there are multiple push-buffers active at the same time.

14.9.44 HOST1X_SYNC_HC_MCCIF_FIFOCTRL_0

Memory Client Interface FIFO Control (where applicable) and Clock Gating Control Register

Note: *This FIFO timing aspects of this register are no longer supported, but are retained for software compatibility.*

The clock override/ovr_mode fields of this register control the 2nd-level clock gating for the client and MC side of the MCCIF. All clock gating is enabled by default.

A '1' written to the rclk/wclk override field results in one of the following:

- With wclk/rclk override mode = LEGACY, the clock reverts to legacy mode of operation where the clock is on whenever the client clock is enabled.
- With wclk/rclk override mode = ON, the clock is always on inside the MCCIF and PC.

A '1' written to the cclk override field keeps the client's clock always on inside the MCCIF.

14.9.46 HOST1X_SYNC_MLOCK_0_0

MLOCK Registers

MLOCK is 1 whenever someone holds the lock, and is 0 otherwise. MLOCK is normally set and cleared using the host methods ACQUIRE_MLOCK and RELEASE_MLOCK.

If a CPU wants to acquire a lock, then it reads this register. If the value returned is 0, it has successfully acquired the MLOCK. A return value of 1 indicates that the acquire failed. At any time, the CPU can write 0 to MLOCK, releasing the MLOCK (note that hardware does not check if the CPU owned the lock). If the CPU writes a 1 to MLOCK, this is undefined and is ignored by the hardware (a NOP). Use MLOCK_OWNER to read the status of a lock (since reading MLOCK itself has a side effect).

Bit	Reset	Description
31:0	X	BASE_n

14.10 Host Class Methods

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

Class offsets are always relative to the class (based at 0).

14.10.1 NV_CLASS_HOST_INCR_SYNCPT_0

All Classes have the INCR_SYNCPT method. For host, this method, immediately increments SYNCPT[indx], irrespective of the condition. Note that INCR_SYNCPT_CNTRL and INCR_SYNCPT_ERROR are included for consistency with host clients, but writes to INCR_SYNCPT_CNTRL have no effect on the operation of Host1x, and because there are no condition FIFOs to overflow, INCR_SYNCPT_ERROR will never be set.

Offset: 0x0 | Byte Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description

7:0	0x0	INDX: syncpt index value

14.10.2 NV_CLASS_HOST_INCR_SYNCPT_CNTRL_0

Offset: 0x1 | Byte Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxx0)

Bit	Reset	Description
8	0x0	INCR_SYNCPT_NO_STALL: If NO_STALL is 1, then when FIFOs are full, INCR_SYNCPT methods will be dropped and the INCR_SYNCPT_ERROR[COND] bit will be set. If NO_STALL is 0, then when FIFOs are full, the client host interface will be stalled.
0	0x0	INCR_SYNCPT_SOFT_RESET: If SOFT_RESET is set, then all internal states of the client syncpt block will be reset. To do a soft reset, first set SOFT_RESET of all Host1x clients affected, then clear all SOFT_RESETs.

14.10.3 NV_CLASS_HOST_INCR_SYNCPT_ERROR_0

Offset: 0x2 | Byte Offset: 0x8 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	COND_STATUS: COND_STATUS[COND] is set if the FIFO for COND overflows. This bit is sticky and will remain set until cleared. Cleared by writing 1.

14.10.4 NV_CLASS_HOST_WAIT_SYNCPT_0

Wait on syncpt method.

Command dispatch will stall until:

SYNCPT[indx][NV_HOST1X_SYNCPT_THRESH_WIDTH-1:0] >=
threshold[NV_HOST1X_SYNCPT_THRESH_WIDTH-1:0]

The comparison takes into account the possibility of wrapping. Note that more bits are allocated for index and threshold than may be used in an implementation. Use NV_HOST1X_SYNCPT_NB_PTS for the number of syncpts, and NV_HOST1X_SYNCPT_THRESH_WIDTH for the number of bits used by the comparison.

Offset: 0x8 | Byte Offset: 0x20 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:24	X	INDX
23:0	X	THRESH

14.10.5 NV_CLASS_HOST_WAIT_SYNCPT_BASE_0

Wait on syncpt method using base register.

Command dispatch will stall until:

SYNCPT[indx][NV_HOST1X_SYNCPT_THRESH_WIDTH-1:0] >= (SYNCPT_BASE[base_indx]+offset)

The comparison takes into account the possibility of wrapping. Note that more bits are allocated for INDX and BASE_INDX than may be used in an implementation. Use NV_HOST1X_SYNCPT_NB_PTS for the number of syncpts, Use NV_HOST1X_SYNCPT_NB_BASES for the number of syncpt_bases, and NV_HOST1X_SYNCPT_THRESH_WIDTH for the number of bits used by the comparison If NV_HOST1X_SYNCPT_THRESH_WIDTH is greater than 16, the offset is sign-extended before it is added to SYNCPT_BASE.

Offset: 0x9 | Byte Offset: 0x24 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Offset: 0x13 | Byte Offset: 0x4c | Read/Write: R/W | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	TICKCNT_ENABLE: Enable or Disable tick counter 0 = DISABLE 1 = ENABLE

14.10.16 NV_CLASS_HOST_INDCTRL_0

Indirect Addressing

These registers (along with INDDATA) are used to indirectly read/write either register or memory. Host registers are not accessible using this interface. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA.

Either INDCTRL/INDOFF2 or INDOFF can be used, but INDOFF may not be able to address all memory in chips with large memory maps. The redundant bits in INDCTRL and INDOFF are shared, so writing either offset sets those bits.

Note: *The following restrictions apply to the use of indirect memory writes: 1) At initialization time, do a dummy indirect write (with all byte enables set to zero). 2) Dedicate an MLOCK for indirect memory writes, then before a channel issues a set of indirect memory writes it must acquire this MLOCK; after the writes have been issued, the MLOCK is released -- this will restrict the use of indirect memory writes to a single channel at a time.*

Offset: 0x2b | Byte Offset: 0xac | Read/Write: R/W | Reset: 0xXX00000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

14.11 Host Proto Channel Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

14.11.1 HOST1X_PROTCHANNEL_FIFOSTAT_0

CFNUMEMPTY is the number of free slots available in the per-channel command FIFO (needed for PIO or polling for completion of a wait).

Offset: 0x0 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	INDRDY: Indicates that INDCOUNT==0, so it should be OK to issue another read
28:24	X	OUTFENTRIES: Number of entries available for reading in this channel's output FIFO
20:16	X	REGFNUMEMPTY: Register write/read FIFO free count
12	X	CFGATHER: Indicates whether or not GATHER is active. If a GATHER command issued via PIO, software must wait for the GATHER to be IDLE before issuing another command. 0 = IDLE 1 = BUSY
11	X	CFEMPTY: Indicates whether the command FIFO is empty or not 0 = NOTEMPTY 1 = EMPTY
10:0	X	CFNUMEMPTY: Command FIFO free count

14.11.2 HOST1X_PROTCHANNEL_INDOFF_0

The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA.

The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use INDOFF2 to set the offset while still using INDOFF to set the other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases. For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.

Indirect frame buffer writes are STRONGLY DISCOURAGED. There are better ways to write to memory (direct and through the channel memory map) and there is limited flow control in the host. It is very easy to get into trouble with indirect frame buffer writes.

Offset: 0x4 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	AUTOINC: Auto increment of read/write address 0 = DISABLE 1 = ENABLE
30	X	ACCTYPE: access type: indirect register or indirect frame buffer 0 = REG 1 = FB
29	X	BUF32B: Buffer up 32 bits of register data before sending it. Otherwise, register writes will be sent as soon as they are received. Does not support byte writes in 16-bit host. Does not affect frame buffer writes. 0 = NOBUF 1 = BUF
28:27	X	INDSWAP: Indirect frame buffer access swap control. 00 = No byte swap 01 = 16-bit byte swap ([31:0] -> {[23:16],[31:24],[7:0],[15:8]}) 10 = 32-bit byte swap ([31:0] -> {[7:0],[15:8],[23:16],[31:24]}) 11 = 32-bit word swap ([31:0] -> {[15:8],[7:0],[31:24],[23:16]}) 0 = NONE 1 = BYTE16 2 = BYTE32 3 = WORD32
25:18	X	INDMODID: ACCTYPE=REG: register module ID. This field should not be programmed to equal the module_id of Host1x. 0 = HOST1X 1 = DPAUX1 2 = VI 4 = TSECB 8 = DISPLAY 9 = DISPLAYB 12 = DSI 13 = VIC 14 = NVJPG 16 = DSIB 18 = NVDEC 19 = NVENC 20 = TSEC 21 = SOR 22 = SOR1 23 = DPAUX 24 = ISP 26 = ISPB 27 = VII2C

0	X	INDOFFUPD: Optionally disable the update of INDOFFSET when writing this register 0 = UPDATE 1 = NO_UPDATE

14.11.3 HOST1X_PROTCHANNEL_INDCNT_0

Indirect register access count

Used to trigger indirect reads. Holds the number of registers/memory locations that will be read out. Channels should not request more than there is space available in their output FIFO. Only the protected channel should make liberal use of this feature for speeding up context switching.

For indirect frame buffer reads, each channel cannot issue more than NV_HOST1X_MAX_IND_FB_READS at once. The read data must return and be written into the per-channel output FIFO before any additional reads can be issued.

Offset: 0x8 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0X0	INDCOUNT

14.11.4 HOST1X_PROTCHANNEL_INDDATA_0

This register, when written, writes the data to the INDOFFSET in INDOFF. For reads, a REGFNUMEMPTY number of 32-bit values can be read before needing to poll FIFOSTAT again.

The per-channel output FIFO (OUTFENTRIES) is readable via this offset. A read of INDDATA will pop an entry off of the per-channel output FIFO.

Offset: 0xc │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	0X0	INDDATA: Read or write data

14.11.5 HOST1X_PROTCHANNEL_INDOFF2_0

Note: *This spec file contains additions to the "common" registers that cannot be put in the common section, otherwise all of the other registers will shift.*

The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA.

The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use INDOFF2 to set the offset while still using INDOFF to set the other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases. For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.

Indirect frame buffer writes are STRONGLY DISCOURAGED. There are better ways to write to memory (direct and through the channel memory map) and there is limited flow control in the host. It is very easy to get into trouble with indirect frame buffer writes.

14.11.17 HOST1X_PROTCHANNEL_TICKCOUNT_THRESHOLD_HI_0

This register holds the high 32 bits of the tick count threshold value

Offset: 0xbc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	TICKS_THRESHOLD_HI

14.11.18 HOST1X_PROTCHANNEL_TICKCOUNT_THRESHOLD_LO_0

This register holds the low 32 bits of the tick count threshold value

Offset: 0xc0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	TICKS_THRESHOLD_LO

14.11.19 HOST1X_PROTCHANNEL_TICKCOUNT_THRESHOLD_CTRL_0

Offset: 0xc4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	DISABLE	THRES_CMP: Enable or disable tick threshold compare 0 = DISABLE 1 = ENABLE

CHAPTER 15: VIDEO IMAGE COMPOSITOR (VIC)

The Video Image Compositor (VIC) unit implements video post-processing functions needed by a video playback application to produce the final image for the player window. The VIC can also perform scaling, composition, and rotation when no 3D rendering is involved.

The compositor implements much of the DirectX Video Acceleration 2.0 Enhanced Video Processor specification, including de-interlacing, scaling, color conversion, proc-amp, and compositing for up to 8 input surfaces. It supports advanced features like gamma/de-gamma programming, color correct processing, and pixel decompression.

15.1 Features

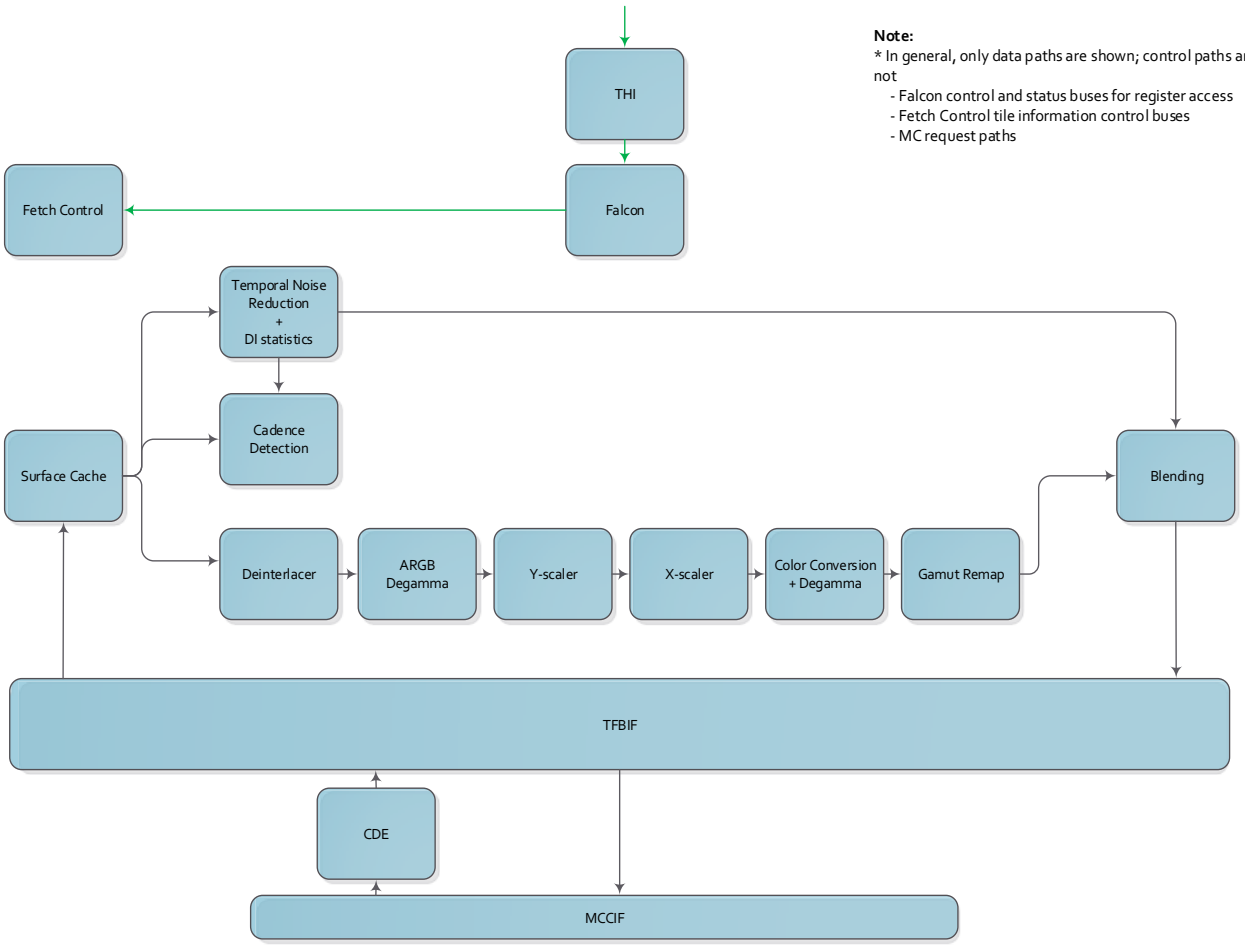
The VIC implements the following features:

- De-interlacing
- Inverse Teleciné
- Temporal Noise Reduction for Video and Camera
- Scaling (5-tap and 10-tap)
- Color and Pixel Format Conversion
- Memory Format Conversion
- Blend/Composite
- Rotation/Flips

15.2 Block Diagram Description

The following figure shows the top-level block diagram of the Video Image Compositor.

Figure 28: VIC Block Diagram



15.2.1 Falcon Microprocessor

The NVIDIA Falcon Microcontroller is used for method processing and performing processing related to inverse telecine.

15.2.2 Tegra Host Interface (THI)

The Tegra Host Interface (THI) shim handles incoming methods from the Host1x bus and passes those methods to the Falcon microcontroller, in addition to handling Tegra sync points.

15.2.3 Tegra Frame Buffer Interface (TFBIF)

The Tegra Frame Buffer Interface (TFBIF) interfaces with the Tegra X1 memory system. The TFBIF has one read and one write MCCIF client.

15.2.4 Color Decompression Engine (CDE)

The Color Decompression Engine reads compressed surfaces generated by the GPU.

15.2.5 Fetch Unit

During preprocessing (IVTC passes) the fetch control breaks the output surfaces into 16x16 byte tiles and processes columns of these tiles at a time.

During main processing, the fetch control breaks the output surface up into 64x16 pixel tiles and processes those individually. For each tile, the fetch unit loops over all input surfaces.

When processing each tile, 64*16+*n* pixels need to be fetched, where *n* is the extra padding needed for scaling and deinterlacing. The correct input tile size to be fetched is (64*s_x+n)x(16*s_y+n), where s_x and s_y are the horizontal and vertical downscale factors. "n" here depends on the filter taps specified (1, 2, 5 or 10-tap), as well as the deinterlacing algorithm used.

Each tile being fetched is stored in the Surface Cache. This cache holds 128 entries of 256 bytes.

15.2.6 Inverse Telecine (IVTC) Unit

The IVTC unit runs on individual video streams at a time and consists of 2 separate passes.

The first pass does noise reduction and motion adaptation buffer updates. It also calculates the weave and artifact counts used for the IVTC decision. The final decision for IVTC is done in Falcon microcode.

The second pass combines the updated motion adaptation buffer and the previous motion buffer (which has a different parity) and combines them for DiSi1 deinterlacing during the main processing pass.

15.2.7 Scale Unit

The Scale Unit consists of three blocks:

- The first block deinterlaces the input. The deinterlacing modes supported are DiSi1, BOB, and WEAVE. Weave is only used on progressive content or when inverse telecine detected a cadence.
- The second block scales the data in the vertical direction producing at most 16 lines of output to the next stage.
- The third block scales the data in the horizontal direction producing at most 64 pixels of output.

15.2.8 Blend Unit

The Blend Unit consists of four blocks:

- The first block buffers the incoming data and converts from any input order into interleaved pixel order (either ARGB or AYUV).
- The second block performs all color conversion tasks.
- The third block blends data into the output buffer. This stage is also used during preprocessing.
- The fourth block is an input-output DMA that can read original buffer data from the memory system and write back the final blended result. The reading is only used during preprocessing.

15.3 Functionality

15.3.1 Configurability

The VIC operates at 8 pixels/clock. It supports 8 slots.

15.3.2 Color Correct Processing

When processing colors, the VIC supports the following:

- Full sRGB support
- Precise internal pixel format precision that:
  - satisfies the DirectX srgb2linear and linear2srgb error requirements
  - is visually indistinguishable from the GPU output
- Linear Space Scaling and Blending

15.3.3 Config Structure

The Config Structure is the primary programming interface that allows software to talk to the VIC unit. The Config Structure is a series of sub-structures which define the full use case to be executed by VIC. Software sets up the ConfigStruct in DRAM; the VIC hardware then reads in this structure from memory and interprets it to decide on the operations that need to be performed.

15.3.4 Pixel Decompression

VIC can decompress pixels compressed by the GPU ROP unit. Refer also to Chapter 25: Color Decompression Engine in this document.

The supported formats, decompression modes, and surface sizes are:

- Pixels formats supported: 32-bit per pixel formats such as A8R8G8B8; only single plane formats are supported
- Memory formats supported: Block-linear 2CRA compressed surfaces
- Supported decompression modes are:
  - Arithmetic decompression (1:2 decompression)
  - Reduction compression (1:8 decompression)
  - ZBC decompression for solid color tiles.
- Slot support: Decompression is supported on all 8 slots. Software has to indicate through the config structure if compression is enabled for each slot.
- The maximum surface size supported for any compressed surface is 4096x4096 pixels

The Color Decompression Engine (CDE) transparently compresses regular requests sent by the VIC unit, and decompresses data in the read responses on-the-fly before sending the data back to the client. To decompress the compressed pixel data that is fetched from memory, the CDE needs to store the compbit information for every ROP tile (32Bx8) that is fetched from memory in a local buffer known as the CompTagBuffer (CTB). This local buffer is maintained as a shared resource for all 8 slots that need to be partitioned among the slots at the beginning of the frame. This partitioning is done in the Falcon microcode.

A worst-case use case of 2:1 downscaling on all 8 slots is supported. If certain slots are not being scaled, it is possible to re-allocate the CTB entries to the other slots instead so that some slots can support a larger downscale at the expense of the non-scaled slots CTB entries.

The following new methods have been added to the VIC class to let software set the comp-tag buffer base addresses - SlotNCompressBitOffset(), and the expected method data is bits 39:8 of the buffer base, just like all the other Offset() methods.

The following fields have been added to the VIC config structure for decompression support:

- DecompressEnable – 1 bit (per slot) in the SlotConfig structure
- DecompressCtbCount – 8 bits (per slot) in the SlotConfig structure. This field is used if the driver implements the CTB partitioning code listed above instead of the Falcon microcode.
- DecompressZbcColor – 32 bits (per slot) in the SlotConfig structure

Refer to Chapter 24: Display Controller in this TRM for more information on the CDE.

15.3.5 Slots

The VIC supports up to 8 different input pictures that can be composited on to a single surface. Support for 8 input pictures enables composition of multiple streams in a single pass. For example, for Blu-Ray content:

- Background
- Primary Video
- Secondary Video
- Presentation Graphics

- Interactive Graphics

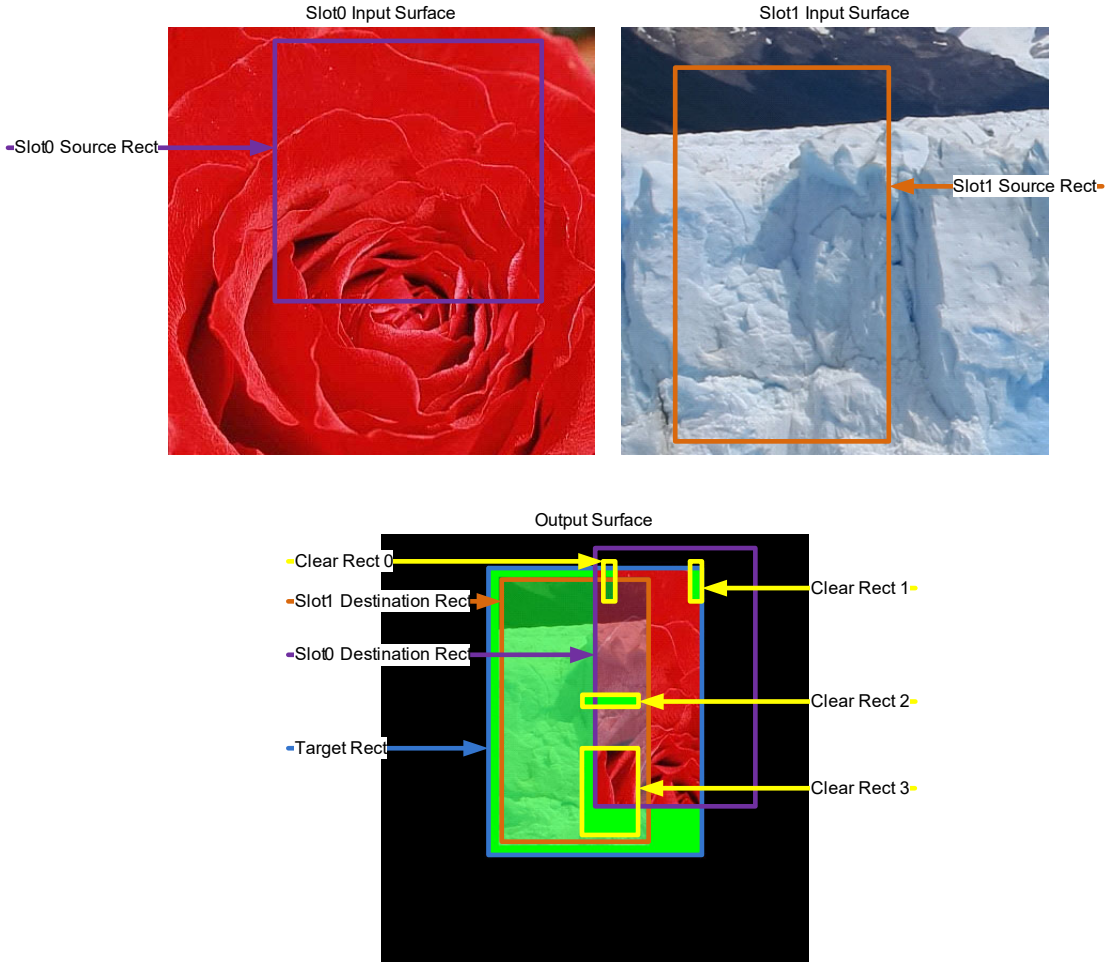
Each slot has a state that is specified through the config structure. Control parameters, such as the input formats, deinterlacing, scaling factors, clipping, color-space conversion, are independently set per input surface. All slots support the same functionality.

During the composition stage, the slots are blended in ascending order (that is, the output of slot1 will be blended onto slot 0, the output of slot 2 is blended on to slot 1, etc.).

Each slot can be programmed to access multiple surfaces. The number of surfaces used depends on the type of slot input (e.g., interlaced versus progressive), input format (e.g., packed versus planar color formats), and also on the type of processing (e.g., temporal noise reduction versus cadence detection versus deinterlacing).

15.3.5.1 Surface Composition

Figure 29: Programming Input and Output Surface Parameters



The maximum dimension of any image on the input or output sides of the VIC is 16384 pixels. The dimensions of each input slot surface can be defined along with the pixel and memory format types in the VIC Config Structure.

A source rectangle defines the region of pixels of the input slot surface that will contribute to the composition of the output surface, and a destination rectangle defines the region of the output surface that is affected by a given input slot. Together, the source and destination rectangle parameters specify the scaling ratios desired. Each slot can also dictate how pixel data is laid out in each surface cache entry by specifying the amount of pixel data, i.e., the number of bytes wide, logically represented by each cache entry; this provides flexibility in reducing the memory over-fetch associated with fetch of surfaces under various use cases (e.g., scaling ratios, deinterlacing modes, etc.).Via the OutputConfig structure, the dimensions of the output surface can be defined along with the pixel and memory format types. The same structure also defines a target rectangle to restrict the pixel

processing output to a certain rectangle in the output surface. A programmable color can also be set to fill the background of the target rectangle.

The VIC allows the programming of clear rectangles that prevent the fetch of pixels from specific rectangular regions of input slots. The use of the clear rectangles can be used to reduce redundant pixel fetches, for example, if an opaque surface is known to occlude a layer below it, a clear rectangle can be specified to prevent fetching of pixels from the occluded region of the lower layer. Up to eight clear rectangles are specified via the ClearRectStruct structs, and per-slot clear rectangle mask enables are specified via the SlotConfig struct, Clear rectangles are specified relative to the output surface co-ordinate system.

With the addition of the sub-pixel source rectangle feature, source rectangle coordinates are specified in the config structure in a U14.16 format, allowing the source rectangle to be specified at a sub-pixel resolution. Destination, target, and clear rectangles coordinates are pixel aligned.

15.3.6 Memory Format Support

The following memory formats must be supported on input and output. Input and output memory formats do not have to match.

- Pitch Linear
- Block Linear (16Bx2 kind with sector ordering)
  - 64x8 byte GOB format with 16x2 byte sectors
  - Contiguous 64B atoms are laid out as 32x2 byte blocks

The Tegra memory controller is optimized for 64B requests, and all VIC requests should be optimized to issue at least 64B sized requests.

The VIC Surface Cache supports the above memory formats on input when fetching pixel data from memory.

The VIC Output Buffer supports the above memory formats on input when reading background image data when pre-processing inverse telecine data from memory, and on the output side when writing composited image data back to memory.

Memory formats supported by the VIC are enumerated as follows:

Table 48: Memory Format Enumerations

Surface Kind Enumeration	Encoding (Four Bits)
BLK_KIND_PITCH	0x0
BLK_KIND_GENERIC_16Bx2_TEGRA	0x1

To fully support the Block Linear format, block height is programmable to any one of the following enumerations.

Table 49: Block Height Enumerations

Block Height Enumeration	Value	Encoding (Four Bits log2 Encoding)
ONE_GOB	1	0
TWO_GOBS	2	1
FOUR_GOBS	4	2
EIGHT_GOBS	8	3
SIXTEEN_GOBS	16	4
THIRTYTWO_GOBS	32	5

15.3.6.1 Surface Transformation

The Blend unit is responsible for generating the destination surface addressing that will implement mirroring (across X-axis and/or Y-axis) of tiles within the Target rectangle of the output surface.

The output buffer can mirror pixels in the X and Y directions within each output tile. This ability in addition to the fetch control changes mentioned above gives the ability to flip the contents of the entire Target rectangle about its axis.

The output buffer also supports transposition of the Target Rectangle. This ability when combined with target rectangle flips gives the ability to rotate images by any multiple of 90 degrees.

Rotation must be done in the pipeline after deinterlacing because the deinterlacer assumes a normal orientation of the input fields (interlaced field lines run horizontal). Rotation of the image prior to deinterlacing will make the deinterlacer ineffective.

Figure 30: Interlaced Field Lines Run Horizontally

The programmed starting address of the source and destination rectangles will remain at the upper left corner of the unit. The ‘Source Image’ diagrammed below shows the logical tile traversal pattern as the input rectangle traverses the VIC unit (tiles are read in raster order from left to right, then top to bottom), and the destination rectangle diagrammed below shows the expected transformations when the programmer specifies the combination of flipX, flipY, and transposeXY transformations available to be applied to the output rectangle.

Figure 31: Surface Transformation Orientations

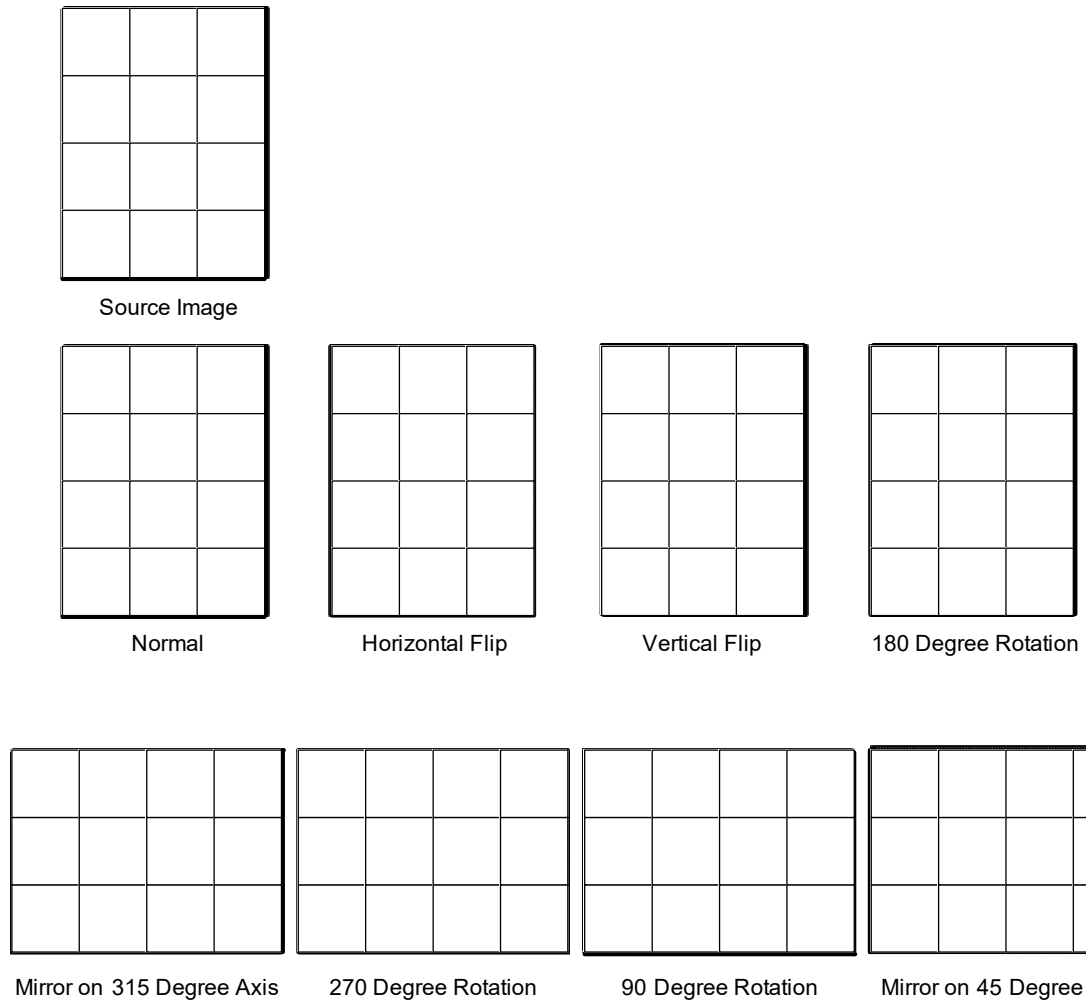


Table 50: Output Buffer Surface Transformation Controls

Transformation	transposeXY	flipY	flipX
Normal (no transformation)	0	0	0
H flip (mirror on vertical axis)	0	0	1
V flip (mirror on horizontal axis)	0	1	0
180-degree rotation	0	1	1
Mirror on 315-degree axis	1	0	0
270-degree rotation	1	1	0
90-degree rotation	1	0	1
Mirror on 45-degree axis	1	1	1

Surface mirroring (FlipX/FlipY) is accomplished via programming of the OutputConfig structure. Surface transposition is accomplished via programming of the OutputTranspose field of the OutputConfig structure structure.

The table below shows the output image for a certain surface composition and how the output transformations affect the final output. The results of the transformations are summarized in the rules below.

1. The output surface parameters (SurfaceWidth/Height, LumaWidth/Height, and ChromaWidth/Height) are transposed when output transpose is enabled. This means that if the target rectangle/destination rectangles fit within the output surface before transformation, they will also fit within the output surface after all transformations are done.
2. The position of the target rectangle in the output surface gets flipped or transposed along with all of its contents (clear rectangles and destination rectangles) when OutputFlipX/OutputFlipY/OutputTranspose are enabled.

3. When output flips are enabled, the entire contents of the target rectangle are flipped, including all ClearRects and DestinationRects and their contents. The axis of the flip is the axis of the output surface.
4. When OutputTranspose is enabled, the position of the target rectangle is transposed, as well as all of its contents (including all clear/destination rectangles).
5. When transpose and flips are enabled together, the overall effect of the transformation happens as if the flip operations occur first, followed by the transpose operation.

15.3.7 Memory Copy

The VIC memory copy bandwidth scales with the VIC core frequency. The VIC core pixel processing pipeline can process 2, 4, 8, or 16 pixels per VIC clock. The Tegra X1 VIC unit is sized to operate on 8 pixels per clock.

15.3.8 Temporal Noise Reduction

VIC 1.0 implemented a temporal noise reduction algorithm based on a motion adaptive IIR filter, where the filter weight was adapted based on a few constants and the SOS difference between a 3x3 neighborhood of pixels around the current pixel in the current and previous frames. This same algorithm is supported in VIC 3.0 and 4.0 as well.

The VIC 1.0 TNR algorithm (hereafter called TNR1) works well for videos or captures that have good lighting conditions and lower levels of noise in the input video. However, when the lighting conditions are poor and there is a lot of noise in the input video/capture, the algorithm tries to be safe by not modifying it much, and allows most of the noise to pass through into the output.

The TNR2 algorithm performs significantly better in the above mentioned cases by pre-filtering the data spatially and allowing significantly higher alpha values in the IIR blend. This algorithm can be turned on by programming the AdvancedDenoise* fields in the SlotConfig structure. The TNR2 algorithm also requires information about the lighting conditions at which the video or capture is being shot (information that will probably be derived from ISP statistics), and this information should be programmed into the LightLevel fields in the SlotConfig structure (4 bits, 0-darkest, 15-brightest).

15.3.9 Inverse Telecine

There are two statistics that the VIC hardware calculates: the difference count and the artifact count. The VIC hardware just calculates the statistics; a state machine on the Falcon Microcontroller has to interpret these.

15.3.10 Deinterlacing

The VIC supports various modes of deinterlacing the input video content such as DiSi1, BOB, and WEAVE. Weave is only used on progressive content or in case inverse telecine detected a cadence.

15.3.11 Color Fill

Programming the output surface with only a background color and writing to memory will produce a color fill.

15.3.12 Pixel Format Support

The VIC pipeline supports an increased number of pixel formats compared to what is currently comprehended by VIC1.0 on input and output. The VIC pipeline can accept a surface of a given input pixel format and produce a given output pixel format.

The table below lists the supported pixel formats. The symbols in color conversion mode column describe the internal VIC representation of the format, (e.g., 1P_1C represents 1 plane with 1 component pixels, 2P_1+2C represents 2 planes, 1 plane with 1 component pixels and a second plane with 2 component pixels).

Table 51: Pixel Format Support

Pixel Format	FOURCC	Input Support	Output Support	Rotation	Scaling	High Quality Deinterlacing	New index	Color_Conversion_Mode
T_A8		Y	Y	Y	Y	N	0	1P_1C

T_Y8___U8V8_N420 (YUV420 semi-planar)	e.g., NV21	Y	Y	Y	Y	N	61	2P_1+2C
T_Y8___V8U8_N420 (YUV420 semi-planar)	e.g., NV12	Y	Y	Y	Y	Y*	62	2P_1+2C
T_Y8___U8___V8_N444 (YUV444 planar)**	e.g., YV24	Y	Y	Y	Y	N	63	3P_1+1+1C
T_Y8___U8___V8_N422 (YUV422 planar)**	e.g., YV16	Y	Y	Y	Y	N	64	3P_1+1+1C
T_Y8___U8___V8_N422R (YUV422R planar)**		Y	Y	Y	Y	N	65	3P_1+1+1C
T_Y8___U8___V8_N420 (YUV420 planar)**	e.g., YV12	Y	Y	Y	Y	Y	66	3P_1+1+1C

* DiSi1 deinterlacing only works on NV24 surfaces and field-based variants of NV12, YV12, YUY2, and UYVY formats (with each field stored in a separate surface).

** VIC supports three independent surface pointers for each of the input slots and output surfaces, one each for luma, chroma-u and chroma-v.

In the color format, the notation called “A:B:C” notation is used to describe how often U and V are sampled relative to Y.

- 444 (4:4:4) means no downsampling of the chroma channels.
- 422 (4:2:2) means 2:1 horizontal downsampling, with no vertical downsampling. Every scan line contains four Y samples for every two U and V samples.
- 420 (4:2:0) means 2:1 horizontal downsampling, with 2:1 vertical downsampling.
- R refers to ‘rotated’. 422 by default means horizontal downsampling; while 422R means vertical downsampling. Instead of the chroma being shared between 2 horizontally adjacent luma components, it is shared between 2 vertically adjacent luma components.

The VIC does not support 24-bit color formats, either RGB or YUV.

15.3.13 Scaling and Filtering

The VIC contains Y and X-scaler units that together allow 5- or 10-tap polyphase filtering and scaling of the input surface. The hardware can be programmed with a set of filter coefficients for each filter-type (Detail/Noise/Normal), phase (0,1/32,2/32, .. 32/32), scale ratio (1:1, 2:1, 4:1, 8:1, 16:1), filter_length (5-tap, 10-tap) and stream (sub-picture or normal). Based on the actual scale-ratio, phase, etc., the hardware can then interpolate between these programmed values for use in the actual filters.

There are four filter types (5-tap non-substream, 5-tap substream, 10-tap non-substream, 10-tap substream). Five tables are needed for each coefficient type as different tables are needed for different scale down ratio of 1:1, 2:1, 4:1, 8:1 and 16:1[1]. Thus 20 tables are needed with a maximum downscale ratio of 16:1.

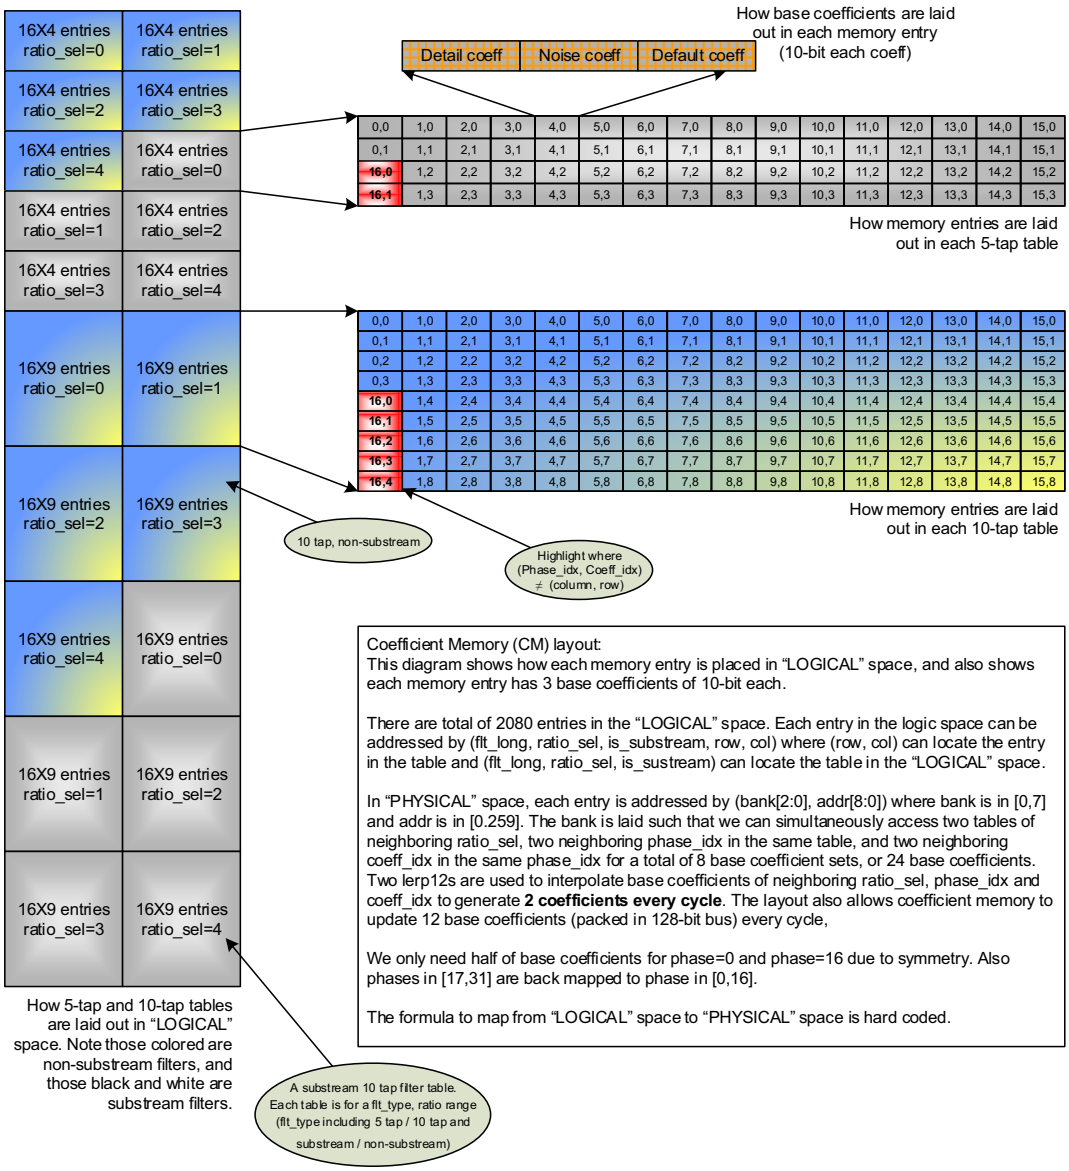
Each table has 16X4 memory entries (for the 5-tap filter) or 16X9 memory entries (for 10-tap filter). Each memory entry has three 10-bit base coefficients (for Detail/Noise/Default) that will be feed into a LERP3 simultaneously to interpolate based on different noise and detail weight. The table has 16 columns, and each column stores all the coefficients for phase 0/32, 1/32, 2/32, 3/32, 4/32, 5/32, 6/32, 7/32, 8/32, 9/32, 10/32, 11/32, 12/32, 13/32, 14/32 and 15/32, with the exception that the first column stores coefficients for both 0/32 and 16/32.

Each column stores four sets of base coefficients for the 5-tap filter because the last coefficient can be derived from the remaining four. phase 0/32 and 16/32 are special cases in that only two sets of base coefficients are needed for each of them in the 5-tap case,only four sets of base coefficients are needed for phase 0/32 in the 10-tap case, and five sets of base coefficients are needed for phase 16/32 in the 10-tap case. Therefore, phase 0/32 and 16/32 are folded into the same column. Due to symmetry, the base coefficients for phases 17 through 31 do not need to be stored.

The VIC also implements 1-tap (nearest-neighbor) and 2-tap (bi-linear) filtering modes. These modes can be used when power and bandwidth are of greater concern than quality. The 1-tap and 2-tap modes use filter coefficients that are based only on the output pixel phase with respect to the input pixel grid, and do not use the programmable coefficient tables at all. As a result, Detail Filtering or Noise Filtering can be disabled when using these modes.

1. 1:1 ratio contains identify filter that can be used for all scale up cases. Different scale down ratio requires different coefficients since the filter is a low pass filter the bandwidth of which is related to the scale ratio. Coefficients for 2:1, 4:1, 8:1 and 16:1 are stored to interpolate any downscale ratios.

Figure 32: Filter Coefficient Arrangement



15.3.13.1 Filter Override Mode

The VIC unit supports a filter override mode that can be enabled by setting both DownsampleHoriz and DownsampleVert in the config structure to 0. In this mode, software can specify the exact filter kernels that it wants to apply independently for each slot, and again independently for luma and chroma planes. The filter kernels thus specified are directly applied to the pixels, with the hardware skipping the interpolations for detail/noise/scaling and for the scale ratio. The only hardware interpolation done in this mode is between adjacent phase values based on the actual pixel phase.

Because of the restricted size of the FilterCoefficient table, there is only enough space to specify coefficients for 5 slots; thus only the first 5 slots can be enabled when the filter coefficient override mode is enabled.

15.3.13.2 Panoramic Scaling

The VIC also implements a "panoramic" scaling mode which can be used to convert images between different aspect ratios while avoiding any letterboxing. This mode essentially implements a non-linear scaling in the horizontal direction, with the scale ratio changing as we move away from the center of the image.

Panoramic scaling has an additional parameter *p* ([-1, 1]) that defines the magnitude of the second order term in a polynomial. The polynomial parameters for scaling can then be defined as follows.

The original scaling factor *f* is changed based on the location *x* ([-1, 1]) within the destination rectangle.

$$scaling\_factor_x = f * (a + 3bx^2) \quad \text{with} \quad a = \begin{cases} 1 - \frac{1}{2}p & p < 0 \\ 1 - p & p \geq 0 \end{cases} \quad \text{and} \quad b = \begin{cases} \frac{1}{2}p & p < 0 \\ p & p \geq 0 \end{cases}$$

The source sample position *x'* is therefore calculated as:

$$x' = f * (ax + bx^3) = a'x + b'x^3 \quad \text{with} \quad a' = fa \quad \text{and} \quad b' = fb$$

The new scaling factor can be calculated incrementally using 2 counters.

Panoramic scaling for 4:3 to 16:9 conversions should have $p = -\frac{2}{3}$, while 16:9 to 4:3 conversions should have $p = \frac{1}{4}$ for 1:1 scaling in the center.

15.3.13.3 Detail Filter Clamping

When using the Detail Filtering mode for edge enhancement, etc., it is possible for large pixel overshoots that result in a "ghosting" effect in the filtered output. To avoid such large overshoots, the Detail Filter clamping mode prevents the output pixel from being very different from the center input pixel of the filter support region.

For example, if the DetailFltClamp value in the SlotConfig structure is set to 10, and we are doing 5-tap filtering, then the output pixel value in each of the scalers (Y/X) is clamped so that it is within +/- 10 of the center (third) input pixel of the 5-tap filter support. Setting the DetailFltClamp value to 0 disables the clamping.

15.3.14 Pixel Format Conversion

Color conversion and proc-amp are implemented using a matrix multiplication on every pixel. The matrix only changes when the surfaces changes.

Current chain of operations:

- Proc-amp + Output CC (4x3 matrix)
- Clamping (optional soft clamping, 2 control entry)

The 4x3 matrix values are specified in the MatrixStruct as S12.8 values. In addition, the result of the matrix multiplication will be right shifted by r_shift. To allow for highest accuracy r_shift should always be as high as possible without losing any range in the other coefficients. Note that the constant offsets (c03, c13, c23) are S12.8 and are not affected by r_shift.

$$\begin{pmatrix} out0 \\ out1 \\ out2 \end{pmatrix} = \begin{pmatrix} c00 & c01 & c02 & c03 \\ c10 & c11 & c12 & c13 \\ c20 & c21 & c22 & c23 \end{pmatrix} \begin{pmatrix} in0 \gg r\_shift \\ in1 \gg r\_shift \\ in2 \gg r\_shift \\ 1 \end{pmatrix}$$

Soft Clamping

Soft clamping defines a piecewise linear function consisting of three pieces. The control entries define the area of soft clamping. For example, the following equation applies for the values *a* and *b*:

$$v' = \begin{cases} 0 & v < -a \\ \frac{v+a}{2} & -a \le v < a \\ v & a \le v < b \\ \frac{v+b}{2} & b \le v < 2-b \\ 1 & 2-b \le v \end{cases}$$

When converting between pixel formats with components of varying bit width, bit replication is used for expanding component bit widths, and truncation is used for reducing component bit widths.

Dithering and undithering are not supported.

Handling Subsampled Chroma Formats

The chroma location for pixel formats with subsampled chroma can be specified using the ChromaLocHoriz and ChromaLocVert parameters in the VIC Config structure. Each of these parameters can take values 0, 1, or 2 representing a chroma location as in the below table.

Table 52: Chroma Location

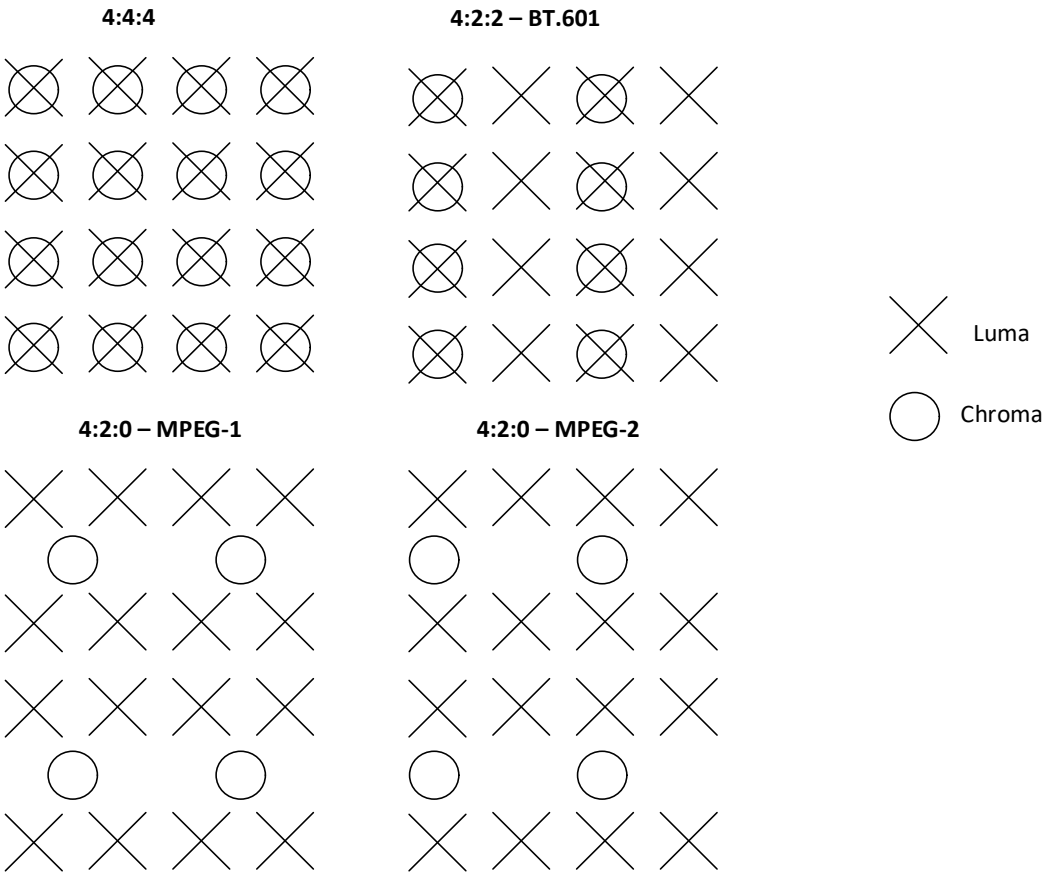
ChromaLoc	Chroma Position
0	Co-sited with even luma values
1	Midway between even and odd luma values
2	Co-sited with odd luma values

For example, the following table shows the ChromaLocHoriz and ChromaLocVert parameters for four YUV formats shown in the figure below.

Table 53: Example ChromaLoc Values

Format	ChromaLocHoriz	ChromaLocVert	Comment
4:4:4	Don’t Care	Don’t Care	Not subsampled
4:2:2 – BT601	0	Don’t Care	
4:2:0 – MPEG1	1	1	
4:2:0 – MPEG2	0	1	

Figure 33: Example YUV Formats



Data Size Conversion

When expanding the number of bits in a component (e.g., from RGB565 to RGB888), expansion should use bit replication of the MSBs of the original value to fill in the LSBs of the expanded bit length value. For example, if converting from a 5-bit value to an 8-bit value, the first 3 MSBs of the source 5-bit value should be concatenated as the 3 new LSBs to the original 5-bit value to produce the new expanded 8-bit value.

For example: 5-bit R5=11000’b expanded to 8 bit R8=11000110’b

When reducing the number of bits in a component (for example, from RGB888 to RGB565), the LSBs of the old value should be truncated to arrive at the shortened value.

For example: 8-bit R8=11000000’b reduced to 5-bit R5=11000’b

Replication followed by truncation will ensure that the truncated value will equal the original pre-replicated operand, i.e., RGB565 >RGB888 expansion followed immediately by RGB888 > RGB565 reduction will result in the same original value.

Luminance Conversion

Conversion from luminance-only color formats (e.g., L8/Y8/YUV100, A8L8) to and from RGB or YUV formats should be done as outlined below.

- Luminance-only to YUV

  L > Y, 128 > U, 128 > V
- Luminance-only to RGB

  L > R, L > G, L > B
- YUV to Luminance-only

  Y > L

- Clamp L between 0.0 and 1.0
- RGB to Luminance-only

  (R*5 + G*9 + B*2)/16 > L
- Clamp L between 0.0 and 1.0

Adding and Removing Alpha

If converting from a pixel format with alpha to a pixel format with no alpha, the alpha value should be dropped.

If converting from a pixel format with no alpha to a pixel format with alpha, the alpha value in the destination pixel format should be set to 1.0.

15.3.15 Luma Keying

Coefficient values to compute the Luma value of the pixel from the pixel components can be specified in the LumaAlphaStruct, along with the upper and lower luma key values. Any pixel that has a luma that falls within the luma key range will have its alpha value zeroed out so that it can be processed appropriately in the blending stage.

Since the pixel values in the pipeline are of a higher precision than the LumaKeyLower and LumaKeyUpper values specified in the Config structure, care should be taken when comparing the pixel luma values against these limits. The LumaKeyLower value should be bit-extended by adding zeroes to the LSBs to match the pixel luma bit width. LumaKeyUpper should be extended by adding ones to the LSBs up to the desired bit width.

15.3.16 Blender

The blender API allows for symmetric blend modes between the VIC and Display units.

The VIC blender supports the following different blending modes:

- DXVAHD_ALPHA_FILL_MODE_OPAQUE
- DXVAHD_ALPHA_FILL_MODE_BACKGROUND
- DXVAHD_ALPHA_FILL_MODE_DESTINATION
- DXVAHD_ALPHA_FILL_MODE_SOURCE_STREAM
- DXVAHD_ALPHA_FILL_MODE_COMPOSITED
- DXVAHD_ALPHA_FILL_MODE_SOURCE_ALPHA

All modes other than _ALPHA_FILL_MODE_COMPOSITED are as defined in the Microsoft DXVA spec and are carried over from VIC 1.0. The new mode that allows the VIC and Display blenders to match each other is enabled by setting the AlphaFillMode in the OutputConfig structureto _ALPHA_FILL_MODE_COMPOSITED. When the AlphaFillMode is set to anything other than _ALPHA_FILL_MODE_COMPOSITED, the srcFact and dstFact parameters specified below are ignored and do not affect the processing.

The parameterizable blender interface allows a variety of blend modes, including the following:

- Per-Pixel Non-Premultiplied Alpha Blend

  output = src*src_alpha + dst*(1-src_alpha)
- Per Pixel Source Premultiplied Alpha Blend

  output = src + dst*(1-src_alpha)
- Constant-Alpha Blend

  output = src*const_alpha + dst*(1-const_alpha)
- Per-Pixel Non-Premultiplied Alpha Blend with constant blend

  output = src*src_alpha*const_alpha + dst*(1-src_alpha*const_alpha)

- Per-Pixel Premultiplied Alpha Blend with constant blend

  output = src*const_alpha + dst*(1-src_alpha*const_alpha)

Note: *ColorKeySelect should always be set to disabled.*

The blend data path will require the color key comparison match result, and per-slot inputs from the config structure to formulate the blend equation.

srcFactC, srcFactA, dstFactC, and dstFactA multiplicand inputs are determined by the config structure programming and color key comparison results.

Table 54: Per-Slot Blend Configuration

Blend Spec Name	Register Name	Description
K1	AlphaK1	10-bit constant alpha value
K2	AlphaK2	10-bit constant alpha value
srcFactC_Match_Select	srcFactCMatchSelect	3-bit enum which sets srcFactC: K1: AlphaK1 K1_TIMES_DST: AlphaK1*dstA NEG_K1_TIMES_DST: 1.0-(AlphaK1*dstA) K1_TIMES_SRC: AlphaK1*srcA ZERO: 0
dstFactC_Match_Select	dstFactCMatchSelect	3-bit enum which sets dstFactC: K1: AlphaK1 K2: AlphaK2 K1_TIMES_DST: AlphaK1*dstA NEG_K1_TIMES_DST: 1.0-(AlphaK1*dstA) NEG_K1_TIMES_SRC: 1.0-(AlphaK1*srcA) ZERO: 0 ONE: 1.0
srcFactA_Match_Select	srcFactAMatchSelect	3-bit enum which sets srcFactA: K1: AlphaK1 K2: AlphaK2 ZERO: 0 NEG_K1_TIMES_DST: 1.0-(AlphaK1*dstA)
dstFactA_Match_Select	dstFactAMatchSelect	3-bit enum which sets dstFactA: K2: AlphaK2 NEG_K1_TIMES_SRC: 1.0-(AlphaK1*srcA) ZERO: 0 ONE: 1.0
UseK3	UseOverrideR	1-bit Boolean to override srcR with constant values K3R
UseK3	UseOverrideG	1-bit Boolean to override srcG with constant values K3G
UseK3	UseOverrideB	1-bit Boolean to override srcB with constant values K3B
UseK3	UseOverrideA	1-bit Boolean to override srcA with constant values K3A
K3R	OverrideR	10-bit source override R value
K3G	OverrideG	10-bit source override G value
K3B	OverrideB	10-bit source override B value
K3A	OverrideA	10-bit source override A value
MaskR	MaskR	1-bit Boolean to override outputR to equal dstR
MaskG	MaskG	1-bit Boolean to override outputG to equal dstG
MaskB	MaskB	1-bit Boolean to override outputB to equal dstB
MaskA	MaskA	1-bit Boolean to override outputA to equal dstA

Given the source and destination factor settings based on config structure inputs and color match results, the per-pixel blend equations are as follows, where srcR, srcG, srcB, srcA, dstR, dstG, dstB, and dstA represent the incoming R, G, B, A components of the incoming source and already present destination pixels in the SFMem buffer (blended results of background and slot[0] through to slot[n-1] for input slot[n]).

```
outputR = (srcFactC * srcR) + (dstFactC * dstR)
outputG = (srcFactC * srcG) + (dstFactC * dstG)
outputB = (srcFactC * srcB) + (dstFactC * dstB)
outputA = (srcFactA * srcA) + (dstFactA * dstA)
```

If the ColorKeySelect is set to DISABLED, then srcFactC, srcFactA, dstFactC, and dstFactA will be programmed by srcFactCMatchSelect, srcFactCMatchSelect, srcFactCMatchSelect, and srcFactCMatchSelect, respectively.

If the ColorKeySelect is set to ENABLED, then srcFactC, srcFactA, dstFactC, and dstFactA are programmed by srcFactCMatchSelect, srcFactCMatchSelect, srcFactCMatchSelect, and srcFactCMatchSelect, respectively, if the destination color key match result returns true, and programmed by srcFactCNoMatchSelect, srcFactCNoMatchSelect, srcFactCNoMatchSelect, and srcFactCNoMatchSelect, respectively, if the destination color key match result returns false.

UseK3 allows the incoming source components to be overridden by constant color components K3R, K3G, K3B, K3A.

MaskR, MaskG, MaskB, and MaskA Boolean settings provide additional per-component mask bits to allow pass-through of the destination pixel components to the output pixel

A programmable background color can still be set to fill the target rectangle background via the OutputConfig structure. The programmed background color should follow these rules:

- The background color is programmed in the same color space as the blending color space. For example, if the blending is happening in an RGB color space, then the background color is treated as an ARGB value. If the blending happens in a YUV color space, the background color is treated as an AYUV value
- Similarly, if the blending happens in a linear color space, the background color is treated as a linear color space value. If the blending is in non-linear space, then the background color is also expected to be non-linear.

15.3.17 Subpixel Source Rectangles

Source rectangles can be specified to a sub-pixel resolution. This feature can be used to smoothly zoom into a portion of an image in real-time, for example, when using the zoom button on a camera. Specifying source and destination rectangles to a pixel resolution quantizes the allowed zoom factor, and hence can cause the zoom to feel jerky. Allowing the source rectangles to be specified to a sub-pixel resolution avoids this problem and makes the zoom smooth.

The config structure is therefore modified to make the source rectangle coordinates U14.16 numbers. Once we have the (decimal) source rectangles, we can calculate adjust the starting phase of the scaling filters accordingly so as to achieve the sub-pixel shift/scale required.

Note that all source coordinates (left, top, right, and bottom) include the bounding pixels. For instance: (0,0)-(0,0) contains 1 pixel, while (0,0)-(1-1) contains a square of 2x2 pixels. This means that rectangles which are less than 1 pixel wide or tall cannot be used. Also, specifying a rectangle of (0.0,0.0)-(0.0,0.1) results in a source rectangle that is 1 pixel wide and 1.1 pixel high, which is not immediately apparent.

15.3.18 Maximum Surface and Rectangle Size Support

The VIC supports surface and rectangle sizes up to 16384x16384 pixels.

This size affects all input and output surfaces parameters as well as all fetch calculations related to these parameters:

- Per-input slot and output surface width/height, luma width/height, chroma width/height
- Per-input slot source and destination rectangle dimensions
- Clear rectangle dimensions
- Output target rectangle dimensions

15.4 Programming Guidelines

The compositor mainly implements the DirectX Video Acceleration 2.0 Enhanced Video Processor specification. This does de-interlacing, scaling, color conversion, proc-amp and compositing for up to 8 input surfaces. It also supports features like gamma correction and non-linear color enhancement.

15.4.1 Class Overview

The software programming interface for the VIC is similar to that of the other video engines in Tegra like NVENC and NVDEC. This compatibility is maintained by virtue of the shared front-ends of both these engines on the Host1x interface, consisting of a THI (Tegra Host Interface) module and a programmable Falcon microcontroller.

15.4.1.1 Method Interface

VIC will have its own class definition, which includes a couple of registers named METHOD_OFFSET and METHOD_DATA, which are interpreted by the THI and are used to create method writes (corresponding to methods in the VIC class specification) into the VIC. These methods will be used to set up pointers to the various surfaces that the VIC needs to read or write, as well as pointers to config structures needed. The VIC class also defines trigger methods such as Execute(), used to start the actual processing of the data for the next output image.

15.4.1.2 Sync-Points

Interaction between hardware and software are controlled and synchronized through the Tegra sync-point mechanism. For example software can request to be notified when the VIC engine is done processing a certain frame's worth of data by enqueuing a sync-point method after the Execute() method that will be sent down for that frame and by programming Host1x to raise an interrupt to the CPU when the sync-point is updated by the VIC hardware.

The THI block is responsible for keeping track of outstanding sync-points and sending appropriate sync-point ACKs back to Host1x. It does this by handling the interrupts raised by the VIC after completing an Execute_Notify() method, and translating that to a sync-point counter update for Host1x.

15.4.1.3 Context-Switch

When programming VIC on GPU products, a hardware interrupt based context switching is used. The Falcon host interface has a context switch state machine that examines incoming context_ptr/valid_flg and performs the correct context switch operation.

Context switching on Tegra devices uses a different mechanism than on GPU devices. We have introduced a new method-based context switching interface to replace the interrupt driven context switching mechanism. To the existing method interface, we add two methods: a context save, and a context restore method. To support the new interface, two changes are required:

- Falcon OS microcode should be modified to act accordingly when receiving either context save or context restore method; it will flag an interrupt when a valid context switch save operation is completed;
- THI interrupt handler should be modified to increment the CTX_SAVE_DONE sync point to Host1x if a valid context save done interrupt is received. This is required to stall Host1x before sending a subsequent context restore method in case any intermediate methods need to be submitted (e.g., ASID switch before restoring the next context)

It is possible that in future Tegra products, multiple ASIDs could exist, and each context could be run with a separate ASID. A Host1x ASID switch method could be pushed after saving the current context, and before restoring the next context.

When using either interrupt-driven context switching, or method-based context switching, VIC supports only WFI (wait-for-idle) context-switching.

The same context switch mechanism can be used to save and restore contexts around power-gating events. When software wishes to power gate the VIC, a context save method should be sent down to save the current context before power gating. On resuming from ELPG, software has to issue a soft-reset to the VIC engine, and then go through the entire re-initialization sequence for VIC, including boot-strapping of the Falcon microcontroller. After the power-up of the engine is complete, software should send a restore method to VIC, which will then cause the saved context to be restored.

Note that VIC is primarily a state-less engine. When processing each frame, methods are issued to the VIC to point to the various surfaces used during each frame's processing, and programming the VIC engine involves writing a configuration structure that specifies all functionality required within the current frame. The engine will read in this configuration structure at the start of every frame of processing. The only state that may require context switch saving would be any pending methods required for upcoming frame executes that have not yet processed by the Falcon microcontroller. There are no security-specific programmable configuration bits in the engine, and thus no concern with handling context switching of security configuration bits.

15.4.1.4 Interrupts

The THI block intercepts interrupts generated by the Falcon to acknowledge the end of the Execute_Notify() methods and translates them to sync-point acknowledges that it then sends out to Host1x. Thus, the only events that cause an interrupt to be generated to the CPU should be fatal events that need software intervention (often a full engine soft-reset) in order to fix.

In VIC 1.0, the Falcon microprocessor launches the VIC hardware on its task and then polls on an idle status register in order to determine when the task is complete. This is inefficient in terms of power and we therefore have added a hardware interrupt which can notify the Falcon microprocessor when all work has been completed. The microprocessor can therefore launch the work and go to a low power wait state, until it is woken up by the interrupt, after which it can service the interrupt and then notify the driver through the sync-point mechanism, etc.

The idle interrupt is enabled by the bit in register NV_CVIC_MISC_INTR_EN_IDLE and will fire when all sub-units of the VIC are idle, and will be hooked up to bit 3 of the Falcon EXT interrupt bus - i.e., the Falcon microcode can mask or check the status of this interrupt using EXT_EXTIRQ4. The programming sequence for this interrupt should be:

1. Falcon microcode does all the VIC initialization and setup. This includes enabling the EXT_EXTIRQ4 interrupt in IRQMASK, setting IRQDEST to route it to the Falcon, and making it an edge-triggered interrupt.
2. Falcon microcode enables the interrupt just before writing the FC_PREPROCESS or FC_COMPOSE registers by writing into NV_CVIC_MISC_INTR_EN_IDLE.
3. Falcon microcode then enters a wait state.
4. On receiving the interrupt, Falcon microcode wakes up, clears the interrupt by writing into NV_CVIC_FALCON_IRQSCLR_EXT_EXTIRQ4 and then disables the interrupt by writing 0x0 into NV_CVIC_MISC_INTR_EN_IDLE.
5. The rest of the Falcon microcode sequence completes as before, including generating any EXECUTE_AWAKEN interrupts to host, etc.

15.4.1.5 Driver Programming Model

The compositor operation requires the following buffers to be provided. These buffers will be explained in more detail in the following sections. When the Execute() method is sent, the Falcon program will be initiated which will in turn trigger the various VIC operations in the correct sequence.

Buffers	I/O	Producer	Description/Restrictions
Config Buffer	I	Driver	Configuration parameters
Palette Buffer	I	Driver	Palette table
History Buffer	I/O	App	Histogram and Cadence parameters
Input surfaces	I	Driver/VIC	Input Surfaces
Noise reduced surfaces	I/O	VIC	Noise reduced version of input
Motion map surfaces	I/O	VIC	Motion map of input
Output surface	O	VIC	Final output surface (post-composition)
FCE Ucode buffer	I	Driver	FCE microcode
CrcStruct Offset	O	VIC	CRC struct

15.4.1.6 Surface Padding and Alignment

The base address of all buffers (input and output) programmed into the VIC have to be aligned to a multiple of the block size for block-linear surfaces, and a multiple of 256B for pitch linear surfaces. Thus, the buffer base addresses will always be aligned to at least 256B; the base address pointers programmed into the VIC reflect this and only accept address bits [39:8].

The parameters SurfaceWidth and SurfaceHeight used in the ConfigStruct refer to the actual image dimensions. LumaWidth and LumaHeight refer to the padded buffer dimensions, and apply to both luma and RGBA surfaces. ChromaWidth and ChromaHeight refer to the padded buffer dimensions for the chroma planes of planar or semi-planar YUV surfaces. All the Surface/Luma/Chroma widths and heights are programmed in terms of pixels, not bytes. The constraints below describe the restrictions on the buffer widths and heights.

The VIC does not assume that the widths of block-linear buffers are automatically padded to the next multiple of 64B. The VIC Luma/Chroma Width fields are still used to describe the padded surface pitch for the block-linear buffer, and can be any multiple of the block width.

When using VIC configurable surface cache entry modes of 16Bx16, 32Bx8 or 64Bx4, VIC can read in any block linear surface. Note, however, the VIC cache entry mode of 128Bx2 will only work where the buffer widths are multiples of 128B.

The constraint for any image buffer size is for it to be a multiple of the surface memory format block size as well as the configurable surface cache entry size. The memory format block size is considered to be 256x1 for pitch linear, and 64x(8<<BLK_HEIGTH) for block linear buffers. BLK_HEIGHT is the log2 encoded block height as usual.

For input surfaces:

- If pitch linear, then the configurable surface cache entry size can be set to 256Bx1, 128Bx2, or 64Bx4. The buffer width should be padded to a multiple of 256B, and the height should be padded to a multiple of the configurable surface cache entry height.
- If block linear, then the configurable surface cache entry size can be set to 128Bx2, 64Bx4, 32Bx8 or 16Bx16. The buffer width should be padded to the next multiple of the max of 64B or the configurable surface cache entry width, and the height should be padded to the max of the configurable surface cache entry height and the block height in lines (8 << BLK_HEIGHT, where BLK_HEIGHT is the number of GOBs tall per block linear block, log2 encoded).

For output surfaces:

- If pitch linear, the buffer width should be padded to a multiple of 256B.
- If block linear, the buffer width should be padded to the next multiple of 64B, and the height should be padded to a multiple of the block height in lines (8 << BLK_HEIGHT, where BLK_HEIGHT is the number of GOBs tall per block linear block, log2 encoded).

As noted previously, the VIC has to process 16Bx16 blocks of memory in the pre-process phase. This would be very inefficient to do if the surfaces are set up as pitch-linear buffers, and therefore the usage of pitch-linear buffers for images that need pre-processing is strongly discouraged. For block linear buffers, the Falcon microcode forces the cache-line dimensions for the pre-process phase alone to 16Bx16 to increase efficiency. As a result of this, software should make sure to make the image buffer height a multiple of 16 when enabling pre-processing.

While any pixel data outside of the boundaries defined by SurfaceWidth/SurfaceHeight of an input surface will not be used to contribute to the output image, it may still be read into the VIC surface cache. If the image buffer is padded as described above, the hardware will not issue any read or write accesses outside of the image buffer range.

15.4.1.7 Bootstrapping the VIC Falcon

The process of initializing and bootstrapping involves loading a portion of the Falcon microcode using register triggered hardware DMAs and then starting the Falcon microcontroller to execute this microcode. This bootstrap code in turn fetches all the remaining required microcode from memory and continues execution. This procedure will have to be followed both on boot and while resuming from a power-gating event.

On boot, if the VIC must be used for splash screen rendering, the Falcon should be bootstrapped by the boot loader. The VIC Falcon microcode binary may be embedded into the boot loader binary.

Once in the OS, the Falcon may be re-bootstrapped by a driver, with a more recent version of the Falcon microcode. Under Windows, bootstrapping will likely be the responsibility of the GPU Resource Manager (RM). Under Linux/Android, bootstrapping will likely be the responsibility of the Linux host driver.

OS Overview

The MSDEC OS is a lightweight OS that runs on Falcon. It is independent of the engine (VLD, PDEC, PPP, or SEC). The OS takes care of the following functionalities:

- Loading itself from boot-loader code.
- Setting up the IRQDEST and IRQMASK registers to demarcate which interrupts are handled by host and which by Falcon.
- Setting up Interrupt handlers 0 and 1 and exception handler.
- Processing method and context switch interrupts
- One receiving an execute method, loading the correct application code for the engine, and triggering execution of application code.
- Notifying host of any application error (Mailbox0 specifies that it is an application error, and Mailbox1 contains error code).
- Notifying host of any other errors, as specified in the msdecos_host_interface.h header file.

OS State Machine

The OS during a typical sequence of operation goes through the following states:

1. RM loads 256 bytes of OS IMEM and DMEM through PRIV writes.
2. OS loads the rest of OS code through imreads.
3. Initializes the engine.
4. Handles any incoming context switch and method interrupts.
5. On receiving an execute method, calls app and hand over execution to app.
6. Once app is done, sets engine to wait mode and wait for interrupts.

If there are any error/exception interrupts during the course of execution of the app (or OS) then the interrupt handlers raise interrupt to host with an appropriate error code and wait for the interrupt to be cleared before proceeding.

OS boot up and initialization sequence

The OS resident code fits into 768 bytes and the OS resident data into 512 bytes. Of the resident data, the first 256 contain global constants that might be initialized to non-zero values, but the bytes 256-511 are all initialized to zero at the time of context switch and need not be loaded in explicitly through dmreads.

RM loads the first 256 bytes of IMEM and DMEM through PRIV writes. The first 256 bytes of OS code loads the remaining 512 bytes through IMEM reads.

Initialization accomplishes the following:

1. OS writes its version number to DWORD 0 in DMEM, which can be used for debug purposes.
2. The watchdog timer is disabled by setting bit zero of WDTMRCTL to zero.
3. Interrupt vectors and exception vector are initialized.
4. IRQMASK and IRQDEST initialized to appropriate values. See Chapter 3: Interrupt Controller for details.
5. Enable interrupts 0 and 1 to start process interrupts

15.4.2 Application Enumerations

Below are the enumerators used in the configuration structures passed by the driver:

- DXVAHD_FRAME_FORMAT
- PIXEL_FORMAT
- DXVAHD_DEINTERLACE_MODE_PRIVATE
- DXVAHD_ALPHA_FILL_MODE
- BLK_KIND
- BLEND_SRCFACTC
- BLEND_DSTFACTC
- BLEND_SRCFACTA
- BLEND_DSTFACTA
- GAMMA_MODE
- FILTER_LENGTH
- FILTER_TYPE

Table 55: DXVAHD_FRAME_FORMAT

Enumerant	Value	Description
DXVAHD_FRAME_FORMAT_PROGRESSIVE	0	A_PROGRESSIVE frame format refers to a non-interlaced surface. The only deinterlacing mode that is valid for this frame format is _WEAVE.
DXVAHD_FRAME_FORMAT_INTERLACED_TOP_FIELD_FIRST	1	An interlaced surface, but the top and bottom fields (from different time instants) are weaved together into a single input surface with the top field on the first and every alternating line. The valid deinterlacing modes for this frame format are _WEAVE and _BOB.
DXVAHD_FRAME_FORMAT_INTERLACED_BOTTOM_FIELD_FIRST	2	An interlaced surface, but the top and bottom fields (from different time instants) are weaved together into a single input surface with the bottom field on the first line. The valid deinterlacing modes for this frame format are _WEAVE and _BOB.
DXVAHD_FRAME_FORMAT_TOP_FIELD	3	A surface with frame format _TOP_FIELD is a field surface and is hence half the height of the original progressive source. The lines in the current surface should be displayed above the lines of the previous field (which would be of type _BOTTOM_FIELD). The valid deinterlacing modes for this frame format are _WEAVE, _BOB_FIELD, _NEWBOB, _DISI1 and _WEAVE_LUMA_BOB_FIELD_CHROMA.
DXVAHD_FRAME_FORMAT_BOTTOM_FIELD	4	A surface with frame format _BOTTOM_FIELD is a field surface and is hence half the height of the original progressive source. The lines in the current surface should be displayed below the lines of the previous field (which would be of type _TOP_FIELD). The valid deinterlacing modes for this frame format are _WEAVE, _BOB_FIELD, _NEWBOB, _DISI1 and _WEAVE_LUMA_BOB_FIELD_CHROMA.
DXVAHD_FRAME_FORMAT_SUBPIC_PROGRESSIVE	5	The _SUBPIC frame formats are similar to the non-subpic frame formats, but are meant for the sub-picture layers from the blu-ray spec. Choosing a sub-picture vs. a non-sub-picture frame format affects the filter kernels that are used to scale the slot.
DXVAHD_FRAME_FORMAT_SUBPIC_INTERLACED_TOP_FIELD_FIRST	6

DXVAHD_FRAME_FORMAT_SUBPIC_TOP_FIELD	8	
DXVAHD_FRAME_FORMAT_SUBPIC_BOTTOM_FIELD	9	
DXVAHD_FRAME_FORMAT_TOP_FIELD_CHROMA_BOTTOM	10	A field surface with the luma corresponding to the _TOP_FIELD, but with chroma corresponding to the _BOTTOM_FIELD. The valid deinterlacing modes for this frame format are _WEAVE, _BOB_FIELD, _NEWBOB, _DISI1 and _WEAVE_LUMA_BOB_FIELD_CHROMA.
DXVAHD_FRAME_FORMAT_BOTTOM_FIELD_CHROMA_TOP	11	A field surface with the luma corresponding to the _BOTTOM_FIELD, but with chroma corresponding to the _TOP_FIELD. The valid deinterlacing modes for this frame format are _WEAVE, _BOB_FIELD, _NEWBOB, _DISI1 and _WEAVE_LUMA_BOB_FIELD_CHROMA.
DXVAHD_FRAME_FORMAT_SUBPIC_TOP_FIELD_CHROMA_BOTTOM	12	
DXVAHD_FRAME_FORMAT_SUBPIC_BOTTOM_FIELD_CHROMA_TOP	13

T_V8	74

Table 57: DXVAHD_DEINTERLACE_MODE_PRIVATE

Enumerant	Value	Description
DXVAHD_DEINTERLACE_MODE_PRIVATE_WEAVE	0	Weave the top and bottom fields together. Requires previous and current field surfaces to be enabled.
DXVAHD_DEINTERLACE_MODE_PRIVATE_BOB_FIELD	1	Simply double the current field in height. Only requires current field to be enabled.
DXVAHD_DEINTERLACE_MODE_PRIVATE_BOB	2	Simply double the current field in height. Only works with the _INTERLACED frame formats, and picks the current field lines out of the input interleaved surface. Only requires current field to be enabled.
DXVAHD_DEINTERLACE_MODE_PRIVATE_NEWBOB	3	Similar to the BOB_FIELD mode, but uses a motion adaptive algorithm to decide whether to BOB or WEAVE fields together. Requires at least the following fields enabled: previous, next, current, previous motion, motion, combined motion.
DXVAHD_DEINTERLACE_MODE_PRIVATE_DISI1	4	Uses a motion adaptive algorithm to decide whether to BOB or WEAVE fields together. In addition, uses an edge-directed spatial interpolation algorithm in order to avoid any weave artifacts. Requires at least the following fields enabled: previous, next, current, previous motion, motion, combined motion.
DXVAHD_DEINTERLACE_MODE_PRIVATE_WEAVE_LUMA_BOB_FIELD_CHROMA	5	Uses the WEAVE algorithm on the luma, and the BOB_FIELD algorithm on the chroma components.
DXVAHD_DEINTERLACE_MODE_PRIVATE_MAX	15	This is not a valid mode for deinterlacing and should not be programmed into the hardware.

Table 58: DXVAHD_ALPHA_FILL_MODE

Enumerant	Value	Description
DXVAHD_ALPHA_FILL_MODE_OPAQUE	0	Opaque (all alpha inside target rect will be set to 1.0).
DXVAHD_ALPHA_FILL_MODE_BACKGROUND	1	Background (all alpha inside target rect will be set to background alpha).
DXVAHD_ALPHA_FILL_MODE_DESTINATION	2	Destination (alpha will remain unchanged).
DXVAHD_ALPHA_FILL_MODE_SOURCE_STREAM	3	Source stream (alpha from source stream without planar alpha).
DXVAHD_ALPHA_FILL_MODE_COMPOSITED	4	Composited (composited alpha, starting with background). In this mode, the blend parameters specified by SrcFactA/DstFactA/ SrcFactC/DstFactC etc. are used.
DXVAHD_ALPHA_FILL_MODE_SOURCE_ALPHA	5	Source alpha (alpha from source stream with planar alpha).

Table 59: BLK_KIND

Enumerant	Value	Description
BLK_KIND_PITCH	0	This enum is used to program the various "BlkKind" fields in the ConfigSructure.
BLK_KIND_GENERIC_16Bx2	1	Tegra Block Linear (16Bx2) memory format

Table 59: BLK_KIND

Enumerant	Value	Description
BLK_KIND_BL_NAIVE	2	This format is not supported in the VIC hardware and should not be programmed in the config structure.
BLK_KIND_BL_KEPLER_XBAR_RAW	3	This format is not supported in the VIC hardware and should not be programmed in the config structure.
BLK_KIND_VP2_TILED	15	This format is not supported in the VIC hardware and should not be programmed in the config structure.

Table 60: BLEND_SRCFACTC

Enumerant	Value	Description
BLEND_SRCFACTC_K1	0	SrcFactC = AlphaK1
BLEND_SRCFACTC_K1_TIMES_DST	1	SrcFactC = AlphaK1 * dstA
BLEND_SRCFACTC_NEG_K1_TIMES_DST	2	SrcFactC = 1.0 - (AlphaK1 * dstA)
BLEND_SRCFACTC_K1_TIMES_SRC	3	SrcFactC = AlphaK1 * srcA
BLEND_SRCFACTC_ZERO	4	SrcFactC = 0

Table 61: BLEND_DSTFACTC

Enumerant	Value	Description
BLEND_DSTFACTC_K1	0	DstFactC = AlphaK1
BLEND_DSTFACTC_K2	1	DstFactC = AlphaK2
BLEND_DSTFACTC_K1_TIMES_DST	2	DstFactC = AlphaK1 * dstA
BLEND_DSTFACTC_NEG_K1_TIMES_DST	3	DstFactC = 1.0 - (AlphaK1 * dstA)
BLEND_DSTFACTC_NEG_K1_TIMES_SRC	4	DstFactC = 1.0 - (AlphaK1 * srcA)
BLEND_DSTFACTC_ZERO	5	DstFactC = 0.0
BLEND_DSTFACTC_ONE	6	DstFactC = 1.0

Table 62: BLEND_SSTFACTA

Enumerant	Value	Description
BLEND_SRCFACTA_K1	0	SrcFactA = AlphaK1
BLEND_SRCFACTA_K2	1	SrcFactA = AlphaK2
BLEND_SRCFACTA_NEG_K1_TIMES_DST	2	SrcFactA = 1.0 - (AlphaK1 * dstA)
BLEND_SRCFACTA_ZERO	3	SrcFactA = 0.0
BLEND_SRCFACTA_MAX	7	Invalid mode - should not be programmed.

Table 63: BLEND_DSTFACTA

Enumerant	Value	Description
BLEND_DSTFACTA_K2	0	DstFactA = AlphaK2
BLEND_DSTFACTA_NEG_K1_TIMES_SRC	1	DstFactA = 1.0 - (AlphaK1 * srcA)
BLEND_DSTFACTA_ZERO	2	DstFactA = 0.0
BLEND_DSTFACTA_ONE	3	DstFactA = 1.0
BLEND_DSTFACTA_MAX	7	Invalid mode - should not be programmed.

Table 64: GAMMA_MODE

Enumerant	Value	Description
GAMMA_MODE_NONE	0	Do not apply any degamma or regamma to the color components.
GAMMA_MODE_SRGB	1	Apply the sRGB degamma/regamma curve to the color components.

Table 64: GAMMA_MODE

Enumerant	Value	Description
GAMMA_MODE_REC709	2	Apply the Rec.709 degamma/regamma curve to the color components.
GAMMA_MODE_RESERVED	3	Apply the Rec.2020 degamma/regamma curve to the color components.

Table 65: FILTER_LENGTH

Enumerant	Value	Description
FILTER_LENGTH_1TAP	0	Nearest-neighbour filtering
FILTER_LENGTH_2TAP	1	Bi-linear filtering
FILTER_LENGTH_5TAP	2	5-tap filters with filter kernel specified using the FilterStruct
FILTER_LENGTH_10TAP	3	10-tap filters with filter kernel specified using the FilterStruct

Table 66: FILTER_TYPE

Enumerant	Value	Description
FILTER_TYPE_NORMAL	0	Filter kernel that is used for regular scaling.
FILTER_TYPE_NOISE	1	Filter kernel that is used for spatial smoothing. The weight of this filter is specified using the FilterNoise/ChromaNoise parameters in the SlotConfig structure.
FILTER_TYPE_DETAIL	2	Filter kernel that is used for spatial sharpening. The weight of this filter is specified using the FilterDetail/ChromaDetail parameters in the SlotConfig structure.

15.4.3 Application Memory Structures

15.4.3.1 Config Structure

The Config structure is read from the frame buffer by the surface cache unit and is stored in small memories inside each subunit. The entire ConfigStruct is the concatenation of the Surface Cache, Surface List, Color Conversion, Blending and Fetch Control structs (in this order). The structs are read in 128-bit units from memory and sent to the according subunits memory with the correct memory address by the Surface Cache.

The config structure is broken up into smaller structs that are used depending on the active slots and their content. Each structure is a multiple of 128 bits in size, and the start of the struct needs to be aligned to a 256 byte boundary.

Note: NV12 and NV24 share the same pixel format but can be distinguished by the fact that NV24 is a field based format (i.e., every surface contains a single field) whereas NV12 is frame based (i.e., every surface contains an entire frame).

Note: For highest quality, filter override mode as defined in FetchControlCoeffStruct should always be used.

The following table defines the smaller structs that comprise ConfigStruct.

Table 67: ConfigStruct Substructures

Name	Data Type	Offset	Notes
pipeConfig	PipeConfig (128 bits)	0	
outputConfig	OutputConfig (128 bits)	128	
outputSurfaceConfig	OutputSurfaceConfig (128 bits)	256	
outColorMatrixStruct	MatrixStruct (256 bits)	384	
clearRectStruct[4]	ClearRectStruct (128 bits)	640 + (i * 128)	Up to eight clear rectangles supported. Each ClearRectStruct specifies two rectangles
slotStruct[8]	SlotStruct (1408 bits)	1152 + (i * 1408)	Per-slot configuration structures

pipeConfig

Table 68: PipeConfig Details

Name	Data Type	Offset	Notes
DownsampleHoriz	fixed<0,11,0> (11 bits)	0	TargetWidth/DownsampleWidth (U9.2 used to load bias filter) Set to 0 to enable filter override mode (mapping between stream and filter explained below)
reserved0	fixed<0,5,0> (5 bits)	11	
DownsampleVert	fixed<0,11,0> (11 bits)	16	TargetHeight/DownsampleHeight (U9.2 used to load bias filter) Set to 0 to enable filter override mode (mapping between stream and filter explained below)
reserved1	fixed<0,5,0> (5 bits)	27	
reserved2	fixed<0,32,0> (32 bits)	32	
reserved3	fixed<0,32,0> (32 bits)	64	
reserved4	fixed<0,32,0> (32 bits)	96	

outputConfig

This structure specifies the output flip enables and Target rectangle.

Table 69: outputConfig Details

Name	Data Type	Offset	Notes
AlphaFillMode	fixed<0,3,0> (3 bits)	0	Alpha fill mode (DXVAHD_ALPHA_FILL_MODE)
AlphaFillSlot	fixed<0,3,0> (3 bits)	3	SlotId for when AlphaFillMode == Source stream/Source alpha
BackgroundAlpha	fixed<0,10,0> (10 bits)	6	Background color A
BackgroundR	fixed<0,10,0> (10 bits)	16	Background color R
BackgroundG	fixed<0,10,0> (10 bits)	26	Background color G
BackgroundB	fixed<0,10,0> (10 bits)	36	Background color B
RegammaMode	fixed<0,2,0> (2 bits)	46	The regamma curve to be used for the blended output
OutputFlipX	fixed<0,1,0> (1 bit)	48	Horizontal flip enable
OutputFlipY	fixed<0,1,0> (1 bit)	49	Vertical flip enable
OutputTranspose	fixed<0,1,0> (1 bit)	50	Transpose enable
reserved1	fixed<0,1,0> (1 bit)	51	
reserved2	fixed<0,12,0> (12 bits)	52	
TargetRectLeft	fixed<0,14,0> (14 bits)	64	Target rectangle. Restricts the output to a certain rectangle inside the output surface. Pixels outside of this area are guaranteed to remain unmodified.

Table 69: outputConfig Details

Name	Data Type	Offset	Notes
reserved3	fixed<0,2,0> (2 bits)	78	
TargetRectRight	fixed<0,14,0> (14 bits)	80	
reserved4	fixed<0,2,0> (2 bits)	94	
TargetRectTop	fixed<0,14,0> (14 bits)	96	
reserved5	fixed<0,2,0> (2 bits)	110	
TargetRectBottom	fixed<0,14,0> (14 bits)	112	
reserved6	fixed<0,2,0> (2 bits)	126	

outputSurfaceConfig

Table 70: outputSurfaceConfig

Name	Data Type	Offset	Notes
OutPixelFormat	fixed<0,7,0> (7 bits)	0	Pixel format of output surface (PIXEL_FORMAT)
OutChromaLocHoriz	fixed<0,2,0> (2 bits)	7	Chroma location of output surface (See SurfaceListSurfaceStruct)
OutChromaLocVert	fixed<0,2,0> (2 bits)	9	
OutBlkKind	fixed<0,4,0> (4 bits)	11	The block linear kind of the output surface (BLK_KIND)
OutBlkHeight	fixed<0,4,0> (4 bits)	15	Block-linear height (in gobs, log2)
reserved0	fixed<0,3,0> (3 bits)	19	
reserved1	fixed<0,10,0> (10 bits)	22	
OutSurfaceWidth	fixed<0,14,0> (14 bits)	32	Output surface width minus 1
OutSurfaceHeight	fixed<0,14,0> (14 bits)	46	Output surface height minus 1
reserved2	fixed<0,4,0> (4 bits)	60	
OutLumaWidth	fixed<0,14,0> (14 bits)	64	Padded output surface luma width minus 1
OutLumaHeight	fixed<0,14,0> (14 bits)	78	Padded output surface luma height minus 1
reserved3	fixed<0,4,0> (4 bits)	92	
OutChromaWidth	fixed<0,14,0> (14 bits)	96	Padded output surface chroma width minus 1
OutChromaHeight	fixed<0,14,0> (14 bits)	110	Padded output surface chroma height minus 1
reserved4	fixed<0,4,0> (4 bits)	124	

outColorMatrixStruct

The matrices defined in these structures are used to specify the color space conversion between input and output pixel formats if any.

Table 71: outColorMatrixStruct Details

Name	Data Type	Offset	Notes
matrix_coeff00	fixed<0,20,0> (20 bits)	0	Matrix entry (0,0) of 4x3 color conversion matrix. Precision and right shift are the same as for the luma vector.
matrix_coeff10	fixed<0,20,0> (20 bits)	20	Matrix entry (1,0) of 4x3 color conversion matrix
matrix_coeff20	fixed<0,20,0> (20 bits)	40	Matrix entry (2,0) of 4x3 color conversion matrix
matrix_r_shift	fixed<0,4,0> (4 bits)	60	Right shift value for matrix
matrix_coeff01	fixed<0,20,0> (20 bits)	64	Matrix entry (0,1) of 4x3 color conversion matrix
matrix_coeff11	fixed<0,20,0> (20 bits)	84	Matrix entry (1,1) of 4x3 color conversion matrix
matrix_coeff21	fixed<0,20,0> (20 bits)	104	Matrix entry (2,1) of 4x3 color conversion matrix
reserved0	fixed<0,3,0> (3 bits)	124	
matrix_enable	fixed<0,1,0> (1 bit)	127	
matrix_coeff02	fixed<0,20,0> (20 bits)	128	Matrix entry (0,2) of 4x3 color conversion matrix
matrix_coeff12	fixed<0,20,0> (20 bits)	148	Matrix entry (1,2) of 4x3 color conversion matrix
matrix_coeff22	fixed<0,20,0> (20 bits)	168	Matrix entry (2,2) of 4x3 color conversion matrix
reserved1	fixed<0,4,0> (4 bits)	188	
matrix_coeff03	fixed<0,20,0> (20 bits)	192	Matrix entry (0,3) of 4x3 color conversion matrix
matrix_coeff13	fixed<0,20,0> (20 bits)	212	Matrix entry (1,3) of 4x3 color conversion matrix
matrix_coeff23	fixed<0,20,0> (20 bits)	232	Matrix entry (2,3) of 4x3 color conversion matrix
reserved2	fixed<0,4,0> (4 bits)	252	

ClearRectStruct[4]

The ClearRectStruct structures together define 8 clear rectangles. These rectangles are enabled or disabled for each slot using the fields in SurfaceList0Struct.

Table 72: ClearRectStruct[4] Details

Name	Data Type	Offset	Notes
ClearRect0Left	fixed<0,14,0> (14 bits)	0	First clear rectangle of 128-bit chunk
reserved0	fixed<0,2,0> (2 bits)	14	
ClearRect0Right	fixed<0,14,0> (14 bits)	16	

Table 72: ClearRectStruct[4] Details

Name	Data Type	Offset	Notes
reserved1	fixed<0,2,0> (2 bits)	30	
ClearRect0Top	fixed<0,14,0> (14 bits)	32	
reserved2	fixed<0,2,0> (2 bits)	46	
ClearRect0Bottom	fixed<0,14,0> (14 bits)	48	
reserved3	fixed<0,2,0> (2 bits)	62	
ClearRect1Left	fixed<0,14,0> (14 bits)	64	Second clear rectangle of 128-bit chunk
reserved4	fixed<0,2,0> (2 bits)	78	
ClearRect1Right	fixed<0,14,0> (14 bits)	80	
reserved5	fixed<0,2,0> (2 bits)	94	
ClearRect1Top	fixed<0,14,0> (14 bits)	96	
reserved6	fixed<0,2,0> (2 bits)	110	
ClearRect1Bottom	fixed<0,14,0> (14 bits)	112	
reserved7	fixed<0,2,0> (2 bits)	126	

slotStruct[8]

Table 73: slotStruct[8] Details

Name	Data Type	Offset
slotConfig	SlotConfig (512 bits)	0
slotSurfaceConfig	SlotSurfaceConfig (128 bits)	512
lumaKeyStruct	LumaKeyStruct (128 bits)	640
colorMatrixStruct	MatrixStruct (256 bits)	768
gamutMatrixStruct	MatrixStruct (256 bits)	1024
blendingSlotStruct	BlendingSlotStruct (128 bits)	1280

SlotConfig

This structure contains enable bits for each slot, which need to be set as described below.

- Noise reduction requires a forward and backward reference field for interlaced content and a backward reference for progressive content (see Methods section about how to set surfaces). Both require a noise reduced surface (field for interlaced, frame for progressive).
- MotionMap calculation is required for DiSi1/DiNewBob and also needs a forward and backward reference. Behavior is not defined for progressive streams so enabling it needs to be flagged as an error.
- Cadence Detection will enable artifact and weave counts. It will also enable Falcon code to force deinterlace mode to weave if a cadence was detected.

Table 74: SlotConfig Details

Name	Data Type	Offset	Description
SlotEnable	fixed<0,1,0> (1 bit)	0	Enable or disable bit for this slot
DeNoise	fixed<0,1,0> (1 bit)	1	Enable bit for noise reduction
AdvancedDenoise	fixed<0,1,0> (1 bit)	2	Enable the advanced denoising algorithm (TNR2) for each slot.
CadenceDetect	fixed<0,1,0> (1 bit)	3	Cadence detection enable bit
MotionMap	fixed<0,1,0> (1 bit)	4	Motion map enable bit for each slot. Required for DiSi1/ DiNewBob
MMapCombine	fixed<0,1,0> (1 bit)	5	Enable bit for combine motion map for each slot. This is required for DiSi1/DiNewBob. This requires MotionMap being enabled and also required a prevMotionMap surface (see Methods). Behavior without MotionMap enabled is undefined and has to be flagged as an error.
IsEven	fixed<0,1,0> (1 bit)	6	Select if current field is even (used for cadence detection)
ChromaEven	fixed<0,1,0> (1 bit)	7	Enable if chroma of current field is even
CurrentFieldEnable	fixed<0,1,0> (1 bit)	8	Indicates which surfaces are enabled for fetching Bit 0: Current field Bit 1: Previous field Bit 2: Next field Bit 3: Next field (noise filtered, takes priority over unfiltered field) Bit 4: Current motion field Bit 5: Previous motion field Bit 6: Previous previous motion field Bit 7: Combined motion field
PrevFieldEnable	fixed<0,1,0> (1 bit)	9	
NextFieldEnable	fixed<0,1,0> (1 bit)	10	
NextNrFieldEnable	fixed<0,1,0> (1 bit)	11	
CurMotionFieldEnable	fixed<0,1,0> (1 bit)	12	
PrevMotionFieldEnable	fixed<0,1,0> (1 bit)	13	
PpMotionFieldEnable	fixed<0,1,0> (1 bit)	14	
CombMotionFieldEnable	fixed<0,1,0> (1 bit)	15	
FrameFormat	fixed<0,4,0> (4 bits)	16	Frame format of the frame (DXVAHD_FRAME_FORMAT)
FilterLengthY	fixed<0,2,0> (2 bits)	20	Filter length for each stream: 0: 1-tap (nearest neighbor) 1: 2-tap (bi-linear) 2: 5-tap 3: 10-tap
FilterLengthX	fixed<0,2,0> (2 bits)	22	
Panoramic	fixed<0,12,0> (12 bits)	24	Panoramic scaling parameter.

Table 74: SlotConfig Details

Name	Data Type	Offset	Description
reserved1	fixed<0,22,0> (22 bits)	36	
DetailFltClamp	fixed<0,6,0> (6 bits)	58	The maximum range allowed for the difference between the filter output and center pixel of the input filter support. Set to 0 to disable clamping.
FilterNoise	fixed<0,10,0> (10 bits)	64	Strength of the spatial noise filter for slot 0. All detail and noise filter values (including chroma) become meaningless and should be set to 0 as soon as filter override is enabled
FilterDetail	fixed<0,10,0> (10 bits)	74	Strength of the detail filter for slot 0
ChromaNoise	fixed<0,10,0> (10 bits)	84	Strength of the noise filter for slot 0
ChromaDetail	fixed<0,10,0> (10 bits)	94	Strength of the detail filter for slot 0
DeinterlaceMode	fixed<0,4,0> (4 bits)	104	Deinterlace mode (DXVAHD_DEINTERLACE_MODE_PRIVATE)
MotionAccumWeight	fixed<0,3,0> (3 bits)	108	Accumulation weight for motion IIR filter for slot 0 (default should be 6). The first time an even/odd motion field is calculated AccumWeight should be set to 0 to avoid having to clear the motion buffer beforehand.
Noiselir	fixed<0,11,0> (11 bits)	111	Accumulation weight for noise reduction IIR filter for slot 0 (default value should be 0x300).
LightLevel	fixed<0,4,0> (4 bits)	122	Describes the level of lighting present when the input image was captured. This parameter is used along with the AdvancedDenoise bits to determine the exact denoising algorithm to be applied for noise reduction.
reserved4	fixed<0,2,0> (2 bits)	126	
SoftClampLow	fixed<0,10,0> (10 bits)	128	Lower soft clamping bound
SoftClampHigh	fixed<0,10,0> (10 bits)	138	Upper soft clamping bound
reserved5	fixed<0,3,0> (3 bits)	148	
reserved6	fixed<0,9,0> (9 bits)	151	
PlanarAlpha	fixed<0,10,0> (10 bits)	160	10-bit Planar alpha value. This planar alpha will be multiplied with the alpha value coming from the stream. In case of palettized alpha formats (like AI44/A8P8/AI88) the stream alpha value is the alpha value from the surface multiplied with the alpha value from the palette.
ConstantAlpha	fixed<0,1,0> (1 bit)	170	If true, planar alpha value will be used instead of stream alpha, if false, stream alpha will be multiplied with planar alpha. Constant alpha has to be set for all surfaces not containing any alpha data (like XRGB/NV12/YUY2/UYVY/YV12).
StereoInterleave	fixed<0,3,0> (3 bits)	171	Enable pixel interleave for auto-stereoscopic panels (STEREO_INTERLEAVE)
ClipEnabled	fixed<0,1,0> (1 bit)	174	Enable clip against negative values after gamut matrix
ClearRectMask	fixed<0,8,0> (8 bits)	175	Clear rectangle mask
DegammaMode	fixed<0,2,0> (2 bits)	183	The de-gamma curve to be used for the slot (GAMMA_MODE)
reserved7	fixed<0,1,0> (1 bit)	185	

Table 74: SlotConfig Details

Name	Data Type	Offset	Description
DecompressEnable	fixed<0,1,0> (1 bit)	186	Decompression enable bit for the slot. If set to false, then all requests will bypass the CDE and go directly to MCCIF. If this bit is set, then all requests to the surface will be treated as potentially compressed, and the compress bits will be looked up for every ROP tile in the surface
reserved9	fixed<0,5,0> (5 bits)	187	
DecompressCtbCount	fixed<0,8,0> (8 bits)	192	The number of CompTagBuffer (CTB) entries that are assigned to this slot. Software has to allocate the total available compatg entries to each of the slots, based on the scaling ratios etc.
DecompressZbcColor	fixed<0,32,0> (32 bits)	200	The Zero-Bandwidth-Clear color to be used when a ROP tile is ZBC compressed.
reserved12	fixed<0,24,0> (24 bits)	232	
SourceRectLeft	fixed<0,30,0> (30 bits)	256	The source rectangle defines the region of pixels that will be read from the source surface. Any pixel data outside of this will not be used inside VIC but might still be read. The source rectangle co-ordinates are specified in a U14.4 format, allowing us to specify fractional co-ordinates. The source rectangle should lie entirely within the input surface for the slot, that is, negative values, or values greater than the size of the surface are illegal.
reserved14	fixed<0,2,0> (2 bits)	286	
SourceRectRight	fixed<0,30,0> (30 bits)	288	
reserved15	fixed<0,2,0> (2 bits)	318	
SourceRectTop	fixed<0,30,0> (30 bits)	320	
reserved16	fixed<0,2,0> (2 bits)	350	
SourceRectBottom	fixed<0,30,0> (30 bits)	352	
reserved17	fixed<0,2,0> (2 bits)	382	
DestRectLeft	fixed<0,14,0> (14 bits)	384	The destination rectangle defines the region of the output surface that is affected by this slot. Together with the source rectangle it also defines the scaling rations. Any pixel outside of this region will not be affected by this input stream. For any non-4:4:4 format all corners need to fall on a multiple of 2 (Right and Bottom are minus 1 encoded though).
reserved18	fixed<0,2,0> (2 bits)	398	
DestRectRight	fixed<0,14,0> (14 bits)	400	
reserved19	fixed<0,2,0> (2 bits)	414	
DestRectTop	fixed<0,14,0> (14 bits)	416	
reserved20	fixed<0,2,0> (2 bits)	430	
DestRectBottom	fixed<0,14,0> (14 bits)	432	
reserved21	fixed<0,2,0> (2 bits)	446	

Table 74: SlotConfig Details

Name	Data Type	Offset	Description
reserved22	fixed<0,32,0> (32 bits)	448	
reserved23	fixed<0,32,0> (32 bits)	480	

SlotSurfaceConfig

Surface parameters for each slot

Table 75: SlotSurfaceConfig Details

Name	Data Type	Offset	Description
SlotPixelFormat	fixed<0,7,0> (7 bits)	0	Pixel format for each stream (PIXEL_FORMAT) Only NV12, YUY2, and UYVY allow for motion buffer calculation and DiSi1/DiNewBob de-interlacing and noise reduction.
SlotChromaLocHoriz	fixed<0,2,0> (2 bits)	7	Horizontal chroma location - (0: co-located with even luma; 1: in between even and odd luma; 2: co-located with odd luma; 3: between odd and next even luma;)
SlotChromaLocVert	fixed<0,2,0> (2 bits)	9	Vertical chroma location - (0: co-located with even luma; 1: in between even and odd luma; 2: co-located with odd luma; 3: between odd and next even luma)
SlotBlkKind	fixed<0,4,0> (4 bits)	11	Block-linear kind (BLK_KIND)
SlotBlkHeight	fixed<0,4,0> (4 bits)	15	Block-linear height (in gobs, log2)
SlotCacheWidth	fixed<0,3,0> (3 bits)	19	Number of horizontal bytes per surface-cache cache-line. Each 256B cache line can store a source region of size as enumerated below. 0: 16Bx16 (BL16Bx2) 1: 32Bx8 (BL16Bx2) 2: 64Bx4 (BL16Bx2, PL) 3: 128Bx2 (BL16Bx2, PL) 4: 256Bx1 (PL)
reserved0	fixed<0,10,0> (10 bits)	22	
SlotSurfaceWidth	fixed<0,14,0> (14 bits)	32	Width of surface minus 1. Any pixel data outside of this will not be used inside VIC but might still be read.
SlotSurfaceHeight	fixed<0,14,0> (14 bits)	46	Height of surface minus 1. Any pixel data outside of this will not be used inside VIC but might still be read.
reserved1	fixed<0,4,0> (4 bits)	60	
SlotLumaWidth	fixed<0,14,0> (14 bits)	64	Padded luma width of surface minus 1. Any pixel data outside of this will not be read.
SlotLumaHeight	fixed<0,14,0> (14 bits)	78	Padded luma height of surface minus 1. Any pixel data outside of this will not be read.
reserved2	fixed<0,4,0> (4 bits)	92	
SlotChromaWidth	fixed<0,14,0> (14 bits)	96	Padded chroma width of surface minus 1. Any pixel data outside of this will not be read. This value is not required for pixel interleaved surfaces such as ARGB
SlotChromaHeight	fixed<0,14,0> (14 bits)	110	Padded chroma height of surface minus 1. Any pixel data outside of this will not be read. This value is not required for pixel interleaved surfaces such as ARGB
reserved3	fixed<0,4,0> (4 bits)	124	

LumaKeyStruct

Used to enable Luma keying and plane alpha parameters.

Table 76: LumaKeyStruct Details

Name	Data Type	Offset	Description
luma_coeff0	fixed<0,20,0> (20 bits)	0	Matrix entry (0) of 4x1 luma conversion matrix in S12.8 format
luma_coeff1	fixed<0,20,0> (20 bits)	20	Matrix entry (1) of 4x1 luma conversion matrix in S12.8 format
luma_coeff2	fixed<0,20,0> (20 bits)	40	Matrix entry (2) of 4x1 luma conversion matrix in S12.8 format
luma_r_shift	fixed<0,4,0> (4 bits)	60	The result of the matrix multiplication will be right shifted by r_shift. To allow for highest accuracy, r_shift should always be as high as possible without losing any range in the other coefficients.
luma_coeff3	fixed<0,20,0> (20 bits)	64	Matrix entry (3) of 4x1 luma conversion matrix in S12.8 format. Is not affected by r_shift.
LumaKeyLower	fixed<0,10,0> (10 bits)	84	Lower luma key value
LumaKeyUpper	fixed<0,10,0> (10 bits)	94	Upper luma key value
LumaKeyEnabled	fixed<0,1,0> (1 bit)	104	Luma key enable
reserved0	fixed<0,2,0> (2 bits)	105	
reserved1	fixed<0,21,0> (21 bits)	107	

MatrixStruct

The matrices defined in these structures are used to specify the color space conversion between input and output pixel formats if any.

Table 77: MatrixStruct Details

Name	Data Type	Offset	Description
matrix_coeff00	fixed<0,20,0> (20 bits)	0	Matrix entry (0,0) of 4x3 color conversion matrix. Precision and right shift are the same as for the luma vector.
matrix_coeff10	fixed<0,20,0> (20 bits)	20	Matrix entry (1,0) of 4x3 color conversion matrix
matrix_coeff20	fixed<0,20,0> (20 bits)	40	Matrix entry (2,0) of 4x3 color conversion matrix
matrix_r_shift	fixed<0,4,0> (4 bits)	60	Right shift value for matrix
matrix_coeff01	fixed<0,20,0> (20 bits)	64	Matrix entry (0,1) of 4x3 color conversion matrix
matrix_coeff11	fixed<0,20,0> (20 bits)	84	Matrix entry (1,1) of 4x3 color conversion matrix
matrix_coeff21	fixed<0,20,0> (20 bits)	104	Matrix entry (2,1) of 4x3 color conversion matrix
reserved0	fixed<0,3,0> (3 bits)	124	
matrix_enable	fixed<0,1,0> (1 bit)	127	
matrix_coeff02	fixed<0,20,0> (20 bits)	128	Matrix entry (0,2) of 4x3 color conversion matrix

Table 77: MatrixStruct Details

Name	Data Type	Offset	Description
matrix_coeff12	fixed<0,20,0> (20 bits)	148	Matrix entry (1,2) of 4x3 color conversion matrix
matrix_coeff22	fixed<0,20,0> (20 bits)	168	Matrix entry (2,2) of 4x3 color conversion matrix
reserved1	fixed<0,4,0> (4 bits)	188	
matrix_coeff03	fixed<0,20,0> (20 bits)	192	Matrix entry (0,3) of 4x3 color conversion matrix
matrix_coeff13	fixed<0,20,0> (20 bits)	212	Matrix entry (1,3) of 4x3 color conversion matrix
matrix_coeff23	fixed<0,20,0> (20 bits)	232	Matrix entry (2,3) of 4x3 color conversion matrix
reserved2	fixed<0,4,0> (4 bits)	252	

BlendingSlotStruct

Input parameters to blend equations in DXVAHD_ALPHA_FILL_MODE_COMPOSITED alpha fill mode

- outputR = (srcFactC * srcR) + (dstFactC * dstR)
- outputG = (srcFactC * srcG) + (dstFactC * dstG)
- outputB = (srcFactC * srcB) + (dstFactC * dstB)
- outputA = (srcFactA * srcA) + (dstFactA * dstA)

Table 78: BlendingSlotStruct Details

Name	Data Type	Offset	Description
AlphaK1	fixed<0,10,0> (10 bits)	0	Constant Alpha value
reserved0	fixed<0,6,0> (6 bits)	10	Constant Alpha value
AlphaK2	fixed<0,10,0> (10 bits)	16	Constant Alpha value
reserved1	fixed<0,6,0> (6 bits)	26	
SrcFactCMatchSelect	fixed<0,3,0> (3 bits)	32	Blend Source Factor for Color if the color key comparison matches (BLEND_SRCFACTC)
reserved2	fixed<0,1,0> (1 bit)	35	
DstFactCMatchSelect	fixed<0,3,0> (3 bits)	36	Blend Destination Factor for Color if the color key comparison matches (BLEND_DSTFACTC)
reserved3	fixed<0,1,0> (1 bit)	39	
SrcFactAMatchSelect	fixed<0,3,0> (3 bits)	40	Blend Source Factor for Alpha if the color key comparison matches (BLEND_SRCFACTA)
reserved4	fixed<0,1,0> (1 bit)	43	
DstFactAMatchSelect	fixed<0,3,0> (3 bits)	44	Blend Source Factor for Alpha if the color key comparison matches (BLEND_DSTFACTA)
reserved5	fixed<0,1,0> (1 bit)	47	
reserved6	fixed<0,4,0> (4 bits)	48	

Table 78: BlendingSlotStruct Details

Name	Data Type	Offset	Description
reserved7	fixed<0,4,0> (4 bits)	52	
reserved8	fixed<0,4,0> (4 bits)	56	
reserved9	fixed<0,4,0> (4 bits)	60	
reserved10	fixed<0,2,0> (2 bits)	64	
OverrideR	fixed<0,10,0> (10 bits)	66	Source RGBA override values
OverrideG	fixed<0,10,0> (10 bits)	76	
OverrideB	fixed<0,10,0> (10 bits)	86	
OverrideA	fixed<0,10,0> (10 bits)	96	
reserved11	fixed<0,2,0> (2 bits)	106	
UseOverrideR	fixed<0,1,0> (1 bit)	108	Enable source RGBA value override
UseOverrideG	fixed<0,1,0> (1 bit)	109	
UseOverrideB	fixed<0,1,0> (1 bit)	110	
UseOverrideA	fixed<0,1,0> (1 bit)	111	
MaskR	fixed<0,1,0> (1 bit)	112	Per-component blend output override enables (replace blend output with destination RGBA values)
MaskG	fixed<0,1,0> (1 bit)	113	
MaskB	fixed<0,1,0> (1 bit)	114	
MaskA	fixed<0,1,0> (1 bit)	115	
reserved12	fixed<0,12,0> (12 bits)	116	

15.4.3.2 Palette Structure

PaletteStruct sends palette information for indexed formats. Each slot has its own space in the palette buffer even if the format is not indexed. For non-indexed formats the space should be left blank and should not be used by any other slots to send palette data. The number of palette entries for each slot can be at most 256.

15.4.3.3 History Buffer

The History buffer will be used to store inter-frame communication data. The structure holds cadence related information for each slot.

First dword of the hist_control (control_vector) should be set by the driver and informs Falcon whether to calculate the LUT for histogram enhancement and to calculate cadence or not.

If histogram enhancement is enabled for a slot and FALCON_CONTROL is set (explained in the SetControlParams() method) then Falcon calculates the LUT and updates the HistogramLutStruct's multiplier table of the config structure. If histogram

enhancement is enabled and FALCON_CONTROL is 0, then driver should calculate the LUT. And if the histogram enhancement flag is 0, then the table should be initialized to 1024.

Second part of the history buffer is used to store the 64 bin histogram data. This data is produced by the VIC and is used by either Falcon or driver to calculate the LUT.

15.4.3.4 FCE Microcode Buffer

This buffer holds the Fetch Control Engine (FCE) microcode that Falcon should load to the FCE unit. The driver should also pass the size of the FCE microcode with the SetFceUcodeSize() method.

15.4.3.5 Input Picture Buffers

Each picture is a separate buffer with its own surface offset method. The driver needs to send these offset methods for only the used pictures (source and reference) for the current execute.

15.4.3.6 Noise-Reduced Picture Buffers

This buffer is used by the app to keep a noise-reduced picture data of future fields if DeNoise is enabled. In the next execute, noise-reduced picture data is used as the current field, and noise-reduced picture data of the previous execute will be used as previous picture. Noise reduction requires a forward and a backward reference field for interlaced content and a backward reference for progressive content.

In the NV24 case, the VIC app uses an additional surface to keep noise reduced field of the current picture. In this case, the current noise reduced surfaces are used as previous reference surfaces.

Noise-reduced picture buffer dimensions for a slot should be same as input buffer of that slot.

15.4.3.7 Motion Map Buffers

These buffers keep motion map data of the current and previous fields if MotionMap is enabled. The previous motion map buffer should be initialized to 255 (both luma and chroma) at the start of the clip. Use the motion map buffer of the previous execute pass prev motion map in the current execute for subsequent frames. MotionMap calculation is required for DiSi1 and also needs a forward and a backward reference. Behavior is not defined for progressive streams.

Motion map buffer dimensions for a slot should be same as input buffer of that slot.

15.4.3.8 Output Buffer

This buffer stores output data.

15.4.3.9 CRC Buffer

The InterfaceCrcStruct and InputCrcStruct are shared to store the CRC information. These are selected based on method SetCrcMode.

15.4.4 Application Error Codes

The following table defines the error codes.

Table 79: Error Codes

Name	Value	Description
MSDECOS_ERROR_NONE	0x00000000	Default return code for app
MSDECOS_ERROR_EXECUTE_INSUFFICIENT_DATA	0x00000001	To be returned by the app to the OS
MSDECOS_ERROR_SEMAPHORE_INSUFFICIENT_DATA	0x00000002	Insufficient semaphore methods received. Method Data written out into MAILBOX1. MAILBOX0 bits 31:20- Method ID. MAILBOX0 bits 19-12: Method Count (SWFIFO + MTHDCOUNT register)
MSDECOS_ERROR_INVALID_METHOD	0x00000003	Unsupported method

Table 79: Error Codes

Name	Value	Description
MSDECOS_ERROR_INVALID_DMA_PAGE	0x00000004	Unsupported method
MSDECOS_ERROR_UNHANDLED_INTERRUPT	0x00000005	The app has either no interrupt handler or an unhandled OS error
MSDECOS_ERROR_EXCEPTION	0x00000006	Exception raised by Falcon
MSDECOS_ERROR_INVALID_CTXSW_REQUEST	0x00000007	Invalid CTXSW request to the OS
MSDECOS_ERROR_APPLICATION	0x00000008	Application returned a nonzero error code
MSDECOS_ERROR_SWBREAKPT	0x00000009	Exception raised to dump registers in debug mode
VicErrorConfigStructSizeMismatch	0xb0b60060	The size of the config structure as defined in the SetControlParams method does not match the expected size of the ConfigStructure for the current VIC hardware
VicErrorInvalidInputFormatSlot_0	0xb0b60070	The input pixel format specified for slot 0 does not match one of the supported input pixel formats
VicErrorInvalidInputFormatSlot_1	0xb0b60071	The input pixel format specified for slot 1 does not match one of the supported input pixel formats
VicErrorInvalidInputFormatSlot_2	0xb0b60072	The input pixel format specified for slot 2 does not match one of the supported input pixel formats
VicErrorInvalidInputFormatSlot_3	0xb0b60073	The input pixel format specified for slot 3 does not match one of the supported input pixel formats
VicErrorInvalidInputFormatSlot_4	0xb0b60074	The input pixel format specified for slot 4 does not match one of the supported input pixel formats
VicErrorInvalidInputFormatSlot_5	0xb0b60075	The input pixel format specified for slot 5 does not match one of the supported input pixel formats
VicErrorInvalidInputFormatSlot_6	0xb0b60076	The input pixel format specified for slot 6 does not match one of the supported input pixel formats
VicErrorInvalidInputFormatSlot_7	0xb0b60077	The input pixel format specified for slot 7 does not match one of the supported input pixel formats
VicErrorInvalidOutputFormat	0xb0b60080	The output pixel format specified does not match one of the supported output pixel formats
VicErrorApptimerExpired	0xb0b60090	The Falcon microcode is taking longer than expected to complete processing the current frame
VicErrorFcePanicErrIntr	0xb0b600a0	The fetch-control engine threw a panic. Usually indicates a bug in the FCE microcode.
VicErrorFceDivisionByZeroErrIntr	0xb0b600a5	The fetch-control engine threw a divide-by-zero error. Can be caused either by a bug in the FCE microcode, or invalid inputs in the ConfigStruct rectangle specifications.
VicErrorScBankConflictErrIntr	0xb0b600a1	There was a bank conflict error in the surface cache. This can only be caused if there is a bug in either the FetchControl or SurfaceCache hardware
VicErrorScResetErrIntr	0xb0b600a2	SurfaceCache was reset while there were still locked entries in the cache
VicErrorYsSkipdErrIntr	0xb0b600a3	There was a problem in the FetchControl calculation of filter skips for the Y-scaler
VicErrorXsSkipdErrIntr	0xb0b600a4	There was a problem in the FetchControl calculation of filter skips for the X-scaler

15.4.5 Application Method

The VIC application method registers are accessed directly by the driver. Because the VIC uses the shared MSDEC Falcon OS, two ranges of methods are used (in the MSDEC, there are common and application specific ranges). The range of method registers is:

- 0x700-0x77F (common method range) and
- 0x400-0x6FF (method range corresponding to overlay 1)

The following table defines the method map.

Table 80: Method Map

Address	Method
0x0100	VIC.Nop
0x0140	VIC.PmTrigger
0x0200	VIC.SetApplicationID
0x0204	VIC.SetWatchdogTimer
0x0240	VIC.SemaphoreA
0x0244	VIC.SemaphoreB
0x0248	VIC.SemaphoreC
0x024c	VIC.CtxSaveArea
0x0250	VIC.CtxSwitch
0x0300	VIC.Execute
0x0304	VIC.SemaphoreD
0x0400	VIC.SetSurface0Slot0LumaOffset[0]
0x0404	VIC.SetSurface0Slot0ChromaU_Offset[0]
0x0408	VIC.SetSurface0Slot0ChromaV_Offset[0]
0x040c	VIC.SetSurface1Slot0LumaOffset[0]
0x0410	VIC.SetSurface1Slot0ChromaU_Offset
0x0414	VIC.SetSurface1Slot0ChromaV_Offset[0]
0x0418	VIC.SetSurface2Slot0LumaOffset[0]
0x041c	VIC.SetSurface2Slot0ChromaU_Offset[0]

15.4.6 Method Naming and Programming

The VIC uses generic names to avoid confusing name overloading to the 16 surfaces (8 luma, 8 chroma) methods for the MAX_SLOTS

- SurfacexSlotyLumaOffset[y]
- SetSurfacexSlotyChromaU_Offset[y]
- SetSurfacexSlotyChromaV_Offset[y] with x in [0..7] and y in [0..MAX_SLOTS-1]

The following sets of methods are required for a given ConfigStruct setup. Any setup not covered in this section should be regarded as illegal.

Note:

- NV24 frames are treated as NV12 fields. The frame format for NV24 has to be set to FRAME_FORMAT_TOP_FIELD.
- In case of noise reduction, all previously noise reduced surfaces should be used as references instead of the original ones. In case of interlaced fields this also applies to the current fields as they have previously been noise reduced.
- Surface6 has been obsoleted and should not be used.
- History buffer is always required and should be owned by Falcon.

15.4.6.1 Application ID

Application ID is not needed as there is only one application for the engine (unlike different codecs for the MSDEC). But to use it with MSDEC infrastructure, the driver needs to pass the ApplicationId as 1 (corresponding to overlay 1).

15.4.6.2 Progressive Frames

No Preprocessing

Enable bits have to be set to 0x01 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()

Noise Reduction

Enable bits have to be set to 0x07 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference surface)
- SetSurface2SlotLumaOffset() (noise reduced surface)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference surface)
- SetSurface2SlotChromaOffset() (noise reduced surface)

15.4.6.3 Progressive Fields

No Preprocessing

Enable bits have to be set to 0x03 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset() (top field)
- SetSurface1SlotLumaOffset() (bottom field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset() (top field)
- SetSurface1SlotChromaOffset() (bottom field)

Noise Reduction

Enable bits have to be set to 0x03f in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset() (top field)
- SetSurface1SlotLumaOffset() (bottom field)
- SetSurface2SlotLumaOffset() (top field of backward reference surface)
- SetSurface3SlotLumaOffset() (bottom field of backward reference surface)
- SetSurface4SlotLumaOffset() (top field of noise reduced surface)
- SetSurface5SlotLumaOffset() (bottom field of noise reduced surface)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset() (top field)
- SetSurface1SlotChromaOffset() (bottom field)
- SetSurface2SlotChromaOffset() (top field of backward reference surface)
- SetSurface3SlotChromaOffset() (bottom field of backward reference surface)

- SetSurface4SlotChromaOffset() (top field of noise reduced surface)
- SetSurface5SlotChromaOffset() (bottom field of noise reduced surface)

15.4.6.4 Interlaced Frames

No Preprocessing

Enable bits have to be set to 0x01 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()

Noise Reduction

Enable bits have to be set to 0x07 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference surface)
- SetSurface2SlotLumaOffset() (noise reduced surface)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference surface)
- SetSurface2SlotChromaOffset() (noise reduced surface)

15.4.6.5 Interlaced Fields

No Preprocessing

This is for BOB_FIELD only. For WEAVE, see “No Preprocessing” under “Progressive Fields“.

Enable bits have to be set to 0x01 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()

Cadence Detection

Enable bits have to be set to 0x07 in fetchControl0Struct. This also requires cadence detection to be enabled.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)

- SetSurface2SlotChromaOffset() (forward reference field)

Motion Calculation

Enable bits have to be set to 0x17 in fetchControl0Struct. The data in the current motion field is read first and IIR filtered with the newly calculated motion before it is written back.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface4SlotLumaOffset() (current motion field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface4SlotChromaOffset() (current motion field)

Motion Calculation and Cadence Detection

Same as above in Motion Calculation except that cadence detection is enabled.

DISI1 (Motion Calculation and Motion Combine)

Enable bits have to be set to 0xb7 in fetchControl0Struct. The data in the current motion field is read first and IIR filtered with the newly calculated motion before it is written back. The combined motion field is generated out of current motion and previous motion to be used in DiSi1 deinterlacer.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface4SlotLumaOffset() (current motion field)
- SetSurface5SlotLumaOffset() (previous motion field)
- SetSurface7SlotLumaOffset() (combined motion field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface4SlotChromaOffset() (current motion field)
- SetSurface5SlotChromaOffset() (previous motion field)
- SetSurface7SlotChromaOffset() (combined motion field)

DISI1 (Motion Calculation and Motion Combine) and Cadence Detection

Same as above in DiSi1 except that cadence detection is enabled.

Noise Reduction

Enable bits have to be set to 0x0f in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (previously noise reduced backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface3SlotLumaOffset() (noise reduced forward reference field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (previously noise reduced backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface3SlotChromaOffset() (noise reduced forward reference field)

Noise Reduction and Cadence Detection

Same as above in Noise Reduction except that cadence detection is enabled.

Noise Reduction and Motion Calculation

Enable bits have to be set to 0x1f in fetchControl0Struct. The data in the current motion field is read first and IIR filtered with the newly calculated motion before it is written back.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface3SlotLumaOffset() (noise reduced forward reference field)
- SetSurface4SlotLumaOffset() (current motion field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface3SlotChromaOffset() (noise reduced forward reference field)
- SetSurface4SlotChromaOffset() (current motion field)

Noise Reduction and Motion Calculation and Cadence Detection

Same as above in Noise Reduction and Motion Calculation except that cadence detection is enabled.

Noise Reduction and DISI1 (Motion Calculation and Motion Combine)

Enable bits have to be set to 0xbf in fetchControl0Struct. The data in the current motion field is read first and IIR filtered with the newly calculated motion before it is written back. The combined motion field is generated out of current motion and previous motion to be used in DiSi1 deinterlacer.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()

- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface3SlotLumaOffset() (noise reduced forward reference field)
- SetSurface4SlotLumaOffset() (current motion field)
- SetSurface5SlotLumaOffset() (previous motion field)
- SetSurface7SlotLumaOffset() (combined motion field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface3SlotChromaOffset() (noise reduced forward reference field)
- SetSurface4SlotChromaOffset() (current motion field)
- SetSurface5SlotChromaOffset() (previous motion field)
- SetSurface7SlotChromaOffset() (combined motion field)

Noise Reduction and DISI1 (Motion Calculation and Motion Combine) and Cadence Detection

Same as above in Noise Reduction and DiSi1 except that cadence detection is enabled.

15.4.7 Programming Restrictions

15.4.7.1 Input parameters

- When a slot is enabled in the slotConfig structure, it should have one or more surfaces enabled in the SurfaceEnable bits.
- The source and destination rectangles should be of non-zero sizes (i.e. right >= left and bottom >= top).
- Since the Luma Width/Height parameters represent padded surface sizes, the values in these parameters should be greater than or equal to the corresponding surface width/height parameters.
- For single plane surfaces like RGB surfaces, the Chroma Width/Height parameters should be programmed to zero since the Falcon microcode uses these parameters to check for the existence of multi-plane formats.
- The Chroma Width/Height parameters should be greater than or equal to the sub-sampled size of the surface width/height parameters.
- For surfaces with sub-sampled chroma
  - The source rectangle should be big enough to have at least one chroma sample within the rectangle.
  - The input surface size should be a multiple of two in the direction of the sub-sampling
- For operations involving video pre-process operations like IVTC, TNR/TNR2, DiSi1 Deinterlacing, the supported pixel formats are restricted as below:

Operations	Pixel Formats
Deinterlacing/ Cadence Detection	T_Y8___V8U8_N420, T_Y8___U8___V8_N420, T_Y8_U8__Y8_V8, T_U8_Y8__V8_Y8
TNR/TNR2	T_Y8___V8U8_N420, T_Y8___U8___V8_N420, T_Y8_U8__Y8_V8, T_U8_Y8__V8_Y8

- When the input uses interlaced surfaces, there are the following additional restrictions:
  - The source rectangle height should be a multiple of 2 to account for the surface being comprised of 2 fields.

  - If the input pixel format uses chroma sub-sampling in the vertical direction (420 or 422R), then the source rectangle height should be a multiple of 4.
- Note that the source rectangle is always specified in "frame co-ordinates". Therefore, when deinterlacing two fields of height y each, the source rectangle height should be within $2*y$.

15.4.7.2 Scaling

- When panoramic scaling is enabled
  - The destination rectangle should be at least 4 pixels wide and 4 pixels tall
  - The maximum downscaling ratio is 7:1
- For non-panoramic scaling
  - The maximum downscaling ratio is 16:1
- When enabling the filter override mode (see DownsampleVert/Horiz), only 5 slots can be enabled. This is because of the available size of the coefficient structure.

15.4.7.3 Luma Keying

- When Luma keying is enabled, the luma key range should be non-empty (i.e. lower <= upper)

15.4.7.4 Soft clamping

- The soft clamping lower and upper thresholds should be set such that the lower threshold is less than or equal to the upper threshold at all times

15.4.7.5 Deinterlacing

- The BOB deinterlacing mode is designed to work on interlaced-frame input (i.e. the source is interlaced, but the two fields are stored interleaved together in a single frame-surface.)
- The BOB_FIELD, DISI1, NEWBOB deinterlacing modes are designed to work on interlaced-field input (i.e. the fields are stored as separate surfaces.)
- The only allowed deinterlacing mode for progressive inputs is WEAVE, where it behaves as a deinterlacing bypass.
- For interlaced inputs, the WEAVE algorithm expects field surfaces and weaves them together.

Cadence Detection

- Requires field based surfaces
- Needs forward and backward reference surfaces enabled

Motion calculation

- Motion map calculation requires field based surfaces with forward and backward reference surfaces and writes out a current motion surface
- Combine motion map calculation requires field based surfaces with current and previous motion surfaces enabled and writes out a combined motion surface

15.4.7.6 Noise Reduction

- The allowed range for the IIR strength parameter is 0x0 to 0x400 (inclusive)

Field based noise reduction

- Requires forward and backward reference surfaces enabled, as well as a noise reduced output surface

Frame based noise reduction

- Requires current and backward reference surfaces enabled, as well as a noise reduced output surface

15.4.7.7 Output parameters

- The list of pixel formats supported on the output is not exactly the same as the list of input pixel formats. For example, the palette pixel formats are not supported on output.
- When output transformations are enabled, then all destination and clear rectangles should lie entirely within the target rectangle.
- Since the Luma Width/Height parameters represent padded surface sizes, the values in these parameters should be greater than or equal to the corresponding surface width/height parameters.
- The Chroma Width/Height parameters should be greater than or equal to the sub-sampled size of the surface width/height parameters.
- For surfaces with sub-sampled chroma
  - The target and destination rectangles should be big enough to have at least one chroma sample within the rectangle.
  - The output surface size should be a multiple of two in the direction of the sub-sampling

Target rectangle

- Target rectangle should lie entirely within the output surface (no negative co-ordinates, or co-ordinates outside of the output surface size).
- The target rectangle should be non-empty (i.e. right >= left and bottom >= top).

Clear rectangles

- When a clear rectangle is enabled, it should have a non-zero width and height (i.e. right >= left and bottom >= top).

Alpha Fill Mode

- For alpha fill mode _SOURCE_ALPHA, the AlphaFillSlot parameter should be set to a valid and enabled slot

15.4.8 Performance and Power Tuning Guidelines

Fully Opaque/Fully Transparent surfaces

VIC hardware cannot know when a certain slot is fully opaque or fully transparent. Thus, when for example a fully opaque slot lies over other slots, the data for the other slots is still fetched from memory and is blended with the data for the opaque slot, even though the slots below the opaque slot will not affect the output. Software should therefore program VIC to avoid the fetch of the data below the opaque surface by putting a clear rectangle over the area beneath the opaque slot, and enabling the ClearRectMask for all the slots below the opaque slot. This software enhancement will significantly reduce the VIC bandwidth requirements, and will also enhance the VIC performance for use cases involving opaque surfaces.

Smaller Target Rectangles

For cases where the displayed image does not cover all of the screen, software should optimize bandwidth by only generating/compositing the portion of the screen which actually has usable data, and let either Display (preferably), or VIC fill in the rest of the screen with a background color. This will save both read and write bandwidth in such use cases.

Memory Formats

The CacheWidth parameter in the VIC ConfigStruct defines the mapping of the 256B surface cache cache-lines to rectangular screen space. Based on our performance testing simulations, the recommendation for programming this parameter is as below

- For pitch-linear surfaces, set the CacheWidth to 64Bx4 - i.e., CacheWidth=2
- For block-linear surfaces, set the CacheWidth to 32Bx8 - i.e., CacheWidth=1

Clock Gating

VIC has 3 levels of clock gating, just like most other units in Tegra. Software should ensure that 1st and 2nd level clock gating is enabled for VIC at all times so that the VIC hardware can try to turn off clock branches whenever any portion of the logic is unused.

- 2nd level clock gating control: Bit 5 of CLK_RST_CONTROLLER_LVL2_CLK_GATE_OVRE_0 should be set to 0.
- NV_PVIC_THI_SLCG_OVERRIDE_HIGH_A and NV_PVIC_THI_SLCG_OVERRIDE_LOW_A should both be set to 0x0 to enable automatic clock-gating of VIC sub-units when idle.

Power Gating

The VIC partition(s) can be power-gated when not in use, and software should put VIC in power gate mode for any use case that does not make use of VIC. Software should follow the power gating/ungating in order to put VIC in PG mode, or take VIC out of PG mode.

15.5 VIC THI Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

15.5.1 NV_PVIC_THI_INCR_SYNCPT

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:16	R	0	Reserved
15:8	R/W	0	NV_PVIC_THI_INCR_SYNCPT_COND: 0: COND_IMMEDIATE (default) 1: COND_OP_DONE Indicates sync point condition at which THI has to return the index value back to Host1x. Following are the values of sync point conditions supported in THI: 8'h0: INCR_SYNCPT_0_COND_IMMEDIATE 8'h1: INCR_SYNCPT_0_COND_OP_DONE
7:0	R/W	0	NV_PVIC_THI_INCR_SYNCPT_INDX: 0: INDX_INIT (default) Indicates the sync point index value, THI will return this index value back to Host1x when the particular sync point condition is done.

15.5.2 NV_PVIC_THI_INCR_SYNCPT_ERR

COND_STATUS[COND] is set if the FIFO for COND overflows. This bit is sticky and will remain set until cleared. Cleared by writing 1.

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:4	R	0	Reserved
1	RW1C	0	NV_PVIC_THI_INCR_SYNCPT_ERR_COND_STS_OPDONE: 0: COND_STS_OPDONE_INIT (default) 1: COND_STS_OPDONE_CLEAR
0	RW1C	0	NV_PVIC_THI_INCR_SYNCPT_ERR_COND_STS_IMM: 0: COND_STS_IMM_INIT (default) 1: COND_STS_IMM_CLEAR

15.5.3 NV_PVIC_THI_CTXSW_INCR_SYNCPT

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:8	R	0	Reserved

Bit	R/W	Reset	Description
7:0	R/W	0	NV_PVIC_THI_CTXSW_INCR_SYNCPT_INDX: 0: INDX_INIT (default) Indicates the sync point index value, THI will return this index value back to Host1x when the CONTEXT SAVE/Restore operation is done.

15.5.4 NV_PVIC_THI_CTXSW

Context switch register. Should be common to all modules. Includes the current channel/class (which is writable by software) and the next channel/class (which the hardware sets when it receives a context switch).

Context switch works like this:

Any context switch request triggers an interrupt to the host and causes the new channel/class to be stored in NEXT_CHANNEL/NEXT_CLASS (see vmod/chexample). Software sees that there is a context switch interrupt and does the necessary operations to make the module ready to receive traffic from the new context. It clears the context switch interrupt and writes CURR_CHANNEL/CLASS to the same value as NEXT_CHANNEL/CLASS, which causes a context switch acknowledge packet to be sent to the host. This completes the context switch and allows the host to continue sending data to the module.

Context switches can also be pre-loaded. If CURR_CLASS/CHANNEL are written and updated to the next CLASS/CHANNEL before the context switch request occurs, an acknowledgment will be generated by the module and no interrupt will be triggered. This is one way for software to avoid dealing with context switch interrupts. Another way to avoid context switch interrupts is to set the AUTO_ACK bit. This bit tells the module to automatically acknowledge any incoming context switch requests without triggering an interrupt. CURR_* and NEXT_* will be updated by the module so they are always current.

Offset: 0x20 | Read/Write: R/W | Reset: 0x0000F800

Bit	R/W	Reset	Description
31:28	R/W	0	NV_PVIC_THI_CTXSW_NEXT_CHANNEL: 0: NEXT_CHANNEL_INIT (default) Indicates next requested channel of engine.
27:26	R	0	Reserved
25:16	R/W	0	NV_PVIC_THI_CTXSW_NEXT_CLASS: 0: NEXT_CLASS_INIT (default) Indicates next requested class of engine.
15:12	R/W	Fh	NV_PVIC_THI_CTXSW_CURR_CHANNEL: Fh: CURR_CHANNEL_INIT (default) Indicates current working channel of engine. Reset to invalid.
11	R	1	NV_PVIC_THI_CTXSW_AUTO_ACK: 1: AUTO_ACK_INIT (default) This bit tells the module to automatically acknowledge any incoming context switch requests without triggering an interrupt. CURR_* and NEXT_* will be updated by the module so they are always current.
10	R	0	Reserved
9:0	R/W	0	NV_PVIC_THI_CTXSW_CURR_CLASS: 0: CURR_CLASS_INIT (default) Indicates current working class of engine.

15.5.5 NV_PVIC_THI_CONT_SYNCPT_EOF

Offset: 0x28 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:9	R	0	Reserved
8	R/W	0	NV_PVIC_THI_CONT_SYNCPT_EOF_COND: 0: COND_INIT (default) Sync Point Condition Control: This bit can be used to enable/disable generation of continuous sync point increment. 1: Enable 0: Disable

Bit	R/W	Reset	Description
7:0	R/W	0	NV_PVIC_THI_CONT_SYNCPT_EOF_INDEX: 0: INDEX_INIT (default) Sync Point Counter Index: This parameter specifies the index of the sync point counter that are returned to host when continuous sync point is enabled (COND = ENABLE) and whenever an FRAME_DONE happens.

15.5.6 NV_PVIC_THI_METHOD0

There are two method registers METHOD0 and METHOD1

Offset: 0x40 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:12	R	0	Reserved
11:0	R/W	0	NV_PVIC_THI_METHOD0_OFFSET: 0X 0: OFFSET_INIT (default) This contains method ID which is to be sent to Falcon over method interface. THI waits for write to METHOD_DATA (0X011) register before triggering any write over Falcon method interface.

15.5.7 NV_PVIC_THI_METHOD1

Offset: 0x44 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:0	R/W	0	NV_PVIC_THI_METHOD1_DATA: 0: DATA_INIT (default) This contains method DATA which is to be sent to Falcon over method interface. Write to this register triggers write over Falcon method interface.

15.5.8 NV_PVIC_THI_INT_STATUS

Offset: 0x78 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:1	R	0	Reserved
0	RW1C	0	NV_PVIC_THI_INT_STATUS_FALCON_INT: 0: FALCON_INT_INIT (default) 1: FALCON_INT_CLEAR Implies if there is any pending Falcon interrupt corresponding to an error condition.

15.5.9 NV_PVIC_THI_INT_MASK

Offset: 0x7c | Read/Write: R/W | Reset: 0x00000001

Bit	R/W	Reset	Description
31:1	R	0	Reserved
0	R/W	1	NV_PVIC_THI_INT_MASK_FALCON_INT: 1: FALCON_INT_INIT (default) When set, this bit enables generation of interrupts corresponding to Falcon error conditions

15.6 VIC Falcon Registers

15.6.1 HOSTIF Miscellaneous Registers

15.6.1.1 NV_PVIC_FALCON_ITFEN

Offset: 0x1048 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:3	R	0	Reserved
2	R/W	0	NV_PVIC_FALCON_ITFEN_PRIV_POSTWR. Indicates whether to use a post write on the main priv interface. By default, all writes to the Control and Status Bus (CSB) from the main priv interface are non-posted to support error reporting. 0: PRIV_POSTWR_INIT (default) 0: PRIV_POSTWR_FALSE 1: PRIV_POSTWR_TRUE
1	R/W	0	NV_PVIC_FALCON_ITFEN_MTHDEN. Method interface enable. When set, allows the host to push methods into the method FIFO 0: MTHDEN_INIT (default) 0: MTHDEN_DISABLE 1: MTHDEN_ENABLE
0	R/W	0	NV_PVIC_FALCON_ITFEN_CTXEN. Context switch interface enable. When set, allows the context switch state machine to react to incoming context switch requests from the host. 0: CTXEN_INIT (default) 0: CTXEN_DISABLE 1: CTXEN_ENABLE

15.6.2 Falcon UCTL Registers

15.6.2.1 NV_PVIC_FALCON_CPUCTL

Offset: 0x1100 | Read/Write: R/W | Reset: 0x000000XX

Bit	R/W	Reset	Description
31:6	R	0	Reserved
5	R	Unknown	NV_PVIC_FALCON_CPUCTL_STOPPED: Indicates whether the CPU is currently in the stopped state. Falcon exits this state if a 1 is written to the STARTCPU bit or if an interrupt arrives on one of its 2 inputs and the corresponding IE bit in CSW is set. 1: STOPPED_TRUE 0: STOPPED_FALSE
4	R	Unknown	NV_PVIC_FALCON_CPUCTL_HALTED: Indicates whether the CPU is currently in the halted state. Falcon can only exit this state when a 1 is written to the STARTCPU bit. 1: HALTED_TRUE 0: HALTED_FALSE
3	RW1C	Unknown	NV_PVIC_FALCON_CPUCTL_HRESET: Set to TRUE to apply hard reset. This bit will auto-clear. Setting it FALSE has no effect. 1: HRESET_TRUE 0: HRESET_FALSE
2	RW1C	Unknown	NV_PVIC_FALCON_CPUCTL_SRESET: Set to TRUE to apply soft reset. This bit will auto- clear. Setting it FALSE has no effect. 1: SRESET_TRUE 0: SRESET_FALSE
1	RW1C	Unknown	NV_PVIC_FALCON_CPUCTL_STARTCPU: Set STARTCPU to TRUE to start CPU execution while in a HALTED state. If a start request is still pending, setting to FALSE will cancel the start request. Writing any value has no effect while the CPU is running. 1: STARTCPU_TRUE 0: STARTCPU_FALSE
0	RW1C	Unknown	NV_PVIC_FALCON_CPUCTL_IINVAL: Set to TRUE to mark all blocks in IMEM except block 0 as INVALID. This bit will auto-clear. Setting to FALSE has no effect. 1: IINVAL_TRUE 0: IINVAL_FALSE

15.6.2.2 NV_PVIC_FALCON_BOOTVEC

Offset: 0x1104 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:0	R/W	0	NV_PVIC_FALCON_BOOTVEC_VEC: Stores the initial execution start address of the CPU when it is first started after a reset. 0: VEC_INIT (default)

15.6.3 Falcon DMA Registers

15.6.3.1 NV_PVIC_FALCON_DMACTL

Offset: 0x110c | Read/Write: R/W | Reset: 0x000000XX

Bit	R/W	Reset	Description
31:7	R	0	Reserved
6:3	R	None	NV_PVIC_FALCON_DMACTL_DMAQ_NUM: Indicates valid request number at DMA request queue.
2:1	R	0	Reserved
0	R/W	1	NV_PVIC_FALCON_DMACTL_REQUIRE_CTX: When set to TRUE, a valid context must be loaded before any DMA request can be serviced. Pending requests without a valid current context remain pending, and do not prevent the engine from reporting idle. When clear, DMA requests are serviced regardless of the current context. Once a request is issued, it must complete before the engine can report idle, as needed for example to process WFI context switch requests. 1: REQUIRE_CTX_INIT (default) 1: REQUIRE_CTX_TRUE 0: REQUIRE_CTX_FALSE

15.6.3.2 NV_PVIC_FALCON_DMATRFBASE

Offset: 0x1110 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:0	R/W	0	NV_PVIC_FALCON_DMATRFBASE_BASE: 0: BASE_INIT (default)

15.6.3.3 NV_PVIC_FALCON_DMATRFMOFFS

IMEM/DMEM offset for the transfer.

Offset: 0x1114 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:16	R	0	Reserved
15:0	R/W	0	NV_PVIC_FALCON_DMATRFMOFFS_OFFS: 0: OFFS_INIT (default)

15.6.3.4 NV_PVIC_FALCON_DMATRFCMD

Offset: 0x1118 | Read/Write: R/W | Reset: 0x0000XXXX

Bit	R/W	Reset	Description
31:15	R	0	Reserved
14:12	R/W	Unknown	NV_PVIC_FALCON_DMATRFCMD_CTXDMA:
11	R	0	Reserved

Bit	R/W	Reset	Description
10:8	R/W	Unknown	NV_PVIC_FALCON_DMATRFCMD_SIZE: 0: SIZE_4B 1: SIZE_8B 2: SIZE_16B 3: SIZE_32B 4: SIZE_64B 5: SIZE_128B 6: SIZE_256B
7:6	R	0	Reserved
5	R/W	Unknown	NV_PVIC_FALCON_DMATRFCMD_WRITE: 1: WRITE_TRUE 0: WRITE_FALSE
4	R/W	Unknown	NV_PVIC_FALCON_DMATRFCMD_IMEM: 1: IMEM_TRUE 0: IMEM_FALSE
3:2	R	0	Reserved
1	R	Unknown	NV_PVIC_FALCON_DMATRFCMD_IDLE: Indicates that the DMA engine is still busy with a transfer or has more transfers pending in the queue. 1: IDLE_TRUE 0: IDLE_FALSE
0	R	Unknown	NV_PVIC_FALCON_DMATRFCMD_FULL: Indicates that the DMA request queue is full and a valid request is still needed to move into the queue. 1: FULL_TRUE 0: FULL_FALSE

15.6.3.5 NV_PVIC_FALCON_DMATRFFBOFFS

Frame buffer (FB) offset for the transfer.

Offset: 0x111c │ Read/Write: R/W │ Reset: 0x00000000

Bit	R/W	Reset	Description
31:0	R/W	0	NV_PVIC_FALCON_DMATRFFBOFFS_OFFS: 0: OFFS_INIT (default)

CHAPTER 16: CPU COMPLEX

The NVIDIA® Tegra® X1 processor CPU complex contains two multi-core CPU clusters. Each cluster contains four identical CPUs (four Cortex®-A57 CPUs in one and four Cortex-A53 CPUs in the other). All of the CPUs include the NEON Media Processing Engine. Each cluster has its own L2 cache which is shared with all cores of the same cluster.

Note: *The CPU subsystem supports a switch-cluster mode meaning that only one of the clusters can be active at any given time*

16.1 Cortex-A57 CPU Cluster

All four CPUs in Cluster 0 are identical Cortex-A57 implementations of ARM's v8 architecture. The CPU features include:

- Full implementation of ARMv8 architecture
- Superscalar, variable-length, out-of-order pipeline
- Dynamic branch prediction with Branch Target Buffer (BTB) and Global History Buffer RAMs, a return stack, and an indirect predictor
- 48-entry fully-associative L1 instruction TLB with native support for 4 KB, 64 KB, and 1 MB page sizes.
- 32-entry fully-associative L1 data TLB with native support for 4 KB, 4 KB and 1 MB pages sizes.
- 4-way set-associative unified 1024-entry Level 2 (L2) TLB in each processor
- Fixed 48 KB L1 instruction cache and 32 KB L2 data cache
- A 2 MB L2 cache shared by all the Cortex-A57 cores
- Embedded Trace Microcell (ETM) based on the ETMv4 architecture
- Performance Monitor Unit (PMU) based on the PMUv3 architecture
- Cross Trigger Interface (CTI) for multiprocessor debugging
- Cryptographic Engine for crypto function support
- Interface to an external Generic Interrupt Controller (vGIC-400)
- Support for power management with multiple power domains
- Cortex-A57 Revision r1p1--with the ECO fix for ARM bug # 829520 (current version at the time of writing)

Further information on the Cortex-A57 CPU is available in documentation ARM has published on their website. This information includes the Technical Reference Manual and Software Developers' Errata Notice.

16.2 Cortex-A53 CPU Cluster

All four CPUs in the second cluster are identical Cortex-A53 implementations of ARM's v8 architecture. The CPU features include:

- Full implementation of ARMv8 architecture instruction set
- In-order pipeline with dual-issue support for most instructions
- Fixed 32 KB L1 instruction cache and 32 KB L1 data cache
- A 512 KB L2 cache shared by all the Cortex-A53 cores. It provides coherency across all the Cortex-A53 cores.
- Embedded Trace Microcell (ETM) based on the ETMv4 architecture

- Performance Monitor Unit (PMU) based on the PMUv3 architecture
- Cross Trigger Interface (CTI) for multiprocessor debugging
- Cryptographic Engine for crypto function support
- Interface to an external Generic Interrupt Controller (vGIC-400)
- Support for power management with multiple power domains
- Cortex-A53 Revision: r0p2 (current version at the time of writing)

Further information on the Cortex-A53 CPU is available in documentation ARM has published on their website. This information includes the Technical Reference Manual and Software Developers' Errata Notice.

16.3 MSELECT Registers

16.3.1 MSELECT_CONFIG_0

Offset: 0x0 I Read/Write: R/W I Reset: 0x07ff4020 (0bx00001111111111110100000000100000)

Bit	Reset	Description
30	0x0	WRAP_TO_INCR_SLAVE3
29	0x0	WRAP_TO_INCR_SLAVE2 (GPU)
28	0x0	WRAP_TO_INCR_SLAVE1 (PCIe)
27	0x0	WRAP_TO_INCR_SLAVE0 (APC)
26	0x1	UNSUPP_SIZE_ERR_EN
25	0x1	ERR_RESP_EN_SLAVE2 (GPU)
24	0x1	ERR_RESP_EN_SLAVE1 (PCIe)
23	0x1	WRITE_TIMEOUT_EN_SLAVE3
22	0x1	READ_TIMEOUT_EN_SLAVE3
21	0x1	WRITE_TIMEOUT_EN_SLAVE2 (GPU)
20	0x1	READ_TIMEOUT_EN_SLAVE2 (GPU)
19	0x1	WRITE_TIMEOUT_EN_SLAVE1 (PCIe)
18	0x1	READ_TIMEOUT_EN_SLAVE1 (PCIe)
17	0x1	WRITE_TIMEOUT_EN_SLAVE0 (APC)
16	0x1	READ_TIMEOUT_EN_SLAVE0 (APC)
15	0x0	SAFE_MODE_MASTER1
14	0x1	ENABLE_GPU_APERTURE
13	0x0	ENABLE_APB_APERTURE
12:6	0x0	RESERVED2
5	0x1	ENABLE_PCIE_APERTURE
4:1	0x0	RESERVED1
0	0x0	SAFE_MODE_MASTER0

To allow WRAP burst type transactions for PCIe and GPU on the MMIO path:

Set bits 24:25 in MSELECT_CONFIG_0 register to 0bx00 in order to disable unsupported type check.

Set bits 29:28 in MSELECT_CONFIG_0 register to 0bx11 in order to enable WRAP type and its conversion to INCR type.

16.3.2 MSELECT_ERROR_STATUS_0

1	CLEAR	WRITE_TIMEOUT_SLAVE0: i=0 0 = CLEAR 1 = SET
0	CLEAR	READ_TIMEOUT_SLAVE0: i=0 0 = CLEAR 1 = SET

CHAPTER 17: FLOW CONTROLLER

The flow controller provides the sequencing of hardware-controlled CPU power states for the main CPU complex and the ARM7 coprocessor (also known as BPMP-Lite, and historically AVP or COP).

17.1 Flow Controller Sequences

The flow controller orchestrates several complex sequences. The following subsections describe those sequences in detail.

17.1.1 CPU Power Gating/Ungating Sequence

The Cortex-A57 processor's power-gating can be triggered by either i) a direct register write to PMC or ii) interacting with the flow controller. This section describes the power-gating sequence via flow-controller interaction.

The flow controller interfaces with the Processors, PMC, and CAR to implement power-gating on/off hardware-sequence. The power-gating controller is in the PMC, while clock and reset controls are in the CAR.

17.1.1.1 CPU Power-Gating (Power OFF) Sequence

- [SW-CPU] Prepare processor (flush CPU L1$, context save, set up flow controller) for power-gating
- [SW-CPU] Execute WFI to make sure there is no outstanding processor transaction
- [HW-CPU] Assert *STANDBYWFI* to the flow controller
- [HW-Flow] If INTERCEPT_ENTRY_PG_COREx_ENABLE is set, the flow controller generates an interrupt to LIC. The interrupt is routed to ARM7/BPMP-Lite. The flow controller waits for FC_SEQUENCE_INTERCEPT.INTERRUPT_PENDING_COREx to be cleared.
- [HW-Flow] Assert flow2car_*_rst
  - This is not used in power gate sequence when powergate_enable is high
  - When power-gate enable is "0", the CAR uses this to assert CPU reset
- [HW-Flow] Request the PMC (by asserting flow2pmc_req and associated bus) to power-off the CPU
- [HW-PMC] Assert the clamp control signal. This goes to ccplex and also goes to the CAR.
- [HW-CAR] Assert CPU reset and reset the CPU clock
  - [HW-CPU] Stop CPU clock
- [HW-CAR] Ack PMC to indicate CPU clock is stopped
- [HW-PMC] Power off CPU (assert CPU PG-enables)
- [HW-PMC] Clear PWRGATE_STS register bit. This is to indicate that CPU is power-gated.
- [HW-PMC] Ack to the flow controller to confirm power-off (by asserting pmc2flow_ack)

Note: *After receiving ack from the PMC, the flow controller must not issue a new request to the PMC until pmc2flow_ack goes idle.*

- [HW-Flow] Deassert flow2pmc_req (after seeing the Ack)
- [HW-PMC] Deassert Ack (after seeing request deassertion)
- [HW-Flow] Do not start another request until Ack goes down

17.1.1.2 CPU Power-Ungating (Power ON) Sequence

The generic CPU power-ungating (power OFF) sequence is described below. The specific details of main CPU (Cortex-A15) are described in their respective power-gating sections.

- [HW-Flow] After detecting wake up condition
- [HW-Flow] If INTERCEPT_EXIT_PG_COREx_ENABLE is set, The flow controller generates an interrupt to LIC. The interrupt is routed to ARM7/BPMP-Lite. The flow controller waits on FC_SEQUENCE_INTERCEPT.INTERRUPT_PENDING_COREx to be cleared by the BPMP-Lite through a register write.
  - This sequence is applicable to the main CPU (Cortex-A57 or Cortex-A9) core only.
- [HW-Flow] Request PMC to power-on CPU (by asserting flow2pmc_req and associated bus)
- [HW-PMC] Power-on the CPU (deassert CPU PG-enables)
- [HW-PMC] Set PWRGATE_STS register bit. This indicates that the CPU is power-ungated
- [HW-PMC] Ack flow controller (by asserting pmc2flow_ack) that CPU is powered on
- [HW-Flow] Deassert flow2car_*_rst to CAR
- [HW-CAR] Request the CPU to ungate the CPU clock (by deasserting car2ce*_cke)
- [HW-CPU] Ungate the CPU clock
- [HW-CAR] Request the PMC to remove CPU clamp (by asserting car2pmc_ack)
  - This makes sure that the clock gets ungated well ahead of reset deassertion
- [HW-PMC] Removes the clamping (by deasserting pmc2ce*_clamp)
  - This goes to the CPU and also to the CAR
- [HW-PMC] Ack the flow controller (by deasserting pmc2flow_ack)
- [HW-CAR] Deasserts reset
- [SW-CPU] CPU fetches code from reset vector.

Note: *Note all of the Cortex-A57 CPUs share one reset-vector register (in the EVP registers).*

17.1.2 Non-CPU Power Gating/Ungating Sequence

From a software perspective, non-CPU power gating/ungating is done as part of CPU power gating/ungating request. The flow controller issues a separate request (to the PMC) for power-gating CPU and non-CPU domains. The main reason is that the PMC can only sequence one power domain at a time, so the flow controller serializes requests on behalf of the PMC. From the flow controller hardware perspective, the sequence for non-CPU domain power gating is similar to CPU domain power gating/ ungating which is described in above sections.

As part of the non-CPU power gating sequence, prior to power gating the non-CPU logic (L2, etc.), the flow controller will need to flush/invalidate the L2 cache through the L2FLUSHREQ/L2FLUSHDONE interface.

17.1.3 CPU Rail Gating/Ungating Sequence

This section describes CPU rail gating/ungating with the help of the flow controller.

From a software perspective, the CPU rail is powered on/off as part of CPU power-gating on/off request. The flow controller issues a separate request (to the PMC) for CPU power gating/ungating and CPU rail gating/ungating. The main reason is that the PMC can only sequence one power-domain at a time, so the flow controller serializes requests on behalf of the PMC. From flow controller hardware perspective, the sequence for CPU rail gating is similar to individual CPU power gating, which is described in the above sections. However, as part of CPU rail-ungating, the flow controller also triggers RAM re-repair as described below.

17.1.3.1 CPU Rail Ungating Steps

- [HW-Flow] Request the PMC to power-on the CPU rail
- [HW-Flow] Wait for PMC acknowledgment
- [HW-Flow] Request the Re-shift block (also known as the re-repair block) to re-repair all of the segments of CPU repair chain
  - [HW-Reshift] Performs repair of all segments of CPU chain in parallel
- [HW-Flow] Wait for re-repair acknowledgments (from all segments)
- [HW-CAR] Deassert CPU cluster0 reset

17.1.3.2 Cluster RAM Re-Repair

At (cold or warm) boot power-up of the CPU rail, software powers up the CPU rail (by direct register writes to the PMC or the PMIC), and triggers RAM repair by writing to the RAM_REPAIR[REQ] register of the flow controller. After that software polls RAM_REPAIR[STS] to ensure that the repair is done.

After boot power-up of the CPU rail, whenever the CPU rail is powered up by the flow controller, the flow-controller hardware also requests cluster RAM re-repair, and ensures that the repair is completed.

The re-repair request and ack signals are per segment of the CPU repair chain. The request, once asserted (high), must remain high for as long as it does not receive the corresponding ack signal.

17.1.4 CC4 Power State Sequence

The following is a high-level description of the CC3 HVC and Retention entry and exit sequences. A few important items to highlight:

- Entry and Exit from CC3 HVC is entirely driven by fixed-function hardware.
- Entry and Exit from CC4 Retention is aided by BPMP-Lite processor.
- The cluster always enters CC3 HVC state prior to entering Retention state.

Entry Sequence

- [SW-CPU] Software executes WFI on a given core to bring the core into idle state (C1 or C6)
  - Once the core asserts STANDBYWFI for the specific core, a hardware-based counter (in the flow controller) is initialized to CC4_CORE<x>_CTRL.CORE_IDLE_TIMER and starts counting down.
- [HW-CPU] The last core standing asserts STANDBYWFI indicating that it is idle and will enter an idle power state (C1 or C6).
  - As with all the other cores, once the core asserts STANDBYWFI for the specific core, a hardware-based counter (in the flow controller) is initialized to CC4_CORE<x>_CTRL.CORE_IDLE_TIMER and starts counting down.
  - If PG (C6) is requested, the core is allowed to enter and complete power-gating sequence.
- For the cores that are allowed to participate in the decision on whether to enter HVC (i.e., CC4_CORE<x>_CTRL.TIMER_COUNTDOWN_VALID is set), if any CC4_CORE<x>_CTRL.CORE_HVC_ENABLE is not set, then the cluster does not enter HVC and remains in CC1.
- If the min(CC4_CORE<x>_CTRL.CORE_IDLE_TIMER) is greater than CC3_HVC_CONTROL. HVC_RES_TIME_THRESHOLD, then the cluster is allowed to enter CC3 HVC.
- [HW-Flow] The flow controller checks the status of the CPUQACTIVE signal, one per core. If CPUQACTIVE is de-asserted, the flow controller asserts the CPUQREQ signal requesting a transition to the “retention” state for each core. The flow controller does the same with the L2 cache.
  - Note that ARM refers to the CPUQx interface as “retention” interface

- Note that the flow controller is required to handshake only with the cores that are in C1. No handshake is required (or possible) for cores that are in WFI and power gated (=C6). The flow controller is fully aware which cores have been power-gated up to this point.
- [HW-CPU] If cores and L2 cache are still idle, they accepts the request and assert CPUQACCEPTn and L2QACCEPTn signal, otherwise they assert the CPUQDENYn and L2QDENYn signals, respectively.
- [HW-Flow] If denied, the flow controller de-asserts CPUQREQ and L2QREQ signals and retries the previous two steps again after the programmable time period
  - CC3_HVC_RETRY. THRESHOLD represents the retry interval. The down-counting counter initialized to this threshold runs on SCLK
- [HW-Flow] If CPUQACCEPTn and L2QACCEPTn are asserted, the flow controller is free to proceed with the CC4 entry sequence.
- [HW-Flow] If FC_SEQUENCE_INTERCEPT. INTERCEPT_HVC_ENABLE set, generate an interrupt and wait on FC_SEQUENCE_INTERCEPT. HVC_INTERRUPT_PENDING to be cleared.
  - BPMP can potentially clock gate the secondary clocks coming into VDD_CPU so that they do not become a limiting factor to Vmin.
- [HW-Flow] The flow controller asserts the Skipper3 override signal
  - This is a request to SoC Therm to initiate pulse skipping to scale down the CPU frequency.
  - SoC Therm uses pre-configured skipper control values
  - flow2soctherm_skipper3_override is kept asserted
- [HW-Flow] The flow controller triggers the CL_DVFS logic via a dedicated interface. It asserts the flow2cldfvs_override signal.
  - CL_DVFS transitions to open-loop mode. Voltage control is disabled.
- [HW-Flow] The flow controller issues a request to the PMC to lower the voltage
  - This represents a new CPU_ID encoding on the FC to PMC (VDD_CPU) rail control interface
- [HW-PMC] The PMC disables the TSOC polling/sensing on VDD_CPU rail
- [HW-PMC] The PMC requests VDD_LOW from PMIC via CPU_PWR_REQ interface
  - This assumes that VDD_LOW in the PMIC has properly been set to Vmin by software prior to the start of the HVC sequence
- [HW-PMC] The PMC notifies the flow controller that the rail voltage change request has been issued
- [HW-FC] The flow controller enters CC4 HVC state
  - The flow controller sets CC3_HVC_CONTROL.CC3_HVC_ENTERED to indicate that HVC state achieved
  - The flow controller monitors the CPUQACTIVE and L2QACTIVE signals for activity
- [HW-FC] Check to see if (INTERCEPT_ENTRY_CC4_ENABLED)
  - If INTERCEPT_ENTRY_CC4_ENABLED is not set, the flow controller does not attempt to enter the Retention state and continues to monitor CPUQACTIVE and L2QACTIVE signals for activity
- For the cores that are allowed to participate in the decision on whether to enter Retention (i.e., CC4_CORE<x>_CTRL.TIMER_COUNTDOWN_VALID is set), if any CC4_CORE<x>_CTRL.CORE_RET_ENABLE is not set, then the cluster does not enter the Retention state and remains in HVC.
- If the min(CC4_CORE<x>_CTRL.CORE_IDLE_TIMER) is greater than CC4_RET_CONTROL. RET_RES_TIME_THRESHOLD, then the cluster is allowed to enter CC4 Retention.
- [HW-FC] If the above conditions are met, then the flow controller moves to the next step. Otherwise, the flow controller enters a standby state monitoring the CPU's xQACTIVE signals:
- [HW-FC] The flow controller issues an interrupt to LIC

  - LIC routes the interrupt to ARM7 (BPMP-Lite)
- At this point, ARM7/BPMP can attempt to bring the CPU into CC4 Retention (VDD_CPU = Vret)
- BPMP-Lite takes control of the sequence and determines in the background whether to enter CC4_RETENTION
- [BPMP-Lite] If a pending interrupt in FC (CC4_FC_STATUS.INT_STATUS), BPMP-Lite aborts the sequence to enter CC4 Retention
- [BPMP-Lite] Disable the LIC-GIC interface by writing to the LIC state register. Disable legacy IRQ and FIQ in the flow controller
- [BPMP-Lite] Instruct the flow controller to not process further interrupts
- Set CC4_FC_STATUS.CC4_WAKE_MASK register
- [BPMP-Lite] Wait for a fixed delay. This delay will make sure that any in flight interrupt is seen by the flow controller.
- [BPMP-Lite] Check the pending interrupt in the flow controller (CC4_FC_STATUS.INT_STATUS), BPMP-Lite aborts the sequence to enter CC4 Retention
- [BPMP-Lite] Enables CPU clamp signals. Disables clock to the CPU.
- [BPMP-Lite] Writes 0x0 to the CC3_HVC_DFLL_CTRL_MODE register in the CL_DVFS. The flow controller keeps the flow2cldvfs_override signal asserted. This write disables CL_DVFS (as long as override signal is kept asserted).
- [BPMP-Lite] Sets VDD_LOW in the PMIC to Vret
- [BPMP-Lite] Clears the interrupt in the flow controller by writing to CC3_HVC_CONTROL.INTERRUPT_PENDING.
  - This step makes sure that BPMP stays uninterrupted through the retention entry sequence.

Exit Sequence

- [HW-CPU] Assertion of CPUQACTIVE (or L2QACTIVE) is an indication that the CPU is requesting exit from the HVC state. Note that if the Retention state has been entered, the CPU and L2 are inactive (= no running clock). The flow controller will need to also monitor wake events from LIC or SoC.
- [HW-Flow] If CC4_WAKE_MASK is set, we are coming out of the Retention state (not CC4 Vmin). If CC4_FC_STATUS.CC4_WAKE_MASK is set, the flow controller issues an interrupt.
- [HW-Flow] Waits for CC4_FC_STATUS.CC4_WAKE_MASK to be cleared by BPMP-Lite
- [BPMP-Lite] Updates the VDD_LOW (in the PMIC) to Vmin.
- [BPMP-Lite] Writes 0x1 to the FC_DFLL_CTRL_MODE register. The flow controller keeps the override signal to CLDVFS asserted. Enables CL_DVFS and puts it into open loop mode.
- [BPMP-Lite] Waits for the timer to allow for voltage ramp up. Turns on CCPLEX clocks. De-asserts the clamps. Enables the LIC->GIC interface. Clears the CC4_FC_STATUS.CC4_WAKE_MASK register in the flow controller.
- [HW-Flow] De-asserts the SoC Therm override control signal
- [HW-Flow] The flow controller requests CPU rail power up from the PMC
- [HW-PMC] Asserts CPU_PWR_REQ from the PMIC. Wait on timer to ensure that the rail is up.
- [HW-PMC] Enable TSOSC
- [HW-PMC] Send Ack back to the flow controller as a response to the earlier CPU rail up request.
- [HW-Flow] If coming out of CC4 HVC only, if FC_SEQUENCE_INTERCEPT. INTERCEPT_HVC_ENABLE set, generate an interrupt and wait on FC_SEQUENCE_INTERCEPT. HVC_INTERRUPT_PENDING to be cleared.
  - The BPMP will ungate the secondary clocks into VDD_CPU, if they were gated in the first place at entry into the CC3_HVC sequence.
- [HW-FC] De-asserts the override signal to CL_DVFS. The CL_DVFS goes back to closed-loop mode. Voltage control is enabled.

17.2 Flow Controller Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

In the Flow Controller register descriptions, CPU refers to CPU0, and BPMP-Lite refers to the ARM7 coprocessor.

The EVENTS register is replicated per core, once for BPMP-Lite, four times for the CPU cores.

The fields and enums have the following interpretation:

- MODE defines how the flow controller logic operates; the reset value is 0x0 for CPU0 and BPMP-Lite (does nothing) and 0x2 for CPU1, 2, 3 (WAITEVENT). This is related to the default behavior of the reset generator.
- Enumerated values for the field MODE are defined below.

Field Mode	Enumerated Value	Description
FLOW_MODE_NONE	0	No flow control
FLOW_MODE_RUN_AND_INT	1	Keep running but generate interrupt when event conditions met (not used)
FLOW_MODE_WAITEVENT	2	Stop running until event conditions met
FLOW_MODE_WAITEVENT_AND_INT	3	Same as FLOW_MODE_WAITEVENT but generate an interrupt when resumed (not used)
FLOW_MODE_STOP_UNTIL_IRQ	4	Stop until an interrupt controller interrupt occurs
FLOW_MODE_STOP_UNTIL_IRQ_AND_INT	5	Same as FLOW_MODE_STOP_UNTIL_IRQ but generate another interrupt when resumed (not used)
FLOW_MODE_STOP_UNTIL_EVENT_AND_IRQ	6	Stop until event conditions met AND an interrupt controller interrupt occurs

---

Note: *There is no enum for 7.*

The rest of the fields define which conditions will be taken into account to restart a halted processor.

There are two types of events:

- Counted events: Decrement the field called ZERO. Flow controller resumes when this counter reaches 0
- Activity events: The flow controller resumes when the activity occurs, no counting

17.2.1 FLOW_CTLR_HALT_CPU0/1/2/3_EVENTS_0

HALT_CPUx_EVENTS_0 offsets are as follows:

FLOW_CTLR_HALT_CPU0_EVENTS_0: Offset: 0x0

FLOW_CTLR_HALT_CPU1_EVENTS_0: Offset: 0x14

FLOW_CTLR_HALT_CPU2_EVENTS_0: Offset: 0x1c

FLOW_CTLR_HALT_CPU3_EVENTS_0: Offset: 0x24

Each of the four blocks has the same registers and bits.

Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:29	0x0	MODE: 0 = FLOW_MODE_NONE 1 = FLOW_MODE_RUN_AND_INT 2 = FLOW_MODE_WAITEVENT 3 = FLOW_MODE_WAITEVENT_AND_INT 4 = FLOW_MODE_STOP_UNTIL_IRQ 5 = FLOW_MODE_STOP_UNTIL_IRQ_AND_INT 6 = FLOW_MODE_STOP_UNTIL_EVENT_AND_IRQ Bit 31: Halt = Halt until an event (e.g., interrupt). This bit is set by software and cleared by hardware when wake event is received by hardware. Bit 30: Wait = Wait until event counter counts down to zero. This bit is set by software and cleared by hardware when wait event is observed by hardware. Bit 29: Sync = This bit causes the NEXT Flow Controller reg read to stall the processor until the wake event occurs (Obsolete for CPUs. May be used for COP).
28	0x0	JTAG: Resume on JTAG activity
27	0x0	SCLK: Resume on Nth SYSCLK cycle ticks
26	0x0	X32K: Resume on Nth X32K clock input ticks
25	0x0	uSEC: Resume on Nth µs clock ticks
24	0x0	mSEC: Resume on Nth ms clock ticks
23	0x0	SEC: Resume on Nth second RTC clock ticks
22	0x0	X_RDY: Resume on Nth XIO.RDY Ext. IO Ready events
21:20	0x0	SMP31/0: Resume on Nth SMP.3[1,0] Semaphore set events
19:16	0x0	XRQ_D/C/B/A: Resume on Nth XRQ.[D,C,B,A] External Trigger events
15:12	0x0	OBE/F,IBE/F: Resume on Nth [O,I]B[E,F] [Outbox, Inbox] [Empty, Full] Events
11	0x0	LIC_IRQn: Resume on Legacy Interrupt Controller IRQ interrupt For CPU0, wake on cpu_nirq0 For CPU1, wake on cpu_nirq1 For CPU2, wake on cpu_nirq2 For CPU3, wake on cpu_nirq3 For CPU4, wake on the cpu_nirq which corresponds to CPU4 CPU-ID.
10	0x0	LIC_FIQn: Resume on Legacy Interrupt Controller FIQ interrupt. See LIC_IRQn for the description of <n>.
9	0x0	GIC_IRQn: Resume on MPCore GIC IRQ interrupt For CPU0, wake on MPCore nirq0 For CPU1, wake on MPCore nirq1 For CPU2, wake on MPCore nirq2 For CPU3, wake on MPCore nirq3 For CPU4, wake on MPCore_LP nirq.
8	0x0	GIC_FIQn: Resume on MPCore GIC FIQ interrupt. See GIC_IRQn for the description of <n>.
7:0	0x0	ZERO: Initialized then decremented. Note: If more than one event is enabled, the event counter will decrement based on an OR condition of enabled events.

17.2.2 FLOW_CTLR_HALT_COP_EVENTS_0

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description

8	0x0	GIC_FIQ
7:0	0x0	ZERO

17.2.3 FLOW_CTLR_CPU0/1/2/3_CSR_0

The CPU_CSR registers are replicated for each CPU cores. They define additional characteristics of the flow controller linked to CPU cores, especially the interaction of the flow controller with power management functions. The LP1 state is normally entered and exited via side effects of the flow controller operation.

All fields of the CPU_CSR register have an initial value of 0.

FLOW_CTLR_CPUx_CSR_0 offsets are as follows:

FLOW_CTLR_CPU0_CSR_0: Offset: 0x8

FLOW_CTLR_CPU1_CSR_0: Offset: 0x18

FLOW_CTLR_CPU2_CSR_0: Offset: 0x20

FLOW_CTLR_CPU3_CSR_0: Offset: 0x28

Each of the four blocks has the same registers and bits.

Read/Write: R/W │ Reset: 0xXXXX0000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	R/W	Reset	Description
27:24	RO	X	PWR_STATE: Current state of the PowerGate State Machine
23	RO	X	WAIT_EVENT: CPU is waiting, wake up is via an event
22	RO	X	HALT: CPU is halted – This bit is asserted when STANDBYWFI is asserted.
21	RO	X	P2F_ACK: pmc2flow_ack signal, this is the same signal for all CPUs
20	RO	X	F2P_PWRUP: flow2pmc_pwrup, this is the same signal for all CPUs
19	RO	X	F2P_REQ: flow2pmc_req valid, this is the same signal for all CPUs
17	RO	X	F2C_MPCORE_RST: TRUE when Requesting Reset of MPCore
15	RW	0x0	INTR_FLAG: TRUE when Interrupt is Active -- Write-1-to-Clear
14	RW	0x0	EVENT_FLAG: TRUE when Event is Active -- Write-1-to Clear

Bit	R/W	Reset	Description
13:12	RW	0x0	ENABLE_EXT: If ENABLE is TRUE, then this specifies what to power off. 00b: PowerGate CPU only. 01b: PowerGate CPU and non-CPU (note, this option must be used only when last CPU is being power-gated) 10b: PowerGate CPU and turn CPU rail off (note, this option is valid for cluster0 CPU, and must be used only when last CPU is being power-gated). 11b: PG Emulation. Note, this option is for CPU-only PG emulation except for cluster-switch case (i.e., with SWITCH_CLUSTER=1) in which emulation applies to all PG steps of source cluster. In PG emulation, PG partition is reset but not power-gated.
11:8	RW	0x0	WAIT_WFI_BITMAP: All cores indicated in bitmap must be in STANDBY_WFI before CPU PowerGating.
7:4	RW	0x0	WAIT_WFE_BITMAP: All cores indicated in bitmap must be in STANDBY_WFE before CPU PowerGating. This is deprecated and shouldn't be used.
3	RW	0x0	IMMEDIATE_WAKE: If set, CPU is powered up immediately (without waiting for int or event)
2	RW	0x0	SWITCH_CLUSTER: If set, the active cluster will be switched when all indicated CPU reach STANDBY_WFI. This bit self clears once the cluster switch sequence is completed.
1	RW	0x0	EVENT_ENABLE: Generates an event when the flow controller exits the halted state
0	RW	0x0	ENABLE: PowerGate Enable. STANDBYWFx causes power-gating based on ENABLE_EXT values. Note 1: Software sets this bit to '1' for requesting CPU power-gating. CPU is power-gated based on the value of ENABLE_EXT field. Note 2: This bit is set by software and cleared by hardware (when power-gating sequence is completed).

17.2.4 FLOW_CTLR_COP_CSR_0

BPMP-Lite Control/Status for Interrupts

R/W addr=6000:700c

Offset: 0xc │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0xxxxxxxxxxxxxxx)

Bit	Reset	Description
15	0x0	INTR_FLAG: TRUE when Interrupt is Active -- Write-1-to-Clear

17.2.5 FLOW_CTLR_XRQ_EVENTS_0

These events are not used as flow controller wake events.

XRQ Event Detect Selector Register

Offset: 0x10 │ Read/Write: R/W │ Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:24	0x0	XRQ_D7_XRQ_D0: Setting a bit to 1 enables event triggering for the corresponding bit in GPIO port D. The assertion level is determined by GPIO_INT.LVL.D. If more than one XRQ.D bit is set, the events are ORed together. The resultant event is enabled by setting the XRQ.D bit in the HALT_CPU.EVENTS or HALT_COP.EVENTS registers.
23:16	0x0	XRQ_C7_XRQ_C0: Setting a bit to 1 enables event triggering for the corresponding bit in GPIO port C. The assertion level is determined by GPIO_INT.LVL.C. If more than one XRQ.C bit is set, the events are ORed together. The resultant event is enabled by setting the XRQ.C bit in the HALT_CPU.EVENTS or HALT_COP.EVENTS registers.
15:8	0x0	XRQ_B7_XRQ_B0: Setting a bit to 1 enables event triggering for the corresponding bit in GPIO port B. The assertion level is determined by GPIO_INT.LVL.B. If more than one XRQ.B bit is set, the events are ORed together. The resultant event is enabled by setting the XRQ.B bit in the HALT_CPU.EVENTS or HALT_COP.EVENTS registers.
7:0	0x0	XRQ_A7_XRQ_A0: Setting a bit to 1 enables event triggering for the corresponding bit in GPIO port A. The assertion level is determined by GPIO_INT.LVL.A. If more than one XRQ.A bit is set, the events are ORed together. The resultant event is enabled by setting the XRQ.A bit in the HALT_CPU.EVENTS or HALT_COP.EVENTS registers.

17.2.6 FLOW_CTLR_CLUSTER_CONTROL_0

This register is reserved.

Offset: 0x2c │ Read/Write: R/W │ Reset: 0x04004000 (0b00000100000000000001000000xxxxxxx0)

Bit	Reset	Description
31:20	0x40	POST_SWITCH_DELAY
19:8	0x40	PRE_SWITCH_DELAY
0	0x0	ACTIVE

17.2.7 FLOW_CTLR_CPU_PWR_CSR_0

Offset: 0x38 │ Read/Write: R/W │ Reset: 0x000001XX (0bxxxxxxxxxxxxxxxxx00000001xxxx0xx0)

Bit	R/W	Reset	Description
15	RW	0x0	DBG_STS_EN:
14:13	RW	0x0	DBG_C1NC_STS:
12:11	RW	0x0	DBG_C0NC_STS:
10:9	RW	0x0	DBG_RAIL_STS:
8	RW	0x1	CPU_RG_CFG: If this bit is set, then the flow controller would initiate last-CPU PG (along with CPU RG (rail-gating) or non-CPU PG) only when other 3 CPUs are already power-gated. This is primarily for debug purposes. 0 = DISABLE 1 = ENABLE
7:6	RO	X	C1NC_STS: Hardware updates this register based on the current status of the C1NC partition. Before requesting a power-off (or on) request, flow controller updates this status to "in the process" status. Note that the flow controller requests C1NC power on/off based on this register value or PMC power gate-status of C1NC depending upon the USE_FLOW_STS register. 0 = PARTITION_OFF 1 = PG_IN_PROGRESS 2 = PU_IN_PROGRESS 3 = PARTITION_ON
5:4	RO	X	C0NC_STS: hardware updates this register based on the current status of the C0NC partition. Before requesting a power-off (or on) request, flow controller updates this status to "in the process" status. Note, flow controller requests C0NC power on/off based on this register value or PMC pwrgate-status of C0NC depending upon USE_FLOW_STS register. 0 = PARTITION_OFF 1 = PG_IN_PROGRESS 2 = PU_IN_PROGRESS 3 = PARTITION_ON
3	RW	0x0	USE_FLOW_STS:If this is set (=1), then the flow controller will use C0NC_STS/ C1NC_STS/ RAIL_STS bits to determine whether to power-gate C0NC/C1NC/CRAIL domains. If this bit is clear (=0), then the flow controller will use the PMC powergate-status of C0NC/C1NC/CRAIL to determine whether to power-gate the C0NC (and C1NC) domains. In either case, the C0NC_STS/C1NC_STS/RAIL_STS fields are updated in the same way.
2:1	RO	X	RAIL_STS: Hardware updates this register based on the current status of the CPU-rail. Before requesting a power-off (or on) request, flow controller updates this status to "in the process" status. Note, flow controller requests CPU-RAIL power on/off based on this register value or PMC power gate-status of CRAIL depending upon USE_FLOW_STS register. 0 = RAIL_OFF 1 = RG_IN_PROGRESS 2 = RU_IN_PROGRESS 3 = RAIL_ON
0	RW	0x0	RAIL_ENABLE: CPU rail power-on request. Software sets this to request CPU rail power-on by flow-controller interaction. If rail is already on, writing to this is ignored. Hardware clears this bit when CPU power rail in turned on.

17.2.8 FLOW_CTLR_MPID_0

Offset: 0x3c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1:0	0x0	CPU_ID: CPU-ID of CPULP. Software programs this field before cluster0 -> cluster1 switch. This ID is provided to MPCore_LP which is what is read when the OS reads MPIDR. Also, the flow controller uses this to identify wake interrupts to be used for CPULP wakeup.

17.2.9 FLOW_CTLR_RAM_REPAIR_0

Offset: 0x40 | Read/Write: R/W | Reset: 0x00000004 (0bxxxxxxxxxxxxxxxx00000000xxxx01x0)

Bit	R/W	Reset	Description
23:16	RO	X	DBG_STS: Repair done (acknowledge) from repair logic.
15:8	RW	0x0	DBG_REQ: Repair request for individual segments.
3	RW	0x0	DBG_EN: Debug enable to be able to repair of individual segments of the cluster0 repair chain 0 = DISABLE 1 = ENABLE
2	RW	0x1	BYPASS_EN: RAM repair bypass enable. 0: Flow-controller requests RAM-repair at CPU RAIL power-up. 1: Flow-controller does not request RAM-repair at CPU RAIL power-up 0 = DISABLE 1 = ENABLE
1	RO	X	STS: Indicates Cluster repair chain status. hardware sets this to '1' when repair of all segments is done. hardware clears this to '0' when RAM repair is requested.
0	RW	0x0	REQ: Cluster0 RAM repair request. Software sets this bit to '1' to initiate RAM repair request to all segments in parallel. Hardware clears this bit when software triggered repair is done (i.e., STS=1) 0 = DISABLE 1 = ENABLE

17.2.10 FLOW_CTLR_FLOW_DBG_SEL_0

Offset: 0x44 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx0000xxxx0000)

Bit	R/W	Reset	Description
19:18	RO	X	RG_PWR_STATE: Current state of Rail Gate state machine
17:16	RO	X	RU_PWR_STATE: Current state of Rail Ungate state machine
15:14	RO	X	NC_PG_PWR_STATE: Current state of Non CPU Power Gate state machine
13:12	RO	X	NC_PU_PWR_STATE: Current state of Non CPU Power Ungate state machine

Bit	R/W	Reset	Description
11:8	RW	0x0	CNT1_SEL: Activity selection which would be counted by CNT1. **Note** power/rail activities are counted only when power/rail gating is via flow controller (and not direct PMC register write). 0: Idle (counter holds its current value) 1: Increment by 1 every time CPU0 is power gated 2: Increment by 1 every time CPU1 is power gated 3: Increment by 1 every time CPU2 is power gated 4: Increment by 1 every time CPU3 is power gated 5: Increment by 1 every time and of CPU0/1/2 or 3 is power-gated 6: Increment by 1 every time CPU-LP is power gated 7: Increment by 1 every time Ccluster0 non-CPU is power gated 8: Increment by 1 every time Cluster1 non-CPU is power gated 9: Increment by 1 every time CPU RAIL is powered off 10: Increment by 1 every time cluster0 is switched to cluster1 11: Increment by 1 every time cluster1 is switched to cluster0 12: Increment by 1 every time HVC is entered 13: Increment by 1 every time Retention is entered 0 = IDLE 1 = CPU0_PG 2 = CPU1_PG 3 = CPU2_PG 4 = CPU3_PG 5 = CPU0123_PG 6 = CPULP_PG 7 = C0NC_PG 8 = C1NC_PG 9 = CRAIL_OFF 10 = C0_TO_C1_SWITCH 11 = C1_TO_C0_SWITCH 12 = HVC_ENTRY 13 = RETENTION_ENTRY
3:0	RW	0x0	CNT0_SEL: Activity selection which would be counted by CNT0. **Note:** Power/rail activities are counted only when power/rail gating is via the flow controller (and not direct PMC register write). 0: Idle (counter holds its current value) 1: Increment by 1 every time CPU0 is power gated 2: Increment by 1 every time CPU1 is power gated 3: Increment by 1 every time CPU2 is power gated 4: Increment by 1 every time CPU3 is power gated 5: Increment by 1 every time and of CPU0/1/2 or 3 is power-gated 6: Increment by 1 every time CPU-LP is power gated 7: Increment by 1 every time Ccluster0 non-CPU is power gated 8: Increment by 1 every time Cluster1 non-CPU is power gated 9: Increment by 1 every time CPU RAIL is powered off 10: Increment by 1 every time cluster0 is switched to cluster1 11: Increment by 1 every time cluster1 is switched to cluster0 12: Increment by 1 every time HVC is entered 13: Increment by 1 every time retention is entered 0 = IDLE 1 = CPU0_PG 2 = CPU1_PG 3 = CPU2_PG 4 = CPU3_PG 5 = CPU0123_PG 6 = CPULP_PG 7 = C0NC_PG 8 = C1NC_PG 9 = CRAIL_OFF 10 = C0_TO_C1_SWITCH 11 = C1_TO_C0_SWITCH 12 = HVC_ENTRY 13 = RETENTION_ENTRY

17.2.11 FLOW_CTLR_FLOW_DBG_CNT0_0

Offset: 0x48 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	VALUE: Activity count value (updated by hardware based on CNT0_SEL). This register can be written by software to be able to clear it.

17.2.12 FLOW_CTLR_FLOW_DBG_CNT1_0

Offset: 0x4c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	VALUE: Activity count value (updated by hardware based on CNT1_SEL). This register can be written by software to be able to clear it.

17.2.13 FLOW_CTLR_FLOW_DBG_QUAL_0

Offset: 0x50 | Read/Write: R/W | Reset: 0x00000000 (0bxx00xx00xxx00000xxx00000xxx00000)

Bit	Reset	Description
29	0x0	IRQ2CCPLEX_ENABLE:Qualifier for legacy IRQ 0 = DISABLE 1 = ENABLE
28	0x0	FIQ2CCPLEX_ENABLE:Qualifier for legacy FIQ 0 = DISABLE 1 = ENABLE
25:24	0x0	AXICIF_CG_DIS: CCPLEX AXICIF/MCCIF clock gating disable. Bit 0: Fast cluster rclk-gating disable (1=DISABLE, 0=ENABLE). Bit 1: Fast cluster wclk-gating disable (1=DISABLE, 0=ENABLE).
20:16	0x0	PWRUPREQ_QUAL: CPU DBGPWRUPREQ qualifier. Bit encoding similar to PWRDNREQ_QUAL.
12:8	0x0	NOPWRDWN_QUAL: CPU DBGNOPPWRDN qualifier. Bit encoding similar to PWRDNREQ_QUAL. Note: Multi cycle paths are defined on flow2car*_pg_enable andflow2car_mpcore*_rst. pg_enable should be stable before flow2car_mpcore*_rst gets asserted. For the "PG Emulation" case, this delay should be handled in software. ccplex2flow_dbgnopwrdwn also acts as pg_emulation case. This should be programmed before.
4:0	0x0	PWRDNREQ_QUAL: CPU DBGPWRDNREQ qualifier. Bit 0 for CPU0. Bit 1 for CPU1. Bit 2 for CPU2. Bit 3 for CPU3. Bit 4 for CPU-LP (also known as shadow CPU).

17.2.14 FLOW_CTLR_FLOW_CTLR_SPARE_0

Offset: 0x54 | Read/Write: R/W | Reset: 0xffff0000 (0b11111111111111110000000000000000)

Bit	Reset	Description
31:16	0xffff	SPARE_HI
15:0	0x0	SPARE_LO

17.2.15 FLOW_CTLR_FC_SEQUENCE_INTERCEPT_0

Offset: 0x5c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxx00000000000000000000)

Bit	Reset	Description
21	0x0	INTERCEPT_HVC_ENABLE: If set, generates an interrupt to LIC before starting the HVC sequence and after exiting the HVC sequence. This interrupt is routed to ARM7/BPMP-Lite. 0 = DISABLE 1 = ENABLE
20	0x0	INTERCEPT_ENTRY_CC4_ENABLE: If set, generates an interrupt to LIC after the HVC state has been entered. This interrupt is routed to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
19	0x0	INTERCEPT_ENTRY_PG_NONCPU_ENABLE: 0: State machine does not halt at the start of the non-CPU power gating sequence 1: State machine halts at the start of the non-CPU power gating sequence. Issues an interrupt to ARM7/BPMP-Lite. 0 = DISABLE 1 = ENABLE
18	0x0	INTERCEPT_EXIT_PG_NONCPU_ENABLE: 0: State machine does not halt at the start of the non-CPU power ungating sequence 1: State machine halts at the start of the non-CPU power ungating sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
17	0x0	INTERCEPT_ENTRY_RG_CPU_ENABLE: 0: State machine does not halt at the start of the CPU rail gating sequence 1: State machine halts at the start of the CPU rail gating sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
16	0x0	INTERCEPT_EXIT_RG_CPU_ENABLE: 0: State machine does not halt at the start of the CPU rail ungating sequence 1: State machine halts at the start of the CPU rail ungating sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
15	0x0	INTERCEPT_ENTRY_PG_CORE0_ENABLE: 0: State machine does not halt at the start of the core0 power state entry sequence 1: State machine halts at the start of the core0 power state entry sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
14	0x0	INTERCEPT_EXIT_PG_CORE0_ENABLE: 0: State machine does not halt at the start of the core0 power state exit sequence 1: State machine halts at the start of the core0 power state exit sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
13	0x0	INTERCEPT_ENTRY_PG_CORE1_ENABLE: 0: State machine does not halt at the start of the core1 power state entry sequence 1: State machine halts at the start of the core1 power state entry sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
12	0x0	INTERCEPT_EXIT_PG_CORE1_ENABLE: 0: State machine does not halt at the start of the core1 power state exit sequence 1: State machine halts at the start of the core1 power state exit sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
11	0x0	INTERCEPT_ENTRY_PG_CORE2_ENABLE: 0: State machine does not halt at the start of the core2 power state entry sequence 1: State machine halts at the start of the core2 power state entry sequence. Issues interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
10	0x0	INTERCEPT_EXIT_PG_CORE2_ENABLE: 0: State machine does not halt at the start of the core2 power state exit sequence 1: State machine halts at the start of the core2 power state exit sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
9	0x0	INTERCEPT_ENTRY_PG_CORE3_ENABLE: 0: State machine does not halt at the start of the core3 power state entry sequence 1: State machine halts at the start of the core3 power state entry sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE
8	0x0	INTERCEPT_EXIT_PG_CORE3_ENABLE: 0: State machine does not halt at the start of the core3 power state exit sequence 1: State machine halts at the start of the core3 power state exit sequence. Issues an interrupt to ARM7/BPMP-Lite 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
7	0x0	INTERRUPT_PENDING_NONCPU: When set, it is an indication of an FC interrupt pending before starting non CPU Power Gating/Power Ungating. Sequence is halted until the bit is cleared. This is set by hardware and cleared by software. Software should write "1" to this bit to clear it. 0 = NOT_PENDING 1 = PENDING
6	0x0	INTERRUPT_PENDING_CRAIL: When set, it is an indication of an FC interrupt pending before starting CPU rail gating/ ungating. Sequence is halted until the bit is cleared. This is set by hardware and cleared by software. Software should write "1" to this bit to clear it. 0 = NOT_PENDING 1 = PENDING
5	0x0	INTERRUPT_PENDING_CORE0: When set, it is an indication of an FC interrupt pending from core0. Sequence is halted until the bit is cleared. This is set by hardware and cleared by software. Software should write "1" to this bit to clear it. 0 = NOT_PENDING 1 = PENDING
4	0x0	INTERRUPT_PENDING_CORE1: When set, it is an indication of FC interrupt pending from core1. Sequence is halted until the bit is cleared. This is set by hardware and cleared by software. Software should write "1" to this bit to clear it. 0 = NOT_PENDING 1 = PENDING
3	0x0	INTERRUPT_PENDING_CORE2: When set, it is an indication of FC interrupt pending from core2. Sequence is halted until the bit is cleared. This is set by hardware and cleared by software. Software should write "1" to this bit to clear it. 0 = NOT_PENDING 1 = PENDING
2	0x0	INTERRUPT_PENDING_CORE3: When set, it is an indication of FC interrupt pending from core3. Sequence is halted until the bit is cleared. This is set by hardware and cleared by software. Software should write "1" to this bit to clear it. 0 = NOT_PENDING 1 = PENDING
1	0x0	CC4_INTERRUPT_PENDING: Indicates that an interrupt was issued by FC to LIC after HVC state has entered. Interrupt stays asserted until ARM7/BPMP-Lite has cleared this bit. This is set by hardware and cleared by software. Software should write "1" to this bit to clear it. 0 = NOT_PENDING 1 = PENDING
0	0x0	HVC_INTERRUPT_PENDING: Indicates that an interrupt was issued by FC to LIC before starting HVC sequence or after exiting HVC sequence. Interrupt stays asserted until ARM7/BPMP-Lite has cleared this bit. This is set by hardware and cleared by software. Software should write "1" to this bit to clear it. 0 = NOT_PENDING 1 = PENDING

17.2.16 FLOW_CTLR_CC4_HVC_CONTROL_0

Offset: 0x60 | Read/Write: R/W | Reset: 0x0000000X (0b00000000000000000000000000000xx0)

Bit	R/W	Reset	Description
31:3	RW	0x0	HVC_RES_TIME_THRESHOLD: This represents the programmable time threshold required to enter HVC
2:1	RO	X	CC4_HVC_STS: This is a status register that indicates whether HVC entry/exit sequence has started/completed. 0 = CC4_HVC_NOT_ENTERED 1 = CC4_HVC_ENTRY_IN_PROGRESS 2 = CC4_HVC_EXIT_IN_PROGRESS 3 = CC4_HVC_ENTERED
0	RW	0x0	CC4_HVC_ENABLE: 0 = DISABLE 1 = ENABLE

17.2.17 FLOW_CTLR_CC4_RETENTION_CONTROL_0

Offset: 0x64 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000xx0)

Bit	Reset	Description
31:3	0x0	RET_RES_TIME_THRESHOLD: This represents the programmable threshold required to enter Retention in units of microseconds.

Bit	Reset	Description
0	0x0	CC4_RET_ENTERED: Indicates that CC4 Retention has been entered (VDD_CPU -> Vret). Set by BPMP_Lite at the end of the sequence 0 = CLEAR 1 = SET

17.2.18 FLOW_CTLR_CC4_FC_STATUS_0

Offset: 0x68 | Read/Write: R/W | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00x)

Bit	R/W	Reset	Description
2	RW	0x0	CC4_LIC_INTR_EN: This allows LIC interrupts to act as retention wake events. For HVC, this should be "0". On retention entry, BPMP can enable this after blocking interrupts to GIC. On retention exit, BPMP should clear this. 0 = DISABLE 1 = ENABLE
1	RW	0x0	CC4_WAKE_MASK: When set (by BPMP-Lite), prevents the FC from processing wake up events. It is used to allow the retention entry sequence to complete once it has reached certain point.
0	RO	X	INT_STATUS: Indicates that an interrupt to FC is pending in HVC. This register is updated by hardware and is readable by software. Software should read this only in HVC to decide whether to enter retention or not. 0 = PENDING 1 = NOT_PENDING

17.2.19 FLOW_CTLR_CC4_CORE0/1/2/3_CTRL_0

CC4_COREx_CTRL_0 offsets are as follows:

FLOW_CTLR_CC4_CORE0_CTRL_0: Offset: 0x6c

FLOW_CTLR_CC4_CORE1_CTRL_0: Offset: 0x70

FLOW_CTLR_CC4_CORE2_CTRL_0: Offset: 0x74

FLOW_CTLR_CC4_CORE3_CTRL_0: Offset: 0x78

Each of the four blocks has the same registers and bits.

Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:3	0x0	CORE_IDLE_TIMER: This register initializes a countdown timer that is used to determine whether to enter HVC or Retention. There is one for each core. The smallest of them is compared to a programmable residency threshold time (RET_RES_TIME_THRESHOLD for retention or HVC_RES_TIME_THRESHOLD for HVC). Its value represents units of microseconds. The countdown timer initialized by this register value counts down at every microsecond pulse. The hardware countdown timer is initialized to this value and enabled as soon as the core enters WFI (= asserts STANDBYWFI).
2	0x0	TIMER_COUNTDOWN_VALID: If this bit is set, the respective core is allowed to participate in the decision to enter CC3 HVC4 or CC4 Retention. If this bit is not set, the CORE_IDLE_TIMER does not countdown.
1	0x0	CORE_RET_ENABLE: If the respective TIMER_COUNTDOWN_VALID bit is set, the core participates in the decision to enter Retention and interrupt the BPMP-Lite. If this bit is not set, then the core cluster does NOT enter Retention and the BPMP-Lite is not interrupted. Software should initialize this bit every time before the core executes WFI (to enter C1 or C6) and software running on this specific core desires that the core cluster enters retention once the core has entered the requested power state (C1 or C6). It is reset when the core in C1 de-asserts STANDBYWFI (i.e., exiting C1) or when a wake-up event is received for the PG (in C6) core. It is also reset during an FC reset.
0	0x0	CORE_HVC_ENABLE: If the respective TIMER_COUNTDOWN_VALID bit is set, the core participates in the decision to enter HVC. If this bit is not set, the core cluster does NOT enter HVC. Software should initialize this bit every time before the core executes WFI (to enter C1 or C6) and software running on this specific core desires that the core cluster is allowed to enter HVC once the core has entered the requested power state (C1 or C6). It is reset when the core in C1 de-asserts STANDBYWFI (i.e., exiting C1) or when a wake-up event is received for the power-gated (in C6) core. It is also reset during an FC reset.

17.2.20 FLOW_CTLR_CORE0/1/2/3_IDLE_COUNTER_0

COREx_IDLE_COUNTER_0 offsets are as follows:

FLOW_CTLR_CORE0_IDLE_COUNTER_0: Offset: 0x7c

FLOW_CTLR_CORE1_IDLE_COUNTER_0: Offset: 0x80

FLOW_CTLR_CORE2_IDLE_COUNTER_0: Offset: 0x84

FLOW_CTLR_CORE3_IDLE_COUNTER_0: Offset: 0x88

Each of the four blocks has the same registers and bits.

Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:3	X	CORE_IDLE_COUNTER: This register captures the current value of the core's idle countdown counter which is initialized to CC4_CORE<x>_CTRL.CORE_IDLE_TIMER at STANDBYWFI asserted by the specific core.

17.2.21 FLOW_CTLR_CC4_HVC_RETRY_0

Offset: 0x8c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	THRESHOLD: This represents the threshold to retry HVC entry after QDENY signals are asserted.

17.2.22 FLOW_CTLR_L2FLUSH_TIMEOUT_CNTR_0

Offset: 0x90 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	STATUS: This bit is set by hardware in case of l2flushrequest timeout. This bit can be cleared by software. Software should write "1" to this bit to clear it. Hardware clears this before starting next Rail Gate request or non CPU PG request. 0 = CLEAR 1 = SET
30:1	0x0	THRESHOLD: l2flush timeout counter starts incrementing after l2flushrequest is asserted. It asserts timeout once the counter reaches the CNTR_THRESHOLD value. If l2flushdone signal is not asserted for CNTR_THRESHOLD # of sclks after l2flushrequest is asserted, the flow controller de-asserts the l2flushrequest signal, asserts the STATUS field, and will not proceed with Rail Gate/Non-CPU PG request
0	0x0	ENABLE: Enables L2FLUSH TIMEOUT counter 0 = DISABLE 1 = ENABLE

17.2.23 FLOW_CTLR_L2FLUSH_CONTROL_0

Offset: 0x94 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx01)

Bit	Reset	Description
1	0x0	REQ: Issues software L2 FLUSH request. Software sets this bit to '1' to initiate L2 FLUSH request. The flow controller sends a software L2FLUSH request only if all unpower-gated cores are in WFX and the REQ bit is set. Hardware clears this bit when the software triggered L2 FLUSH request is done. In case of software timeout, software should explicitly clear this bit. L2FLUSH_TIMEOUT_CNTR is only used for hardware flush. 0 = DISABLE 1 = ENABLE
0	0x1	ENABLE: Enables hardware L2FLUSH handshake 0 = DISABLE 1 = ENABLE

17.2.24 FLOW_CTLR_BPMP_CLUSTER_CONTROL_0

Offset: 0x98 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2	0x0	ACTIVE_CLUSTER_LOCK: This field can only be written by a secure write. The ACTIVE_CLUSTER field can only be written if the ACTIVE_CLUSTER_LOCK bit is "0". 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
1	0x0	CLUSTER_SWITCH_ENABLE: This field should only be written by the BPMP prior to allowing master core initiate CC6. 0 = DISABLE 1 = ENABLE
0	0x0	ACTIVE_CLUSTER: This field should only be written by the BPMP during cluster switch sequence after CPU cluster enters CC6. ACTIVE_CLUSTER field can only be written if ACTIVE_CLUSTER_LOCK bit is "0". 0 = FAST 1 = SLOW

CHAPTER 18: MEMORY CONTROLLER

18.1 Introduction

Tegra® X1 devices feature two Memory Controllers and two External Memory Controllers, one set per 32-bit channel.

The Tegra X1 memory controller (MC) handles memory requests from internal clients and arbitrates among them to allocate memory bandwidth for DRAM. The external memory controller (EMC) communicates with external LPDDR3 or LPDDR4 devices.

Key features in the Tegra X1 memory controller include:

- Enhanced arbiter design for higher memory efficiency
- Dual channels
- System Memory Management Unit (SMMU)/Translation Unit (TU) for virtual to physical address mapping for any device
- Support for LPDDR3 and LPDDR4 SDRAMs
- 64-bit memory interface implemented as 2 32-bit channels (with x16 subpartitions for LPDDR4)
- 34-bit virtual addressing
- Up to 8 GB memory capacity
- Swiss-Cheese mode beyond 4GB
- Support for two DRAM ranks of unequal size and unequal device density
- Generalized security apertures
- Variable transaction sizes based on the requests from the clients (one 64-byte transaction with variable dimensions, two 32-byte transactions with variable dimensions, etc.)

The memory interface speed varies with memory type and the specific Tegra X1 SKU, so is not stated in this document.

Terminology Used in this Section

Term	Definition
Channel	Independent memory controller (including row-sorter and EMC) with dual sub-partitions * 32b Channel for LPDDR4
DRAM Channel	Minimum width independent port supported by DRAM * 16b data width on LPDDR4 Matches up to one of our subpartitions
Subpartition	½ the data width of a memory controller channel. The memory controller provides a single read or write command and row address to both subpartitions in the channel to transfer 64B, but provides 3 independent column address bits to each subpartition, allowing it access different 32B sectors of a GOB between the subpartitions. * 16b Subpartition for LPDDR4

18.2 Memory Controller Architecture

The memory controller architecturally consists of the following parts:

- Arbitration Domains (ADs), which can handle a single request or response per clock from a group of clients. Typically, a system has a single Arbitration Domain, but an implementation may divide the client space into multiple Arbitration Domains to increase the effective system bandwidth. Multiple Traffic Classes within a single Arbitration Domain and Protocol Arbiter are allowed.

- Protocol Arbiters (PAs), which manage a related pool of memory devices. A system may have a single Protocol Arbiter or multiple Protocol Arbiters.
- Memory Crossbar, which routes request and responses between Arbitration Domains and Protocol Arbiters. In the simplest version of the system, the Memory Crossbar is a pass through between a single Arbitration Domain and a single Protocol Arbiter.
- Global Resources, which include entities such as configuration registers which are shared across the Memory Subsystem.
- Write CAMs (WCAMs), which improves performance and throughput for PCIe® ordered clients (PCIe, SATA, HDA, and USB3), CPU writes, and CPU copies.
- Memory Controller Client Interface (MCCIF), which provides a standardized interface for access to the Memory Controller.
- Translation Unit, which handles virtual-to-physical address translation, aperture decode, physical address security checks, and protocol arbiter-specific decodes (such as external DRAM address decodes).

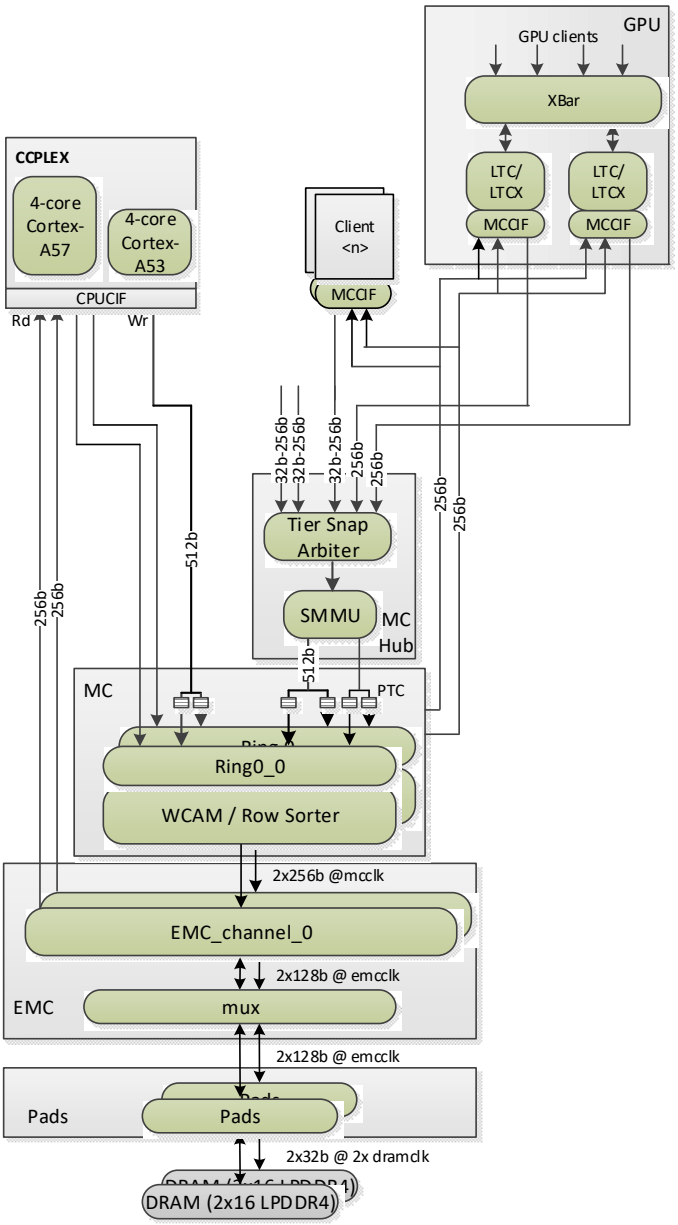
The Tegra X1 device supports either a single or a dual channel memory interface depending on the memory type and width.

There is an alternate path through the memory controller to access IRAM via AHB re-direction.

The figure below is a view of how memory requests are arbitrated in the Tegra X1 MSS. Memory client requests are first arbitrated through a sequence of ring arbiters which perform a type of round-robin arbitration. There are three ring arbiters referred to as ring0, ring1, and ring2. Ring1 arbiter clients are the ISO clients (display and camera) and the winner of the ring2 arbiter. Each ring has a rate control mechanism referred to as Priority Tier Snap Arbiter (PTSA). The client’s bandwidth guarantee is specified by the PTSA rate (also referred to as “DDA”).

The block labelled “Row Sorter” is a pending request buffer (it sorts requests by the DRAM row that it refers to). This row sorter is made up of many “bank queues” which hold the requests made to the same DRAM bank/row. The number of requests pending in the row sorter can affect whether ring1 or ring2 arbiters are throttled (slowed down) based on thresholds.

Figure 34: Memory Request Arbitration



18.3 Hardware Features

18.3.1 LPDDR4 Support

LPDDR4 DRAMs differ from LPDDR3 in the following significant ways:

- Up to 2x the bandwidth per pin
- 2x the DRAM clock frequency
- Burst length of 16 (compared to burst length of 8 on LPDDR3)
- 32-bit device composed of two independent 16-bit channels (64-bit LPDDR4 has four independent channels)
- Initialization time training is required for frequencies above 400 MHz. Periodic/DVFS write training for temperature compensation is needed above 1000 MHz.
- Has optional internal ECC, which extends time for masked writes

- Has SDR address and control

A 16-bit LPDDR4 channel with burst length 16 has the same 32B DRAM atom as a 32-bit LPDDR3 channel with burst length 8. The 64-bit LPDDR interface is treated as two 32-bit channels, each with two 16-bit sub-channels (or sub-partitions). Each 32-bit LPDDR4 channel is logically the equivalent of a 64-bit Tegra K1 LPDDR3 channel.

18.3.2 LPDDR4 Masked Writes

On LPDDR4, with internal ECC, masked writes are internally converted to read-modify-writes and are 4x slower than normal writes (tCCDMW = 4 * tCCD). This timing is used from any Write (masked/unmasked) to a Masked Write on the same bank. There is no penalty across banks or for any other commands.

The arbitration is updated to correctly track the timing for masked writes, and will not allow masked writes to be part of the cycle's arbitration if they do not meet tCCDMW. This timing will be tracked per-bank and per-rank, so it will only mask the bank that does not meet the timing. Other banks will still be allowed to issue their requests.

64B write requests are masked writes if any byte is not enabled. 16B write requests are always masked.

32B requests are more complicated. They are masked if any byte for the 32B is not enabled. They are also masked if the AP (auto-precharge) bit is set to allow the page to be closed in both subpartitions. Otherwise 32B requests are not masked writes. When AP is set, the masked write request is sent to both subpartitions. Otherwise, it is only sent to the target subpartition for the 32B request.

18.3.3 Rank 1 to Rank 0 Support

The industry standard is to map the larger DRAM rank to CS1. For addressing simplicity, the larger rank starts at DRAM address 0; the hole from the smaller rank is at the top of address space. A programmable swizzle of per-rank command bits is implemented between the EMC and the control pads. The swizzle registers are documented in the "Memory Controller Registers" section below.

Note: *In Tegra X1 devices, the DRAM configuration must be identical across channels.*

18.3.4 Channel Interleave and Swizzle

The channel interleave is determined by the MC_EMEM_ADR_CFG_CHANNEL_MASK_0 register. The following equation determines the channel:

```
channel = ^(EMEM_ADR_CFG_CHANNEL_MASK_0_EMEM_CHANNEL_MASK[31:9] & addr[31:9])
```

Mask bits [10:9] select single channel vs. dual-channel modes and 1KB interleave, each with its own physical address to <channel, device, row, bank, column> mapping.

Interleave	MASK[10:9]
Single channel	2'b00
1KB	2'b10

The basic interleave (1KB) is determined by mask bits [10:9]. To avoid channel camping, address MSBs need to be hashed into the channel field (controlled by the MSBs of the mask register).

Recommended settings of the register are the following:

Interleave	MASK[31:0]
Single channel	32'b 0000 0000 0000 0000 0000 000x xxxx xxxx
1KB	32'b 1111 1111 1111 1111 0010 010x xxxx xxxx

In single channel mode, the channel bit must always be zero. For the dual-channel cases, the address space is divided into a locally "manicured region" of 128KB (256 pixels wide by 128 pixels tall, assuming the recommended block height of 16 gobs). In

this manicured region, the channels are interleaved in a regular checkerboard. In 512B mode, the tile size is 64Bx8. In 1KB mode, the tile size is 64Bx16. With the recommended block height of 16 gobs (128 lines), having mask bit 13 set mirrors the channels in 8 successive columns. At the 64KB boundary, the channel mapping should be inverted to dovetail with the 128KB bank manicure described in the next section. Beyond 128KB randomization of the channel is desired, so the system will not have performance divots at particular strides, which is done by XORing in the address MSBs. Note that the manicured region will result in the same channel being hit 4 times in a row if the stride is exactly 16KB.

18.3.5 Bank Interleave and Swizzle

A similar approach is taken to load balance across banks: the banks are interleaved in a manicured region of 64KB (single-channel case) or 128KB (dual-channel case). Additionally XORed are a hash of address MSBs to avoid systematic abutment issues between manicure tiles or bank camping when accessing with a constant stride.

The bank interleave formula, assuming 3 bank bits, is as follows:

```
bank[2:0] = msb_swizzle[2:0] ^ manicure_swizzle[2:0] ^ bank_base[2:0];
```

The terms in the equation are:

- bank_base. This is the raw bank number from the physical address (typically a one-hot-encoding of the bank bits)
- manicure_swizzle. This swizzles the bank bits within the manicure region to give an ideal interleave of banks within the region.
- msb_swizzle. This is a hash of address MSBs that is constant for each manicure region but random from one manicure region to the next, with special care taken to prevent horizontal abutment conflicts.

Single-Channel Settings

For the single-channel case, the recommended bank mask settings are the following:

```
bank_base[2:0]        = addr[12:10]
manicure_swizzle[2:0] = {addr[15]^addr[13],addr[14],addr[13]}
Galois[16:31][2:0]    = {5,7,3,6,7,5,1,6,5,1,6,5,4,3,5,1}
EMEM_ADR_CFG_BANK_MASK_0_EMEM_BANK_MASK = 0b 1110 1011 0111 0111 0010 01xx xxxx xxxx
EMEM_ADR_CFG_BANK_MASK_1_EMEM_BANK_MASK = 0b 0010 0100 1001 1110 0100 10xx xxxx xxxx
EMEM_ADR_CFG_BANK_MASK_2_EMEM_BANK_MASK = 0b 0101 1101 1011 1011 1011 00xx xxxx xxxx
```

Dual-channel settings

For the dual-channel case, the recommended bank mask settings are the following:

```
bank_base[2:0]        = addr[13:11] = xaddr[12:10]
manicure_swizzle[2:0] = {0,addr[14],addr[15]} = (0,xaddr[13],xaddr[14])
Galois[17:31][2:0]    = {1,3,5,4,7,2,3,4,6,5,1,7,2,3,5,0}

EMEM_ADR_CFG_BANK_MASK_0_EMEM_BANK_MASK = 0b 0110 1110 0101 0111 0100 01xx xxxx xxxx
EMEM_ADR_CFG_BANK_MASK_1_EMEM_BANK_MASK = 0b 0011 1001 0111 0010 0010 10xx xxxx xxxx
EMEM_ADR_CFG_BANK_MASK_2_EMEM_BANK_MASK = 0b 0100 1011 1001 1100 0001 00xx xxxx xxxx
```

18.3.6 Hub + Dual-channel Architecture

To support LPDDR4, which has 2x the bandwidth per pin of LPDDR3, Tegra X1 devices provide two MC channels. The MC (shown in Figure 34) is configured as follows:

- A central hub (MCHUB), containing the snap arbiter tree and SMMU
- Two MC channels, each with an instance of ring 0, the WCAM, and row sorter
- Two EMC channels and EMC

Each channel arbitrates and schedules requests independently. When driving LPDDR4, each of the two channels drives 32 DRAM I/Os with independent arbitration and scheduling. The DRAM configuration must be identical across the two channels.

18.3.6.1 Cross Channel Ordering

Ordering is more complex on Tegra X1 devices because of its two channels. There is one WCAM instance per channel, so there is no single point of global visibility.

WAW Ordering Via Write-Ack

Use cases that use write-ack ensure visibility of writes before issuing dependent work. The WCAM for each channel returns a write_ack only when the write data will be visible to subsequent reads to that channel. For clients with a single write request interface, the MC reorders write_acks between the channels, so a write_ack is only returned to the client if write_acks for all previous requests (regardless of the channel). So when a write_ack for a request has been received, it is guaranteed that all prior writes, regardless of the channel, are globally visible.

The CPU has separate write interfaces for each channel and has a separate write_ack interface for each channel. The CPU is responsible for proper ordering of its requests.

The GPU has separate write clients for each L2 slice, which have no ordering requirements between them, so the lack of ordering for writes between the two GPU clients does not introduce new ordering requirements to the GPU. The GPU uses explicit membars and sysmembars to ensure writes have been appropriately flushed.

WAW Ordering Using the Producer-Consumer Model

In the producer/consumer model, a client issues data writes followed by a flag write. A consumer client reads the flag and when it changes, assumes the data is valid. A data write from the producer could pass the channel fork and be stalled above WCAM for that channel while the flag write goes down the other channel and could be viewed by the consumer, who would believe the data is valid. Although this is pathological, certain clients, such as PCIe-ordered clients and CPU strongly-ordered and dev accesses require strict ordering enforcement.

The CPU enforces its own ordering for strongly-ordered and dev accesses. A strongly ordered or dev request to a particular channel will not be issued (from CPUCIF to MC) until all prior writes to other channel have been acknowledged.

The MC enforces ordering for ordered clients such as PCIe and other clients that require PCIe ordering. It does this with an interlock at each PCFIFO. The enable for the interlock is based on client-ID, and will be programmable by config registers. The config register should follow the same formatting as the SMMU Ordered config bits.

The interlock contains a register that stores the client address bits (down to the channel bit based on the current channel interleave) for unacknowledged writes from the client and a counter that tracks how many unacknowledged writes are pending. This circuit will exist on the output of all PCFIFOs. Reads are always allowed (there are no RAR ordering requirements from the MC), but writes will be blocked if the counter is non-zero and the address of the new request does not match the stored address. Note that this circuit is conservative: it interlocks writes that cross a potential channel interleave boundary (1KB), but the channel may not toggle on every boundary.

WAW Ordering for AHB Clients

The AHB client is a special case, since it conveys transactions on behalf of multiple internal clients that can be active on the AHB bus simultaneously. The aggregate AHB bandwidth requirement is 520 MB/s at 204 MHz emcclk. Assume that bandwidth is evenly divided between two clients, with each client issuing a 64B request (which is really a 2x-inflated 32B request) every 64B/(260 MB/s) = 0.25 µs. Assume 100 emcclks of round-trip write ack latency (this is the conservative estimate for non-DRAM-limited cases). Because requests from different clients will almost certainly be to different DRAM pages, each request will incur an interlock stall of 100 emcclks / 204 MHz = 0.5 µs. So indiscriminately stalling could throttle bandwidth by a factor-of-2 from the bandwidth requirement. In practice, it will be unlikely for two clients to be equally matched in bandwidth. Also, the write ack latency will typically be lower, assuming a good ratio of TLB hits to misses.

Clients with Internal Write-after-Write Ordering Barriers

Several clients that require PCIe ordering, such as PCI and SATA, have a shim that can enable a write-after-write ordering barrier for a programmable block size. For clients other than CPU and AHB, these are recommended to be disabled and the PC-FIFO barrier described above be used instead, since write-ack latency is shorter from the PCFIFO and performance will therefore be better.

18.3.6.2 PTSA Register Programming for Dual Channel

The ring1 and ring2 PTSA DDAs see full memory bandwidth, but each ring0 instance sees only half of memory bandwidth. PTSA registers need to be programmed to take this into account:

- **GRANT_DECREMENT.** GRANT_DECREMENT is set to allow the maximum bandwidth required for any client at any arbiter. Each ring1 feeder carries only half the ring1 bandwidth—at most 0.50% of peak DRAM bandwidth.
- **DDA rate settings at ring 0.** These should be scaled by 0.5 in dual-channel mode, since there are two parallel instances of ring 0.

18.3.6.3 Dual-Channel Registers

Some parts of the design are replicated per-channel, while others are not. Configuration registers are sometimes duplicated for the two channels, while others are not, and have a single instance in the design.

Configuration registers live in 6 different places. MCHUB, MC Channel (0+1), EMC Channel (0+1), and the EMC pad macros. There can be duplicated registers across channels.

Accesses to MC and EMC should normally be done through the broadcast range. The only exception is the per-channel statistics registers. When using unicast accesses, it is possible to configure MC+EMC incorrectly, since the common areas (MCHUB and EMC Pad Macros) are available through all apertures.

There are 6 configuration apertures in MC+EMC:

Aperture	Write Destination	Write Action	Read Source
MC = MCB (broadcast)	MCHUB + MC Channel 0 + MC Channel 1	Write a Reg. in MCHUB if offset matches and discard if does not. Write a Reg. in MC0 if offset matches and discard if does not. Write a Reg. in MC1 if offset matches and discard if does not.	MCHUB +MC Channel 0
MC0 (unicast)	MCHUB + MC Channel 0	Write a Reg. in HUB if offset matches and discard if does not. Write a Reg. in MC0 if offset matches and discard if does not.	MCHUB + MC Channel 0
MC1 (unicast)	MCHUB +MC Channel 1	Write a Reg. in HUB if offset matches and discard if does not. Write a Reg. in MC1 if offset matches and discard if does not.	MCHUB + MC Channel 1
EMC = EMCB (broadcast)	Pad Macros + EMC Channel 0 + EMC Channel 1	Write a Reg. in Pad Macros if offset matches and discard if does not. Write a Reg. in EMC0 if offset matches and discard if does not. Write a Reg. in EMC1 if offset matches and discard if does not.	Pad Macros + EMC Channel 0
EMC0 (unicast)	Pad Macros + EMC Channel 0	Write a Pad Macros if offset matches and discard if does not. Write a Reg. in EMC0 if offset matches and discard if does not.	Pad Macros + EMC Channel 0
EMC1 (unicast)	Pad Macros + EMC Channel 1	Write a Reg. in Pad Macros if offset matches and discard if does not. Write a Reg. in EMC1 if offset matches and discard if does not.	Pad Macros + EMC Channel 1

18.3.6.4 ARC Requests

All requests are checked against the IRAM aperture at the output of ring1. Any requests inside IRAM are then routed to ARC. Responses for ARC requests are always merged in the MC channel 0 response stream.

ARC responses are always sent back with rot==1 in order to properly merge ARC requests in the MCCIF during dual channel operation.

18.3.6.5 Interrupt Handling

Interrupts need to be handled in a backwards compatible way. Interrupts and decode error status signals are routed across channels to allow all interrupt information to be accessible from channel 0.

There are 2 modes of operation:

- Combined interrupt mode, where the 2 channels are combined into a single set of interrupt registers (in channel 0).
- Independent interrupt mode combines the actual interrupt signals, but none of the status registers are merged.

The local interrupt status signals need to be updated to trigger when the other channel's interrupt is set, not off the other channel's interrupt status signals, since the interrupt clear might not happen in the two channels at the same exact time.

Combined Interrupt Mode

Some characteristics of combined interrupt mode include:

- MC Channel 0's interrupt registers report interrupts for both channel 0 and channel 1
- MC Channel 0's interrupt registers include SMMU interrupts
- There is only a single set of registers to read during an MC interrupt:
  - Read INTSTATUS using broadcast read
  - Clear INTSTATUS using broadcast write
  - Read interrupt error information registers using broadcast read

Independent Interrupt Mode

In independent interrupt mode, each MC channel independently tracks its own interrupt information. The interrupt sent to the core is an OR of the two channels. **This is only intended as a debug mode for MC.**

- Software needs to read INTSTATUS from both channels using unicast reads
- Software can clear INTSTATUS using unicast or broadcast writes
- Requires software to know if there are
- Allows tracking interrupts independently in each channel
- Both channels will present SMMU interrupts

18.3.6.6 MC Cross Channel Interrupt Signals

These should always be merged into channel 0 when operating in the combined interrupt mode, except channel2mc_intr, which should only be merged in when not operating in combined interrupt mode.

These signals should be tied to 1'b0 on channel 1.

18.3.7 DRAM Protocol Arbiter Features

- Hybrid 2x32-bit / 1x64-bit data bus
  - 4 chip selects
  - 4 individually controllable clock-enables
  - Operates in either single x32 or hybrid 2x32 / 1x64 configuration
  - Supports per-byte data masks
- Each chip select may support different sizes and geometries
  - Size of Rank 0 must be larger than or equal to Rank 1
  - 2 or 3 bank bits
  - Column width: 9 to 12 bits
  - Row width: 12 to 16 bits
- Per-byte data masks
- Support for BL8
- Data transfer minimization:
- Support for 1T and 2T
- Support for low-power modes:
  - Software controllable entry/exit from: self-refresh, power down, deep power down
  - Hardware dynamic entry/exit from: power-down, self-refresh
  - Support for intermittent or disabled DLL
  - Disable unused address/command taps based on whether in POP or Discrete mode.
  - Pads use DPD mode during idle periods
- For Tegra X1 devices, trims can be set/adjusted per-byte AND per-chip-select. The PVT-compensated value can still be used and a PVT/frequency-compensated adjustment can be added to it (1/16, 1/8, 3/16 of a cycle) or a non-PVT-offset can be added.
- Support for x32, x16, or x8 chips attached to the channel
  - DQ/DQS swizzling: MRR_BYTESEL need to match byte swizzling.
- Deadline-based arbitration with a latency allowance that can be specified per-client, and under some circumstances, dynamically adjusted for a given client.

18.3.8 Memory Crossbar

The Memory Crossbar (MXB) is in charge of adapting Arbitration Domains (ADs) to Protocol Arbiters (PAs). In the simplest system with a single AD and PA running off of a single clock, the MXB is a simple pass-through or does not exist. The Tegra X1 MXB has one AD and two PAs, one for DRAM and the other for requests redirected to the AHB. The MXB handles conflict arbitration between responses from multiple PAs to the same AD.

18.3.9 Memory Sub-Partitions

The Tegra X1 Memory Controller implements sub-partitions. The 64 B memory atom is divided into two sectors: one sector containing bytes 0 to 31 and the other containing bytes 32 to 63. Each sector is stored in one of the two DRAM channels. With three additional column address bits for the second sector, clients can make 64 B requests of different shapes while retaining the bandwidth and power efficiency of a 64B memory atom. This feature also allows the CPU to request that one of the two 32 B sectors in a 64 B atom be returned first.

The sub-partition mechanism is used by the GPU, display clients (for rotation), VIC (for rotation), NVENC (in x,y flip mode), and the CPU (for critical-word-first). Clients that choose not to use the sub-partition feature set the extra column address bits to the same values as the other channel. They see the DRAM as a simple 64 B memory system. The sub-partition feature is only beneficial in systems with a 64 b memory. In systems with 32b memory, client addressing and request granularity are unchanged, but the MC treats each 32 B sector as an independent 32 B atom.

See the Section 18.7.2: Sub-Partitions for more information.

18.3.10 Global Resources

The Memory Subsystem also contains some global resources not owned by a particular AD or PA:

- A combined SMMU/TU
- Configuration registers and statistics counters

18.3.11 Supported Page Sizes

The MSS considers the following uses of pages and page size:

- DRAM page sizes from 1 KB to 4 KB.
- OS page: 4 KB for all operating systems
- Row Sorter page: 1 KB

18.4 Software Features

The majority of software interaction with the memory subsystem involves:

- Initial configuration
- Power management
- Device management
- Translation management
- ISO client bandwidth allocation
- Statistics and debugging

18.4.1 Initial Configuration

The details for configuring the Memory Subsystem (MSS) can be broken down into the following:

- Global Memory Subsystem configuration
- Arbitration Domain configuration
- Protocol Arbiter configuration
- Client configuration

Note: *This configuration must be performed as part of the chip-wide boot sequence*

18.4.1.1 Global Memory Subsystem Configuration

Some parts of the Memory Subsystem must be configured before any transfers are allowed into the system. The address map must be configured to set which portions of the physical address map are allocated to which Protocol Arbiters, and what portions of it are protected by the physical address protection mechanisms.

The Arbitration Domains operate off of a unified arbitration clock. This clock is further divided-down to produce a clock-rate independent clock for counting latency intervals across the Memory System (also known as “ticks”). This divide-down should be

programmed to a constant interval at initialization (and any other clock-rate change). A 30 ns interval is suggested since it is an even divide-down of many common DRAM clocks, but any convenient granularity may be chosen.

There are several global memory system tuning options that tend to shape the memory performance. Some of these can be set statically, at initialization time, others depend on clock frequencies. For example, with SMMU configuration, the SMMU requires software to set up and maintain page tables in memory, enable translation for clients, and assign clients to address space identifiers.

18.4.1.2 Arbitration Domain Configuration

Physical implementation decisions (such as the mapping of clients to partition clients) and default client bandwidth allocations require configuration options in the Arbitration Domain.

18.4.1.3 Protocol Arbiter Configuration

Each Protocol Arbiter has its own requirements for initialization. Timing parameters specific to the Arbiter, the DRAM and the current operating clock speed have to be written into Protocol Arbiter configuration registers. The type and geometry of the attached DRAM also have to be programmed. Afterwards, the DRAM will require a set of initialization cycles to be issued.

Device/Rank Geometry

DRAM devices come in many sizes, widths, etc. The arbiter must be programmed to drive the correct combination of address bits, data bits, and protocol.

Device Timing and Arbiter Timing

A DRAM arbiter has configuration related to timing parameters specific to the attached device. The JEDEC timing specifications for the device have to be converted from nanoseconds to cycle counts. The controller must also be programmed with the cycles per tick number for their particular clock domain (refer to Section 18.4.1.1: Global Memory Subsystem Configuration).

Other Arbiter Parameters

Other parameters related to arbitration that need to be configured include:

- overall number of requests outstanding
- which clients are considered isochronous
- which clients participate in power-saving hysteresis operations

Device/Rank Initialization and Calibration Cycles

In particular, PAs need to write registers in the DRAM devices via special cycles to initialize the DRAM. In general all special cycles to a device are done via a hardware/software handshake that looks like:

- Software writes information about the special cycle to an Arbiter-specific register
- The Controller does the special cycle out to the DRAM device(s) when timing requirements are met
- Software checks a status register to ensure the special cycle is complete; or for Mode Register Read operations, the Controller issues an interrupt to indicate that the special cycle has been consumed

Special cycles may be emitted during normal operation as well; the Arbiter will inject them into the data stream at the appropriate places (typically along with refresh cycles).

During device initialization, software must ensure that no client can access the memory. This can be done with per-module flush-enable bits.

18.4.1.4 Client Configuration

The Priority Tier Snap Arbiters normally are configured dynamically to provide bandwidth guarantees to ISO clients. However, for certain clients the PTSA settings are programmed statically (for example, when the PTSA is used as a timeout). For these clients, the PTSA settings are part of the initial configuration.

Latency allowance may also be configured dynamically for certain clients. Latency allowance should be programmed to default values during initial configuration.

18.4.2 Power Management

The primary forms of system power management involve transition to and from low-power DRAM states and management of clock frequency.

18.4.2.1 Low-Power States

The DRAM controller and DRAMs can operate in a number of low-power states. The controller can be programmed to automatically enter a precharge power-down or self-refresh state after some amount of time without a request. The power-down state can be independently entered for each individual DRAM device/rank – it is possible for one device/rank to be in power-down while another is active. If software knows that the system will not be making further DRAM requests, it can cause an immediate transfer to the self-refresh state by writing an override register. If multiple chip selects are available for the DRAM controller, both the hardware and software may choose to enter low-power states on a per-chip-select basis.

Once a request is queued to the controller for that DRAM, the hardware will automatically wake from the low-power state if it entered that state via hardware control. This can take a relatively long amount of time since the controller may be required to issue a number of refresh cycles first. For software-initiated self-refresh, software must issue a register write to start the transition from self-refresh back to a fully-powered state.

Deep power-down must be explicitly requested by software, since it causes DRAM data to be lost. Software must disable new incoming requests to the MSS, wait for all outstanding in-flight requests to retire, and then write a register to transition to the deep power-down state. To exit the state, software must reinitialize the DRAM and controller before re-enabling transfers. Deep power-down mode may be enabled for each chip-select in a Protocol Arbiter independently and each Protocol Arbiter independently.

Normal active bank power optimization is managed principally by the Protocol Arbiter. The arbiter will arrange to close banks as soon as possible and to hold requests for as long as the latency timer will allow, with the intent of grouping same-page accesses into a coherent burst.

18.4.2.2 Request Dribble

The “OSIdle” use cases (with or without display active) are important cases of active power management. Display and audio clients can be prone to “dribbling”, that is, sending isolated requests at infrequent intervals.

There are two main causes of dribbling:

- Isochronous dribble, caused by a low periodic request rate. This can be (and should be) managed in the Display client by using hysteresis (high and low watermarks) on the request buffer to group requests into bursts.
- Clock crossing dribble, which is caused by a large disparity between the client clock and the Arbitration Domain clock. If the client’s clock is slow (which it often is for Display), individual requests will have several idle cycles between each request. In general, this is unavoidable by the client.

It is difficult for the Protocol Arbiter to handle the second type of dribble when it is under load, because it cannot “see” a large enough window of requests to group the traffic efficiently. Low-data-rate isochronous clients should have client-side request hysteresis to handle isochronous dribble. The Protocol Arbiter can handle clock-crossing dribble when it is under load, because the delays are smaller and it will schedule other traffic preferentially while waiting for the dribbling traffic to accumulate. When in the OSIdle use case, the Protocol Arbiter will not have enough traffic to keep the client dribble from becoming DRAM dribble (isolated requests that open and close the DRAM pages more often than necessary).

To manage DRAM dribble, the controller adds the concept of the “*hysteresis hold-off*” (also known as iso holdoff), which is a per-controller state bit. When the hold-off is active, the controller is held off from issuing activate commands to open new DRAM pages. Incoming requests will back up in the Protocol Arbiter’s row sorter and store buffer until the hold-off is released.

The hold-off is enabled whenever an individual device goes idle due to lack of work. It is released automatically whenever a latency timer expires, or the Protocol Arbiter stalls due to fullness. The net effect of the hold-off is to group *all* requests for the DRAM into activity bursts.

The hold-off causes a delay in requests transitioning from a memory-idle state. This can affect some traffic in a negative manner – principally requests that are low-latency like the CPU. To keep the hold-off from impacting these requests, software has a per-module configuration bit that disables the hold-off for certain known-latency-sensitive clients. Whenever a request with the holdoff-disable bit set enters the Protocol Arbiter, the hold-off is released. The holdoff is enabled whenever an individual device/rank goes idle due to lack of pending requests. The holdoff is released automatically whenever a request expires, the Protocol Arbiter stalls due to fullness, a request from a non-hysteresis client is received, or the bank-queue length reaches a programmable threshold. The net effect of the holdoff is to group requests for the DRAM into activity bursts.

18.4.2.3 Clock Frequency Scaling

A final aspect of power management is scaling the Memory System clocks. In principle, there are two sets of clocks that can be controlled:

- The Memory System “arbitration clock”, which is the clock used by the Arbitration Domains. Changing this clock reduces the overall bandwidth of the system and reduces the power required by the client interfaces and cross-chip Memory System routing.
- Individual Protocol Arbiter clocks. These reduce the bandwidth available to a particular memory pool and reduce the power consumed by the external pins and the external DRAM. Some Protocol Arbiters may be synchronous to the arbitration clock and not be explicitly controllable via a separate clock enable.

Tegra X1 devices have a single clock domain for the Arbitration Domain and the Protocol Arbiter: mcclk. The command controller runs on a second clock called emcclk, which matches the frequency of the command bus on the DRAMs. Mcclk can be configured to run at 1x, 1/2x, or 1/4x of emcclk. Mcclk and emcclk are phase-aligned.

Both clocks may be changed as part of frequency scaling. Changing the arbitration clock rate affects the Arbitration Domain’s idea of the latency timeout. Software should change the divide-down register to keep the scale of latency timeout “ticks” to a (relatively) constant time unit. Generally a tick time of 30 ns is used since it divides evenly into most of the common DRAM frequencies, but any value of tick granularity may be chosen.

Both the arbitration clock and memory clock have separate divide-downs.

Changing the Protocol Arbiter clock rate affects the relative memory timing parameters. The DRAM timing parameters are double-buffered to allow software to update the timing values for the next clock speed setting and then simultaneously switch to using the new values by writing a trigger.

The DRAM protocol itself may require further clock-change restrictions. To further facilitate the hardware/software handoff and reduce latency for the clock-change operation, a hardware handshake exists between the clock controller module and the Protocol Arbiter.

The MSS maintains two copies of each configuration register that may need to change due to a clock-change, the “active” and “assembly” copies; this is also known as a “shadowed” register. The active copy is what the MSS is configured to use, and cannot be written to. The assembly copy can be written to at any time, and it can be copied onto the active via a trigger mechanism. The clock-change handshake includes a hardware-initiated trigger for this shadow update.

To assist in full-system power analysis, the Protocol Arbiter should include enough statistics about the DRAM bus cycles to be able to calculate the DRAM power consumed.

18.4.3 Device Management

The EMC is primarily responsible for DRAM device management (ZQCAL, thermal management, etc.).

The exception to this is that the MC schedules refresh commands to the DRAM.

18.4.4 Translation Management

Surface allocation for most Tegra X1 clients is straightforward: software allocates the surface out of the device’s virtual space, and then backs the mappings with physical pages. The mapping between virtual and physical addresses is described using PTE and PDEs in the SMMU’s page table.

GPU surfaces have their own virtual address space that is translated by the GMMU within the GPU. The GMMU either translates requests into physical addresses that bypass the SMMU or into a second virtual address space that is then translated into physical addresses by the SMMU.

18.4.5 Statistics and Debugging

Statistics are used for performance monitoring and for generating usage information for guiding dynamic voltage and frequency scaling. Hardware will provide a set of statistics counters that are used for DVFS, both for global MSS bandwidth and for individual PA bandwidth. A separate set of counters with additional filtering support will be available for performance monitoring and debugging.

The hardware blocks illegal transfers to memory. Some transfers are based on physical DRAM limitations (addressing outside of the address map), permissions (addressing “secure” physical memory from a non-secure client) and from the SMMU (accessing an unmapped page). All of these are reported via a fault interface which records the transfer information of the last faulting address, including the following data:

- Virtual address of fault
- Module and client ID of fault
- Fault type

Faulting transfers continue through the system, but faulting reads return all-ones and faulting writes discard the write data. Writing a fault triggers a (maskable) interrupt.

18.4.6 Coherency and Ordering

For coherence and ordering:

1. The MSS does not guarantee the coherency between different clients if the write-response tag has not been provided back to the clients.
2. The MSS guarantees that if a write is sent with a write-response tag and that tag is returned to the client, no other read or write issued after the response is received from anywhere in the system can pass that write.
3. The MSS guarantees that within a single client, write responses will complete in-order.
4. For PCIe ordered clients, the MSS guarantees that all writes will complete in-order.

For the most part, the memory system is fire-and-forget. Software however needs to be involved in the configuration, translation, and power management services as described above.

18.5 Software Interfaces

The primary software interface for configuration is via the APB bus registers.

- Initial configuration
- Power management
- Device/rank management
- Translation management
- ISO client bandwidth allocation (per use case)
- Statistics and debugging

18.5.1 Boot

Tegra X1 devices have a two-stage boot:

- The Boot ROM is responsible for getting the chip out of reset to where driver-level software can take over.

- The Boot Loader or the OS-recovery code is the portion of the driver responsible for completing the boot process to the general-purpose OS.

The Boot ROM is an actual ROM built into the chip, and the Boot Loader and OS recovery section are externally loaded code. The Boot Loader is only used for Cold boot; Warm boot utilizes operating-system recovery code.

Tegra X1 devices can “boot” in two ways: “Warm boot” or “Cold boot”. Cold boot is defined as booting from a fully powered-off or fully reset state. Warm boot is defined as recovery from the lowest-power state (LP0), where the external DRAM has been held in self-refresh mode while the Tegra X1 core was powered off. Warm boot use case occurs much more often; for example, it is the use case hit whenever a SmartPhone wakes from Standby to answer a call.

18.5.1.1 IRAM Use

Tegra X1 device contain a protocol arbiter for accessing IRAM (ARC). This path is used only during boot.

The use of this path does not require the SMMU to be set as the IRAM addresses are expected to be physical addresses. The MC redirects requests to IRAM before the SMMU translation.

This is an additional step in the boot process for these scenarios. ARC_CLK_OVR_ON must be enabled to use the ARC path. Once all IRAM accesses are done for boot, ARC_CLK_OVR_ON should be disabled.

18.5.1.2 Cold Boot

Before Memory Subsystem boot can begin, the Boot ROM must read the Boot Configuration Tables (BCTs) from flash memory (slow storage) into on-chip RAM. These tables include the configuration data for up to 4 initial DRAM configurations supported. The Boot ROM then reads the strap signals assigned to the SDRAM and begins to bring up the memory subsystem.

The Cold boot Boot ROM sequence:

1. Fetch the BCT values from the storage device and move them to IRAM using AHB redirection.
2. Configure the PLL used by the MC/EMC based on BCT values
3. Wait for PLLs to lock
4. Program necessary always-on static pad configurations in the PMC
5. Configure memory clocks based on BCT values
6. Enable the MC/EMC clocks
7. Release memory subsystem resets
8. Program other necessary pad/pad-macro configuration
9. Program initial configuration for the MC/EMC based on BCT values
10. Perform the DRAM initialization sequence. This sequence is specific to the DRAM protocol used and varies depending on the requirements of a particular device. An example sequence goes as follows, but this may vary with DRAM type:
    a. Apply power to the device
    b. Wait until voltage is stable
    c. Assert DRAM reset
    d. Wait 200 µs
    e. Deassert DRAM reset
    f. Apply stable clocks
    g. Wait 500 µs
    h. Assert and hold CKE high
    i. Precharge all banks
    j. Send 2 Auto-refresh commands

k. Write to Mode register 0, 1, 2, 3

l. Issue ZQ Calibration command

m. Wait for ZQ calibration and DRAM DLL lock time to complete

11. Enable power-saving features such as clock stop, active power down, dynamic-self-refresh
12. Start periodic sequences such as auto refresh, ZQ calibration, auto-calibration
13. Release the memory-initialization hardware lock[1]

After this, the external DRAM and Memory Subsystem are ready for use.

18.5.1.3 Warm Boot

The Warm Boot sequence is very similar to the Cold Boot sequence; many of the same steps are performed. One difference is that instead of powering on the DRAM, it is awakened out of SelfRefresh. Another difference is the configuration data for Boot ROM portion of MC/EMC initialization is stored in the Power Management Controller (PMC) Scratch registers.

The PMC Scratch registers are in the Always-On partition, and are powered during LP0. The power and area limitations of this implementation restricts the number of PMC Scratch registers available; there are a smaller number of PMC Scratch Registers than the number of bits needed to fully configure the MC and EMC. The Scratch Registers are only used to store the minimum required configuration to get to working DRAM. The Boot ROM may not be able to Warm boot to full speed using only the Scratch Register data; if this limitation is confirmed, the Boot Loader may be required to mimic DVFS software and reprogram the MC/EMC to full-speed operation using data stored in DRAM. It is up to the LP0 Entry software code to ensure the proper configuration gets written to the Scratch Registers.

The Warm boot code provided by the MSS includes algorithms for deriving the approximate MC arbiter performance parameters from the EMC timing parameters. The EMC has provided generation code for the packing/unpacking calls for the scratch registers to ease the software maintenance burden.

The Warm boot Boot ROM sequence:

1. Configure memory PLLs and memory clocks based on Scratch values
2. Wait for PLLs to lock
3. Configure memory clocks based on scratch values
4. Enable the MC/EMC clocks
5. Release memory subsystem resets. Program any necessary static pad configuration that was powered-off in LP0
6. Program any necessary static pad configuration that was powered-off in LP0.
7. Program initial configuration for the MC/EMC based on Scratch values
8. Release the DRAM from software-controlled Self Refresh. This sequence is specific to the DRAM protocol used and may further vary depending on the requirements of a particular device. An example sequence goes as follows:
   a. Apply stable clocks
   b. Assert and hold CKE high
   c. Issue ZQ Calibration command
   d. Wait for ZQ calibration and DRAM DLL lock time to complete
   e. Write to Mode registers if different from LP0 entry values
   f. Issue refreshes to ensure tREFI is satisfied
9. Enable power saving features such as clock stop, active power down, dynamic-self-refresh
10. Start periodic sequences such as auto refresh, ZQ calibration, auto-calibration
11. Release the memory-initialization hardware lock

1.AHB_ARBITRATION_XBAR_CTRL.MEM_INIT_DONE

After the Boot ROM sequence is complete, the operating system restore code may access DRAM and restore a different or higher-speed operation. The operating system may also restore translation or client configuration settings before allowing any user code to execute.

18.5.2 Security Apertures

To secure the MC registers, the CPU complex's page table entries for the MC register space must be marked as secured. Then to access the registers securely, the CPU must be switched into secure mode. For more details about these CPU operations, please read the appropriate ARM Architecture Reference Manual.

To secure a region of EMEM, the page table entries for that region must be marked as secured. Then the MC registers must be configured for the secured region, using the CPU in the secured mode:

- RegWrite(MC_SECURITY_CFG0, security_aperture_base_address);
- RegWrite(MC_SECURITY_CFG1, security_aperture_size_in_megabytes);

After the registers are updated, the CPU must be in secure mode to access the described region of memory:

- Video Protection region
- Security Coprocessor Secure region

For more information on handling security violations, see Section 18.5.12.2: MC Interrupts below.

18.5.3 Software Client-Groupings

The Memory Subsystem inherently implements a hardware mapping of memory clients ("MCCIFs") to super-clients, and super-clients to the hardware modules. Additionally, the MSS implements a system of mapping modules to "software groups" (also known as SWGROUP or SWNAME). This allows a single point of control for all clients for that hardware "engine". Often the list of clients in a SWGROUP is the same as the list of clients in the module that implements the hardware engine.

Each SWGROUP has registers associated with it that select an ASID (Address Space Identifier) and determine whether SMMU translation is enabled or disabled for the client. Normally, each client is associated with one SWGROUP, thus has one ASID associated with it. A few clients have multiple SWGROUPs associated with them, which are selectable on a transaction-by-transaction basis via a 1- or 2-bit SWID flag provided by the client.

The following table lists the encoding of SWID_0 and SWID_1, when the SMMU is enabled. If the SMMU is disabled, SWID has no meaning.

SWID_1	SWID_0	PPCS	Comments
0	0	PPCS	Access uses PPCS address space for translation at SMMU.
0	1	PPCS1	Access uses PPCS1 address space for translation at SMMU.
1	0	PPCS2	Access uses PPCS2 address space for translation at SMMU.

The mapping of SWGROUP to modules for Tegra X1 devices is listed in the following table.

SWGROUP	Modules	Translatable?	Further Description
AFI	PCIe	Yes	PCIExpress
AVPC	AVP Cache	Yes	ARM7 Audio-Video Processor (AVP)
DC	Display head 0	Yes(1)	Display reads, head 0, with dis2mc_swid=1'b0
DC1	Display head 0, secure client	Yes(1)	Display reads, head 0, with dis2mc_swid=1'b1 (TrustZone®-Display window)
DCB	Display head 1	Yes	Display reads, head 1 (dis2mc_swid=don't care)
GPU	GPU	No(2)	Kepler GPU with a[34]==0

SWGROUP	Modules	Translatable?	Further Description
GPUB	GPU	Yes(2)	Kepler GPU with a[34]==1
HC	Host1x	Yes	Host interface
HDA	HDA	Yes	High-Definition Audio engine
ISP2	ISP2	Yes	Image Signal Processor
ISP2B	ISP2	Yes	Image Signal Processor (second instance)
MPCORE	AXICIF	No	CPU Complex
MPCORELP	AXICIF_LP	No	Shadow CPU Complex (Tegra X1 32-bit devices only)
NVENC	NVENC	Yes	Multi Standard Video Encoder
PPCS	AHBDMA, AHBSLV	No(3)	Clients in the AHB cluster, with ppcs2mc_swid = 2'b00
PPCS1	AHBDMA, AHBSLV	Yes	Same as PPCS, with ppcs2mc_swid = 2'b01
PPCS2	AHBDMA, AHBSLV	Yes(1)	Same as PPCS, with ppcs2mc_swid = 2'b10
PTC	MC (SMMU)	N/A	Misses from SMMU PTC
SATA	SATA	Yes	Serial ATA
SDMMC1A	SDMMC1	Yes	SDMMC controller. Each SDMMC controller has a unique use case and can be run via standard (Windows/Android) or NVIDIA drivers, hence each controller has its own (hardcoded) SWID.
SDMMC2A	SDMMC2	Yes	
SDMMC3A	SDMMC3	Yes	
SDMMC4A	SDMMC4	Yes	
TSEC	TSEC	Yes	Tegra Security coprocessor
NVDEC	NVDEC	Yes	Video Decode Engine
NVJPEG	NVJPEG	Yes	JPEG Engine
VI	VI	Yes	Video Input engine for CSI, VIP
VIC	VIC	Yes	Video Compositor
XUSB_HOST	USB3 Host	Yes	Although the same driver controls both units, each has its own SWNAME to maintain compatibility with the Tegra device.
XUSB_DEV	USB3 device	Yes	

1. The MC defines the ASID mapping on a per software-ID (SWGROUP) basis. To support secure ASID for the SE engine (in the AHB cluster) and TrustZone-Display, additional SWID signals are added to the interfaces. The additional SWID signal allows the MC to map the client to different SWIDs, providing flexibility to use a secure ASID for the SMMU.
2. Although the GPU has one physical read client and one physical write client, it can specify one of two SWGROUPs (GPU and GPUB) for a given request, depending on the value of address bit a[34]. LTCX maps a[34] to the MCCIF SWID field. SMMU translation is disabled for SWGROUP GPU and enabled for GPUB. This is how the GPU indicates whether SMMU translation is needed. The MC also performs special video protection region checks for the GPUB.
3. To support the CPU's view of 16GB memory, part of the 0-2G memory address space is used by the CPU to address DRAM. The devices which were previously making requests in the 0-2G address range, assuming that they would be always mapped to other memory space by SMMU, now overlap with devices making physical address requests in the 0-2G range. An additional bit ppcs2mc_swid indicates which requests need to remain untranslated and which requests need SMMU translation. This additional bit selects between the two SWIDs (for AHB clients). These two SWIDs map to two separate ASIDs, where one indicates SMMU translation and the other indicates no translation.

18.5.4 Virtual Addressing: Using the SMMU

For a discussion of the virtual-address translation features provided by the SMMU, see Section 18.5.4: Virtual Addressing: Using the SMMU.

In Tegra X1 devices, the CPU has its own MMU and issues physical addresses to the MSS. Thus it is not possible to enable SMMU translation for the CPU.

18.5.4.1 SMMU Initialization

1. For each Virtual Address Space (VAS) to be used, set up the page table in the DRAM. See Section 18.5.4: Virtual Addressing: Using the SMMU for details on the page-table formats supported.

2. For each ASID, set up the pointer to the page-table base and the ASID-wide protection bits. Since the PTB pointers are stored in a RAM, this uses an indirect access mechanism involving two register writes:
   a. Write MC_SMMU_PTB_ASID_0 with the ASID to be modified.
   b. Write MC_SMMU_PTB_DATA_0 with the information for this VAS:
   - Page Table Base pointer
   - Whether non-secure accesses are allowed
   - Whether reads are allowed
   - Whether writes are allowed
3. Assign hardware engines (SWNAMES) to the ASIDs and turn on translation for those engines. This involves writes to various MC_SMMU_<SWNAME>_ASID_0 registers.
4. If needed for Hardware Diagnostics purposes, disable or enable translation within a SWNAME on a per-client basis. This involves writes to various bits in MC_SMMU_TRANSLATION_ENABLE_*_0 registers.
5. If desired, secure the ASIDs, which prevents untrusted code from modifying the ASID PTB pointers by enabling a requirement for TrustZone security on register writes that modify the PTBs. This operation involves a write to MC_SMMU_ASID_SECURITY_0. Note that this register itself is secured by TrustZone to prevent it from being modified by untrusted sources, and in some situations writes to it must also be TrustZone secured for them to take effect. In particular, you cannot change a module's ASID with a non-secure write if you are trying to change it to a secure ASID, or if it is already a secure ASID.
6. If desired, enable ASID promotion, which allows clients without security access to inherit the security status based on the page-table translation. This operation involves a write to MC_SMMU_ASID_SECURITY_0.
7. Write PTC_FLUSH_TYPE=ALL to MC_SMMU_PTC_FLUSH_0.
8. Write TLB_FLUSH_VA_MATCH=ALL to MC_SMMU_TLB_FLUSH_0.
9. Configure reserved bits found to be necessary during chip bring-up, if any. There are reserved bits in MC_SMMU_PTC_CONFIG_0 and MC_SMMU_TLB_CONFIG_0.
10. Enable the SMMU by writing SMMU_ENABLE=ENABLE to MC_SMMU_CONFIG_0. Note that this register is secured by TrustZone to prevent it from being modified by untrusted sources, and writes to it must also be TrustZone secured for them to take effect.

The following alternate initialization sequence is used when TrustZone is enabled on Win8, since the UEFI (Boot Loader) is secure, whereas the software memory driver (NVMEM) is not:

1. Hardware initializes the MC_SMMU_TRANSLATION_ENABLE_*_0 register to enable translation. This is done by enabling the bits by default on cold boot (reset) or warm boot (lp0). Note that software depends on this. The software memory driver cannot configure the MC_SMMU_TRANSLATION_ENABLE_*_0 register, since it is TrustZone protected.
2. The UEFI sets up the display for SMMU translation: SMMU_ASID_DC = x, SMMU_ASID_DCB = x.
3. Enable the SMMU: SMMU_ENABLE=ENABLE to MC_SMMU_CONFIG_0.
4. Later the software memory driver sets up the rest of the ASIDs: SMMU_ASID_xxx = y (y is a non-secure ASID).

18.5.4.2 Page Table Modifications after Initialization

Modifications may be made to the page tables while the system is operating, however, care must be taken to avoid modifying an entry that is in active use. Modifying an entry in active use will result in undefined operation; the most likely failure is the use of an out-of-date cached translation. The general rules for safe modification are:

- If no client is using an ASID, then that ASID and its page table can be modified.
- If no client is using any PTE in a PDE, that PDE can be modified.
- If no client is using a PTE, that PTE can be modified.

It is up to software to ensure these rules are followed when virtual address translations need changed. Once software has updated the page-table or ASID mappings, the final step is to perform PTC and TLB invalidates on the modified entries. Note that the granularity of invalidation is at the PTE group, which is the number of PTEs that fit in a memory atom. Software can write:

- MC_SMMU_TLB_FLUSH_0 to flush a specific page group, 4 MB section, entire ASID or the entire TLB.
- MC_SMMU_PTC_FLUSH_0 to flush a specific PTE or PDE from the PTC

18.5.4.3 Collecting Statistics on SMMU Performance

The TLB and PTC each have hit and miss statistics counters. To enable statistics collection, set MC_SMMU_*_CONFIG_0.*_STATS_ENABLE == ENABLE, where * stands for PTC or TLB. The counters will begin collecting information when enabled. To check the results, read the appropriate registers:

- MC_SMMU_STATS_TLB_HIT_COUNT_0
- MC_SMMU_STATS_TLB_MISS_COUNT_0
- MC_SMMU_STATS_PTC_HIT_COUNT_0
- MC_SMMU_STATS_PTC_MISS_COUNT_0

These counters do not saturate when full; instead they wrap from MAX_UINT to 0. There is no explicit reset for these counters; the only reset-like option is to force the counter bits to all 1's using the MC_SMMU_*_CONFIG_0.*_STATS_TEST trigger bits. This is essentially like resetting the counters to -1.

18.5.5 Clock Frequency Management

Software programs the emcclk and mcclk frequencies to provide the required bandwidth and latency while minimizing power.

1. The performance of some devices are highly sensitive to MC clock frequency. Some drivers dynamically specify a minimum emcclk frequency that meets their needs. Drivers make these requests on behalf of the CPU, AVP, HDMI, the various USB controllers, GPU, MPE (NVENC), and ACTMON.
2. ISO drivers specify their ISO bandwidth requirements, which imply a minimum emcclk frequency. The ISO manager (part of IMP) ensures that the bandwidth requested is feasible within system parameters.
3. Thermal throttling dynamically specifies the highest MC clock frequency that should be allowed.
4. The central clock code computes the new EMC/MC frequency as: MIN(MAX(frequency_requests_from_1), ISO_MBps_to_MHz(sum(bandwidth_requests_from_2)), frequency_request_from_3)

18.5.6 DVFS Sequences

DVFS (Dynamic Voltage and Frequency Scaling) is a software feature for controlling system power. A key hardware feature for supporting that is changing SDRAM frequency on the fly with minimal impact on system performance. That indicates the following requirements:

- EMC timing parameters and their corresponding MC arbitration timing parameters need to be adjusted to the optimal performance for the new frequency. These parameters can be derived from DRAM datasheet.
- All trimmer values need to be adjusted for the new frequency. These values need to be characterized across PVT (process, voltage, temperature) and frequencies.
- The pad configurations that can be turned off to save power at low frequencies should also change with frequency change, such as pad terminations and DQS pulls.
- All registers involved in frequency change should be shadowed. That includes the reserved register fields that can possible be turned on only in a certain frequency range. Note that any Hardware Diagnostics feature that has power implications should be considered to be shadowed.
- No software interference should be expected from software after software pulls the trigger to change frequency and before the clock change completes: Software runs on the CPU from SDRAM. Once the EMC blocks the requests to

SDRAM, the CPU may be frozen until the EMC finishes frequency change and unblocks the requests. Note that the CPU can also possibly run out of the contents in cache during clock change, so both scenarios need to be considered.

- The delay caused by clock change should not cause functional failures or visible artifacts.

That results in a design as follows:

- The CAR module handshakes with the EMC on clock change. The EMC handshakes with the MC on shadow register latching. The whole process is done by hardware and transparent to software.
- A rough estimation of clock change delay is 2-6 µs for LPDDR3.
- Supports two clock change mode: self-refresh clock change mode and power-down clock change mode. LPDDR3 supports both modes. Clock change power-down mode is recommended for LPDDR3 since it takes a shorter time.
- For flexibility, EMC has a 16-deep FIFO to hold register programming and release them during or immediately after clock change. That enables one to send DRAM command or latch in unshadowed registers. Here are a few examples:
  - Self-refresh clock change mode requires programming EMC_SELF_REF to put DRAM in self-refresh during clock change.
  - LPDDR3 clock change requires writing mode registers after clock change.

This is a summary of the frequency change process:

- Software turns off features like self-refresh or auto-calibration if necessary to minimize their interference with DVFS sequence.
- Software programs MC/EMC shadow registers for the new frequency.
- Software sets up the appropriate threshold registers in the Display and VI/ISP for *_ready_for_latency_event.
- Software programs EMC clock change flow control registers, such as entering self-refresh before clock change and programming SDRAM mode registers after clock change.
- Software programs the MC/EMC clock source register to trigger the clock change.
- The CAR sends clock change request to the EMC (clock divider and/or clock source).
- The EMC waits for the iso_ready_for_latency_event signal to be asserted. If and while this signal is deasserted, the EMC/MC continues normal DRAM operation.
- The EMC stalls all DRAM commands including refreshes.
- The EMC handshakes with the MC to stalls incoming transactions and waits until EMC pipe is flushed
  Within handshaking, EMC may enters power down state if it is in power-down clock change mode.
- The EMC executes pre-clock change sequence such as entering self-refresh and programming mode register to turn off DLL.
- The EMC latches in shadowed registers and requests the MC to latch in shadow registers.
- The EMC acknowledges the CAR to change clock.
- The CAR changes the MC/EMC clock.
- The CAR deasserts the clock change request to the EMC indicating the clock change is done.
- The EMC executes post-clock-change sequence, such as exiting self-refresh and programming SDRAM mode registers.
- The EMC deasserts the clock change acknowledgement to the CAR.
- The EMC unstalls DRAM commands including refresh and resumes incoming MC transactions.
- Software waits 1µs before continuing.

Software programming sequence on the Tegra X1 clock change sequence:

- Before any clock change, usually at boot time

- Keep these register fields in reset values:
  CLKCHANGE_REQ_ENABLE = ENABLED
  CLKCHANGE_SR_ENABLE = DISABLED
- CLKCHANGE_PD_ENABLE:
  ENABLED: power-down clock change mode (for LPDDR3)

- At each clock change:
  - Disable DSR (dynamic-self-refresh) if it is enabled. There are two ways to do this (software can choose which)
    - EMC_DBG.WRITE_MUX = ACTIVE Read-modify-write: EMC_CFG. DYN_SELF_REF = DISABLE
      EMC_DBG.WRITE_MUX = ASSEMBLY
    - Read-modify-write: EMC_CFG. DYN_SELF_REF = DISABLE
      EMC_TIMING_CONTROL.TIMING_UPDATE = 1
      poll for EMC_EMC_STATUS.TIMING_UPDATE_STALLED == 0
  - Program shadow registers.
  - Program STALL_THEN_EXE_BEFORE_CLKCHANGE = 1
    All following EMC register programming will happen after flushing DRAM requests and stalling further DRAM commands, including auto-refreshes. Note that EMC register reads still will not work from this point until the clock change is complete: issuing an EMC register read in this duration will hang the system.
  - (optional) Program unshadowed EMC registers that need to change with clock change
  - (self-refresh clock change mode only) Program SELF_REF to enter self-refresh:
    SELF_REF.DISABLED = ENABLED
    SELF_REF.DEV_SELECTN = depending on DRAM configuration
  - Program STALL_THEN_EXE_AFTER_CLKCHANGE = 1
    All following EMC register programming will happen after clock change but before unblocking DRAM requests
  - (self-refresh clock change mode only) Program SELF_REF to exit self-refresh
    SELF_REF.DISABLED = DISABLED
    SELF_REF.DEV_SELECTN = depending on DRAM configuration
  - Program DRAM mode registers by MRW (LPDDR3) to change CL/WL/TWR etc.
  - Program UNSTALL_RW_AFTER_CLKCHANGE = 1
    All following EMC register programming can happen with on-going traffic after clock change
  - Wait 1 µs to ensure the EMC programming goes through before programming CLK_SOURCE_EMC.
  - Program CLK_SOURCE_EMC to change the clock:
    EMC_2X_CLK_SRC: MC/EMC clock source
    USE_PLLM_UD: use low jitter clock
    MC_EMC_SAME_FREQ: drive EMC versus MC clock ratio at 1:1, otherwise 2:1
    EMC_2X_CLK_DIVISOR: EMC clock divider
  - Wait 1 µs, in case the next clock change starts before the current one completes, which is possible if the software runs out of cache.

18.5.7 ZQ Calibration Sequence

ZQ calibration is a feature of LPDDR3 to calibrate R on (the output driver) across PVT (process, voltage, temperature). The EMC supports periodically sending ZQ calibration commands to both DRAMs, requiring only initial configuration after booting. The EMC also supports one time calibration commands at booting.

For cold booting, the boot ROM does a ZQ-init on LPDDR3, and then enables periodic ZQ-short.

For warm booting, boot ROM does ZQ-long on LPDDR3 and then enables periodic ZQ-short.

Self-refresh exit:

There are three cases:

- Software-controlled self-refresh as part of LP0/LP1. The device may spend an arbitrarily long time in either of these low-power states, thus could suffer significant drift temperature since the last ZQ calibration. Software must perform ZQ-long at self-refresh exit.
- Hardware-controlled self-refresh after extended period of idle. The duration should not be long (if the duration were long, software should have triggered LP1). Normal, timer-initiated ZQ-short should be sufficient.
- Hardware-controlled self-refresh as part of DVFS. The self-refresh duration deliberately is kept small since the DVFS sequence is as short as possible. There is no need to perform a ZQ calibration within the DVFS sequence itself, since DRAM voltage is not affected by DVFS. Normal, timer-initiated ZQ-short should be sufficient.

One time calibration:

- LPDDR3, Write MC_MRW:
  - MRW_DEV_SELECTN: 2 for device 0, 1 for device 1. Or use 0 for both (not used because software must control the delays between commands in boot ROM).
  - MRW_MA: 10
  - MRW_OP: 0xFF for ZQ-init. 0xAB for ZQ-long, 0x56 for ZQ-short

Periodic calibration:

- EMC_ZCAL_INTERVAL: Number of microseconds to wait between periodical ZQ commands. Program this register to 0 to disable periodic ZQ calibration
- EMC_ZCAL_WAIT_CNT: Number of clocks to wait after each ZQ command before other commands
- EMC_ZCAL_MRW_CMD:
  - ZQ_MRW_DEV_SELECTN
    2 for device 0 only, 1 for device 1 only, 0 for both devices
  - ZQ_MRW_MA
    LPDDR3: 10
  - ZQ_MRW_OP
    LPDDR3: 0x56 for ZQ-short; 0xAB for ZQ-long

18.5.8 MRR Sequence

Mode Register Read (MRR), if supported by DRAM, can be used for reading the manufacturer ID to identify DRAM vendors, or reading back from the temperature sensor, if applicable to DRAM type.

Simple sequence:

- Before any MRR, such as at booting:
  - Set MRR_BYTESEL and MRR_BYTESEL_X16 corresponding to data byte sizzling, if applied on board. The reason is that LPDDR3 always returns MRR at low byte of a data strobe, which is the only case that EMC needs to know about swizzling.
- For each MRR
  - Check EMC_STATUS.MRR_DIVLD = 0. If not true, read EMC_MRR until it becomes true
  - Issue MRR:
    MRR_MA: the index of the mode register to read back
    MRR_DEV_SELECTN: 2 for device 0, 1 for device 1. 0 or 3 are illegal. If both devices are desired, repeat this sequence on each device.
  - Poll for EMC_STATUS.MRR_DIVLD = 1
  - Read EMC_MRR. Data is in the MRR.DATA field

18.5.9 Auto-Calibration Sequence

Auto-calibration is for periodically calibrating the output driver of Tegra X1 pads. The EMC supports periodic auto-calibration without software interference, usually initiated at booting.

To enable auto-calibration:

- Program AUTO_CAL_INTERVAL: the number of microseconds between two auto-calibrations
- Program EMC_AUTO_CAL_CONFIG:
  AUTO_CAL_START = 1
  AUTO_CAL_ENABLE = 1
  AUTO_CAL_OVERRIDE: 1 to enable override, 0 to use normal auto-calibration
  AUTO_CAL_PD_OFFSET: override value
  AUTO_CAL_PU_OFFSET: override value
  AUTO_CAL_E_CAL_UPDATE: number of EMC clocks E_CAL_UPDATE is asserted
  AUTO_CAL_STEP: number of microseconds between each calibration step

To disable auto-calibration:

- Program AUTO_CAL_INTERVAL to 0

To re-enable auto-calibration after disabling it:

- Program AUTO_CAL_INTERVAL to the new value

18.5.10 LP0/LP1 Entry/Exit

LP0 and LP1 are both power saving modes with DRAM in self-refresh mode. The only difference is that the MC and the EMC are ON during LP1 but powered OFF during LP0.

LP0 and LP1 entry share the same sequence:

- Disable DSR (Dynamic self-refresh) by read-modify-write EMC_CFG. DYN_SELF_REF = DISABLED then program EMC_TIMING_CONTROL.TIMING_UPDATE = 1 to latch in the shadowed register EMC_CFG
- Wait 5 µs for worst case DSR exit time
- Program EMC_REQ_CTRL to stall all transactions

  STALL_ALL_WRITES = 1

  STALL_ALL_READS = 1
- Wait until the EMC pipe is flushed
  poll EMC_EMC_STATUS.NO_OUTSTANDING_TRANSACTIONS == 1
- Enter self-refresh

  EMC_SELF_REF.SELF_REF_CMD = 1

  EMC_SELF_REF.SREF_DEV_SELECTN: 2 for device/rank 0 only, 1 for device/rank 1 only, 0 for both
- (optional) Wait until the device/rank is in self-refresh

  poll EMC_EMC_STATUS.DRAM_IN_SELF_REFRESH ==

  1: dev0/rank0 is in self-refresh; 2: dev1/rank1 is in self-refresh; 3: both devices/ranks are in self-refresh

LP0-exit is also called warm boot. Refer to Section 18.5.1.3: Warm Boot

LP1-exit:

- Exit self-refresh

  EMC_SELF_REF.SELF_REF_CMD = 0

  EMC_SELF_REF.SREF_DEV_SELECTN = 2 for device/rank 0 only, 1 for device/rank 1 only, 0 for both
- poll for self-refresh completes

poll for EMC_EMC_STATUS.DRAM_IN_SELF_REFRESH == 0

- Program EMC_REQ_CTRL to unstall all transactions

  STALL_ALL_WRITES = 0

  STALL_ALL_READS = 0

- (optional) if it is desired to re-enable DSR (possibly turned off by LP1 entry sequence): Read-modify-write EMC_CFG.

  DYN_SELF_REF = ENABLED

  EMC_TIMING_CONTROL.TIMING_UPDATE = 1 to latch in shadowed EMC_CFG

18.5.11 Performance Tuning

Note: *The capitalization in the sections below refers to the actual register name of the associated setting.*

18.5.11.1 Per Client Knobs

Each client of the MSS has some configuration knobs that affect the behavior of the request in the PA. These knobs are:

- ISOchronous
- HYSTeresis

Most clients set their ISO and HYST bits based on the behavior profile of the client; which is static for all systems. The default programming should be acceptable for these bits.

18.5.12 Errors (Interrupts)

Both the MC and the EMC implement a handful of interrupts to inform the software of completed events or error conditions encountered by the hardware. Both the MC and the EMC have implemented the same style of interrupt interface, so this section will use the MC as the example.

The interrupt interface for MC consists of two registers and a hardware output wire. The output signal is wired to the central interrupt handling module on Tegra X1 devices; from there it can be routed to any of the CPU complexes. The first register, INTSTATUS, contains the interrupt vector for MC. Each bit in this register is set when the hardware detects an interrupt. Writing a 1 to the interrupt vector bit will clear the associated interrupt. The second register is INTMASK, each bit in this register corresponds to a vector bit in INTSTATUS. If the MASK bit for an interrupt is *clear (MASKED)*, the corresponding interrupt will *not* forward the interrupt to the central interrupt handling module. If any UNMASKED interrupt vector bits are set, the MC will assert the interrupt to the central interrupt handling module.

18.5.12.1 EMC Interrupts

The EMC generates interrupts on the following conditions:

- DLL alarm: From the EMC Digital DLL when the output delay code reaches the maximum value.
- Attempt to issue a command to a device that is in self-refresh.
- Read data from the MRR is available (to prevent software from polling for data)
- DRAM clock change sequence complete
- Refresh overflow

18.5.12.2 MC Interrupts

The MC contains two classes of interrupts: address decode errors and performance warnings.

When an address decode error occurs, the offending address is captured in the MC_ERR_ADDR register, and information about the error is captured in one or more MC_ERR_*STATUS registers. The captured information assists developers in debugging the error.

A single request can trigger multiple errors. There are multiple error status registers (MC_ERR_*STATUS) that capture the status of different types of errors, as listed below:

- MC_ERR_STATUS – Multiple violations. When more than one of the following violations occurs, the highest-priority violation is reported (listed below in descending priority order):
  - ERR_TYPE = SECURITY_TRUSTZONE – TrustZone carveout violations
  - ERR_TYPE = INVALID_SMMU_PAGE – Any SMMU translation violation

    Decode error on PDE/PTE (reserved bits non-zero)

    Request violates RW, nonsecure PTB/PDE/PTE bit values
  - ERR_TYPE = DECERR_EMEM - DRAM minimum/maximum allowed memory addresses
- MC_ERR_SEC_STATUS - All SEC carveout violations
- MC_ERR_MTS_STATUS - All microcode carveout violations
- MC_ERR_VPR_STATUS - All VPR carveout violations

The capture registers record the following information about the error:

- the Virtual or Physical address of the error (depending on the type of fault)
- which type of fault the captured error corresponds to
- a read/write indicator
- the requester client ID
- the swap bit sent by the client
- if the error was an INVALID_SMMU_PAGE, then information about the page's protection status is also captured
- (only in MC_ERR_STATUS):
  - whether the page was marked non secure in the page-table
  - whether the page was marked readable in the page-table
  - whether the page was marked writeable in the page-table
  - Note that SMMU page protection bits are formed by ANDing the page protection bits from the Page Table Base, PDE, and PTEs from all three stages of the page-walk. The ANDed protection bits and the type of the provoking transaction are both available in the status register.

Subsequent errors (of any type) will not change the status and address registers until the corresponding interrupt is cleared.

To prevent requests with address decode errors from modifying memory or accessing memory they do not have permission to, the MC “squashes” the requests. A write request that is “squashed” has had its byte-enables forced to all-zeros, this prevents the write data from being applied to DRAM. A read request that is “squashed” will have its read-return data forced to all-ones, this protects the data in DRAM from being read by non-secure sources.

There is one performance warning type interrupt: ARBITRATION_EMEM. It fires when the MC detects that a request has been pending in the Row Sorter long enough to hit the DEADLOCK_PREVENTION_SLACK_THRESHOLD. In addition to true performance problems, this interrupt may fire in situations such as clock-change where the EMC back pressures pending traffic for long periods of time. This interrupt helps developers identify and debug performance issues and configuration issues.

SMMU-Translated Requests and Physical Aperture Errors

All Virtual Addresses are translated through the SMMU, then run through the Physical Aperture checks. There are a number of confusing scenarios when debugging these interactions including:

- SMMU fault followed by any physical aperture error of any sort: because the SMMU translation occurs first, the data captured by the ERR_ADR and ERR_STATUS registers will always be the SMMU fault information. Both interrupt bits are set.
- Decode error on a successfully translated (i.e., no SMMU fault indicated) client request: the PA checks will throw a decode error; the data captured includes the Physical Address, not the Virtual Address. The client request is squashed. The decode-error interrupt bit is set.
- Decode error on a Page-Table fetch (PDE or PTE): the page-table fetch will throw a decode error; the data captured includes the Physical Address of the PDE or PTE, and the client ID corresponds to the PTC. In addition, the data returned to the PTC is modified to turn off all access permissions, marking the page INVALID. This forces the client request to also throw a SMMU fault when it is translated. Both the decode-error and SMMU-fault interrupt bits are set. The PDE or PTE are then cached with those modified access permissions, so any subsequent requests to that virtual page are also SMMU fault.
- TrustZone security violation on a translated client request: the PA checks throw a security error, the data captured includes the Physical Address, not the Virtual Address. The security violation interrupt bit is set. The client request is squashed. This behavior allows the Secure Aperture to stand as a “last line of defense” against SMMU page-table modification attacks.
- Protected-region security violation on a translated client request: the PA checks throw a security error. The data captured includes the Physical Address, not the Virtual Address. The security violation interrupt bit is set. However, the client request is squashed.
- Video Protection-region security violation on a translated client request: the PA checks throw a security error. The data captured includes the Physical Address, not the Virtual Address. The security violation interrupt bit is set.

18.6 Functionality

18.6.1 Addressing

The 34-bit physical address space supported by the MC is 16GB. Clients may support larger (e.g. 40-bit) addresses internally, but address MSBs above those connected to the memory controller are assumed to be zero. Clients may use virtual or physical addresses. If a client uses virtual addresses, the addresses are limited to 32 bits (the input width of the SMMU). The SMMU outputs 34-bit physical addresses.

18.6.1.1 Address Map and Aperture

Tegra X1 device’s physical address space includes apertures for DRAM, I/O devices, and the AHB redirection region, as defined in the address map (see Chapter 2: Address Map). The range from 0 to 2GB is designated as the MMIO region. All non-DRAM devices (including the AHB redirection region) map (sparsely) within the MMIO region. Address decoders above the MC decode the address ranges for the MMIO devices and intercept requests for the respective devices before the requests reach the MC.

Requests that reach the MC map to one of the following ranges:

- AHB redirection range between IRAM_BOM and IRAM_TOM
- External memory (DRAM) between EMEM_BOM and EMEM_TOM (maximum of 8 GB)
- Not Assigned range (if the address does not fall in either of the two ranges above)

The AHB redirection path allows MC clients that need to access boot media to access IRAM during boot. See Section 18.6.7: AHB Redirection Region for details on the use and programming of the AHB redirection feature. Note that the AHB redirection range might not map on top of the external memory range, depending on how EMEM_BOM is set.

For accesses that fall within the Not Assigned region, an error is logged, writes are acknowledged and squashed before the WCAM, and reads return all 1s.

Four additional programmable apertures restrict which devices can access defined regions of DRAM:

- TrustZone region

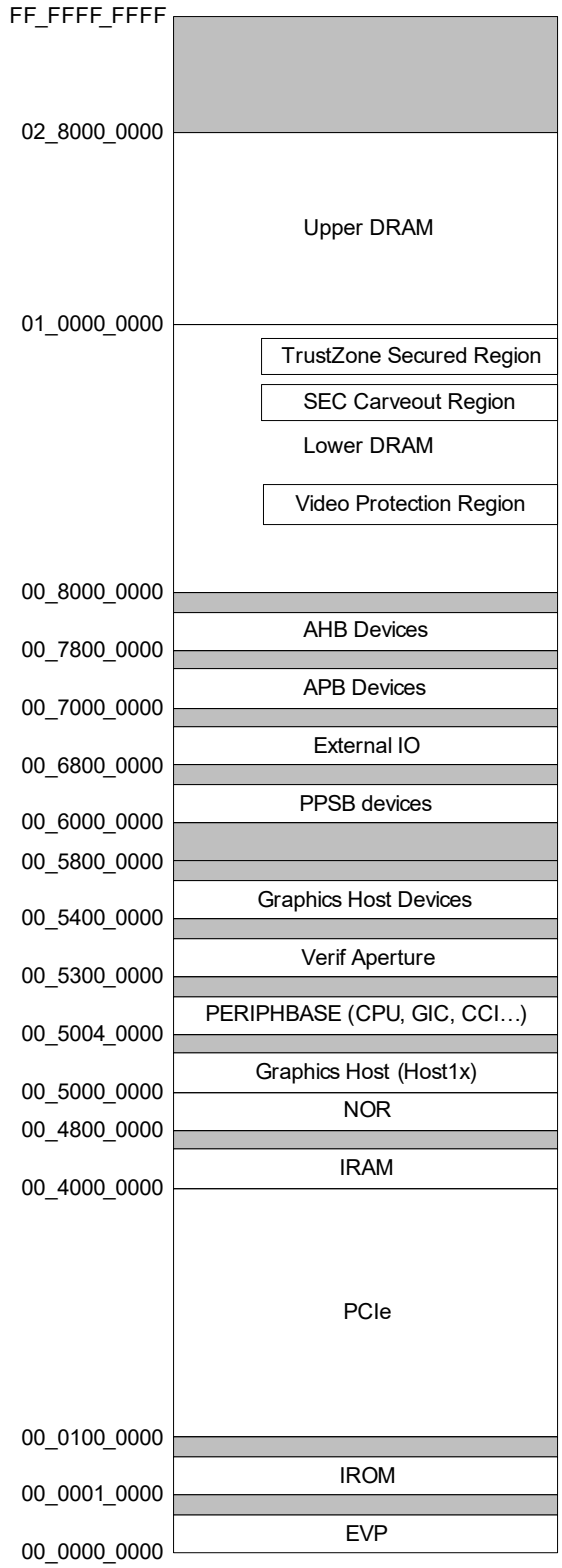
- Video Protection region
- Security Coprocessor Secure region
- Generalized Carveout Protection region

Each of these may be placed anywhere in the external memory range and have programmable size. For details on these programmable apertures, see Section 18.6.8: TrustZone® Security Region, Section 18.6.9: Video Protection Memory Region, and Section 18.6.10: Security Coprocessor Secure Region for more information.

In addition, a range of contiguous physical addresses may be designated as “carveout”. Virtual memory pages mapping to carveout are required to maintain physical contiguity. Carveout is a software-defined region with no hardware aperture detection.

The following figure shows a possible address map for a Tegra X1 system with 8GB of physical memory. For systems with 32-bit addressing (e.g., Windows 8 systems), all memory must live below the 16 GB boundary. If 16GB of DRAM is desired, the external memory range must be configured to map from 0 to 16GB. DRAM is then mapped in the holes in the sparsely populated MMIO space, providing nearly 16GB of addressable DRAM memory. This is the “Swiss Cheese” approach.

Figure 35: Physical Address Map Example for a System with 8 GB of DRAM



18.6.1.2 34-Bit Virtual Addressing

Tegra X1 supports up to 8GB of memory and many SKUs are expected to ship with 8GB populated. The Cortex-A57 and Cortex-A53 CPUs are 64-bit architectures and 64-bit operating systems are expected in the X1 timeframe. So applications will be able to access all 8GB. A 16GB (34-bit) virtual address space is considered necessary to support 8GB of physical memory.

CPU, GPU, and GPU-related clients (DISPLAY, VI, ISP2, NVDEC, NVENC, NVJPG, TSEC) all need to be able to access this 34-bit virtual address space. The CPU and GPU need to be able to access all of it simultaneously.

- CPU does this with its own internal page tables. The MC sees only physical addresses from CPU.
- The GPU can also use physical addressing (performing translation to physical with the GMMU), but this is inefficient. For the GPU, good performance requires dual translation by the GMMU (into an intermediate virtual address space) and then by SMMU, which requires that the GPU have a 34-bit virtual address space.

For the GPU and other clients with 34-bit address interfaces, the ASID registers are extended to point to four ASIDs. The SMMU supports 4GB of virtual address space per ASID, so mapping addr[33:32] into ASID[1:0] extends the virtual address space of a client to 16GB.

18.6.1.3 Client Types

The Memory Subsystem supports five types of clients:

- **32-bit clients with virtual addressing.** These clients use the SMMU for page-based and ASID-based address protection and translation
- **32-bit clients with physical addressing.** These clients either support native scatter-gather or require regions of contiguous physical addresses. Because of the 32-bit input address width, these clients can only access the low 16GB of physical address space. These clients still have ASID protection for secure regions.
- **34-bit clients with virtual addressing.** These clients use the SMMU for page-based and ASID-based address protection and translation. Because the SMMU only handles 32-bit input addresses, the upper two address bits are ignored when operating in this mode.
- **34-bit clients with physical addressing.** These clients either support native scatter-gather or require regions of contiguous physical addresses.
- **34-bit CPUs.** These clients have their own memory management unit and CANNOT under any circumstance use the SMMU for address protection or translation

For Tegra X1 devices, the following list indicates the clients that support 34-bit addressing:

- DFD
- Display
- HDA
- GPU
- ISP2
- (Virtual address client, so only 32 bits are relevant)
- PCIe (AFI)
- SATA
- SDMMC
- TSEC (Virtual address client, so only 32 bits are relevant)
- USB3 (XUSB)
- VI (Virtual address client, so only 32 bits are relevant)

18.6.2 Tegra X1 Granularity

LPDDR3 supports burst lengths of 8. LPDDR4 supports burst lengths of 16. The Memory Subsystem only supports BL8 for LPDDR3 and BL16 for LPDDR4. Because of x64 RAM configs, the minimum quantum to transfer is 64B. When using a 32-bit DRAM channel, the EMC will construct two BL8 requests for LPDDR3 and one BL16 for LPDDR4 to DRAM to service the 64B request from the MC.

To match this, MC transactions carry 64B of data payload. The 64B can be contiguous or can consist of two non-contiguous 32B “sectors” that lie within the same 512B “gob”, each mapping to a different 32-bit for LPDDR3 and 16-bit for LPDDR4 DRAM sub-partition (see Section 18.3.9: Memory Sub-Partitions). Byte access remains possible but involves a 64B access: write accesses can use byte enables to write a set of bytes (including a null set), and read accesses always return two full 32B sectors with potentially unneeded data (also known as overfetch). To efficiently operate in DDR3 mode, most engines in Tegra X1 devices use 64 B memory requests.

The granularity of external access is linked to the burst size programmed for DRAM access. Bursts into each 32-bit DRAM channel for LPDDR3 and 16-bit DRAM channel for LPDDR4 always start at a 32B aligned boundary and consist of 8 data beats for LPDDR3 and 16 data beats for LPDDR4. For x32 configurations, the two 32B sectors in an MC request correspond to two transfers of 8 data beats in LPDDR3 and one transfer of 16 data beats for LPDDR4.

DDR3 and LPDDR3 support different features to enable less data from being transferred than what the Burst Size indicates. The resulting minimum data transfer is indicated in the following table.

DRAM Width	LPDDR3 (BL8)	LPDDR4 (BL16)
x32	32B	32B
x64	64B	64B

Tegra X1 devices support:

- BL8, LPDDR3
- BL16 LPDDR4

18.6.3 Virtual Addressing

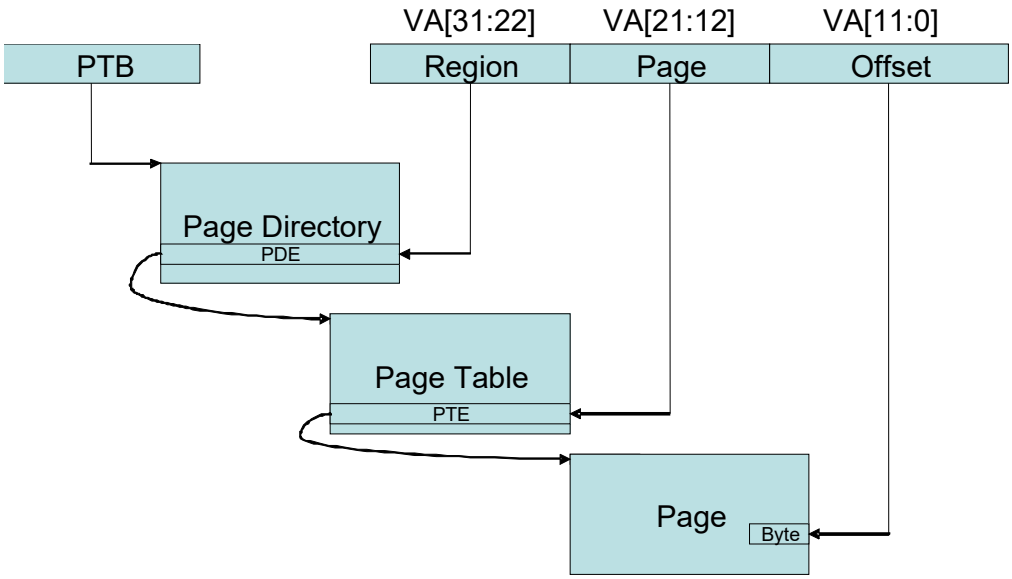
The SMMU is a centralized virtual-to-physical translation for MSS. It maps a 32-bit virtual address to a 34-bit physical address. If the client address is 40 bits then bits 39:32 are ignored. It allows the following:

- Memory allocation for hardware pools (surfaces and buffers) could be made from non-contiguous page-sized chunks of memory
- Areas of the hardware memory map could be marked as protected, preventing access from hardware devices
- Hardware memory access can be controlled on a per-device or per-process basis

The virtual-to-physical translation is via a two-level page table that carves up the virtual address as follows:

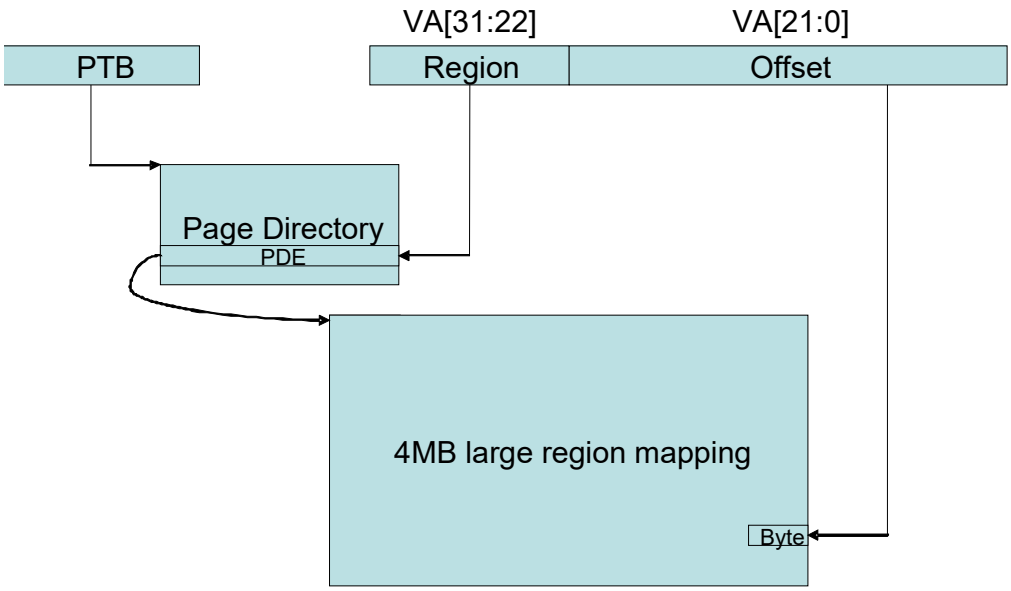
- Bits 31:22 choose a page directory entry (PDE). Each page directory has 1,024 PDEs, each mapping 4MB region.
- Bits 21:12 choose a page table entry (PTE) from a page table. Each page table has 1,024 PDEs, each mapping a 4kB page.
- Bits 11:0 choose a byte within a page

Figure 36: Page Table and Virtual Address



Each PTE or PDE consume 32 bits of memory, so that each page directory or page table consumes one 4kB memory page. In addition, the page directory lookup does an early-out either to map an entire 4MB region of the virtual space as invalid, or to map the region to a contiguous range of physical pages.

Figure 37: Large Region Mapping



The SMMU supports multiple address spaces, each with its own page-table-base register (PTB) and page table. Each address space is tagged with an address space identifier (ASID). This allows for multiple virtual mappings to exist at the same time. Typically, software will assign a different address space to each process that directly uses the hardware drivers, allowing process isolation. The number of ASIDs is 128. Software is responsible for managing the assignments between processes and ASIDs, flushing ASIDs out of the TLB as needed when they are remapped between processes.

ASIDs are assigned based on the SWNAME of the incoming request. An on-chip mapping between SWNAME and the ASID is maintained by the SMMU. For register-based devices, the driver is responsible for updating the mapping between the SWNAME and the ASID when a device in context is swapped between processes.

Untranslated modules are also supported. The SWNAME-to-ASID mapping has a translation-enable bit to allow translation on a per-SWNAME basis. There is also a per-client translation-enable bit for Hardware Diagnostics purposes. This can be used by

any client but is typically used by clients that generate 40-bit addresses. In addition, a global “translation enable” bit disables all translation when cleared (cleared is the default out of reset).If translation is disabled, client address bits 33:0 are sent directly to the output of the TU. If the client only provided a 32-bit address, the physical address bits 33:32 will be set to 0.

If translation is enabled, the lower 32 bits of the client address will be used to generate the physical address. Note that this means that client address bits 39:32 will be ignored if a client sends a 40-bit client address and its associated ASID has translation enabled. This is done to minimize the changes to the SMMU. It is expected that 40-bit clients will typically target ASIDs that have translation disabled.

Both the page and directory tables are stored in DRAM. A translation look-aside buffer (TLB) will be used to cache recently-used translations. Translations that miss in the TLB would incur potentially two additional round-trip DRAM delays, but the latency-scheduling features of the Protocol Arbiter will be used to hide this latency behind the normal latency incurred by the DRAM reordering policy. The TLB is backed by a page-table cache (PTC) to reduce this memory traffic further.

To further improve CPU latency, the Tegra X1 CPU low-latency read paths bypass the SMMU altogether; the hardware also restricts the CPU write paths to untranslated-mode to prevent any configuration mishaps.

18.6.3.1 Page Table Layout

The in-memory layout of a PTE looks like

- 22 bits of physical address (PA[33:12]) for the base of the page
- Protection bits which include
  - A “readable” bit which allows clients to read this page
  - A “writeable” bit which allows clients to write this
  - A “nonsecure” bit which (when unset) restricts access of this page to “secure” TrustZone clients

The remaining bits in the 32-bit word are reserved.

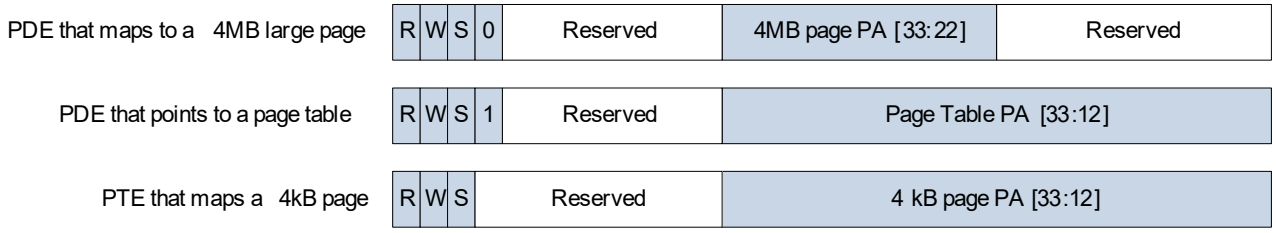
Note: *Wherever physical addresses are used in this document, it is assumed that the device can address 8GB of physical memory.*

The in-memory layout of a PDE looks like:

- A “next level” bit which says if this PDE maps a single 4MB region, or if it points to a page containing a table of PTEs for the second level of translation
- If the “next level” bit is set, there are 22 bits of physical address (PA[33:12]) that point to a page containing the base of the PTE table for this PTE. If the “next level” bit is clear, 12 bits (PA[33:22]) are used to point to the base of an aligned 4MB physical region mapped directly by the PDE.
- The remaining bits set the permissions for the access. For 4MB large pages, these are used directly for the region. For PDEs that point to a second-level page table, these permissions are ANDed with those of the PTE to give the final permission
  - A “readable” bit for the region
  - A “writeable” bit for the region
  - A “nonsecure” bit for the region

The remaining bits in both interpretations are reserved. Reserved bits should be 0, otherwise they can cause an SMMU fault. Because these are compressed in PTC before they are identified as being PDE or PTE, only the subset of reserved bits that are common to all formats (bits [27:22]) will trigger an SMMU fault.

Figure 38: PDE and PTE Formats



The base address of the page directory for a particular ASID is stored on-chip in the ASID table. Changes to this table may require flushing the ASID in question from the TLB.

18.6.3.2 Page Validity and Protection

There is a need on the software side to distinguish between an invalid mapping (which has an invalid PA field) and a mapping that is valid, but has no access. The following pseudo-code describes the recommended conventions.

```
    // page/section/address space permission types
    //
    // note that INVALID implies the PA field is unused.
    // PA is valid for all others, including NO_ACCESS.
    enum Permission {
INVALID        = NvU32(0),
NO_ACCESS      =                              NONSECURE,
SECURE_WRITE_ONLY=     WRITABLE,
WRITE_ONLY     =              WRITABLE | NONSECURE,
SECURE_READ_ONLY= READABLE,
READ_ONLY      = READABLE |           NONSECURE,
SECURE                 = READABLE | WRITABLE,
ANY                    = READABLE | WRITABLE | NONSECURE
     };
```

For more information on handling SMMU faults, see Section 18.5.12.2: MC Interrupts above.

18.6.3.3 Flushes and Page Table Updates

Changes to the page tables require the TLB to be flushed. A software interface for selectively flushing parts of the TLB is provided. The flush command can flush any TLB entries that match a particular subset of virtual addresses. Each address component may be included for matching:

- Match on the ASID, or not
- Match VA[31:22], or not
- Match VA[31:16] or no VA match

Disabling all matches flushes the entire TLB. Note that the TLB is 16 entries wide, so when you match any particular VA, you flush the entire line, which is why the VA matches are down to 16, rather than 12. 4 MB pages are still matched down to VA[16] since they are stored in the TLB using the 4 KB page format.

In addition to the TLB, page table updates require flushing stale entries out of the PTC. This needs to be done on a slot-by-slot basis by writing the PDE or PTE's physical address (PA[33:4]) to the PTC flush command. Each flush flushes 16 aligned PTEs or PDEs (one DRAM atom's worth) out of the cache.

A page table update requires three writes – one to write the PTE to memory, one to flush the stale PTE out of the PTC, and a third to flush the stale VA mapping out of the TLB. However, since a single PTC flush flushes 16 PTEs or PDEs and a single TLB flush can flush the entire TLB, software can reduce the flush traffic by merging flushes from multiple updates.

18.6.4 DRAM Device/Rank□Bank and Page Mapping

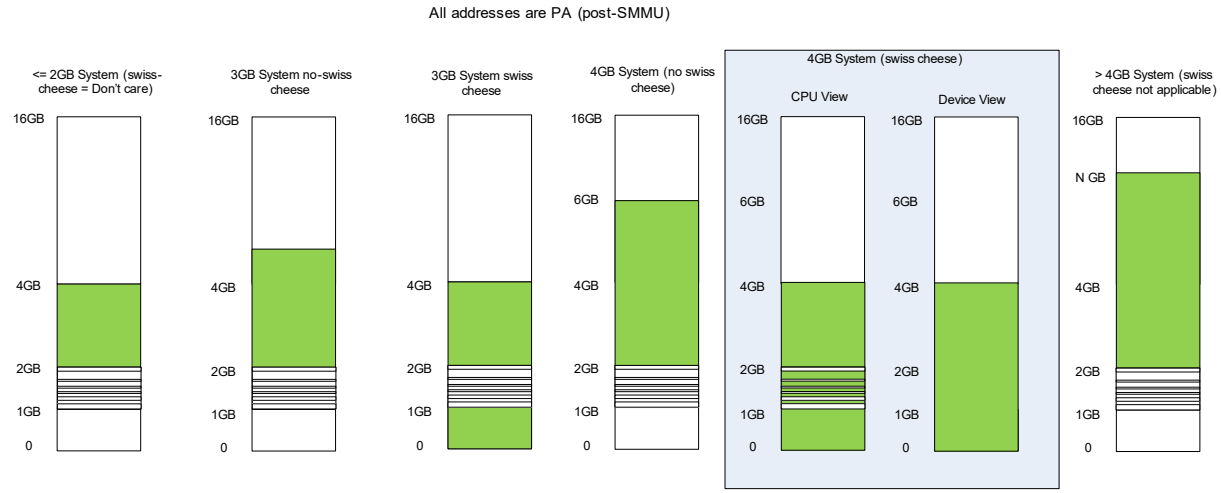
Tegra X1 devices support two modes of addressing; normal addressing mode and swiss-cheese mode. The EMEM_BOM field in the MC_EMEM_CFG_0 register supports the two addressing modes.

EMEM_BOM == 1'b0: EMEM Base is 2GB // Normal AMAP

EMEM_BOM == 1'b1: EMEM Base is 0 // Swiss-cheese mode, EAMAP

The various address ranges for DRAM in both configurations are shown the figure below.

Figure 39: : Physical DRAM Address Space for Configurations



In case of any errors, MC logs the address of the violating request in the MC_ERR_STATUS_0.ERR_ADR_HI and MC_ERR_ADR_0 registers. In case this error address is due to decerr, the logged address is the original Physical Address.

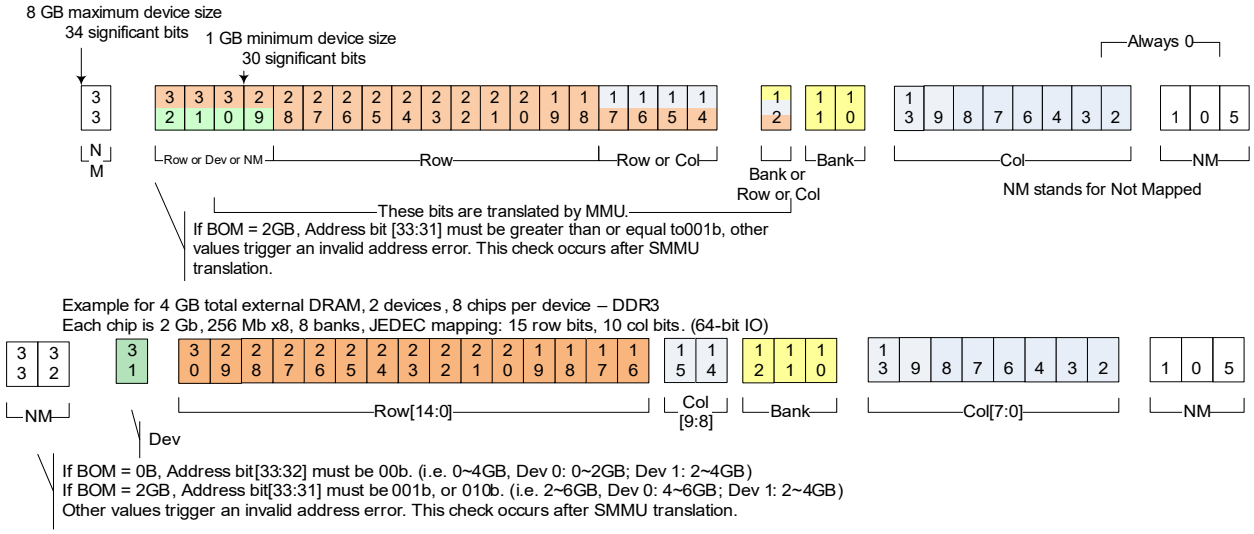
The EMC supports multiple devices with data widths of 8, 16, or 32 bits[1], all identical to form a single rank of either 32 or 64 bits. Up to two ranks are supported.

The bit mapping between the internal linear address and the device/rank, row, column and bank bits is performed as follows:

- The 2 LSBs of the linear address are ignored as the address granularity of the DRAM is 32 bits/4 bytes
- In 64-bit systems, bit 5 of the linear address determines the 32-bit subpartition (with hashing of MSBs)
- In 64-bit systems, bits[9:6,4:2] of the linear address are mapped as column bits [6:0]
- In 32-bit systems, bits[9:2] of the linear address are mapped as column bits [7:0]
- Bits [11:10] are bank bits, possibly hashed.
- Bit [12] is a bank bit if the device has more than two bank bits, possibly hashed.
- The next bits of the linear address are mapped as column bits, as many as remaining after previous mapping
- The next bits of the linear address are mapped as row bits, as many as needed for the selected device
- The next bit is a device/rank bit if device/rank bits are needed

1. A x32 device may be a single x32 chip or two x16 chips in parallel.

Figure 40: Address Mapping Example



The number of sub-partition, bank, column, row, and device bits is limited by the number of address pins available:

- Sub-partition width: 1 or 0
- Bank width: 2 or 3
- Column width: 9 to 12
- Row width: 12 to 16
- Logical Devices/Ranks (also known as chip selects): 1 or 2

When two logical devices/ranks are used, the total memory mapped by the second device/rank must be less than or equal to the first device/rank. The second device/rank also may have a different row, bank, column mapping from the first device.

18.6.5 DRAM Power Modes

The following table maps between the system power modes and DRAM power modes.

	VDD_CORE	VDD_CPU	MC/EMC Power	PLL	MC/EMC Clock	DRAM State
LP0 (deep sleep)	off	off	off	off	off	self-refresh
LP1 (suspend)	on	off	on	off	off	self-refresh
LP2 (idle)	on	off	on	on	on	active

Refer to Chapter 12: Power Management Controller for more details on system power modes.

18.6.6 Bank Hashing

To achieve a good bank interleave, Tegra X1 devices perform a hash of address MSBs into the bank bits.

18.6.7 AHB Redirection Region

During boot, USB3 and flash media (SDMMC/SATA) devices need access to IRAM. Because these clients connect to the MC and do not have a direct path to the IRAM, The MC implements AHB redirection during boot to allow path to IRAM. In this mode, accesses to a programmed memory address aperture are directed to the AHB bus, allowing access to the IRAM.

The AHB aperture is defined by the IRAM_BOM and IRAM_TOM registers, which are initialized to disable this aperture. If the fuse indicates that the boot media is present in one of these clients, that Boot ROM will initialize this aperture to 0x40000000 and 0x4003f000 (1GB, 1GB+IRAM_SIZE), respectively. Once bootup is complete, the boot ROM programs the IRAM_BOM to 0xffffffff and IRAM_TOM to 0x00000000, thus disabling access to IRAM. DRAM is then potentially accessible in this address

range. These aperture register also have an access_control/lock bit. After disabling the aperture, the access_control register should be programmed to lock the registers.

AHB routes the requests targeted to IRAM appropriately and routes all non-DRAM aperture requests (as defined by the swiss-cheese and related configuration) back to the MC as the default DRAM region. Care must be taken to program the IRAM aperture register to prevent a request from being stuck in a loop.

18.6.8 TrustZone® Security Region

The MC can secure a region in the physical address aperture from insecure software sources. The region can be defined on 1MB boundaries in the external memory region, in multiples of 1 MB. If a non-secure request is made to the secured region or if a secure request from the CPU is made outside of the secured region (after this mode is enabled), the MC generates an interrupt (if enabled) and logs the details of the request (address, client ID). After the details are logged, write requests are dropped and read requests are forced to return all 1's, thus protecting the secured region from corruption by the insecure source and avoiding aliasing in the CPU cache.

Only clients configured for security can make secure requests.

After the TrustZone aperture is established, the CPU_STRICT_TZ_APERTURE_CHECK bit in the MC_TZ_SECURITY_CTRL_0 register is set in the MC, which forces correct behavior as follows:

- Secure requests from the CPU can only access TrustZone secure memory space and not access the memory outside TrustZone secure memory space.
- Secure requests from other clients may access the TrustZone secure memory space and also may access memory outside TrustZone secure memory space.
- Non-secure requests from any client can only access memory outside the TrustZone secure memory space.

The register MC_TZ_SECURITY_CTRL_0.CPU_STRICT_TZ_APERTURE_CHECK itself is sticky and cannot be changed once set after cold boot.

The clients that have access to the TrustZone DRAM region are:

- CPU
- PTC
- PPCSCLVMEM (AHB)
- SE
- NVDEC
- DISPLAYT (Trust-Zone Display)
- Host1x

18.6.9 Video Protection Memory Region

This protected memory aperture prevents the CPU (and other unauthorized clients) from accessing data within the region. The MC secures a region in memory from access and modifications by engines that are not part of the video decode and display process.

This aperture is defined by the VIDEO_PROTECT_BOM and VIDEO_PROTECT_SIZE_MB (reset value 0x0) registers. The value 0 for the size register disables this aperture.

In addition to protecting the region in memory, the registers are allowed only secured access by the Boot Loader only. On cold boot when this register is initially programmed, it is also written to the secure PMC-scratch region. On LP0 resume, the register value is restored from this region. This eliminates need for saving this register content on LP0 entry. An additional lock bit locks down the access to this register. On reset the lock bit is cleared. When the lock bit is cleared, the writes are allowed to the VPR aperture registers. When the VPR registers are initialized, the lock bit is set. When the lock bit is set, all writes to the VPR aperture registers are ignored. This lock bit is used for cold boot as well for LP0 exit.

For systems that do not implement VPR, the Boot Loader must still set the lock bit to indicate that programming is completed.

The clients that have access to the VPR aperture are:

- Display
- GPU (GPUB does not have default VPR access)
- TSEC
- VIC
- NVENC
- NVDEC
- HDA

For security reasons, the VIDEO_PROTECT region must be locked by boot loader in devices where the VIDEO_PROTECT security region is available (defined by a fuse). The region must be locked even if the SIZE of the region is zero. Failure to lock this region will prevent the GPU from accessing system memory. The VIDEO_PROTECT region can be locked by writing DISABLE to MC_VIDEO_PROTECT_REG_CTRL_0::VIDEO_PROTECT_WRITE_ACCESS.

Note: *As a part the GPU initialization process, the GPU waits for the VPR and the WPR information from the Memory Controller. VPR and WPR should be in locked state before the Memory Controller can send it to the GPU.*

18.6.10 Security Coprocessor Secure Region

The Security Coprocessor (SEC) engine needs a secured memory space meant exclusively for use by this engine. This memory region, SECR (SEC region) should be accessed only by the SEC engine; no other clients are allowed to read or write to this memory region. This memory region is defined by physical memory range.

The SEC engine (also referred to as TSEC) uses this carveout region as an extension to its I-cache and D-cache. Without this carveout, the TSEC has to encrypt the data before writing to normal DRAM.

The SECR_BOM and SECR_SIZE_MB registers (reset value 0x0) define the 1MB aligned base and size register for this region. In addition to protecting this memory region, these aperture definition registers themselves need to be protected and are allowed to be modified only by the Boot Loader (during cold boot) and the Boot ROM (during LP0 resume) and should be implemented similar to the VPR aperture registers. An additional sticky/secure bit controls this register. On reset this sticky/secure bit is cleared, thus allowing write access to the SECR aperture registers. When the Boot Loader initializes the aperture registers, it also sets this sticky/secure register bit. When this sticky/secure bit is set, all subsequent writes to this register are ignored. On LP0 resume, reset clears this sticky bit; it is set again when the aperture register is restored from the PMC secure scratch space. To avoid saving this aperture register on LP0 entry, the Boot Loader (during cold boot) should store this aperture definition to the PMC secure scratch space.

The size for this carveout region is 1MB.

Any access to this memory aperture by any other client (other than SEC) is ignored (read returns all 1s as the response and writes are dropped) and an error is logged.

18.6.11 Generalized Carveouts

The Tegra X1 Memory Controller has 5 generalized carveout memory regions that can be configured to allow protected access to certain clients: two are reserved for GPU (for Write-Protected-Region), one for NVDEC, one for TSEC0, and one for TSEC1. These clients use generalized carveouts to protect Falcon micro-code from external tampering, but the use of generalized carveouts is not limited to write-protection regions only.

In addition to client ID, generalized carveouts require clients to send two additional fields (via sideband signals): a*perture_id* and *access_level*. Requests to generalized carveouts are then rejected or accepted based on the tuple {*aperture_id*, *access_level*,

client_id, *smmu_translated*} and the configuration of the carveouts. The fields *aperture_id* and *access_level* of clients that do not use generalized carveouts are tied to zero (at the MCCIF).

Fixed-function carveouts supported in Tegra X1 devices:

- TrustZone region
- Video Protection region
- MTS Carveout Protection region

18.7 Memory Tiling

Tegra X1 supports the memory tiling formats described below.

Table 81: Client Shared Tiling Formats

Format	Status	Used for	Description
Pitch Linear	Supported by some clients	Software-compatibility, clients that linearly access memory	Simple array ordering
Block linear 16Bx2 with Tegra X1 sector ordering	Supported by all clients	Kepler color surfaces, clients that access memory in blocks or vertically	Square DRAM page arrangement (blocks) with folded atoms
Legacy (Prior to Tegra 2 devices)	Not Supported		

The parameters associated with each tiling format are listed below:

Table 82: Surface Descriptor Parameters

Parameter	Used by	Description	Values	Minimum Alignment
Layout	All	Surface layout	PITCH, BLOCKLINEAR	N/A
Base Address	Pitch	Starting address of surface, in bytes	32-bit virtual address (40-bit virtual address within the GPU) -or- 34-bit physical address	64B (general) 128B (GPU) 256B (NVENC, VIC)
Pitch	Pitch	Line-to-line stride in bytes	Large enough for at least 4,096 pixels in bytes (some clients may support larger values)	64B (general) 128B (GPU) 256B (NVENC) up to 256B (VIC)[a]
Base Address	Block Linear	Starting address of surface, in bytes	32-bit virtual address (40-bit virtual address within the GPU) -or- 34-bit physical address	512B (one gob)
Block Width	Block Linear	Width of block in gobs	ONE_GOB (this is the only setting supported on Tegra X1)	N/A
Block Height	Block Linear	Height of block in gobs	[ONE_GOB, THIRTYTWO_GOBS] (SIXTEEN_GOBS is the normal setting, but ONE_GOB may be needed for display surfaces outside carveout	N/A
Block Depth	Block Linear	Depth of block in gobs	[ONE_GOB, THIRTYTWO_GOBS] (values greater than ONE_GOB are only supported by the GPU)	N/A
Width	Block Linear	Width of surface in samples	[1, 4096] samples (some clients may support larger values)	1 sample

a. The pitch alignment restrictions for VIC depend on its cache line shape: 256Bx1: 256B, 128Bx2: 128B, otherwise: 64B.

(x,y) to linear address translation is the responsibility of clients. The MCCIF only supports linear address inputs. Contact your NVIDIA representative for access to libraries with translation code to simplify implementation.

18.7.1 Block Linear

The block linear formats map batches of contiguous addresses into rectangular *blocks*, and tile these blocks linearly. Blocking serves two purposes: 1) it maps a DRAM page into a rectangular region, rather than into a one-pixel-tall strip, to capture locality in a graphics geometry stream or other 2D-oriented client, such as an MPEG encoder or decoder, and 2) it makes it possible to predictably interleave banks in x and y, minimizing bank conflicts over a large region.

Blocks themselves are arranged from *GOB*s (*Groups of Bytes*). A Kepler GOB is 512 bytes arranged as 64x8 bytes. GOBs are stacked vertically to form a block. The number of GOBs stacked vertically in a block is controlled by an additional surface parameter called the *block height*. The recommended block height for most buffers in Tegra X1 devices is 16 GOBs (128 lines). This supports 8x8 bank interleaving. For buffers for which linear display access is more important than access by GPU, VIC, or other block-oriented engine, block height can be set to 1 GOB, providing more locality for the display client.

Blocks are arranged horizontally into a *Row of Blocks (ROBs)* to fill out the surface to the width value (or slightly beyond, if the width is not a multiple of the 64B block width). Upper address bit swizzling in the bank swizzling algorithm generally makes it unnecessary to pad the surface width further.

18.7.2 Sub-Partitions

The 64-bit DRAM channel can be divided into two sub-partitions with DQ[31:0] forming sub-partition A and DQ[63:32] forming sub-partition B.

Each 64B atom is divided into 2 sectors of 32B. One sector contains bytes 0 – 31 while the other contains bytes 32 – 63.

18.7.3 Software Guidelines

Software should allocate surfaces respecting the minimum alignments specified in Table 82. This section gives additional alignment restrictions for certain clients and advice on allocating surfaces for best performance.

Certain clients, such as NVENC, NVDEC, NVJPEG, and VIC use 32-bit registers (left-shifted 8) to specify 40-bit base addresses of a buffer. Base addresses for these clients must be aligned to a minimum of 256B.

Certain clients, such as NVENC and VIC, have a fixed cache line size and read all data within a cache line, even if it is beyond the nominal height and width of the surface. For such clients, surface width and height need to be padded to at least the next multiple of the cache line size so the unit does not read beyond the end of the buffer.

Surface Type

- **Block linear** format generally provides best performance and should be chosen by default.
- **Pitch format** may be preferable if producer and consumer clients perform linear accesses and both clients support pitch.
- **Private formats** are used by a few units, such as NVENC, NVDEC, and NVJPEG. For private formats, the client-required allocation and padding rules must be followed.

Block Linear

- **Alignment**. Align surface start address as follows:
  - 512B is the minimum alignment for correct behavior. Performance will be poor (no zero-bandwidth clears, poor page locality).
  - 1KB alignment is better. Zero bandwidth clears will work. Bank interleave will be suboptimal.
  - 8KB alignment is best. All compression features work. Bank interleave assumes 8KB alignment. Use this setting for large buffers.

- **Block height** should normally be programmed to SIXTEEN_GOBS (128 lines). For certain surfaces for which display is the primary client, block heights of ONE_GOB or TWO_GOBS are recommended. Surfaces to be accessed by the GPU texture unit may require a smaller block height under certain conditions.[1]
- **Width** is typically prescribed by the application. Hardware allocates a block linear surface to be an integral number of blocks wide, so its allocated width is width*Bpp rounded up to the next block boundary (64B), which is sufficient padding in almost all circumstances.[2]
- **Height padding**. Surfaces should be an integral number of blocks tall. If a client such as NVENC or VIC has a cache line that is taller than the block height, additional row(s) of blocks may be required for padding.

Pitch

- **Alignment**. Align surface start address to a minimum of:
  - 128 B if surface is to be accessed by the GPU
  - 256 B if surface is to be accessed by NVENC, NVDEC, NVJPEG, or VIC (due to the 8-bit left-shift issue)
  - 64 B otherwise
- **Pitch**. Surface pitch must be a multiple of:
  - 128 B bytes if surface is to accessed by GPU
  - 128 B if surface is to be read by VIC with 128x2 cache line shape
  - 256 B if surface is to be read by VIC with 256Bx1 cache line shape
  - 64 B otherwise.
- **Height padding**. For clients, such as NVENC and VIC, additional lines of padding might be required beyond the nominal height of the surface. For example, when the VIC is reading a source buffer with an internal cache line shape of 32x8, the source buffer must be a multiple of 8 lines tall.

18.8 Latency Allowances Timestamps, Deadlines, and Slacks

The Tegra X1 Memory Controller supports clients with highly differing latency requirements. It achieves this by calculating a deadline for each request as it enters the memory controller and then prioritizing requests that reach their deadline and still have not been serviced.

When all requests are within their deadline, the arbiter grants requests to maximize efficiency (Efficiency Arbitration Mode). If any request(s) have reached their deadline, the arbiter operates in Latency Arbitration Mode, giving high priority to the expired request(s). For a variety of reasons, an expired request may not be able to be granted immediately. Expiration Time is the time between a request reaching its deadline and the time it is actually granted by the arbiter.

18.8.1 Deadline and Slack Computation

When a request is stored in the partition client (PC) FIFO, a deadline is computed for it. The deadline is computed by adding the latency allowance (LA) of the issuing client to the current timestamp. The LA is programmable on a per-client basis. Slack is defined as Deadline – Timestamp with wrapping arithmetic as described below. Negative slack means the request has been pending in the EARB for longer than its latency allowance and should receive latency-mode arbitration.

To decouple the concept of time in the EARB from the clock period of the mcclk, the units of deadlines, LAs, timestamps, and slack are all stored in units of ticks. A tick is the wall-clock granularity; nominally 30ns. There are configuration variables to tell the TIMER unit how to translate mcclk cycles into the appropriate timestamp increments for the current clock-frequency.

When viewing the MC statistics, a positive slack indicates the requested latency allowance was achieved; negative slack indicates the request was pending in the arbiter longer than the programmed latency allowance. Larger (signed) slack values

1. For buffers that are to be accessed using the GPU texture unit, the BlockHeight parameter must match that used by the texture unit. In particular, note that if a texture surface is smaller than the specified size in blocks, texture uses a shrunken blockHeight instead of the nominal parameter specified in the Texture Header.
2. If VIC cacheline shapes of 128x2 or 256x1 are used (generally not recommended for block linear), width must be padded up to a multiple of the cache line width. If this is not possible, a narrower cache line shape must be used.

are indicative of less latency. Since the arbiter represents latency internally in units of deadline timer ticks, the slack value reported in these statistics is also in units of ticks.

18.8.2 Determining the Latency Allowance

NVIDIA determines the latency allowance setting for each client. In many cases, the latency allowance can be statically programmed. In some cases, it must be dynamically programmed based on client bandwidth and/or memory clock frequencies.

Before giving programming guidelines for different client classes, some term definitions are below:

- Latency Tolerance. The latency a client can tolerate while running at its design bandwidth. This may be governed by a) the size of internal latency buffers within the client or b) the size of the client's MCCIF response buffer (which needs to be large enough to store all of the client's requests outstanding in the memory controller). The latency allowance should be less than the Latency Tolerance minus the expected Expiration Time and minus pipeline latencies not accounted for in the latency allowance, to avoid stalling the client.
- Self-queuing time. The time required to process all requests from a client that could reside in the row sorter at once. For example, if a bandwidth-soak client floods the arbiter with requests, such that the row sorter is filled with requests from that client, if requests are serviced with bandwidth B, the self-queuing time for the client is RowSorterSize / B. The latency allowance must be more than the self-queuing time to avoid having the arbiter in Latency Mode all of the time. If the row sorter is known to contain requests from other clients with the same latency allowance, the self-queuing time for a given client can be reduced. However, if the row sorter may contain requests from another client with shorter latency allowance (e.g. CPU), the self-queuing time may be extended.
- Request arrival rate. Some clients dribble requests into the row sorter. These requests may have page-locality and may be able to be processed in the same activate, if the row sorter holds onto the initial request(s) long enough for the subsequent requests to arrive in the row sorter. It is desirable to choose a latency allowance that will allow the aggregation of requests of this type.

Consider rules for choosing the latency allowance for different client classes.

For convenience in later sections, the following components of read latency (the numbers in parentheses assume 800 MHz emcclk) are rolled up:

```
static latency from client to snap arbiter        = 11 emcclks   (14ns)
static latency from snap arb to end of row sorter = 4-54 emcclks (5-68ns)[1]
static latency from row sorter to DRAM pads       = 14 emcclks   (18ns)
DRAM latency (assuming 800 MHz DRAM)              = 24 emcclks   (30ns)
static latency from DRAM pads back to client      = 16 emcclks   (20ns)
                                          -------------------------
                                                  = 69-101 emcclks (86-150ns)
A useful rolled up number is the total static latency (including DRAM latency), but excluding the
portion covered by the latency allowance:
static latency minus snap arbiter to row sorter   = 65 emcclks   (81ns)
```

18.8.2.1 Latency Allowance for Write Clients

Because of the WCAM, the latency allowance for write clients is greatly simplified, which required quick scheduling of writes so that write acknowledges could be returned. Once a request has passed the WCAM, even for a low-latency client like CPU, the contents of the write are globally visible. The actual scheduling of the write can be done leisurely. The recommended latency allowance for all write clients is 128 ticks at maximum emcclk. The value should scale up as emcclk frequency scales down, so other clients with frequency-dependent LA values don't have higher LAs than writes. The equation for writes for Tegra X1 is:

latency allowance (emcclk) = min(255, 128*(800 MHz/emcclk))

The following sections discuss latency allowance for reads among the different client classes.

1. Assuming: 1) CPU client, 2) GPU client with TLB miss/PDE hit/PTE hit.

18.8.2.2 Latency Allowance for CPU Read Clients

For CPU read clients, the latency tolerance is dictated by the number of outstanding requests the CCPLEX supports. For Tegra X1, the fast Cortex-A57 multi-core supports a maximum of 11 outstanding reads (whether directly from the CPU or from the L2 prefetcher). The latency allowance is dictated by a tradeoff between a desire to lower latency (thereby increasing bandwidth, according to Little's Law) and a desire to limit the disruptiveness of CPU requests and to allow the memory controller to process streaming CPU reads with more than one access per activate.

18.8.2.3 Latency Allowance for Bandwidth-Soak Read Clients

For a bandwidth-soak read client, latency to the client must be as low as possible (to minimize expensive latency buffering), so the latency allowance must be as low as possible, while still covering the self-queuing time. So start with the self-queuing time and work upward. To avoid continuous latency panic mode, a latency allowance that is larger than the self-queuing time is needed, using conservative estimates of the row sorter drain bandwidth. A target latency allowance is computed at maximum emcclk rate as follows:

```
target latency allowance = row sorter size / conservative drain bandwidth +
                           static latency from snap arbiter to row sorter;
```

Tegra X1 has a 64-entry row sorter per channel. If it is conservatively assumed that a drain bandwidth of 50% of peak DRAM utilization[1] these 2*64 entries will take 128 entries * 4 emc clocks per request / 50% DRAM utilization = 512 emcclks to drain. To this the static latency is added from the ring 2 snap arbiter to the row sorter including the SMMU (assuming TLB miss / PDE hit / PTE hit and that emcclk = 2*mcclk. This adds an additional 54 emcclks. The total is 512 + 54 = 566 emcclks. The number of ticks (and nsec) this corresponds to depends on the mcclk frequency. At 800 MHz emcclk, this corresponds to 708 nsec or 24 ticks.

From the latency allowance, the total latency of the system can be determined, thus the latency tolerance the client and system must support:

```
total latency = static latency minus snap arb to row sorter  ( 65 emcclks) +
                target latency allowance                     (566 emcclks) +
                expiration time                              ( 88 emcclks)
              = 719 emcclks (899ns)
```

The MCCIF response buffer must provide storage for all requests outstanding for the total latency at the required bandwidth. Using Little's Law:

```
mccif size = total latency * required bandwidth
```

where required bandwidth is the maximum sustained bandwidth for the client. For a bandwidth soak client that can saturate memory bandwidth doing reads alone, this would be peak bandwidth derated by the expected DRAM efficiency. Using Tegra X1 numbers gives the following:

```
mccif size = 719 emcclks * 2*16B/emcclk * 0.85 =
          ~= 19.6 KB (306 64B entries[2])
```

Once the mccif size has been determined, the actual latency allowance can be computed by inverting the equations above:

```
latency allowance = (mccif size) / client bandwidth
                    - static latency minus snap arb to row sorter (65 emcclks)
                    - expiration time                             (88 emcclks)
                  = (mccif size) / client bandwidth – 153 emcclks
```

For a bandwidth-soak client:

1. Drain bandwidth may be reduced because of poor locality in the request stream or because the CPU requests with low latency allowance are consuming bandwidth with minimal row sorter occupancy.
2. The number of entries in the MCCIF response buffer is much larger than the row sorter itself, which seems counterintuitive and wasteful—and it is. This buffer does have to cover latency beyond the row sorter latency (for SMMU misses and static latencies in the request/response path outside of row sorter). The main contributor, though, is that latency allowance is calculated based on a conservative estimate of the drain time (based on 50% DRAM utilization), whereas the FIFO must be sized using that latency allowance with best-case bandwidth. Requests can legitimately sit in the row sorter until the latency allowance + expiration time. This wasted MCCIF storage can be avoided if the arbiter had a graduated priority scheme based on increasing age, rather than the current bimodal priority scheme.

```
client bandwidth = emcclk * 16B * 0.85 (efficiency factor)
```

so

```
latency allowance = (mccif size) / (emcclk * 2 * 16B * 0.85) – 153 emcclks
```

For GPU, taking the calculated mccif size of 306 64B entries, this better match up with what is initially calculated at maximum emcclk and it does:

```
latency allowance = 306 * 64B / (800 MHz * 2 * 16B * 0.85) – 153 / 800 MHz
                  = 900 – 191 nsec = 709ns = 24 ticks
```

On Tegra X1, GPU has connects to the MSS with two clients, each with a half sized MCCIF (conservatively sized to 160 entries). Using this MCCIF buffer size, converting to 30 nsec ticks, with the 255 maximum LA clamp taken into account results in the following:

```
latency allowance (ticks) = min(255, 24*(800 MHz/emcclk))
```

Latency allowance is proportional to emcclk period, so at lower emcclk frequencies, latency allowance will increase. This is appropriate looking at the MCCIF capacity alone. However, clients also have an internal latency tolerance based on the size of their internal buffers, number of active warps, etc. If the client clock slows down in proportion to emcclk, then the client's internal latency tolerance will increase as the MCCIF buffer's latency tolerance does. However, if the client is running at high internal clock rate, but generating only limited memory traffic, software could dial the emcclk frequency down, causing the client to become latency-limited. Software addresses this when a bandwidth soak client is enabled by only allowing emcclk to scale down as much as the client clock.

Since client latency requirements are implicitly captured in the emcclk frequency, latency allowance for bandwidth-soak clients can be purely a function of emcclk frequency, with no dependence on the client clock.

At very low emcclk frequencies when latency allowance is clamped at 255 ticks the row sorter drain time approaches and then exceed the client's latency allowance. The client's requests are processed in latency mode, which hurts DRAM efficiency. Activity monitors automatically adjusts emcclk frequency upward based on the lower DRAM utilization, so this situation should be self-correcting.

18.8.2.4 Latency Allowance for Variable-Bandwidth non-ISO Read Clients

Clients, such as VIC, PCIe, SATA, and XUSB have the following characteristics:

- They have a maximum bandwidth requirement that is specified at some emcclk frequency.
- Their bandwidth is allowed to scale back (proportionately) with emcclk below the target frequency.

The VIC read client is one example. If VIC has matched read and write bandwidth, VIC's read bandwidth requirement is half of 85% of peak DRAM bandwidth at maximum emcclk. As emcclk frequency goes down, VIC's bandwidth requirements go down proportionally. The SATA read client is another example. SATA reads have a bandwidth requirement of 300 MB/sec at emcclk = 400 MHz. Bandwidth is allowed to scale down at lower emclk frequencies.

The analysis for these is similar to bandwidth-soak clients, only it is provisioned for the design bandwidth at the target emcclk. As above, MCCIF size is calculated using the following, evaluated at the design bandwidth and target emcclk:

```
mccif size = total latency * required bandwidth
```

which evaluates to:

```
mccif size = 719 emcclks * required bandwidth
```

Latency allowance at the design point can either be calculated based on MCCIF size:

```
latency allowance = (mccif size) / client bandwidth[1]
                    - static latency minus snap arb to row sorter (65 emcclks)
                    - expiration time                             (88 emcclks)
```

or using the target latency allowance expression:

1. Client bandwidth should be expressed in B per emcclk at the target emcclk rate to provide proper emcclk-dependent scaling.

```
target latency allowance =
                    row sorter size / conservative drain bandwidth +
static latency from snap arbiter to row sorter;
```

If the MCCIF size was determined using the expression above, the resulting latency allowances will match. In some cases the MCCIF will be larger than this. Then there is a range of latency allowance choices that are feasible. Choosing the high end of the range (using the MCCIF size expression) gives the arbiter more freedom to schedule other clients. Choosing the low end of the range (using the target latency allowance expression) provides bandwidth headroom above the requirement. The choice can be made on a per-client basis.

Both of these expressions scale latency allowance up as emcclk frequency goes down, as desired. However, at some point as emcclk frequency goes down, LA will reach the maximum LA value of 255 ticks and will be clamped for emcclk frequencies below that threshold. This can create problems because as emcclk goes below the threshold, the row sorter drain time will approach and then exceed the client's latency allowance, meaning that the client's requests will be processed in latency mode If the client's bandwidth is a small fraction of overall bandwidth, this likely isn't a serious problem. It the client's bandwidth is a large fraction of DRAM bandwidth, the client driver may need to require the emcclk frequency to be higher than this cutoff point. Alternatively, the activity monitors may automatically adjust emcclk frequency upward based on the lower DRAM utilization. In either case, some power efficiency will likely be sacrificed.

For emcclk frequencies above the frequency at the bandwidth target, there are two choices: 1) allow LA to scale, which will support higher bandwidth at higher emcclk frequencies, 2) hold LA constant above the target frequency, which will give the arbiter additional headroom to schedule other clients and improve DRAM efficiency at these high clock frequencies. Client requirements should dictate the choice.

These clients are like bandwidth soak clients, only they operate with lower bandwidth and their bandwidth only needs to scale within a portion of the emcclk frequency range. The calculation for two specific clients is shown below.

VIC. VIC must be able to saturate DRAM bandwidth at maximum emcclk, however, VIC reads normally will be balanced with VIC writes, so the VIC read client only needs to around half saturate DRAM bandwidth (assuming 60% reads). MCCIF size is 256 64B entries. So, latency allowance is given by:

```
(mccif size) / (client bandwidth) – 153 emcclks
 = 256*64 / (2*0.6*0.85*16B/emcclk) – 153 emcclks
 = 851 emcclks (28 ticks at emcclk = 800 MHz, linearly scaling down)
```

Expressed in ticks, with the 255 maximum LA clamp taken into account:

```
latency allowance (emcclk) = min(255,  28*(800 MHz/emcclk))
```

XUSB. XUSB has a bandwidth requirement of 880 MB/sec at 300 MHz emcclk. Bandwidth is allowed to taper off at lower emcclk frequencies. MCCIF size is 32 64B entries. So at 300 MHz emcclk, latency allowance is:

```
(mccif size) / (client bandwidth) – 153 emcclks
 = 32*64 / 0.880 GB/sec – 153 * 300 MHz
 = 2327 – 510 nsec = 1817 nsec = 61 ticks
```

This same latency allowance is used at higher emcclk rates and can scale latency allowance up at lower emcclk rates. The proposed expression for latency allowance for XUSB (measured in 30nsec ticks) is:

```
latency allowance (emcclk) = min(255, 61*max(1.0, 300 MHz/emcclk))
```

This expression exceeds the GPU latency allowance at all emcclks, so dropping below the drain time is not a concern.

18.8.2.5 Latency allowance for fixed-bandwidth non-ISO read clients

These clients differ from bandwidth-soak clients in that they have a fixed (use case dependent) bandwidth requirement that does not scale with emcclk, although there is a minimum emcclk required to support a given use case. By not being required to support full memory bandwidth, their MCCIF buffers can be smaller than for bandwidth-soak clients.

As above, the MCCIF buffer is sized using Little's Law:

```
mccif size = total latency * required client bandwidth
```

The maximum of this expression is desired over all client use cases:

```
mccif size = max over all client use cases (
total latency at minimum emcclk that supports use case *
required client bandwidth at that use case)
```

The same value is used for total latency computed above for bandwidth-soak clients (719 emcclks).

The maximum value of this expression will occur often at the maximum client bandwidth. However, since the total latency term depends on emcclk, the maximum value for this expression could occur at a lower bandwidth point. What matters is the ratio of the client bandwidth requirement to the minimum emcclk frequency that supports the use case.

Once the MCCIF response buffer size has been determined, latency allowance for a given use case can be calculated as above:

```
latency allowance = (mccif size) / (client bandwidth) - 153 emcclks
```

When the client bandwidth and emcclk values are not known precisely, the maximum client bandwidth and minimum emcclk frequency should be used.

If the MCCIF was sized based on the maximum expression above, the resulting latency allowance should exceed the row sorter drain time and be acceptable. However, if in the current use case,

```
mccif size < total latency (719 emcclks) * required client bandwidth
```

then the latency of the system must be reduced by one of the following, so the right hand-side of the latency*bandwidth product fits within the actual MCCIF buffer:

1. Increasing emcclk
2. Decreasing the row sorter size

Tegra X1 minimizes the number of performance knobs that have to be changed by software when frequency changes occur. For some NISO clients it may be feasible to choose one latency allowance setting that is valid for all client use cases and emcclk ratios.

18.8.2.6 Latency allowance for ISO read (i.e. display) clients

Display clients differ in several significant ways from the non-ISO clients:

1. Non-ISO clients can tolerate occasional bandwidth disruptions or excess-latency events; average throughput is what matters. Display clients must not underflow.
2. The display internal latency tolerance is essentially unlimited. The memfetch unit and display itself independently track progress through the frame. Memfetch greedily requests all the pixels required for a frame, subject only to back-pressure from MC. The datapath portion of display reads pixels from the response buffer in raster order at the required rate. There is no internal buffer connecting memfetch and display proper that limits the display latency tolerance.

Full-feature display clients (display windows A,B,C)

Full-feature display clients (for windows A, B, C) have two response buffers: a) the MCCIF response buffer, which exists for reordering only, and b) buffering available in the display mempool, which allows display to manage latency disruption events.

The MCCIF response buffer is large enough to accommodate the required display bandwidth times expected latency.

The display total latency is given by the equations above (latency allowance + expiration time + static latencies). The latency allowance must be large enough to satisfy three requirements:

1. Exceed the self-queuing time when DRAM is saturated. This is the same requirement as for the bandwidth-soak and NISO clients. Using the equations in Section 18.8.2.3: Latency Allowance for Bandwidth-Soak Read Clients a latency allowance >= 25 ticks will satisfy this requirement for a client that is saturating DRAM by itself at maximum emcclk. At lower emcclk rates, the self-queuing time varies in proportion to the emc clock period.

2. Be longer than the GPU latency allowance. A premise of the architecture is that display requests will have a relatively long latency allowance, giving the memory controller flexibility to fill in the gaps relative to requests from lower latency clients. Since the GPU latency allowance is 20-25 ticks at maximum emcclk, display latency should be higher, say ≥ 40 ticks at maximum emcclk.
3. Be long enough to group memfetch requests to the same DRAM page so that display requests can be efficient. The goal is to process three 64B requests in a single activate, which maximizes efficiency and minimizes power. This requirement is most difficult to meet for planar and semi-planar YUV surfaces, which have a pixel depth of 1B. At 300 MHz pixclk (3.33ns per clock), it takes 192 YUV pixels * 3.33ns/pix = 640ns to accumulate 192B. This argues that the latency allowance should be >= 21 ticks at maximum pixclk. As pixclk goes down, the time required to accumulate 192B increases. Fortunately, as pixclk goes down, the latency allowance can be increased counteracting this effect.

Requirements 1) and 2) dominate requirement 3). Requirement 1) is used to determine the target latency allowance. In extreme-bandwidth modes, this will result in a display latency allowance that matches the GPU latency allowance. However, in normal (power-critical) modes this will provide margin that will enable the display latency allowance to be larger than the GPU latency allowance.

On Tegra X1, the display MCCIF is sized to 73 to 180 64B entries, depending on the window and its worst use case requirement.

Working backwards from the MCCIF buffer size, the LA is computed as follows:

```
latency allowance = (mccif size) / bandwidth
                  - static latency minus snap arb to row sorter
                  - expiration time
```

The required bandwidth is the active bandwidth, which is roughly equal to the product of: pixclk, bytes per pixel, the horizontal and vertical bandwidth scale factor, and multiplied by 1.1 (margin for catching up after bandwidth disruption events).

Note that several of the terms are emcclk-frequency-dependent and that for a given display bandwidth, these terms are largest at low emcclk frequencies, resulting in smaller latency allowances. Latency allowance must exceed the row sorter drain time, which is largest at low emcclk frequencies. So there is a critical emcclk frequency at which drain time equals latency allowance.This provides a lower bound for emcclk as a function of the display mode.[1] Setting latency allowance equal to row sorter drain time, and solving for emcclk:

```
mccif size / (pixclk*Bpp*hvscalefactor*1.1)
- static_latency_excluding_snap_arb_to_row_sorter__emcclks / emcclk
- expiration_time__emcclks / emcclk
=
row_sorter_size / conservative_drain_bandwidth
+ static_latency_snap_arb_to_row_sorter__emcclks / emcclk
```

Expanding conservative_drain_bandwidth per the equations above and evaluating for emcclk:

```
emcclk = (static_latency_excluding_snap_arb_to_row_sorter__emcclks +
          static_latency_snap_arb_to_row_sorter__emcclks +
          expiration_time__emcclks +
          row_sorter_size / (16B * 0.5))
         * pixclk*Bpp*hvscalefactor*1.1 / mccif_size
```

Given this minimum emcclk frequency, it can be substituted back into the latency allowance equation to determine a latency allowance that will support the required bandwidth at this minimum emcclk frequency:

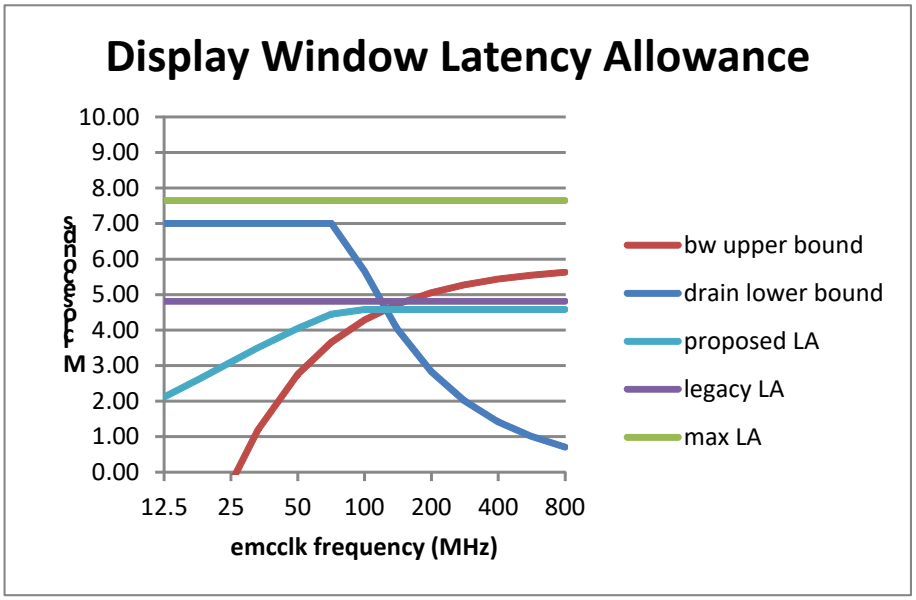
```
latency allowance =
    mccif size / (pixclk*Bpp*hvscalefactor*1.1)
    - static_latency_excluding_snap_arb_to_row_sorter__emcclks / emcclk
    - expiration_time__emcclks / emcclk
```

1. Note that DVFS time also increases with lower emcclk. That also places a lower bound on emcclk, which may be higher or lower than the bound on emcclk computed here. The DVFS-based bound is harder to compute (it cannot be done in a formula). The DVFS bound is ignored here, but this means that a longer latency allowance is determined than necessary.

This latency allowance value can be used at emcclk frequencies higher than the minimum as well. It becomes increasingly conservative as emcclk frequency increases.

The graph below shows the computed latency allowance and the upper and lower bounds for the latency allowance with pixclk = 120 MHz and Bpp = 4. The minimum emcclk frequency occurs at the point the curves cross and the feasible region is to the right of this crossing—below the red curve and above the blue one. For reference, the latency allowance calculated using Tegra X1 equations is also given (it does not always lie within the bounds). Tegra X1 is to use the single latency allowance calculated above, which does not depend on the current emcclk frequency.

Figure 41: Display Window Latency Allowance



Note: *For a given display bandwidth, the latency allowance is smaller at lower emcclk frequencies.*

When lowering emcclk while display is active, the software should program the smaller (more conservative) latency allowance before initiating the frequency change. Similarly, when raising emcclk, software should retain the lower (more conservative) latency allowance used prior to the frequency change until the frequency change is complete.

Under most conditions, bandwidth disruption and DVFS events are not covered by the MCCIF FIFO sizing. Rather, they are accounted for in the 10% excess bandwidth allocated to display clients and in the buffering margin in the display mempool buffer. Certain extreme modes may require more buffering for bandwidth-disruption and DVFS events than can be accommodated in the display mempool. In these cases a portion of the MCCIF buffer may be used for bandwidth-disruption or DVFS buffering. This reduces the effective size of the MCCIF for reordering and streaming. The latency allowance equation above may still be used, but the effective size of the MCCIF should be reduced by the amount used for these other purposes.

Simple display clients (display windows D, T, and cursor)

Simple window display clients (for windows D, T, and cursor) have only a MCCIF response FIFO with no additional response buffering in display. This one buffer must cover: latency allowance + static latency + expiration time + bandwidth disruption time + DVFS time.

Window D can used for applications like the Android status bar and will be enabled in many long-term power scenarios. However, software assures that if WindowD is active, at least one other window will be active. So, for Window D it is assumed that the row sorter drain time and latency allowance are halved relative to the calculation above for Windows A, B, C. Thus, 32 entries (2KB) of MCCIF buffer space is required to allow for streaming at the required bandwidth.

In addition, the window D MCCIF must cover the bandwidth disruption time plus DVFS time. The additional depth required is:

```
max_over_all_emcclk_frequencies(windowD_bandwidth * (bandwidth_disruption_time+DVFS_time))
```

The maximum possible windowD bandwidth at a given emcclk is:

```
min(max_simple_window_bandwidth, max_ISO_bandwidth/2)
```

The max_simple_window_bandwidth term is maximum pixclk (300 MHz) * 4Bpp * 1.1 = 1.32 GB/sec. The max_ISO_bandwidth term can be computed as 16B/emcclk * 40% (the maximum ISO fraction). This is divided by 2, since it is assumed that at least one other window is also active. The bandwidth_disruption_time was calculated as 1342 emcclks.

At high emcclk rates, max_simple_window_bandwidth limits windowD bandwidth, so the additional depth is:

```
1.32 GB/sec * (1342 emcclks + DVFS_time)
```

At low emcclk rates, max_ISO_bandwidth/2 limits windowD bandwidth, so the additional depth is:

```
16B/emcclk * 0.4 /2 * (1342 emcclks + DVFS_time)
```

The first function slopes downward as emcclk frequency increases. The second slopes upward. So the maximum value of the two occurs when max_simple_window_bandwidth equals max_ISO_bandwidth/2 or:

```
1.32 GB/sec = 16B/emcclk * 0.4 / 2
```

Which occurs when:

```
emcclk = 16B * 0.4 / 2 / (1.32GB/sec) = 2.4ns
```

Or, equivalently, when emcclk frequency = 412 MHz. So the worst-case additional buffer depth is:

```
1.32 GB/sec * (1342 * 2.4ns + DVFS_time) =
4.3KB + 1.32GB/sec * DVFS_time
```

The maximum DVFS time is estimated to be <= 2 µs. If it is assumed that DVFS_time is 2 µs, the total required buffer size is:

```
2KB (streaming bandwidth) + 4.3KB + 1.32GB/sec * 2usec =
2KB + 4.3KB + 2.6KB = 8.9KB
```

8.9KB requires 139 64B entries. Note that this is much larger than the MCCIF buffer for a memfetch window. From this, the latency allowance is calculated using the equation above, with an added term for the bandwidth disruption time:

latency allowance =

```
              mccif size(B) / (pixclk(Hz)*Bpp*1.1)
 -    70 / emcclk(Hz)          // static latencies
 -    88 / emcclk(Hz)          // expiration time
              - 1342 / emcclk(Hz)          // bandwidth disruption time
              - dvfs_time
```

Display Window T

Window T may be used in unsecure and secure mode. When used in unsecure mode, it is assumed that windowT has the same bandwidth requirements and software considerations as windowD, so the windowT MCCIF buffer should be at least as large as the windowD buffer (96 entries or 6KB). In secure mode, windowT may be the only window active, so the “other” window’s bandwidth cannot be counted and conveniently divide by 2 in sizing the MCCIF buffer as with windowD. However, the windowT secure mode is of short duration and that extra power usage due to a higher-than-strictly-necessary emcclk will be acceptable. It is best to use the same 96-entry (6KB) MCCIF buffer as for windowD and to run emcclk as high as necessary to achieve a latency allowance that is greater than the drain time. The equation for windowT latency allowance is the same as the one above for windowD.

Display Cursor Window

For cursor, the active bandwidth requirement can be reduced because at most only 256 pixels are visible on a given scanline, so the bandwidth to fetch those pixels can be amortized over the scanline time. It is assumed that the cursor is no wider than 10% of the screen width, thus the cursor bandwidth is 10% of the bandwidth of an active window on the same head and the MCCIF buffer storage required for streaming is 10% that of windows A, B, and C (10% * 4KB = 400B).

There are two ways of handling DVFS for cursor:

1. Cursor handles DVFS by turning off ready_for_latency_event during the active portion of the frame (only a small fraction of frame time, unlike Windows D and T).

   To compute the MCCIF buffer storage required to cover the bandwidth disruption time, the following is evaluate:

   ```
   max_over_all_emcclk_frequencies(bandwidth_disruption_time*windowHC_bandwidth)
   ```

   The bandwidth_disruption_time was calculated as 1342 emcclks.The maximum possible display bandwidth is (16B/emcclk * 40% (the maximum ISO fraction)). Cursor can consume at most 0.1 / (1.0 + 0.1) = 9.1% of this (since the cursor is assumed to cover at most 10% of the window). So the product is 1342 emcclks * 16B/emcclk * 0.4 * 0.1 / (1.0+0.1) = 781B, independent of emcclk.

   Because cursor consumes all of the pixels in scanline in a short burst, whereas the bandwidth is averaging over a whole scanline, an extra margin of one scanline's worth of cursor pixels (maximum of 256 pixels * 4 Bpp = 1KB) is needed in the buffer.

   Summing these together, a total MCCIF buffer size of 400B + 781B + 1KB ~= 2.2KB is calculated. There are some conservative factors in here, such as the 10% cursor size and targeted latency allowance. So, this is rounded down to 2KB or 32 64B entries.

   To calculate latency allowance for the cursor, the MCCIF buffer size is adjusted downward to take into account the bursty unloading of pixels:

   ```
   mccif_size_adjusted(B) = mccif_size (B) – cursor_width * Bpp
   ```

   Taking this MCCIF size as a given, the latency allowance is computed as follows:

   ```
        latency allowance =
    mccif_size_adjusted / (pixclk(Hz)*Bpp*1.1*bw_ratio)
    –   70 / emcclk(Hz)       // static latencies
    –   88 / emcclk(Hz)       // expiration time
                – 1342 / emcclk(Hz)       // bandwidth disruption time
   where bw_ratio = width of cursor / width of screen (which can include hblank time).
   ```

2. Cursor allows DVFS at any time. This is supported by buffering sufficient cursor pixels that DRAM fetches can be stalled for a DVFS time plus the bandwidth_disruption_time plus other factors. The cursor active bandwidth can be provided for t turning off ready_for_latency_event during the active portion of the frame (only a small fraction of frame time, unlike Windows D and T).

18.9 Arbitration Domain

The arbitration domain outside of MC module consists of super and partition clients, as well as any pipe stages necessary to route the partition-client interfaces across the chip.

18.9.1 Module Superclients

Module superclients are relatively simple multiplexes of the requests from all of the MCCIFs in the module.

18.9.2 Partition Clients

Partition clients are similar to Module Superclients in that they are multiplexes of the requests from multiple groups of MSCs.

Each partition client instantiates a snap-arbiter built of a single snap-arbitration ring. Each client gets one slot in that ring. Whenever the partition client has credits for the input FIFO in MC (NV_MC_cif.vx) and it has pending requests, it arbitrates and issues the pending requests.

18.9.3 Snap Arbitration

The Snap Arbiters choose one active client request from across the entire Arbitration Domain.

18.9.3.1 Snap Arbiter Design

Conceptually, each Snap Arbiter works as follows:

1. The Snap Arbiter records a bit vector of all clients with active requests at this point in time.
2. While the bit vector is not clear, the Snap Arbiter selects one of the bits in a fixed priority order.
3. The Snap Arbiter issues the selected client and clears the bit, then continues with step 2.
4. Once all the bits in the previous bit vector are clear, the Snap Arbiter "snaps" another set of requests by going to step 1.

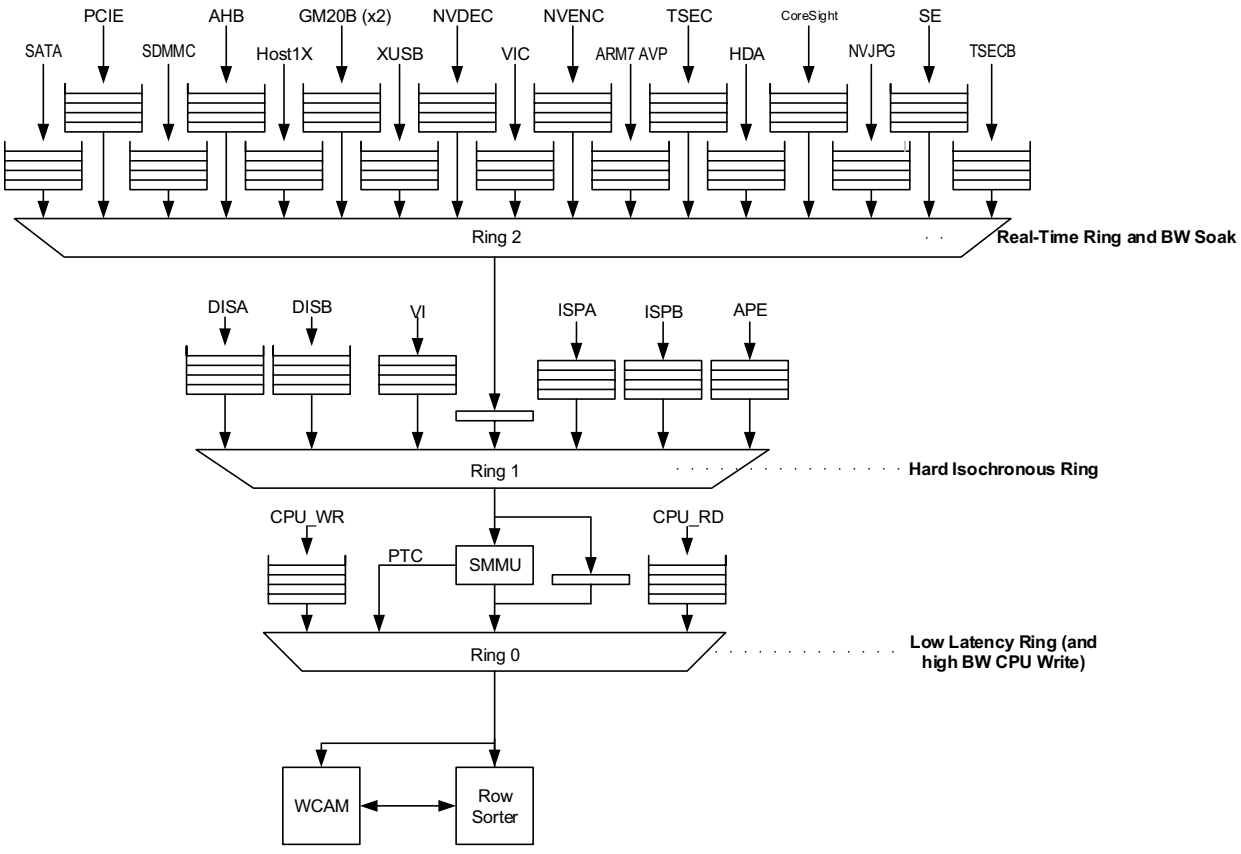
A Snap Arbitration ring makes sure that if N clients are constantly requesting, each gets $^1/_N$ of the available bandwidth (if the weights of all clients are equal).

18.9.3.2 Snap Arbiter Trees

Multiple Snap Arbiters can be chained. For example, if a three-way snap arbitration ring feeds into one of the inputs of a four-way snap arbitration ring, the three clients in the top ring are guaranteed 1/4th of the bandwidth and the three clients in the bottom ring are guaranteed 1/12th of the bandwidth. Note that the snap arbiters do not limit the maximum bandwidth of any client – if a single client is the only requester, it will get 100% of the available bandwidth.

18.9.3.3 The Snap Arbiter Tree

Figure 42: The Tegra Snap Arbiter Tree



The tree is structured in three “rings.”

Ring	Description	Type of Clients	Output Feeds
2	Real-Time Ring	Clients that have real-time requirements but are not isochronous, e.g. MPE. Ideally GPU is a bandwidth soak client. But since that is the only bandwidth soak client left, it is merged into Ring2.	Ring 1
1	Hard-ISOchrononous	Hard ISO clients that have hard latency requirements and fixed bandwidth requirements, e.g. Display, VI, and MSENC	SMMU
0	Low Latency Client	Clients that are latency-sensitive, like PTC and CPU.	Row Sorter

Ideally the Display engine should use carveout memory and not use SMMU translation. This eliminates SMMU translation bottlenecks related to TLB and PTC misses. Display memory in carveout is located in Ring1. Tegra X1 has Display in Ring1 and uses SMMU translation.

18.9.3.4 Bandwidth guarantees for isochronous clients (Priority Tier Snap Arbiter)

In Tegra X1, a snap arbiter ring can be programmed to give multiple grants to the same partition client for a given snap. For example, one would commonly enable 4 display slots in ring 1 and one slot the input from ring 2. Whenever display falls behind in having its requests accepted, it would begin to get more than one grant per snap. When it is most critical, it will get 4 grants for every 1 grant of ring 2 requests. However, there are at least three issues with this scheme.

1. When the efficiency of the memory controller drops, getting 4 grants per snap may still not be enough request bandwidth to keep up with the display demands, eventually resulting in a display underflow.
2. When two display heads are active, the “spool up” (initial fill of data buffers during VBLANK) of one display can take too much bandwidth away from the other display, causing the second display to underflow.
3. The granularity of bandwidth allocation by the Tegra X1 snap arbiter was too coarse, requiring significant “rounding up” for many configs. Although CPU was expected to consume a small fraction of available bandwidth, it could consume up to 1/3. Display in spoolup could starve other ISO clients, such as camera.

These issues are addressed in Tegra X1 by:

- Adding bandwidth guarantee logic to the snap arbiter inputs.
- Providing independent inputs for the display heads into the ring arbiters

The bandwidth guarantee logic uses a simple DDA mechanism in the PTSA, along with dynamic masking of the inputs to the snap arbiter. For each input at any snap arbiter ring, the following control, state, and I/O are provided.

> ***Note:*** *Signed (twos complement) fixed point arithmetic is used for the bandwidth calculations, using F fraction bits and N integer bits (including sign). F=8 and N=6*

Name	Control□state□I/O	Fixed pt format (#int bits . #frac bits)	Description
request	input	-	Client is making a request (true if any slot of the client is requesting)
grant	input	-	Client request was granted last cycle
high_priority	output	-	Client’s request grants are behind the guaranteed rate
rate	control	0.F	Amount to increment accum every mcclk.
accum	state	N.F	Accumulates number of grants “owed” to this client; a negative value indicates that the client has had more grants than its guarantee
maximum	control	N.0	Maximum value of accum allowed
minimum	control	N.0	Minimum value of accum allowed (normally negative)
grant_decrement	global control	1.F	Amount to subtract from accum every mcclk that a grant occurs. This is a global config value that is used for all DDAs.

Each MC cycle, the following computation is done for each client:

```
high_priority = (accum >= 0.0);
accum = accum + rate;
if (grant) accum = accum – grant_decrement;
if (accum > max) accum = max;
if (accum < min) accum = min;
```

If any clients of the ring arbiter have a non-zero value for (high_priority & request), that is, it is high priority and at least one of its slots has a valid request, then the snap arbiter requests inputs with a mask where the mask value is the client's high_priority signal (the client's high_priority is used as a mask for all of the client's slot requests). If no client has a non-zero value for (high_priority & request), then there is no masking of the snap arbiter inputs. Thus any clients that are "behind" will be handled in the next snap arbiter round while clients that are not behind are excluded.

The control parameters *rate*, *min*, and *max* are typically programmed to provide the appropriate bandwidth and operating bounds at maximum mcclk/emcclk with *grant_decrement* =

- 1.203 hex for LP4 with maximum emcclk of 800 MHz
- 1.501 hex for LP3 with maximum emcclk of 933 MHz

At lower mcclk frequencies, rather than increasing each client's rate parameter, the global value grant_decrement is lowered instead.

The PTSA DDA logic is was motivated by the needs of ISO clients, but will be useful for all clients. The DDA logic is to be used as follows for the different client classes:

- **Hard ISO** (display, camera capture, etc.). The PTSA DDAs are used to guarantee bandwidth. *Rate* should be programmed to the steady-state[1] (non-spoolup) bandwidth requirement of the client * 1.1. The extra 10% factor is to allow the client to catch up after DVFS or other service interruption events. Min should be set to -5. The suggested value is rate*32 (mcclks), but the exact setting is not expected to be sensitive. Max should be high enough that with accum hovering near 0 during normal operation, normal MC events, such as PTC misses and refreshes don't result in saturation at max (thus lost bandwidth). The recommended value is 31. The reason for not choosing a larger max value is that it would cause ISO clients to hog the system for an unreasonable time after a bandwidth disruption event.This hogging can harm other ISO clients and will lower the performance of NISO clients by extending the time they are outright denied bandwidth vs. slightly reducing their sustained bandwidth.[2].
- **CPU**. The PTSA DDAs may be used similarly to guarantee a fraction of bandwidth, at low latency, to the CPU. The CPU may request high bandwidth in memcpy, etc. cases, but it requests only a small fraction of memory bandwidth when in latency-critical mode. The CPU read DDA is set to 9% of total MC bandwidth, and the CPU write DDA is set to 1% of total MC bandwidth. Min can be programmed to -4. Max should be programmed fairly low, perhaps around +4, so that the CPU isn't a bandwidth hog after memory system disruptions.
- **Soft-ISO** (mpeg encode, decode, etc.). The PTSA DDAs may similarly be used to request bandwidth. Soft ISO clients are typically in an outer ring without a strict bandwidth allocation, so the DDA doesn't guarantee bandwidth, but it will let these clients compete against non-ISO clients on the ring. For Ring2 soft ISO clients, the DDAs can be programmed with min = max = 1.0 and rate = 0, so they always have high priority. For Ring1 soft-ISO clients (for example, ISP can be configured as Soft-ISO or Hard ISO depending on the use case), they should be programmed the same as Ring2 NISO clients i.e., with min = -2, max = 0, rate = epsilon (i.e., 1). In more nuanced circumstances, Ring 2 soft-ISO clients could be programmed similarly to ISO clients.
- **Non-ISO.** The PTSA DDAs should not be used to guarantee bandwidth. These clients require bandwidth on a best-effort basis. The DDAs, however, can be used to implement a timeout counter, to ensure that these clients get at least one transaction in every N cycles, preventing them from complete starvation if memory efficiency drops and ISO

1. If a client fetches at double-rate for one scan line and does not fetch for the next scan line, *rate* should be set to the double rate, since the DDA cannot average bandwidth over more than a few dozen clocks.
2. There is a tradeoff in the setting of *max*. The larger *max* is, the more bandwidth disruption events will be captured and the better the bandwidth guarantee will be. However, a larger *max* value lengthens the recovery time after a bandwidth-disruption event, when the client continuously requests at high priority, squeezing out bandwidth for NISO clients and potentially hurting other ISO clients. 128 mcclks is a compromise. It should capture PTC misses and normal DRAM stalls due to page-conflicts, etc. It will capture refresh periods so long as they are 320ns or less. Certain high-density DRAMs like 8Gbit DDR3 have longer refresh periods than this so some saturation to *max* and predictable bandwidth loss will occur. This can be handled by slightly increasing the DDA allocation for the client to make up for the loss from *max* saturation, or increasing the *max* value. Another complication is that if *rate* is greater than 0.25, 128**rate* will exceed the maximum *max* value. Either1) scale back *rate* and *grant_decrement* (requiring software to program all the *rate*, *min*, and *max* values on frequency changes), or 2) recognize that *max* will be lower than desired and provision the client with extra bandwidth. The option recommened is 2).

clients would otherwise consume it all. Rate is typically programmed to its minimum value (1 (epsilon). Min is typically programmed to -2 and max to 0.

- **PTC.** This PTSA DDA is used to guarantee high priority for PTC requests. *Rate* should be programmed to 0 and *min* and *max* programmed to 1.0 so that PTC requests always have high priority.
- **Ring2->Ring1 feeder.** This PTSA DDA should be programmed as a non-ISO client and only used to prevent starvation of ring2 clients.
- **Ring1->Ring0 feeder.** This PTSA DDA guarantees bandwidth to ring1 ISO clients. It should be programmed as an ISO client, with *rate* equal to the sum of the ISO client rates in ring1. To allow soft-ISO clients in upper rings to compete against CPU reads, rate can be programmed to additionally include soft-ISO client bandwidth too (this only works if there are no hard-ISO clients on ring 0; otherwise their bandwidth could be compromised). Both translated and un-translated outputs from SMMU share this one DDA to avoid head-of-line blocking, since upstream in SMMU the two paths share a single virtual channel.[1]

Programming each DDA with *rate*=0, *min*=-1, and *max*=-1 will cause the DDAs to have no effect. Also, multiple entries are still supported, it is functional with the DDAs disabled and the snap arbiter operating as it would without the DDAs.

RTAPI Programming

```

1. Ring 0 still has separate inputs for SMMU translated and SMMU bypass (untranslated) requests. One DDA covers them both. If both have valid requests they both can be included in one ring 0 snap arbiter round. The DDA accum value is decremented as each request is granted, which occurs on two separate clock cycles.

```

18.9.3.5 Throttling low-priority CPU reads when ring 1 has high DDA priority

SMMU stalls may allow excess CPU read bandwidth to leak into ring 0, even when ring1 ISO clients were due bandwidth. This can hurt ISO bandwidth goals. To address this the MC_EMEM_ARB_MISC1_0.BLOCK_LP_CPU_RD_IF_SMMU_INP_HP config bit is added. It masks off CPU reads when the CPU DDA indicates low priority, the ring1 feeder DDA indicates high priority, and requests are pending from ring 1. This configuration is recommended for low emcclk cases when high ISO bandwidth fractions are desired. It is not recommended at high emcclk frequencies, because it can restrict CPU's peak read bandwidth.

18.9.3.6 CPU reads may interrupt a snap arbiter round

CPU performance critically depends on latency. CPU read requests may be unnecessarily delayed waiting for the current snap arbiter round to complete. Under certain circumstances a high-priority CPU request may interrupt the current snap arbiter round.

CPU read clients should be connected as the first client in whatever ring they are attached to. This first client will be granted first in a snap arbiter round it participates in. A configuration register determines whether high priority CPU reads can interrupt the current snap arbiter round. The cpu_hi_pri_cnt register field (with allowable settings of 0, 1, 2) specifies how many CPU requests can interrupt the current snap arbiter round (a value of 0 means the feature is disabled). If the feature is enabled, the CPU client has a high priority request and the current snap arbiter round does not contain a CPU request, the CPU request is immediately granted. If the register value is 2, a second high-priority CPU request will be taken next. After the high priority CPU requests have been granted, the round completes normally.

Note: *If another high-priority CPU request is present, it will be snapped in the next round and granted first.*

18.9.4 Fractional Update for Tick Counter

For MC clock periods below 200ns, it is difficult to get a TICK that is close to 30ns (the target length of time for a TICK). The TICK counter is controlled by two fields, CYCLES_PER_UPDATE (the number of MC clks between increment of TICK), and EXTRA_TICKS_PER_UPDATE (the increment amount of TICK, over and above 1). When the MC clk period is less than 30ns, EXTRA_TICKS_PER_UPDATE is usually 0. When the MC clk period is greater than 30ns, CYCLES_PER_UPDATE is 1 and EXTRA_TICKS_PER_UPDATE is non-zero. Note that you can certainly use CYCLES_PER_UPDATE != 1 and EXTRA_TICKS_PER_UPDATE != 0 to make the average TICK length closer to 30ns, but this introduces a considerable amount of "jitter" in the TICK counter for MC clk periods greater than 30ns.

The definition of CYCLES_PER_UPDATE and EXTRA_TICKS_PER_UPDATE includes a 4-bit fractional part each. The following table gives examples of the best programming parameters with and without fractional fields for selected low frequencies.

MC frequency (MHz)	period (ns)	EXTRA_TICKS_PER_UPDATE	CYCLES_PER_UPDATE	avg TICK (ns)	EXTRA_TICKS_PER_UPDATE	CYCLES_PER_UPDATE	avg TICK (ns)
13	76.9	2	1	25.6	1.5625	1.0000	30.0
14	71.4	1	1	35.7	1.3750	1.0000	30.1
20	50.0	1	1	25.0	0.6875	1.0000	29.6
25	40.0	0	1	40.0	0.3125	1.0000	30.5
47	21.3	0	1	21.3	0.0000	1.4375	30.6
50	20.0	0	1	20.0	0.0000	1.5000	30.0
83	12.0	0	2	24.1	0.0000	2.5000	30.1
116	8.6	0	3	25.9	0.0000	3.5000	30.2
150	6.7	0	5	33.3	0.0000	4.5000	30.0

18.9.5 Input throttling

Tegra X1 provides a variety of controls to selectively throttle the input request stream. The general motivation for this is to keep a DRAM-limited system from being clogged with requests so it is unresponsive to subsequent high-priority requests. More specifically:

1. **To limit the number of requests in the row sorter at low clock frequencies** so the row sorter drain time doesn't exceed latency allowance. DRAM bandwidth scales down with decreasing clock frequency. At low clock frequency, if the row sorter maintains its full size and the system is DRAM limited, the row sorter drain time can exceed the latency allowance causing the arbiter to run in latency mode all the time, reducing efficiency. It is normally preferable to increase latency allowance and use the full row sorter, but this is not always possible.
2. **To prevent the row sorter from back-pressuring ring 0 when the DRAMs are saturated**. This improves CPU latency and thereby improves CPU (and system) performance (the CPU latency vs. DRAM load curve shows sharply higher CPU latency when the row sorter back pressures).
3. **To avoid filling the HUM when the DRAMs are saturated**. The purpose of the HUM is to prevent head-of-line blocking on an unusually bank queue, not to provide a repository to pile up requests when the row sorter is full. Gratuitous HUM usage perturbs the order requests enter the row sorter and wastes power.
4. **To avoid filling the SMMU when the DRAMs are saturated.** Since the SMMU does not provide a separate virtual channel for ISO requests, this is important to minimize the number of NISO requests ahead of ISO requests that need to get through. It also is important to limit the time requests sit in the system after receiving a deadline and before the row sorter can process them. In low clock frequency cases, delays in SMMU can cause requests to hit the deadlock_avoidance_threshold before they can be granted by the row sorter.
5. **To prevent ring 2 requests from fully occupying the row sorter and SMMU**, leaving row sorter slots available for ISO requests. The concern is that GPU (or other ring 2) traffic, with arbitrarily bad locality can fill the row sorter during temporary lulls in ISO traffic (for example during horizontal blank periods). When display requests resume, the system may not provide enough bandwidth to allow these requests into the row sorter, starving display. Simulations show exactly this behavior in which ISO traffic into ring 1 is delayed due to the row sorter getting filled (during hblank) with poorly behaved 3D traffic.
6. **To prevent non-ISO requests from fully occupying the row sorter and SMMU**, leaving row sorter slots available for ISO and soft-ISO requests (this is similar to issue 5). Simulations show that soft-ISO requests from VDE and MSENC can be swamped by 3D requests.

Throttling may be performed at three locations:

- Output of RING1 (controlled by RING1_THROTTLE)
- Output of RING2 (controlled by the misnamed RING3_THROTTLE)
- Input of RING2 for particular clients (controlled by NISO_THROTTLE)

Throttling is triggered when the number of requests past a designated point in the system (and not granted by the row sorter) exceeds a programmable threshold. A separate threshold is provided for each throttling location.

18.9.5.1 Outstanding transaction counters

The hardware maintains two counters of outstanding transactions that are used in making throttling decisions:

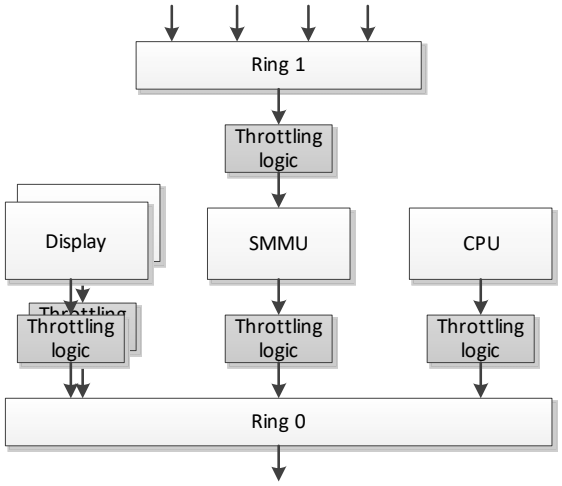
- ARB_OUTSTANDING_COUNT counts the number of requests that have been accepted by ring 0 and are still outstanding in MC. This is exposed in register field: MC_EMEM_ARB_OUTSTANDING_REQ_0.ARB_OUTSTANDING_COUNT.
- ARB_OUTSTANDING_COUNT_RING3 counts the number of requests that have been accepted by any ring and are still outstanding in MC. Note that this includes transactions all of the transactions that would be counted above, but additionally includes transactions in the snap arbiter tree, SMMU, and WCAM. The SMMU has a 64-entry FIFO so it can potentially have up to 64 transactions outstanding. This is exposed in register field: MC_EMEM_ARB_OUTSTANDING_REQ_RING3_0.ARB_OUTSTANDING_COUNT_RING3.
- ARB_OUTSTANDING_COUNT_NISO is an alias for ARB_OUTSTANDING_COUNT_RING3. It has its own output read register field: MC_EMEM_ARB_OUTSTANDING_REQ_RING3_0.ARB_OUTSTANDING_COUNT_RING3.

18.9.5.2 Throttling at the output of Ring 1 (RING1_THROTTLE)

The MC_EMEM_ARB_OUTSTANDING_REQ_0.ARB_MAX_OUTSTANDING threshold is compared with either ARB_OUTSTANDING_COUNT or ARB_OUTSTANDING_COUNT_RING3, depending on config bit: MC_EMEM_ARB_RING0_THROTTLE_MASK_0.ARB_OUTSTANDING_COUNT_ABOVE_SMMU. If disabled, ARB_OUTSTANDING_COUNT is used; if enabled, ARB_OUTSTANDING_COUNT_RING3[1] is used. This comparison determines the throttling level for the following interfaces, as shown in the figure below:

- display input to ring 0
- CPU input to ring 0
- SMMU input to ring 0
- output of ring 1

Figure 43: Conceptual view of ring0 throttle logic



The MC_EMEM_ARB_RING1_THROTTLE_MASK register selects which of the above interfaces is throttled. The degree of throttling is controlled by the MC_EMEM_ARB_RING1_THROTTLE_0 register. The PROD setting for this register are highlighted in bold. Display does not connect to ring 0 in production systems. Throttling was found to be more beneficial at the output of ring 1 than the SMMU input to ring 0 because the latter led to large buildups of requests in the SMMU in DRAM-limited situations, leading to expiry of requests before the row sorter and deadline_avoidance flushes.

This control determines the effective row sorter size and can be used to address issues 1) and 2). It should be set to an emcclk-dependent, empirically-determined value that should permit the full row sorter to be used at moderate to high emcclk frequencies and to reduce the size of the row sorter at lower frequencies. The current recommended formula is:

```
ARB_MAX_OUTSTANDING = CEILING(MIN(Row_sorter_size__B,
                                  Latency_tolerance_ramp,
                                  Deadlock_avoidance_ramp) / 64);
```

where:

```
  Latency_tolerance_ramp = 2*DRAM_width__B*(emcclk__MHz+50);

  Deadlock_avoidance_ramp =
      (Max_latency_usec*emcclk_MHz-Static_latency_snap_arb_to_row_sorter__emcclks)*
2*DRAM_width__B*Conservative_DRAM_efficiency;
```

1. This is the PROD setting, since it includes transactions in the SMMU, which otherwise can grow to an unwieldy number and even expire before entering the row sorter.

and:

```
  Row_sorter_size__B = 4096;          // row sorter size in bytes
  Max_latency_usec = 10;              // max latency
                                      // deadlock avoidance)
  Static_latency_snap_arb_to_row_sorter__emcclks = 54; // current best info
  DRAM_width__B = 8;                  // 4 for a 32-bit memory system
  Conservative_DRAM_efficiency = 0.5; //
                                      // this efficient almost all of the time)
```

The formula has 3 regimes:

1. emcclk > ~200 MHz: Use the full row sorter.
2. ~19 MHz < emcclk <= 200 MHz: Scale MAX_OUTSTANDING down with frequency following a linear ramp empirically to avoid slowdowns to exceeding client latency tolerance.
3. emcclk <= 19 MHz: Scale the row sorter down to keep drain time below 10 µs.

The row sorter needs to be full size in high-emcclk cases (it is paid to sort many client request streams). At some point drain latency gets excessive for certain clients and they start losing throughput due to latency, even though DRAM utilization potentially could be high. At the bottom end, the drain time to keep from triggering deadlock_avoidance timeouts must be clamped.

Note: *The drain time will exceed the maximum latency allowance for lower clock frequencies, meaning the chip will run in latency mode most of the time. This has been found preferable to running with a very small row sorter that is not able to capture the coherence in a simple input stream.*

There is room to optimize this equation within the upper bound from the deadlock avoidance timeout and a lower bound of scaling MAX_OUTSTANDING down linearly with frequency (holding latency constant).

When hysteresis holdoff is allowed, ARB_MAX_OUTSTANDING is overridden and the row sorter is allowed to completely fill (subject to latency allowance expiry). This increases the power savings in low-frequency WinIdle cases when only ISO clients are active. The hysteresis holdoff feature prevents the row sorter from entirely filling in this low-power mode of operation.

18.9.5.3 Output of Ring 2 (RING3_THROTTLE / ARB_MAX_OUTSTANDING_RING3)

The MC_EMEM_ARB_OUTSTANDING_REQ_RING3_0.ARB_MAX_OUTSTANDING_RING3 threshold is compared with MC_EMEM_ARB_OUTSTANDING_REQ_RING3_0.ARB_OUTSTANDING_COUNT_RING3, which counts the number of requests that have been accepted by any snap arbiter ring and are still outstanding in MC. This comparison determines the throttling level for the output of ring 2. The degree of throttling is controlled by the MC_EMEM_ARB_RING3_THROTTLE_0 register.

This control is used to limit the number of requests that can accumulate in the SMMU and to ensure there is space for ISO requests (addresses issues 4 and 5 above). It should be set to an empirically-determined value that is slightly larger than ARB_MAX_OUTSTANDING (suggestion is ARB_MAX_OUTSTANDING + 16).

Note: *PROD settings for RING1_THROTTLE include the SMMU as well, so RING3_THROTTLE is not actually used.*

18.9.5.4 Input of Ring 2 (NISO_THROTTLE / ARB_MAX_OUTSTANDING_NISO)

The MC_EMEM_ARB_OUTSTANDING_REQ_NISO_0.ARB_MAX_OUTSTANDING_NISO threshold is compared with MC_EMEM_ARB_OUTSTANDING_REQ_NISO_0.ARB_OUTSTANDING_COUNT_NISO (the same counter as OUTSTANDING_COUNT_RING3 above). This comparison determines the throttling level for “NISO” partition clients. These are non-ISO ring2 partition clients identified by the MC_EMEM_ARB_NISO_THROTTLE_MASK_0 register. Throttling gates off the

partition client request signals of these clients so the snap arbiter doesn't see the clients' requests. Requests from non-throttled PCs are allowed to proceed. The degree of throttling is controlled by the MC_EMEM_ARB_NISO_THROTTLE_0 register.

This control can be used to address issue 6 above. This is used as RING3_THROTTLE was used on prior chips. When soft-ISO clients are active, non-ISO clients should be identified using the NISO_THROTTLE_MASK register and ARB_MAX_OUTSTANDING_NISO should be set to an empirically-determined value that is higher than ARB_MAX_OUTSTANDING and lower than ARB_MAX_OUTSTANDING_RING3.

18.9.5.5 Limitations of Throttling

Throttling can prevent the row sorter and SMMU from being congested with requests and frequent HUM FIFO when the DRAMs are backed up, but it can limit the number of requests in the row sorter and SMMU when the memory system is operating at high velocity. This can reduce the row-sorter's ability to select efficient requests and can limit the number of requests in flight in the SMMU. The throttle settings should be tuned during bring up. No setting will be perfect for all regimes.

18.9.5.6 CPU Hammer

One limitation found in the mechanisms above is that stalls from PTC misses in the SMMU can allow CPU reads to slip into ring0 beyond CPU's bandwidth allocation, even when ring1 is receiving less bandwidth than programmed. This extra CPU bandwidth reduces the amount of ISO bandwidth the system can provide. To address this, the following additional knob, called "CPU Hammer", is provided:

MC_EMEM_ARB_MISC1_0. BLOCK_LP_CPU_RD_IF_SMMU_INP_HP

When set, it suppresses CPU requests if:

- CPU is ahead of its DDA allocation
- Ring1 is behind its DDA allocation
- Requests are pending at the input of SMMU

When enabled, CPU hammer does block the extra CPU requests in the scenario above. But it can overreach and limit CPU when there isn't enough ring1 bandwidth to saturate the system and the extra CPU bandwidth would have been acceptable (and beneficial).

Unit level testing shows that CPU hammer can raise the ISO bandwidth fraction about 10% (from 46% to 56% at 800 MHz emcclk, with a similar improvement at lower emcclk frequencies). The recommendation to software is to set CPU hammer when ISO bandwidth is needed beyond the low threshold, but to turn CPU hammer if it is not needed for ISO. For this to work, the clocks driver needs to know what the ISO bandwidth demand is and thus can determine whether to set CPU Hammer when selecting a new emcclk frequency.

18.9.6 Display buffer thresholds and "Is Mode Possible" calculations

Full-feature display clients (clients for windows A, B, and C, but not simple windows D, T, and cursor) have four types of buffering available for pixel response data:

1. The portion of the display internal mempool required to buffer line data to avoid refetch (due to the fetch atom being larger than one pixel in height/width or due to scaling).
2. The remainder of the display internal mempool, which can hold pixel data in advance of when it is needed, providing coverage for DVFS or othe r service disruptions.
3. The portion of the MCCIF response buffer that provides storage for requests outstanding in MC (for correctness and reordering).
4. The remainder of the MCCIF response buffer, which can also provide buffering for DVFS or other service disruptions.

The MCCIF response buffer is sized to provide type 3 buffering, but not type 4. The sizing and latency allowance calculations are in Section 18.8.2.3: Latency Allowance for Bandwidth-Soak Read Clients. The display internal mempool (type 2 buffering) provides a cushion for unusually long response latencies and bandwidth disruptions.

For a given display mode to be possible, all four buffer usages must fit within the MCCIF and mempool buffers.To simplify this problem, several conceptual threshold levels are defined within the mempool buffer:

- **threshDisp (“Display threshold”).** Amount display buffer required for the display internal purposes (*e.g.* prefetched blocklinear or rotated display scanlines). This is obtained from the display team.
- **threshLWM (“Low Water Mark Threshold”).** Amount of display buffer to cover display needs, plus bandwidth disruption events.
- **threshDVFS (“DVFS Threshold”).** Amount of display buffer to cover the needs of items above plus span DVFS latency.
- **threshHWM (“High Water Mark Threshold”).** Threshold where buffer occupancy is good enough and there is no benefit to buffering more.

To compute threshLWM, start with threshDisp and add a margin to cover the non-DVFS bandwidth-disruption events.

margin(ns) = max(bandwidth_disruption_time, total_latency)

margin(bytes) = margin(ns) * nominal window bandwidth

The total_latency term can be evaluated using the expression (static latency + latency allowance + expiration time). That leads to an awkward circular dependency for simple windows, whose latency allowance depends MCCIF size, which depends on this margin term. A conservative way to break this dependency is to replace latency allowance with the target latency allowance defined in Section 18.8.2.3: Latency Allowance for Bandwidth-Soak Read Clients which depends on the row sorter drain time and static latencies, and is guaranteed to be larger than the final latency allowance for the mode to be possible.

The next portion of the display buffer is allocated to DVFS, placing threshDVFS the appropriate distance above. To determine the size of the DVFS region:

1. Use the global worst-case DVFS time (~5 µs).
2. Use the worst-case DVFS time for a transition within the range of frequencies the display mode allows.
3. Use the worst-case DVFS time for a transition from the current mcclk frequency to any frequency it could transition to.
4. Use the DVFS time for a transition from the current frequency to a particular frequency being requested.

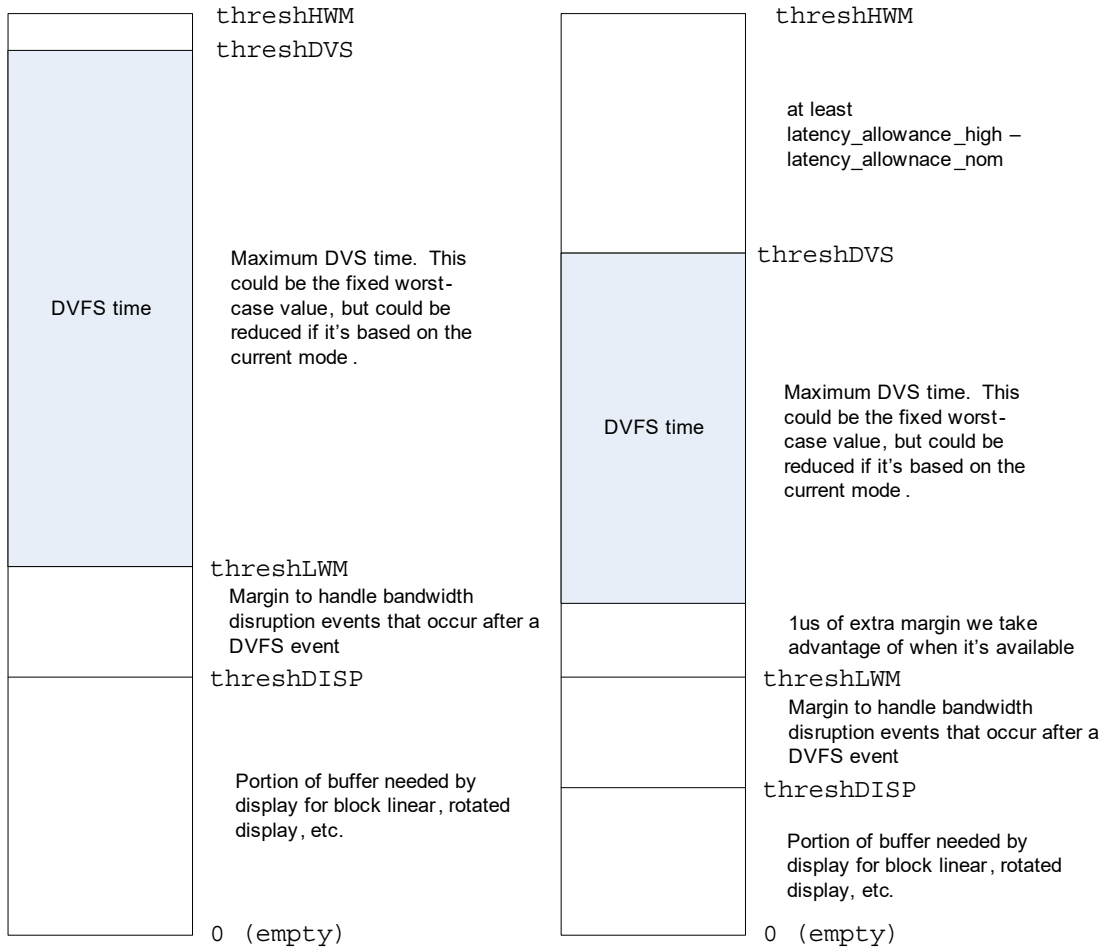
Software can decide which of the above criteria to use. As with margin, to determine the buffer distance in bytes, multiple the DVFS region size in nsec by the nominal window bandwidth.

If either threshLWM or threshDVFS is higher than the top of the buffer, the mode is not possible. For certain extreme modes that don’t require the full MCCIF for reordering/streaming, a portion of the MCCIF buffer can be used to cover bandwidth-disruption events.[1]

If threshDISP is far from the top of the buffer, it is recommended moving it up ~1 µs to provide extra margin after a DVFS event and to make it less likely that the low water mark would be reached. The left figure (a) below shows a high-bandwidth configuration, in which the display requirements, margin, and DVFS require the entire buffer. The right figure (b) shows a more conservative configuration possible when bandwidth requirements are lower. Extra margin is provided above threshLWM and threshDVFS is not at the top of the buffer. In a configuration like this, it would be possible to leave threshDVFS near the top of the buffer, but that would unnecessarily delay the start of DVFS after a vblank, which could be a large fraction of a frame time when a window with a large mempool (capable of handling rotation) is used in a low resolution mode.

1. In such cases, set threshDVFS to the top of the mempool buffer and calculate the amount of additional buffering needed and subtract this from the size of the MCCIF when calculating the latency allowance for the window. If the resulting latency allowance is too short (smaller than the DRAM drain time) the mode is not possible. If the mode is possible, note that the `ready_for_latency_event` signal will not take into account buffered in the MCCIF buffer. Thus, if `ready_for_latency_event` is deasserted, the system is not ready to handle DVFS. However, if `ready_for_latency_event` is asserted, the system may not have sufficient data buffered to robustly handle the bandwidth outage. In these modes, software should separate DVFS events sufficiently to allow buffer recovery from the prior DVFS event.

Figure 44: Display Mempool Thresholds



18.10 Refresh Overhead

The various DRAM types have significantly varying refresh parameters, thus refresh overhead. The following table summarizes the differences:

DRAM type	Density	Temp (°C)	tRP ns	tRCD ns	Refresh interval: tREFI µs	Refresh time: tRFC ns	Refresh overhead (throughput) (tRP+tRFC+tRCD)/ tREFI percent	Refresh overhead (latency): (tRP+tRFC+tRCD) /(2*tREFI) percent	Refresh overhead (latency): $(tRP+tRFC+tRCD)^2$ /(2*tREFI) nsec
LPDDR3-1866	4Gb	0-85	27	24	3.9	130	4.64%	2.32%	4.2
	8Gb	0-85	27	24	3.9	210	6.69%	3.35%	8.7
	4Gb	85-95	27	24	1.95	130	9.28%	4.64%	8.4
	8Gb	85-95	27	24	1.95	210	13.38%	6.69%	17.5
LPDDR4-3200	4Gb	0-85		18	3.9	130	3.79%	1.90%	2.8
	8Gb	0-85	21	18	3.9	180	5.62%	2.81%	6.1
	4Gb	85-95	21	18	1.95	130	8.67%	4.33%	7.3
	8Gb	85-95	21	18	1.95	180	11.23%	5.62%	12.3

18.11 Memory Controller Registers

Refer to Section 1.4: Reading Register Tables in the Introduction chapter for the register table protocol as well as recommendations for accessing registers.

18.11.1 MC Registers

USAGE NOTE: Many MC register fields are shadowed.

Writes to shadowed register fields update the shadow copy (this is default, assumes TIMING_CONTROL_DBG.WRITE_MUX==ASSEMBLY).

Reads to shadowed register fields return the active copy (this is default, assumes TIMING_CONTROL_DBG.READ_MUX==ACTIVE).

This allows a new set of frequency-dependent timing parameters to be written to the shadow registers while memory traffic is ongoing, then when the parameters are completely written, the MC hardware can perform a timing-safe switch.

Such switches can be triggered via two methods: TIMING_CONTROL.TIMING_UPDATE (generally used during initialization), or the automatic CAR/EMC handshake on a clock-frequency or divider change (assuming TIMING_CONTROL_DBG.IGNORE_EMC_TRIGGERS==DISABLED).

Registers that are shadowed are marked by a comment:

> ***Note:*** *This register is shadowed: see usage note in Section 18.11.1: MC Registers.*

USAGE NOTE: Many MC registers should be programmed by the Boot Loader as part of the warm boot (also known as "wake from LP0") and cold boot (also known as "power up") sequences. Suggested actions for the Boot ROM/Boot Loader are noted under "Boot requirements:".

USAGE NOTE: Some MC registers may only be accessed by TrustZone-secured register transactions. See the appropriate ARM Architecture Reference Manual for information on how to handle security. Such registers are marked by a comment:

“Access to this register is restricted to TrustZone-secured requestors.”

USAGE NOTE: The MC register fields to be stored in PMC scratch registers for warm boot must have "[PMC]" in their comments. After adding and removing such PMC flag, the tool warmboot_code_gen must be rerun to generate new boot ROM code.

USAGE NOTE: When writing to a register, any bits that are not intended to be modified should be rewritten with their existing values.

USAGE NOTE: Unspecified bits may not appear in tables and should be written with their Reset values.

18.11.1.1 MC_INTSTATUS_0

Interrupt Status

This register contains trigger bit fields. Bit fields not shown here are reserved.

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxx00xx000000x0xxxxx)

Bit	Reset	Description
17	CLEAR	DECERR_GENERALIZED_CARVEOUT_INT: 0 = CLEAR 1 = SET
16	CLEAR	DECERR_MTS_INT: This interrupt is for access violation on MTS carveout region in the MC. If a client other than CPU read or write is trying to access the region. 0 = CLEAR 1 = SET

Bit	Reset	Description
13	CLEAR	SECERR_SEC_INT: The request violated the SEC Carveout requirements - Only TSEC clients may access the SEC carveout. 0 = CLEAR 1 = SET
12	CLEAR	DECERR_VPR_INT: The request violated the VPR requirements - in case of a read, the request address fell in the VPR range, but the VPR attribute of the request was not set. In case of a write, the request had the VPR attribute set in the request, but the request address did not fall in the VPR range. 0 = CLEAR 1 = SET
11	CLEAR	INVALID_APB_ASID_UPDATE_INT: ASID Update through APB interface resulted in an error. APB interface tried to update secure ASID through Non-secure interface. 0 = CLEAR 1 = SET
10	CLEAR	INVALID_SMMU_PAGE_INT: Address translation error: An access was attempted to an invalid page or a protected page. See ERR_STATUS and ERR_ADR for more information. 0 = CLEAR 1 = SET
9	CLEAR	ARBITRATION_EMEM_INT: Warning that a pending request has reached the deadlock-prevention slack threshold. This indicates that the MC could not meet the programmed performance goals. This interrupt is for use with assisting debug of performance-related issues. 0 = CLEAR 1 = SET
8	CLEAR	SECURITY_VIOLATION_INT: Address translation error: A nonsecure access was attempted to a secured region. See ERR_STATUS and ERR_ADR for more information. 0 = CLEAR 1 = SET
6	CLEAR	DECERR_EMEM_INT: Address translation error: EMEM Address Decode Error. See ERR_STATUS and ERR_ADR for more information. 0 = CLEAR 1 = SET

18.11.1.2 MC_INTMASK_0

Interrupt Masks

Boot requirements: This register should be saved to SDRAM registers and restored by the OS during warm boot. Bit fields not shown here are reserved.

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxx00xx000000x0xxxxx)

Bit	Reset	Description
17	MASKED	DECERR_GENERALIZED_CARVEOUT_INTMASK: 0 = MASKED 1 = UNMASKED
16	MASKED	DECERR_MTS_INTMASK: 0 = MASKED 1 = UNMASKED
13	MASKED	SECERR_SEC_INTMASK: Prevents SECERR_SEC_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
12	MASKED	DECERR_VPR_INTMASK: Prevents DECERR_VPR_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
11	MASKED	INVALID_APB_ASID_UPDATE_INTMASK: Prevents INVALID_APB_ASID_UPDATE_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
10	MASKED	INVALID_SMMU_PAGE_INTMASK: Prevents INVALID_SMMU_PAGE_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED

Bit	Reset	Description
9	MASKED	ARBITRATION_EMEM_INTMASK: Prevents ARBITRATION_EMEM_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
8	MASKED	SECURITY_VIOLATION_INTMASK: Prevents SECURITY_VIOLATION_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
6	MASKED	DECERR_EMEM_INTMASK: Prevents DECERR_EMEM_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED

18.11.1.3 MC_ERR_STATUS_0

Error Data Capture: Status

If a translation error is detected (for example, address-out-of-bounds, security fault, protection fault), this register records information about this access:

- which fault the captured error corresponds to
- a read/write indicator and the request ID (global client ID assigned by the memory controller, see the list below)

If the error was an INVALID_SMMU_PAGE, then information about the page's protection status is also captured:

- whether the page was marked non secure in the page-table
- whether the page was marked readable in the page-table
- whether the page was marked writeable in the page-table

Note: *SMMU page protection bits are formed by ANDing the page protection bits from the Page Table Base, Page Directory Entry, and Page Table Entries from all three stages of the page-walk. The ANDed protection bits and the type of the provoking transaction are both available in the status register.*

Subsequent faults (of any type) will not change the status and address registers until the corresponding interrupt is cleared.

The global memory client IDs are defined as follows:

Client	ID	ID (hex)	SWGROUP	INBAND-SWID	Module	Partition	Description
csr_ptcr	0	(0x00)	ptc				Misses from System Memory Management Unit (SMMU) Page Table Cache (PTC)
csr_display0a	1	(0x01)	dc		display	dis	Display reads, window A

30:28	X	ERR_TYPE: Type of the corresponding error: 0 = RSVD : Code 0x0 is never used. 2 = DECERR_EMEM : There is no physical DRAM attached for this address based on the value of EMEM_SIZE_MB configuration register. 3 = SECURITY_TRUSTZONE : The non-secure client has attempted to access the Trustzone-secured aperture; or a secure client has attempted to access the Trustzone-secured aperture using a non-secure request. 4 = SECURITY_CARVEOUT : Reserved 6 = INVALID_SMMU_PAGE : The SMMU page-translation flagged an error for that access.
27	X	ERR_INVALID_SMMU_PAGE_READABLE: If INVALID_SMMU_PAGE error, set if page permission was readable (AND of PTB/PDE/PTE). Ignore if no INVALID_SMMU_PAGE error.
26	X	ERR_INVALID_SMMU_PAGE_WRITABLE: If INVALID_SMMU_PAGE error, set if page permission was writable (AND of PTB/PDE/PTE). Ignore if no INVALID_SMMU_PAGE error.
25	X	ERR_INVALID_SMMU_PAGE_NONSECURE: If INVALID_SMMU_PAGE error, set if page permission was non-secure (AND of PTB/PDE/PTE). Ignore if no INVALID_SMMU_PAGE error.

Bit	Reset	Description
21:20	X	ERR_ADR_HI: Higher address bits of erring address whose lower bits are available in ERR_ADR register
18	X	ERR_SWAP: Swap bit for transaction
17	X	ERR_SECURITY: Set if the transaction was secure. 0 = NONSECURE 1 = SECURE
16	X	ERR_RW: Direction of the access that caused the error. 0 = READ 1 = WRITE
14:12	X	ERR_ADR1: Second subpartition unique address bits
7:0	X	ERR_ID: Client identifier (see above list) of the access that caused the error.

18.11.1.4 MC_ERR_ADR_0

Error Data Capture: Address

If a translation error is detected, this register records the request byte address.

Subsequent faults (of any type) will not change the status and address registers until the corresponding interrupt is cleared.

Note that the decode-error, security-Trustzone, and security-carveout checks occur on the physical address (in other words, after SMMU translation); thus those error types capture the physical address. All other errors capture the virtual address.

Offset: 0xc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	ERR_ADR

18.11.1.5 MC_SMMU_CONFIG_0

Used for interrupt set/clear enums. When disabled, all transactions are untranslated. When enabled, transactions may be translated. See per-client and per-module enables in SMMU_* registers below.

This register can only be accessed by TrustZone-Secured accesses from the CPU.

Access to this register is restricted to TrustZone-secured requestors.

Boot requirements: This register should be saved to SDRAM registers and restored by the OS during warm boot.

SMMU Enable Register

Offset: 0x10 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	DISABLE	SMMU_ENABLE: 0 = DISABLE 1 = ENABLE

18.11.1.6 MC_SMMU_TLB_CONFIG_0

Translation Lookaside Buffer Config Register

Controls usage of the TLB.

Boot requirements: This register should be saved to SDRAM registers and restored by the OS during warm boot.

Offset: 0x14 | Read/Write: R/W | Reset: 0x30000030 (0b0011xxxxxxxxxxxxxxxxxxxx110000)

Bit	Reset	Description
31	DISABLE	TLB_STATS_ENABLE: Enable TLB Hit and Miss counters 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
30	DISABLE	TLB_STATS_TEST: Set stats registers to all "1s" 0 = DISABLE 1 = ENABLE
29	ENABLE	TLB_HIT_UNDER_MISS: Allow hits to pass misses in the TLB. This value may not be changed on the fly. Ideally, this should be set before enabling the SMMU. At the very least, the TLB needs to be flushed and traffic through the SMMU stopped before changing this value. 0 = DISABLE 1 = ENABLE
28	ENABLE	TLB_ROUND_ROBIN_ARBITRATION: When enabled, forces round robin (RR) arbitration between TLB hit and miss FIFOs. 0 = DISABLE 1 = ENABLE
5:0	0x30	TLB_ACTIVE_LINES: Set the number of active lines. Allows the TLB to be made "virtually smaller" to save power. "Inactive" lines will never hit and never hold data.

18.11.1.7 MC_SMMU_PTC_CONFIG_0

Controls usage of the PTC

Boot requirements: This register should be saved to SDRAM registers and restored by the OS during warm boot.

Page Table Cache Config Register

Offset: 0x18 | Read/Write: R/W | Reset: 0x28000f3f (0b001x1000xxxxxxxxxxxx1111x0111111)

Bit	Reset	Description
31	DISABLE	PTC_STATS_ENABLE: Enable PTC Hit and Miss counters 0 = DISABLE 1 = ENABLE
30	DISABLE	PTC_STATS_TEST: Set stats registers to all "1s" 0 = DISABLE 1 = ENABLE
29	ENABLE	PTC_CACHE_ENABLE: Enable the PTC cache. 0 = DISABLE 1 = ENABLE
27:24	0x8	PTC_REQ_LIMIT: Limit outstanding PTC fill requests to the DRAM.
11:8	0xf	PTC_LINE_MASK: XOR pattern for line generation
6:0	0x3f	PTC_INDEX_MAP: XOR pattern for tag generation

18.11.1.8 MC_SMMU_PTB_ASID_0

Page Table Bases (PTBs)

These pointers point to a 4KB-page aligned table of PDEs for each ASID. They also contain initial permission bits that are ANDed with those in the PDE and PTEs to determine the final permissions of accesses through this ASID.

The PTBs are stored in a RAM that is accessed indirectly though the SMMU_PTB_ASID and SMMU_PTB_DATA registers.

Boot requirements: This RAM should be saved to SDRAM and restored by the OS during warm boot.

Page Table Base ASID Register

This register selects which PTB is modified by the SMMU_PTB_DATA register.

Offset: 0x1c | Read/Write: R/W | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
6:0	X	CURRENT_ASID: ASID used to address SMMU_PTB register

18.11.1.9 MC_SMMU_PTB_DATA_0

Writes or reads to this register write or read the Page Table Base pointer for the ASID defined in the SMMU_PTB_ASID register.

This register is not TrustZone secure, but only a TrustZone secure access may alter the PTB for a secure ASID.

Secure ASIDs have additional privilege over other non-secure ASIDs - they may fetch page tables from secure memory and they can allow clients translated through them to make secure accesses if programmed to do so.

Attempts to write a secure ASID with a non-secure access will be ignored, and non-secure reads will return garbage.

Page Table Base Data Register

Offset: 0x20 | Read/Write: R/W | Reset: 0xX0XXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	ASID_READABLE: if set, reads are allowed for this ASID
30	X	ASID_WRITABLE: if set, writes are allowed for this ASID
29	X	ASID_NONSECURE: if set, non-secure accesses are allowed for this ASID
21:0	X	ASID_PDE_BASE: Pointer to page of PDEs, bits [33:12] for this ASID

18.11.1.10 MC_SMMU_TLB_FLUSH_0

Software can write this register to flush a specific page group, 4 MB section, entire ASID or the entire TLB. There is independent control over matching part or all of the VA and/or matching the ASID.

Note: *The granularity of VA mapping here is at a page group, which is the number of PTEs that fit in a memory atom.*

Translation Lookaside Buffer Flush Register

Offset: 0x30 | Read/Write: R/W | Reset: 0xXX0XXXXX (0bxxxxxxxxxxxx0xxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	TLB_FLUSH_ASID_MATCH: If enabled, only entries matching TLB_FLUSH_ASID are flushed. 0 = DISABLE 1 = ENABLE
30:24	X	TLB_FLUSH_ASID: ASID to match when TLB_FLUSH_ASID_MATCH is ENABLED
19:2	X	TLB_FLUSH_VA_GROUP: Virtual address to match for group flushes, VA[31:15]. VA[14] of this field is ignored due to the TLB line size.
1:0	X	TLB_FLUSH_VA_MATCH: Controls flushing based on VA, one of ALL: Flush entire TLB section: Flush all entries with a VA[31:22] that match TLB_FLUSH_VA_. GROUP: Flush all entries with a VA[31:14] that match TLB_FLUSH_VA_GROUP. By default, the GROUP setting takes effect if this field is programmed to a value of 1. 0 = ALL 2 = SECTION 3 = GROUP

18.11.1.11 MC_SMMU_PTC_FLUSH_0

Software can use this register to flush a specific PTE or PDE from the Page Table Cache (PTC) by writing the atom-aligned physical address of the PTE group. It can also flush the entire PTC via this register.

Note: *The granularity of flushing is at the PTE group, which is the number of PTEs that fit in a memory atom.*

Page Table Cache Flush Register

Offset: 0x34 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1xxx)

Bit	Reset	Description
31:4	X	PTC_FLUSH_ADR: Physical address of PTE group to match for address flushes, PA[31:4]
3	0x1	PTC_NO_WAIT_IDLE_FLUSH: Set bit to immediately flush without waiting for hit FIFO to go idle. Not required because it does not present an ordering hazard.
0	X	PTC_FLUSH_TYPE: Controls flushing, one of ALL: Flush entire PTC ADR: Flush PTEs that are addressed by PTC_FLUSH_ADR 0 = ALL 1 = ADR

18.11.1.12 MC_SMMU_ASID_SECURITY_0

ASID Security Register This register controls which ASIDs are considered "secure". Secure ASIDs cannot have their PTBs read or written by a non-secure access, nor can they be assigned as a module's ASID by a non-secure write. ASIDs may also be enabled as "promoting", which allows modules mapped through them to inherit their secure status. If a secure ASID has its promotion bit enabled, modules mapped to this ASID may access the secure physical memory region.

> ***Note:*** *All ASIDs, regardless of security, may access TrustZone-secure physical memory for page table accesses. This register can only be accessed by TrustZone-Secured accesses from the CPU. Registers for ASID 0 through 31.*

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x38 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	PROMOTING_ASIDS: If bit N in this field is set, clients that are mapped to ASID N may access the TrustZone-secure area of memory if ASID N is also marked as "secure".
15:0	0x0	SECURE_ASIDS: If bit N in this field is set, the PTB of ASID N cannot be read or written by a non-secure access, nor can this ASID be mapped to a module by a non-secure write.

18.11.1.13 MC_SMMU_ASID_SECURITY_1_0

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3c | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	PROMOTING_ASIDS_1: If bit N in this field is set, clients that are mapped to ASID N+16 may access the TrustZone-secure area of memory if ASID N+16 is also marked as "secure".
15:0	0x0	SECURE_ASIDS_1: If bit N in this field is set, the PTB of ASID N+16 cannot be read or written by a non-secure access, nor can this ASID be mapped to a module by a non-secure write.

18.11.1.14 MC_SMMU_ASID_SECURITY_2_0

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x9e0 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	PROMOTING_ASIDS_2: If bit N in this field is set, clients that are mapped to ASID N+32 may access the TrustZone-secure area of memory if ASID N+32 is also marked as "secure".
15:0	0x0	SECURE_ASIDS_2: If bit N in this field is set, the PTB of ASID N+32 cannot be read or written by a non-secure access, nor can this ASID be mapped to a module by a non-secure write.

18.11.1.15 MC_SMMU_ASID_SECURITY_3_0

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x9e4 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	PROMOTING_ASIDS_3: If bit N in this field is set, clients that are mapped to ASID N+48 may access the TrustZone-secure area of memory if ASID N+48 is also marked as "secure".
15:0	0x0	SECURE_ASIDS_3: If bit N in this field is set, the PTB of ASID N+48 cannot be read or written by a non-secure access, nor can this ASID be mapped to a module by a non-secure write.

18.11.1.16 MC_SMMU_ASID_SECURITY_4_0

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x9e8 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	PROMOTING_ASIDS_4: If bit N in this field is set, clients that are mapped to ASID N+64 may access the TrustZone-secure area of memory if ASID N+64 is also marked as "secure".
15:0	0x0	SECURE_ASIDS_4: If bit N in this field is set, the PTB of ASID N+64 cannot be read or written by a non-secure access, nor can this ASID be mapped to a module by a non-secure write.

18.11.1.17 MC_SMMU_ASID_SECURITY_5_0

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x9ec | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	PROMOTING_ASIDS_5: If bit N in this field is set, clients that are mapped to ASID N+80 may access the TrustZone-secure area of memory if ASID N+80 is also marked as "secure".
15:0	0x0	SECURE_ASIDS_5: If bit N in this field is set, the PTB of ASID N+80 cannot be read or written by a non-secure access, nor can this ASID be mapped to a module by a non-secure write.

18.11.1.18 MC_SMMU_ASID_SECURITY_6_0

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x9f0 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	PROMOTING_ASIDS_6: If bit N in this field is set, clients that are mapped to ASID N+96 may access the TrustZone-secure area of memory if ASID N+96 is also marked as "secure".
15:0	0x0	SECURE_ASIDS_6: If bit N in this field is set, the PTB of ASID N+96 cannot be read or written by a non-secure access, nor can this ASID be mapped to a module by a non-secure write.

18.11.1.19 MC_SMMU_ASID_SECURITY_7_0

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x9f4 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	PROMOTING_ASIDS_7: If bit N in this field is set, clients that are mapped to ASID N+112 may access the TrustZone-secure area of memory if ASID N+112 is also marked as "secure".

Bit	Reset	Description
15:0	0x0	SECURE_ASIDS_7: If bit N in this field is set, the PTB of ASID N+112 cannot be read or written by a non-secure access, nor can this ASID be mapped to a module by a non-secure write.

18.11.1.20 MC_EMEM_CFG_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.
- During warm boot, this register may be derived from EMEM_ADR_CFG* register values.

External Memory Aperture Configuration

Offset: 0x50 | Read/Write: R/W | Reset: 0x00002000 (0b0xxxxxxxxxxxxxxxx10000000000000) | Default: 0x00000000

Bit	Reset	Software Default	Description
31	B2GB	B2GB	EMEM_BOM: Base of DRAM memory in GBs [PMC_SECURE]. B2GB should be used for 34b systems, while B0GB supports up to 16GB using extended mapping mode 1 = B0GB 0 = B2GB
13:0	0x7ff	NONE	EMEM_SIZE_MB: Specify the external memory aperture size in megabytes. This field must be set to less than or equal to the available physical memory for proper operation. This value is used to check for decode errors; requests to addresses greater than or equal to EMEM_BOM+EMEM_SIZE_MB will result in an EMEM decode error.

18.11.1.21 MC_EMEM_ADR_CFG_0

The EMEM_ADR_CFG* registers are used to specify the DRAM density and geometry parameters. The MC will use these parameters to derive device, row, bank, column addressing values to EMC.

> ***Note:*** *The maximum size externally supported is dependent on pinout and address-map aperture limitations, and that it may be possible to configure the device/row/bank/column addresses in ways that exceed these limitations.*

For each device attached [1..NUMDEV], the associated per-device address configuration must also be programmed, in the associated register EMEM_ADR_CFG_DEV{N-1}.

The maximum number of row bits carried internally is defined by NV_MC_EMEM_ROW_WIDTH.

The maximum number of address pins is defined by NV_MC_EMEM_ROWPIN_WIDTH.

If not being used to address a device, the chip-select pins may be re-used as row address pins.

Valid settings for EMEM_ADR_CFG_DEV* registers should ensure device address width <= bank width + column width + NV_MC_EMEM_ROW_WIDTH

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

External Memory Address Configuration System

Offset: 0x54 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	N1	EMEM_NUMDEV: [PMC] number of populated DRAM devices. 0 = N1 1 = N2

18.11.1.22 MC_EMEM_ADR_CFG_DEV0_0

Configures the density and geometry of the first attached device.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Note: *DEVSIZE is per subpartition.*

External Memory Address Configuration Device 0

Offset: 0x58 | Read/Write: R/W | Reset: 0x00040202 (0bxxxxxxxxxxxx0100xxxxxx10xxxxx010)

Bit	Reset	Description
19:16	D64MB	EMEM_DEV0_DEVSIZE: [PMC] density of the first attached DRAM device, used to generate width of row address. 2 = D16MB 3 = D32MB 4 = D64MB 5 = D128MB 6 = D256MB 7 = D512MB 8 = D1024MB 8 = D1GB 9 = D2048MB 9 = D2GB 10 = D4096MB 11 = D8192MB 12 = D768MB 13 = D384MB
9:8	W2	EMEM_DEV0_BANKWIDTH: [PMC] width of bank address of the first attached DRAM device. 2 = W2 3 = W3
2:0	W9	EMEM_DEV0_COLWIDTH: [PMC] width of column address of the first attached DRAM device. W8 maps to 1KB page size, W9 to 2KB, W10 to 4KB, etc. 1 = W8 2 = W9 3 = W10 4 = W11 5 = W12

18.11.1.23 MC_EMEM_ADR_CFG_DEV1_0

Configures the density and geometry of the second attached device, if a second device is populated.

To allow for 2 devices with different column width/bank width to be used without creating holes in the system-level address map, the DEVSIZE setting of the second device may be smaller than the others to allow for non-powers-of-2 attached memory sizes.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Note: *DEVSIZE is per subpartition.*

External Memory Address Configuration Device 1

Offset: 0x5c | Read/Write: R/W | Reset: 0x00040202 (0bxxxxxxxxxxxx0100xxxxxx10xxxxx010)

Bit	Reset	Description
19:16	D64MB	EMEM_DEV1_DEVSIZE: [PMC] Density of the second attached DRAM device, used to generate width of row address. 2 = D16MB 3 = D32MB 4 = D64MB 5 = D128MB 6 = D256MB 7 = D512MB 8 = D1024MB 8 = D1GB 9 = D2048MB 9 = D2GB 10 = D4096MB 11 = D8192MB 12 = D768MB 13 = D384MB
9:8	W2	EMEM_DEV1_BANKWIDTH: [PMC] width of bank address of the second attached DRAM device. 2 = W2 3 = W3
2:0	W9	EMEM_DEV1_COLWIDTH: [PMC] width of column address of the second attached DRAM device. W8 maps to 1KB page size, W9 to 2KB, W10 to 4KB, etc. 1 = W8 2 = W9 3 = W10 4 = W11 5 = W12

18.11.1.24 MC_EMEM_ADR_CFG_CHANNEL_MASK_0

External Memory Address Configuration Channel Select Mask

Configures the routing of requests between the two memory channels. The channel select mask is ANDed with the address of a transaction. The resulting value is XORed to a single bit, which is used to select the channel for the transaction.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Mask bits [10:9] select single channel vs. dual-channel modes and 512B vs. 1KB interleave as follows, each with its own physical address to mapping.

Interleave	MASK[10:9]	Remarks
Single channel	2’b00	
512B	2’bx1	Channels alternate on (most) 512B boundaries
1KB	2’b10	Channels alternate on (most) 1KB boundaries while decoding the DRBC data from the address, if mask bit 9th is set then the 9th bit of address is dropped for DRBC decoding and else if mask bit 10 is set then 10th bit address is dropped for address decoding.

Write access to this register is controlled by the EMEM_CFG_ACCESS_CTRL_0 register.

Offset: 0x60 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000xxxxxxxxx)

Bit	Reset	Description
31:9	0x0	EMEM_CHANNEL_MASK: [PMC_SECURE] Mask is ANDed with address and the resulting value is XORed to a single bit

18.11.1.25 MC_EMEM_ADR_CFG_BANK_MASK_0_0

External Memory Address Configuration Bank Select Mask

Configures the calculation of the DRAM bank. The Bank select mask N is ANDed with the address of a transaction. The resulting value is XORd to a single bit, which forms the Nth bit of the bank.

Note: In dual channel mode, MC drops the channel bit (bit 9 or bit 10 depending on the channel mask) and applies the bank mask on the right-shifted address.

- Single channel mode: bank[0] = ^(bank_mask_0[31:10] & address[31:10]);
- Dual channel mode: bank[0] = ^(bank_mask_0[31:10] & address[32:11]);

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Write access to these registers is controlled by the EMEM_CFG_ACCESS_CTRL register

Offset: 0x64 | Read/Write: R/W | Reset: 0xeb772400 (0b11101011011101110011001xxxxxxxxxx)

Secure Region Configuration: Base

Offset: 0x70 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x80000000 (0b100000000000xxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:20	0x800	SECURITY_BOM: SECURITY_BOM is the base of the secured region, limited to MB granularity. This must point to a region of the physical address map allocated to EMEM for it to be effective; the MC cannot secure address space it does not own. (In other words, this is an absolute address, not an offset.) Above is the list of clients with the TrustZone-security access. Note that AXICIF clients will adhere to the standard AXI protocol "aprot[1]==0" indication for secure requests.

18.11.1.29 MC_SECURITY_CFG1_0

Access to this register is restricted to TrustZone-secured requestors.

Boot requirements:

This security configuration register should be saved to SDRAM and restored by the OS during warm boot.

Secure Region Configuration: Bound

Offset: 0x74 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx0000000000000)

Bit	Reset	Description
12:0	0x0	SECURITY_SIZE_MB: SECURITY_SIZE_MB is the size, in megabytes, of the secured region. If set to 0, the security check in MC is disabled.

18.11.1.30 MC_EMEM_ARB_CFG_0

General configuration of the External Memory Arbiter.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.

- During Boot ROM warm boot, this register may be derived from the emcclk and a standard tick-value.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration

Offset: 0x90 | Read/Write: R/W | Reset: 0x00000008 (0b00000000xxx00000xxxxxxx000001000)

Bit	Reset	Description
20:16	0x0	EXTRA_TICKS_PER_UPDATE: The number of extra ticks to add every deadline timer update. Used to keep cycles-per-tick constant when the mcclk period is less than the chosen wall-clock granularity for the deadline counter. If =0, then every tick increments the deadline counter by 1; if =1, then every tick increments the deadline counter by 2, etc. Assuming a target of 30ns-per-tick, some example programming (assumes DIV=2): 10MHz emcclk => 5MHz mcclk => would need to increment deadline counter by 6.67 if using 1 cycle-per-tick => or update by 20 every 3 cycles => 3 cycles-per-tick and 19 extra ticks per update. Since performance is not critical at such slow speeds, rounding errors may be deemed acceptable, so the previous example may be simpler to program as 1 cycle-per-tick and 5 extra ticks per update. Another example, the slowest supported clock speed using a 30ns tick that doesn't distort the tick is: 1.04MHz mcclk => with 31 extra ticks per update and updating every cycle.
8:0	0x8	CYCLES_PER_UPDATE: The number of mcclk cycles per deadline timer update. The target wall-clock granularity ("tick") for the deadline counter should be fixed for the design, then the CYCLES_PER_UPDATE should be used to convert the wall-time value into mcclk cycles. All client latency allowances are also expressed in units of "ticks". Of all deadline-related controls, only the CYCLES_PER_UPDATE and EXTRA_TICKS_PER_UPDATE values need to be updated on a clock-change event. Assuming a target of 30ns per tick, some example programming (assumes DIV=2): 667MHz emcclk => 333MHz mcclk => 10 cycles per tick; 400MHz emcclk => 200MHz mcclk => 6 cycles-per-tick. Note that value 0x0 is illegal.

18.11.1.31 MC_EMEM_ARB_OUTSTANDING_REQ_0

This register can be used to limit the number of outstanding requests in the arbiter and monitor the count.

If outstanding transaction is greater than the maximum, requests are throttled based on MC_EMEM_ARB_RING1_THROTTLE_0 register

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from other MC settings.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: Outstanding Request Limiter

Offset: 0x94 | Read/Write: R/W | Reset: 0x8XXX0040 (0b10xxxxxxxxxxxxxxxxxxxxx001000000)

Bit	R/W	Reset	Description
31	RW	ENABLE	LIMIT_OUTSTANDING: when ENABLED, the total number of requests in the arbiter is limited to the value in ARB_MAX_OUTSTANDING 0 = DISABLE 1 = ENABLE
30	RW	DISABLE	LIMIT_DURING_HOLDOFF_OVERRIDE: when DISABLED, override the limiting of transactions during hold-off to let requests flow freely 0 = DISABLE 1 = ENABLE
24:16	RO	X	ARB_OUTSTANDING_COUNT: Current number of outstanding requests
8:0	RW	0x40	ARB_MAX_OUTSTANDING: The maximum number of requests allowed in the arbiter when LIMIT_OUTSTANDING is set to ENABLE.

18.11.1.32 MC_EMEM_ARB_TIMING_RCD_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tRCD

Offset: 0x98 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	RCD: The minimum number of cycles between activate commands to the same bank. Program to maximum (1,ceil(max(EMC.WR_RCD,EMC.RD_RCD)/DIV)-1-1). Note that value 0x0 is illegal.

18.11.1.33 MC_EMEM_ARB_TIMING_RP_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tRP

Offset: 0x9c | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	RP: The minimum number of cycles between an internal precharge command and an activate command to the same bank. Program to ceil (EMC.RP/DIV)-1+SFA. The combined value of RAP2PRE+RP 0x0 is illegal; the combined value of WAP2PRE+RP 0x0 is illegal.

18.11.1.34 MC_EMEM_ARB_TIMING_RC_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing : tRC

Offset: 0xa0 | Read/Write: R/W | Reset: 0x000000ff (0bxxxxxxxxxxxxxxxxxxxxxxxx11111111)

Bit	Reset	Description
7:0	0xff	RC: This is the minimum number of cycles between activate commands to the same bank. Program to ceil (max(EMC.RC,(EMC.RAS+EMC.RP))/DIV)-1.

18.11.1.35 MC_EMEM_ARB_TIMING_RAS_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tRAS

Offset: 0xa4 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	RAS: This is the minimum number of cycles between an activate command and a precharge command to the same bank. Program to ceil (EMC.RAS/DIV)-1-1.

18.11.1.36 MC_EMEM_ARB_TIMING_FAW_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tFAW

Offset: 0xa8 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
5:0	0x3f	FAW: For 8-bank devices: Only 4 activates may occur within this rolling window. Program to ceil (EMC.TFAW/DIV)-1. Programming this to 0x0 or not programming a device to 4 banks will turn off this check.

18.11.1.37 MC_EMEM_ARB_TIMING_RRD_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tRRD

Offset: 0xac | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	RRD: The minimum number of cycles between an activate command and an activate command to a different bank. Program to ceil (EMC.RRD/DIV)-1.

18.11.1.38 MC_EMEM_ARB_TIMING_RAP2PRE_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tRAP2PRE

Offset: 0xb0 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	RAP2PRE: The number of cycles between a read command with auto-precharge and the internal precharge command generated by the DRAM. Program to ceil (EMC_R2P/DIV). Note that: the combined value of RAP2PRE+RP 0x0 is illegal.

18.11.1.39 MC_EMEM_ARB_TIMING_WAP2PRE_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tWAP2PRE

Offset: 0xb4 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	WAP2PRE: The number of cycles between a write command with auto-precharge and the internal precharge command generated by the DRAM. Program to ceil (EMC_W2P/DIV). Note that: the combined value of WAP2PRE+RP 0x0 is illegal.

18.11.1.40 MC_EMEM_ARB_TIMING_R2R_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tR2R

Offset: 0xb8 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	R2R: The number of cycles between consecutive read commands to different devices (different chip selects). Program to ceil (EMC.REXT/DIV)-1+OTFA+SFA.

18.11.1.41 MC_EMEM_ARB_TIMING_W2W_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tW2W

Offset: 0xbc | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	W2W: The number of cycles between consecutive write commands to different devices (different chip selects). Program to ceil (EMC.WEXT/DIV)-1+SFA.

18.11.1.42 MC_EMEM_ARB_TIMING_R2W_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tR2W

Offset: 0xc0 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	R2W: The number of cycles to turn the bus from reads to writes. Program to ceil (EMC.R2W/DIV)-1+OTFA+SFA.

18.11.1.43 MC_EMEM_ARB_TIMING_W2R_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: DRAM Timing: tW2R

Offset: 0xc4 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	W2R: The number of cycles to turn the bus from reads to writes. Program to ceil (EMC.W2R/DIV)-1+SFA.

18.11.1.44 MC_EMEM_ARB_DA_TURNS_0

The direction arbiter attempts to choose the highest efficiency (i.e., lowest bubbles) direction to open pages next. While programming this register incorrectly may lower performance, it should never cause chip-hangs since the EMC always controls the final DRAM timing decisions. This register should be reprogrammed after clock-change events to bring the computed values back in alignment with EMC's register values. These turn costs are deliberately not computed in hardware to provide better flexibility to tweak arbiter performance.

The configuration registers for turns for DA are separate from the timing registers to allow for flexibility in the programming.

Boot requirements:

- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from MC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: Direction Arbiter: Turns

Offset: 0xd0 | Read/Write: R/W | Reset: 0x0f0f0205 (0b00001111000011110000001000000101)

Bit	Reset	Description
31:24	0xf	W2R_TURN: Bubbles produced by a write to read bus turn. Approximately MC_EMEM_ARB_TIMING_W2R.
23:16	0xf	R2W_TURN: Bubbles produced by a read to write bus turn. Approximately MC_EMEM_ARB_TIMING_R2W.
15:8	0x2	W2W_TURN: Bubbles produced by a write to write (other device) bus turn. Approximately MC_EMEM_ARB_TIMING_W2W.
7:0	0x5	R2R_TURN: Bubbles produced by a read to read (other device) bus turn. Approximately MC_EMEM_ARB_TIMING_R2R.

18.11.1.45 MC_EMEM_ARB_DA_COVERS_0

The direction arbiter attempts to choose the highest efficiency (i.e., lowest bubbles) direction to open pages next. While programming this register incorrectly may lower performance, it should never cause chip-hangs since the EMC always controls the final DRAM timing decisions. This register should be reprogrammed after clock-change events to bring the computed values back in alignment with EMC's register values. These cover costs are deliberately not computed in hardware to provide better flexibility to tweak arbiter performance.

Boot requirements:

- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from MC settings using the given equations.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: Direction Arbiter: Covers

Offset: 0xd4 | Read/Write: R/W | Reset: 0x000f0f0f (0bxxxxxxxx00001111000011110000 1111)

Bit	Reset	Description
23:16	0xf	RCD_W_COVER: Cost to cover the activate-to-write delay. Approximately ceil ((EMC.RTP + EMC.RP + EMC.RD_RCD)/DIV)-1.
15:8	0xf	RCD_R_COVER: Cost to cover the activate-to-read delay. Approximately ceil ((EMC.WTP + EMC.RP + EMC.WR_RCD)/DIV)-1.
7:0	0xf	RC_COVER: Cost to cover the activate-to-activate delay. Approximately MC_EMEM_ARB_TIMING_RC.

18.11.1.46 MC_EMEM_ARB_MISC0_0

BC2AA_HOLDOFF: In the case where the open pages have more work pending than the time it would take to open another page, it is better to hold off opening that page until it is truly needed. The Best-bank Cache computes the pending work and compares it to this threshold and advises the Activation Arbiter to hold-off.

Priority Inversion: In general, if the arbiter is working on a lower-priority request that blocks a higher-priority request, these thresholds are used to limit the number of low-priority requests serviced before the arbiter interrupts the lower-priority traffic to start servicing the higher-priority traffic.

The priority classes are (in increasing priority order): Low (! expired), High (expired), HighIso.

There are three ways priority can be inverted: Bank Activation, Bus Direction, and Refresh:

Bank Activation: If an unexpired request to bank A, row R holds the page open, and a request to bank A, row S expires, the Transaction Arbiter must make a decision whether to finish out the work for row R or to interrupt that transfer to immediately service row S. The TA makes this decision based on the remaining work for row R and whether row S is for an isochronous client, and the two PRIORITY_INVERSION thresholds.

Bus Direction: If the Transaction Arbiter is working on expired requests in direction P, and requests are also expired (or expired-iso) in direction Q, the Transaction Arbiter must make a decision whether to continue working in direction P or switch the bus to direction Q. The Transaction Arbiter will service at maximum PRIORITY_INVERSION_THRESHOLD (or _INVERSION_ISO_THRESHOLD) requests in direction P before switching to direction Q.

Refresh: If the Transaction Arbiter is working on requests, and EMC asks to inject a refresh, the Transaction Arbiter must decide whether it is more efficient (overall) to close the pages immediately or to finish the pages and then close them. Depending on the setting of the REFRESH_ACK_THRESHOLD_USAGE configuration bit (in EMEM_ARB_MISC1 register, below), the Transaction Arbiter will either choose to close the page immediately (NONE), close the page immediately if its length is over the iso threshold (ISO), or close the page immediately if its length is over the normal threshold (NORMAL). If the length is less than the chosen threshold, the Transaction Arbiter will service all remaining requests to the page before acknowledging the EMC refresh request.

When in MC_EMC_SAME_FREQ mode, the priority inversion thresholds should be set to half of their non-same-frequency values.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- The MC_EMC_SAME_FREQ field should be saved to scratch registers and restored by the Boot ROM during warm boot.
- The other fields of this register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from other settings.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: Miscellaneous Thresholds (0)

Offset: 0xd8 | Read/Write: R/W | Reset: 0x720a4010 (0bx11100100000101001000000000010000)

Bit	Reset	Description
30:28	0x7	ATOMS_PER_DVFS_PULSE: [PMC] ATOMS_PER_DVFS_PULSE is used to control the rate at which the MC updates the sys_stats_mon outputs. The MC will toggle the sys_stats_mon outputs for every 2^(ATOMS_PER_DVFS_PULSE+1) atoms of traffic, where an atom is defined as any transaction. Note that 16B, 32B, and 64B requests consume the same amount of memory bus resources. So, in this context, an atom is defined as any request and not cumulative 64B sized transactions. The maximum ATOMS_PER_DVFS_PULSEsetting supported is the reset value, also known as NV_MC_EMEM_DVFS_CNTR_CFG_RESET.
27	DISABLE	MC_EMC_SAME_FREQ: [PMC] Used in conjunction with EMEM_ARB_MISC1.COALESCE_FOR_PERFORMANCE to configure how often the MC can send EMC a data request, should be configured to mirror CAR's CLK_SOURCE_EMC.MC_EMC_SAME_FREQ. If configured to DIV=2 BL=4, then the MC can send a data request every cycle. If configured to DIV=1 BL=4, then the MC can send a data request every other cycle. If configured to DIV=2 BL!=4, then MC can send a data request every other cycle. If configured to DIV=1 BL!=4, then the MC can send a data request once every four cycles. 0 = MC is 1/2 the frequency of EMC (DIV=2). 1 = MC is the same frequency of EMC (DIV=1). 0 = DISABLE 1 = ENABLE
26:21	0x10	EXPIRING_SOON_SLACK_THRESHOLD: Slack threshold below which an isochronous request is considered to be expiring "soon". Used to de-assert mc2emc_idle signal early to wake EMC out of power-down or self-refresh. If using EMC's Dynamic Self Refresh features, set this to the ticks needed to cover exit self-refresh delay; otherwise, if using EMC's ACPD feature, set to the ticks needed to cover exit power-down delay; if neither power-saving feature is being used, the programming of this threshold should have no effect.
20:16	0xa	PRIORITY_INVERSION_ISO_THRESHOLD: Bank Activation: maximum number of unexpired or expired-but-not-isochronous requests that can be serviced before switching to expired isochronous traffic. Bus Direction: maximum number of requests in direction P that can be serviced before switching to expired-isochronous traffic in direction Q. Refresh: maximum number of requests that can be serviced before refresh is sent. Values <= 0x2 disable the feature. Values < 0x6 should be avoided if coalescing for performance.

Bit	Reset	Description
15	DISABLE	EMC_REQ_B2B_XFER: When enabled, the MC allows EMC transactions on back-to-back clocks regardless of EMC consumption bandwidth 0 = DISABLE 1 = ENABLE
14:8	0x40	PRIORITY_INVERSION_THRESHOLD: Bank Activation: maximum number of unexpired requests that can be serviced before switching to expired traffic. Bus Direction: maximum number of requests in direction P that can be serviced before switching to expired traffic in direction Q. Refresh: maximum number of requests that can be serviced before refresh is sent. Values <= 0x2 disable the feature. Values < 0x6 should be avoided if coalescing for performance.
7:0	0x10	BC2AA_HOLDOFF_THRESHOLD: If the pending work is greater than this value, hold off on activations. Generally should be set to match the page-opening cost: MC_EMEM_ARB_TIMING_RC+1.

18.11.1.47 MC_EMEM_ARB_MISC1_0

Two DVFS counters exist in the "NV_MC_ARB_EMEM_stats.v" module: one for all requests and another for CPU-only transactions. Both of these are down counters which decrement for each transaction atom on mcclk.

When these counters reach zero, a single mcclk pulse is generated, and the counters reinitialize to a value of ((2^(ATOMS_PER_DVFS_PULSE+1))-1). The single mcclk pulse that is generated (when the counters reach zero) gets synchronized to sclk (system clock) through a cross-clock domain FIFO control module, which has a minimum response time requirement of (4 * sclk_period + 4 * mcclk_period). Therefore, ATOMS_PER_DVFS_PULSE should never be set such that ((2^(ATOMS_PER_DVFS_PULSE+1)) * mcclk_period) is less than (4 * sclk_period + 4 * mcclk_period).

This translates to the following rule for setting the minimum value of ATOMS_PER_DVFS_PULSE:

ATOMS_PER_DVFS_PULSE >= log2((4 * sclk_period/mcclk_period) + 4) - 1

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- The COALESCE_FOR_PERFORMANCE field should be saved to scratch registers and restored by the Boot ROM during warm boot. It may also be derived from EMC settings.
- The other fields of this register should be saved to SDRAM and restored by the OS during warm boot.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

External Memory Arbitration Configuration: Miscellaneous Thresholds

Offset: 0xdc | Read/Write: R/W | Reset: 0x80a0000a (0b1000xx00101xxxxxxxx0000000001010) | Default: 0x00000008

Bit	Reset	Software Default	Description
31:28	0x8	NONE	DEADLOCK_PREVENTION_SLACK_THRESHOLD: If the slack at the head of any bank-queue, or any of the slacks in the hit-under-miss FIFO is less than -(2^threshold), backpressure the input to the arbiter until the violating slack values have been arbitrated. This is intended to: (a) avoid deadline-wrapping in heavily backpressured corner-cases and (b) quickly get such cases back into high-efficiency arbitration. Value of 0x0 disables the feature. The reset value is NV_MC_EMEM_DL_WIDTH-1. Behavior with values greater than or equal to NV_MC_EMEM_DL_WIDTH is UNDEFINED. If the threshold is reached, ARBITRATION_EMEM_INT will fire.
25:24	NORMAL	NONE	REFRESH_ACK_THRESHOLD_USAGE: Determines which thresholds (if any) the refresh-acknowledge signal will use to determine how to close all pages after EMC has requested a refresh. 0 = NORMAL : Use priority-inversion threshold 1 = ISO : Use priority-inversion-ISO threshold 2 = NONE : Force a precharge immediately to close the page

Bit	Reset	Software Default	Description
23:21	USE_EXPIRING_SOON_SLACK_THRESHOLD	NONE	EXPIRING_SOON_SLACK_THRESHOLD_PD: [PMC] Slack threshold below which an isochronous request is considered to be expiring "soon". Used to deassert the mc2emc_idle_pd signal early to wake the EMC out of power-down. (EXPIRING_SOON_SLACK_THRESHOLD controls exit from self-refresh.) This register should be set to the ticks needed to cover the exit power-down delay. If the available choices are not sufficient, the value should be set in EXPIRING_SOON_SLACK_THRESHOLD and this register should be set to USE_EXPIRING_SOON_SLACK_THRESHOLD 0 = ZERO_TICKS : 0 tick threshold for PD expiring soon 1 = ONE_TICK: 1 tick threshold for PD expiring soon 2 = TWO_TICKS: 2 tick threshold for PD expiring soon 3 = FOUR_TICKS: 4 tick threshold for PD expiring soon 4 = EIGHT_TICKS: 8 tick threshold for PD expiring soon 5 = USE_EXPIRING_SOON_SLACK_THRESHOLD: Use the setting in EXPIRING_SOON_SLACK_THRESHOLD to control mc2emc_idle_pd
12:4	0x0	0x0	ALT_DEADLOCK_PREVENTION_SLACK_THRESHOLD: [PMC] Use the absolute value of deadlock prevention slack threshold instead of 2^n format. Note that the DEADLOCK_PREVENTION_SLACK_THRESHOLD field still needs to be programmed along with this one (for example, 7).
3	ENABLE	ENABLE	COMBINED_INTERRUPT_MODE: [PMC] 1 = combined interrupt mode. 0 = independent interrupt mode. Shadowed 0 = DISABLE 1 = ENABLE
2	DISABLE	0x0	BLOCK_LP_CPU_WR_IF_SMMU_INP_HP: [PMC] When enabled, low priority (due to DDA) CPU writes get blocked when the SMMU output is high priority and a request is present at the input to the SMMU. 0 = DISABLE 1 = ENABLE
1	ENABLE	NONE	ALLOW_BCA_HOLDOFF_WHEN_EXP: [PMC] When enabled, allows BCA holdoff to occur even when expired requests are present. 0 = DISABLE 1 = ENABLE
0	DISABLE	0x0	BLOCK_LP_CPU_RD_IF_SMMU_INP_HP: [PMC] When enabled, low priority (due to DDA) CPU reads get blocked when the SMMU output is high priority and a request is present at the input to the SMMU. 0 = DISABLE 1 = ENABLE

18.11.1.48 MC_EMEM_ARB_MISC2_0

External Memory Arbitration Configuration: Miscellaneous Thresholds (2)

ALLOW_B2B_TA_REQS: For LPDDR4, back-to-back transactions are not allowed or masked writes will not work (i.e. ALLOW_B2B_TA_REQS must be disabled for LPDDR4).

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- The ALLOW_B2B_TA_REQS field should be saved to scratch registers and restored by the Boot ROM during warm boot.
- The other fields of this register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from other settings.

Offset: 0xc8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	DISABLE	ALLOW_B2B_TA_REQS: [PMC] If enabled, the transaction arbiter (TA) is allowed to grant requests on back-to-back cycles. Previously, the only cases where transactions need to be issued on back-to-back cycles were as follows: EMC to MC clock ratio DRAM burst length 4:1 BL=8 2:1 BL=4 Tegra X1 devices do not support 4:1 EMC to MC clock ratio or BL=4, so there is no need to be able to issue transactions on back-to-back cycles. When transactions are only allowed to issue every other clock, both the deadline and the masked_write information should always be correct. This bit is required to be disabled for LPDDR4 since proper masked_write operation is required. 0 = DISABLE 1 = ENABLE

18.11.1.49 MC_EMEM_ARB_RING1_THROTTLE_0

External Memory Arbitration Configuration: Snap Arbiter Throttle

Ring1 Snap Arbiter Throttle - Inserts some number of stall cycles at Ring1 after every request.

Throttle cycle count varies whether outstanding_request count is below (LOW) or above (HIGH) the max_outstanding threshold.

Boot requirements: During Boot ROM section of warm boot, this register may be derived from other settings.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

Offset: 0xe0 | Read/Write: R/W | Reset: 0x001f0000 (0bxxxxxxxxxxxx11111xxxxxxxxxxx00000)

Bit	Reset	Description
20:16	0x1f	RING1_THROTTLE_CYCLES_HIGH: Cycles of throttle after each request when outstanding transaction count is greater than or equal to threshold.
4:0	0x0	RING1_THROTTLE_CYCLES_LOW: Cycles of throttle after each request when outstanding transaction count is below threshold. Suggested programming: (DIV==1)? 1 : 0.

18.11.1.50 MC_EMEM_ARB_RING3_THROTTLE_0

External Memory Arbitration Configuration: Snap Arbiter Throttle

Highest Ring Snap Arbiter Throttle - Although called ring3, this register works on the highest ring.

Boot requirements: This register should be saved in the SDRAM and restored by the OS during warm boot.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

Offset: 0xe4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000xxxxxxxxxxx00000)

Bit	Reset	Description
4:0	0x0	RING3_THROTTLE_CYCLES: Cycles of throttle after each request.

18.11.1.51 MC_EMEM_ARB_OVERRIDE_0

External Memory Arbitration Configuration: Feature Overrides

Boot requirements:

- Some fields of this register should be saved in the scratch registers and restored by the Boot ROM during warm boot.
- This register should be saved in the SDRAM and restored by the OS during warm boot.

Offset: 0xe8 | Read/Write: R/W | Reset: 0x10000000 (0b0xx100xx00000000000000000xxx00xxx)

Bit	Reset	Description

1:0	RST	EMC_GATHER: 0 = RST 2 = DISABLE 3 = ENABLE

18.11.1.56 MC_CLIENT_HOTRESET_CTRL_0

Writing FLUSH_ENABLE to a bit in this register causes a flush to be performed on all of the clients for the selected swname. The status of the flush (done/in progress) can be monitored in the CLIENT_HOTRESET_STATUS register.

A proper client reset sequence is as follows:

1. Set the appropriate FLUSH_ENABLE bit in the CLIENT_HOTRESET_CTRL register to block further access by the client, and start the flush process.
2. Poll the CLIENT_HOTRESET_STATUS register until the appropriate bit returns FLUSH_DONE.
3. Clear module bit in the CLK_RST_CONTROLLER_RST_DEVICES_* register to reset the module.
4. Set module bit in the CLK_RST_CONTROLLER_RST_DEVICES_* register to release the module reset.
5. Clear the appropriate FLUSH_ENABLE bit in the CLIENT_HOTRESET_CTRL register to allow transactions to flow.

Memory Client Hot Reset Control Register

18.11.1.58 MC_EMEM_ARB_ISOCHRONOUS_0_0

Controls whether a client is considered to be an isochronous client for EMEM arbitration. If a client is configured to be isochronous, the arbiter will favor expired isochronous requests over requests of any other type. This applies to arbitration for: best-bank arbiter (BA), activation arbiter (AA), direction arbiter (DA), and transaction arbiter (TA).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

Per-Client Isochronous Settings

18.11.1.62 MC_EMEM_ARB_HYSTERESIS_0_0

Controls whether a client is considered to be a hysteresis client for EMEM arbitration. If a client is NOT marked hysteresis, it will immediately cause the arbiter to turn off ts2aa_holdoff (see the comments for EMEM_ARB_OVERRIDE for further description of ts2aa_holdoff functionality).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

18.11.1.74 MC_SMMU_HC_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU HC ASID Assignment Register

Offset: 0x250 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	HC_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	HC_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.75 MC_SMMU_HDA_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU HDA ASID Assignment Register

Offset: 0x254 | Read/Write: R/W | Reset: 0x00000000 (0b00000000x0000000x0000000x0000000)

Bit	Reset	Description
31	DISABLE	HDA_SMMU_ENABLE: if set, translation is enabled for this module 0 = DISABLE 1 = ENABLE
30:24	0x0	HDA_ASID_3: If translation enabled, ASID to use when va[33:32] = 0x3
22:16	0x0	HDA_ASID_2: If translation enabled, ASID to use when va[33:32] = 0x2
14:8	0x0	HDA_ASID_1: If translation enabled, ASID to use when va[33:32] = 0x1

Bit	Reset	Description
6:0	0x0	HDA_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.76 MC_SMMU_ISP2_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU ISP2 ASID Assignment Register

Offset: 0x258 | Read/Write: R/W | Reset: 0x00000000 (0b00000000x0000000x0000000x0000000)

Bit	Reset	Description
31	DISABLE	ISP2_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
30:24	0x0	ISP2_ASID_3: If translation enabled, ASID to use when va[33:32] = 0x3
22:16	0x0	ISP2_ASID_2: If translation enabled, ASID to use when va[33:32] = 0x2
14:8	0x0	ISP2_ASID_1: If translation enabled, ASID to use when va[33:32] = 0x1
6:0	0x0	ISP2_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.77 MC_SMMU_NVENC_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU MSENC NVENC Assignment Register

Offset: 0x264 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	NVENC_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	NVENC_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.78 MC_SMMU_NV_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field.

SMMU NV ASID Assignment Register

Offset: 0x268 | Read/Write: R/W | Reset: 0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxx00

Bit	Reset	Description
31	DISABLE	NV_SMMU_ENABLE: if set, translation is enabled for this module 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
1:0	0x0	NV_ASID: ASID to use for translation, if enabled

18.11.1.79 MC_SMMU_NV2_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field.

SMMU NV2 ASID Assignment Register

Offset: 0x26c | Read/Write: R/W | Reset: 0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxx00

Bit	Reset	Description
31	DISABLE	NV2_SMMU_ENABLE: if set, translation is enabled for this module 0 = DISABLE 1 = ENABLE
1:0	0x0	NV2_ASID: ASID to use for translation, if enabled

18.11.1.80 MC_SMMU_PPCS_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU PPCS ASID Assignment Register

Offset: 0x270 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	PPCS_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	PPCS_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.81 MC_SMMU_SATA_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU SATA ASID Assignment Register

Offset: 0x274 | Read/Write: R/W | Reset: 0x00000000 (0b00000000x0000000x0000000x0000000)

Bit	Reset	Description
31	DISABLE	SATA_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
30:24	0x0	SATA_ASID_3: If translation enabled, ASID to use when va[33:32] = 0x3
22:16	0x0	SATA_ASID_2: If translation enabled, ASID to use when va[33:32] = 0x2
14:8	0x0	SATA_ASID_1: If translation enabled, ASID to use when va[33:32] = 0x1

Bit	Reset	Description
6:0	0x0	SATA_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.82 MC_SMMU_VI_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU VI ASID Assignment Register

Offset: 0x280 | Read/Write: R/W | Reset: 0x00000000 (0b00000000x0000000x0000000x0000000)

Bit	Reset	Description
31	DISABLE	VI_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
30:24	0x0	VI_ASID_3: If translation enabled, ASID to use when va[33:32] = 0x3
22:16	0x0	VI_ASID_2: If translation enabled, ASID to use when va[33:32] = 0x2
14:8	0x0	VI_ASID_1: If translation enabled, ASID to use when va[33:32] = 0x1
6:0	0x0	VI_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.83 MC_SMMU_VIC_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU VIC ASID Assignment Register

Offset: 0x284 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	VIC_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	VIC_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.84 MC_SMMU_XUSB_HOST_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU XUSB_HOST ASID Assignment Register

Offset: 0x288 | Read/Write: R/W | Reset: 0x00000000 (0b00000000x0000000x0000000x0000000)

Bit	Reset	Description
31	DISABLE	XUSB_HOST_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
30:24	0x0	XUSB_HOST_ASID_3: If translation enabled, ASID to use when va[33:32] = 0x3
22:16	0x0	XUSB_HOST_ASID_2: If translation enabled, ASID to use when va[33:32] = 0x2
14:8	0x0	XUSB_HOST_ASID_1: If translation enabled, ASID to use when va[33:32] = 0x1
6:0	0x0	XUSB_HOST_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.85 MC_SMMU_XUSB_DEV_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU XUSB_DEV ASID Assignment Register

Offset: 0x28c | Read/Write: R/W | Reset: 0x00000000 (0b00000000x0000000x0000000x0000000)

Bit	Reset	Description
31	DISABLE	XUSB_DEV_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
30:24	0x0	XUSB_DEV_ASID_3: If translation enabled, ASID to use when va[33:32] = 0x3
22:16	0x0	XUSB_DEV_ASID_2: If translation enabled, ASID to use when va[33:32] = 0x2
14:8	0x0	XUSB_DEV_ASID_1: If translation enabled, ASID to use when va[33:32] = 0x1
6:0	0x0	XUSB_DEV_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.86 MC_SMMU_TSEC_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU TSEC ASID Assignment Register

Offset: 0x294 | Read/Write: R/W | Reset: 0x00000000 (0b00000000x0000000x0000000x0000000)

Bit	Reset	Description
31	DISABLE	TSEC_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
30:24	0x0	TSEC_ASID_3: If translation enabled, ASID to use when va[33:32] = 0x3
22:16	0x0	TSEC_ASID_2: If translation enabled, ASID to use when va[33:32] = 0x2
14:8	0x0	TSEC_ASID_1: If translation enabled, ASID to use when va[33:32] = 0x1
6:0	0x0	TSEC_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.87 MC_SMMU_PPCS1_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU PPCS1ASID Assignment Register

Offset: 0x298 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	PPCS1_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	PPCS1_ASID: If translation enabled, ASID to use when va[33:32] = 0x0

18.11.1.88 MC_VIDEO_PROTECT_VPR_OVERRIDE_0

MC VPR OVERRIDE Register

Offset: 0x418 | Read/Write: R/W | Reset: 0xe4bac343 (0b111xx1xx1011101x11xx0x1101xx0011)

18.11.1.90 MC_SMMU_TLB_SET_SELECTION_MASK_0_0

TLB Set Selection Mask (Bit 0)

Mask is ANDed with the Virtual Address, and the resulting value is XORed to a single bit. That bit selects either set0 or set1.

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

Offset: 0x600 | Read/Write: R/W | Reset: 0x00008000 (0bxxxxxxxx000000001xxxxxxxxxxxxxxx)

Bit	Reset	Description
23:15	0x1	TLB_SET_SELECTION_MASK_0

18.11.1.91 MC_DISPLAY_SNAP_RING_0

Display Arbiter Ring Selection

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

Offset: 0x608 | Read/Write: R/W | Reset: 0x00000003 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx11)

Bit	Reset	Description
31	ENABLED	DISPLAY_SNAP_RING_WRITE_ACCESS : 0 = ENABLED 1 = DISABLED
1	RING1	DISB_SNAP_RING : 0 = RING0 1 = RING1
0	RING1	DIS_SNAP_RING : 0 = RING0 1 = RING1

18.11.1.92 MC_ERR_VPR_STATUS_0

Offset: 0x654 | Read/Write: RO | Reset: 0x00XXX0XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
21:20	X	ERR_VPR_ADR_HI: Higher address bits of erring address whose lower bits are available in the ERR_VPR_ADR register
18	X	ERR_VPR_SWAP
17	X	ERR_VPR_SECURITY: Set if transaction was secure. 0 = NONSECURE 1 = SECURE
16	X	ERR_VPR_RW: Direction of the access that caused the error. 0 = READ 1 = WRITE
14:12	X	ERR_VPR_ADR1: Second subpartition unique address bits
7:0	X	ERR_VPR_ID: Client identifier (see above list) of the access that caused the error.

18.11.1.93 MC_ERR_VPR_ADR_0

Offset: 0x658 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	ERR_VPR_ADR

18.11.1.94 MC_IRAM_REG_CTRL_0

Access control register for IRAM aperture programming. This bit is "sticky." Registers are writeable by default.

Once write access is disabled, it cannot be re-enabled without a system reset

The following registers are controlled by this field:

- IRAM_BOM
- IRAM_TOM

Offset: 0x964 I Read/Write: R/W I Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	ENABLED	IRAM_CFG_WRITE_ACCESS: 0 = ENABLED 1 = DISABLED

18.11.1.95 MC_EMEM_CFG_ACCESS_CTRL_0

Access Control Bit for EMEM_CFG Registers

This bit is "sticky." Registers are writeable by default. Once write access is disabled, it cannot be re-enabled without a system reset.

The following registers are controlled by this register:

- EMEM_CFG
- EMEM_ADR_CFG
- EMEM_ADR_CFG_DEV0
- EMEM_ADR_CFG_DEV1
- EMEM_ADR_CFG_CHANNEL_MASK
- EMEM_ADR_CFG_BANK_MASK_0
- EMEM_ADR_CFG_BANK_MASK_1

- EMEM_ADR_CFG_BANK_MASK_2
- EMEM_BANK_SWIZZLE_CFG0
- EMEM_BANK_SWIZZLE_CFG1
- EMEM_BANK_SWIZZLE_CFG2
- EMEM_BANK_SWIZZLE_CFG3

Offset: 0x664 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	ENABLED	EMEM_CFG_WRITE_ACCESS: 0 = ENABLED 1 = DISABLED

18.11.1.96 MC_TZ_SECURITY_CTRL_0

Trustzone Security Control Register

Controls "Strict"ness of TrustZone security check.

This register is "sticky" - once the strict check is enabled, it cannot be disabled without a reset.

Offset: 0x668 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	DISABLED	CPU_STRICT_TZ_APERTURE_CHECK: When this bit is set to ENABLED, the TrustZone security check requires that the CPU's security state bit exactly match the aperture. That is, when the CPU sets the NS bit to 0, it can ONLY access the TrustZone secured aperture. When the NS bit is 1, the CPU may NOT access the TrustZone secured aperture. Any violation causes a security violation to be flagged. When this bit is set to DISABLED, the security check is relaxed. In this mode, the CPU can access memory outside of the TrustZone secured aperture even though the NS bit is set to 0 (that is, even though the CPU is in secure mode). The above description only applies to the CPU complex clients (read and write). Other clients operate in the relaxed mode. 0 = DISABLED 1 = ENABLED

18.11.1.97 MC_EMEM_ARB_OUTSTANDING_REQ_RING3_0

External Memory Arbitration Configuration: Highest Ring Outstanding Request Limiter

> ***Note:*** *Although called ring3, this register works on the highest ring.*

This register is used to limit the number of outstanding requests in the arbiter and monitor the count. If the outstanding transactions are greater than the maximum, the highest ring requests are throttled based on the MC_EMEM_ARB_RING3_THROTTLE_0 register.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During the Boot ROM section of warm boot, this register can be derived from other MC settings.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers.*

Offset: 0x66c | Read/Write: R/W | Reset: 0x8XXX0080 (0b10xxxxxxxxxxxxxxxxxxxxx010000000)

Bit	R/W	Reset	Description
31	RW	ENABLE	LIMIT_OUTSTANDING_RING3: When ENABLED, requests into ring3 are throttled after the request count reaches ARB_MAX_OUTSTANDING_RING3. 0 = DISABLE 1 = ENABLE
30	RW	DISABLE	LIMIT_DURING_HOLDOFF_OVERRIDE_RING3: When DISABLED, overrides the limiting of ring3 transactions during holdoff to let requests flow freely. 0 = DISABLE 1 = ENABLE
24:16	RO	X	ARB_OUTSTANDING_COUNT_RING3: Current number of outstanding requests
8:0	RW	0x80	ARB_MAX_OUTSTANDING_RING3: The maximum number of requests allowed in the arbiter when LIMIT_OUTSTANDING is set to ENABLE

18.11.1.98 MC_SEC_CARVEOUT_BOM_0

Offset: 0x670 | Read/Write: R/W | Reset: 0xfff00000 (0b111111111111xxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:20	0xfff	SEC_CARVEOUT_BOM: [PMC_SECURE] Base address for the SEC carveout address space.

18.11.1.99 MC_SEC_CARVEOUT_SIZE_MB_0

Offset: 0x674 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	SEC_CARVEOUT_SIZE_MB: [PMC_SECURE] SEC_CARVEOUT_SIZE_MB is the size, in megabytes, of the SEC carveout region. If set to 0, the security check in MC is disabled.

18.11.1.100 MC_SEC_CARVEOUT_REG_CTRL_0

Offset: 0x678 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	ENABLED	SEC_CARVEOUT_WRITE_ACCESS: [PMC_SECURE] Sticky bit to control the writes to the other Sec Carveout aperture registers. 0 = ENABLED 1 = DISABLED

18.11.1.101 MC_ERR_SEC_STATUS_0

Offset: 0x67c | Read/Write: RO | Reset: 0x00XXX0XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
21:20	X	ERR_SEC_ADR_HI: Higher address bits of erring address whose lower bits are available in the ERR_ADR register
18	X	ERR_SEC_SWAP
17	X	ERR_SEC_SECURITY: Set if the transaction was secure. 0 = NONSECURE 1 = SECURE
16	X	ERR_SEC_RW: Direction of the access that caused the error. 0 = READ 1 = WRITE
14:12	X	ERR_SEC_ADR1: Second subpartition unique address bits.
6:0	X	ERR_SEC_ID: Client identifier (see above list) of the access that caused the error.

18.11.1.102 MC_ERR_SEC_ADR_0

Offset: 0x680 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	ERR_SEC_ADR

18.11.1.103 MC_PC_IDLE_CLOCK_GATE_CONFIG_0

Partition Idle Clock Gate Config

Boot requirements:

This register should be saved in the SDRAM and restored by the OS during warm boot.

Offset: 0x684 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	CLOCK_GATE_IDLE_TICKS: Number of idle "ticks" before a partition client is clock-gated

18.11.1.104 MC_STUTTER_CONTROL_0

Offset: 0x688 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	SLOW_EMCCLK_DURING_DSR: When ENABLED, the clock to the EMC will be slowed during dynamic self refresh. 0 = DISABLED 1 = ENABLED

18.11.1.105 MC_EMEM_ARB_NISO_THROTTLE_0

External Memory Arbitration Configuration: Snap Arbiter Throttle

Highest Ring Snap Arbiter Input Throttle - This register applies to the inputs of the highest ring. Refer to the EMEM_ARB_NISO_THROTTLE_MASK register to see how partition clients are configured into the "NISO meta-client" group for the purpose of NISO client throttling.

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

Offset: 0x6b0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000xxxxxxxxxxx00000)

Bit	Reset	Description
20:16	0x0	NISO_THROTTLE_CYCLES_HIGH: Cycles of throttle after each request when the outstanding transaction count is greater than or equal to the threshold.
4:0	0x0	NISO_THROTTLE_CYCLES: Cycles of throttle after each request.

18.11.1.106 MC_EMEM_ARB_OUTSTANDING_REQ_NISO_0

External Memory Arbitration Configuration: Highest Ring Input NISO Outstanding Request Limiter

Although called NISO, this register applies to the inputs of the highest snap-arbiter ring. Refer to the EMEM_ARB_NISO_THROTTLE_MASK register to see how partition clients are configured into the "NISO meta-client" group for the purpose of NISO client throttling.

This register can be used to limit the number of outstanding requests in the arbiter and monitor the count. If the outstanding transactions are greater than the maximum, the highest ring requests are throttled based on the MC_EMEM_ARB_NISO_THROTTLE register.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During the Boot ROM section of warm boot, this register may be derived from other MC settings.

This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

Offset: 0x6b4 | Read/Write: R/W | Reset: 0x8XXX0080 (0b10xxxxxxxxxxxxxxxxxxxx010000000)

Bit	R/W	Reset	Description
31	RW	ENABLE	LIMIT_OUTSTANDING_NISO: When ENABLED, requests into NISO are throttled after the request count reaches ARB_MAX_OUTSTANDING_NISO. 0 = DISABLE 1 = ENABLE
30	RW	DISABLE	LIMIT_DURING_HOLDOFF_OVERRIDE_NISO: When DISABLED, overrides the limiting of NISO transactions during holdoff to let requests flow freely. 0 = DISABLE 1 = ENABLE
24:16	RO	X	ARB_OUTSTANDING_COUNT_NISO: Current number of outstanding requests.
8:0	RW	0x80	ARB_MAX_OUTSTANDING_NISO: The maximum number of requests allowed in the arbiter when LIMIT_OUTSTANDING is set to ENABLE.

18.11.1.107 MC_EMEM_ARB_NISO_THROTTLE_MASK_0

External Memory Arbitration Configuration: Highest Ring Input NISO Throttle Mask

This register is used to group partition clients in the highest level snap-arbiter ring into a "NISO meta-client" group for the purpose of throttling. This allows soft-ISO clients in this ring to meet their bandwidth needs.

To prevent non-ISO (NISO) clients from filling the MC row-sorter (which could prevent soft-ISO clients from getting bandwidth), selective throttling is implemented at the input of ring2. To do this, the EMEM_ARB_NISO_THROTTLE_MASK register is used to specify which partition clients get included into a "NISO meta-client" group. To implement throttling, a total number of outstanding transactions counter (for example, only one counter exists in the whole "NV_MC_cif" to track this, and is shared by all throttling circuits) gets compared to a programmable maximum limit for this NISO meta-client group. If the number is greater than the maximum limit, all clients included in the "NISO meta-client" group get throttled based on the EMEM_ARB_NISO_THROTTLE register. This NISO_THROTTLE register is used to specify a number of stall cycles that get inserted at the input to the ring after every request from any of the clients included in the NISO group.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0x6b8 | Read/Write: R/W | Reset: 0x00000000 (0bxx000xxx00xx0x0xxxxxxx0x0xxx000x)

Bit	Reset	Description

2	DISABLE	RING0_THROTTLE_MASK_PTC: If enabled, include ptc in the ring0 meta-client group for throttling. 0 = DISABLE 1 = ENABLE
0	ENABLE	RING0_THROTTLE_MASK_MPCORER: If enabled, include mpcorer in the ring0 meta-client group for throttling. 0 = DISABLE 1 = ENABLE

18.11.1.109 MC_EMEM_ARB_TIMING_RFCPB_0

External Memory Arbitration Configuration: DRAM Timing : tRFCPB

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.
- This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

Offset: 0x6c0 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxx001111111)

Bit	Reset	Description
8:0	0x7f	RFCPB: [PMC] specifies the per-bank auto refresh cycle time. This is the minimum number of cycles between a per-bank auto refresh command and a subsequent per-bank refresh (any bank) or activate command to that bank. Program to ceil(EMC.RFC_0_RFCPB/DIV)

18.11.1.110 MC_EMEM_ARB_TIMING_CCDMW_0

External Memory Arbitration Configuration: DRAM Timing : tCCDMW

> ***Note:*** *Although this chapter makes references to other DRAM types (such as DDR3L) only LPDDR3 and LPDDR4 memory types are officially supported and tested by NVIDIA. Other memory types should not be considered without first consulting NVIDIA to assess feasibility.*

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.
- This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

Offset: 0x6c4 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000001)

Bit	Reset	Description
5:0	0x1	CCDMW: [PMC] This field supports LPDDR4 DRAMs. It specifies the DRAM CAS to CAS delay timing when the current command is any type of write and the next command is a masked write to the same bank. If the DRAM type does not specify a timing parameter for tCCDMW (as in type DDR3L or LPDDR3), then set this field to tCCD timing (i.e., tCCD = 8 tCK at BL=16). Program to ceil(EMC.CCDMW/DIV)-1+SFA.

18.11.1.111 MC_EMEM_ARB_REFPB_HP_CTRL_0

External Memory Arbitration Configuration: REFPB - Per Bank Refresh High Priority control

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.
- This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

Offset: 0x6f0 | Read/Write: R/W | Reset: 0x000a1020 (0bxxxxxxxxxx0001010x0010000x0100000)

Bit	Reset	Description
22:16	0xa	REFPB_OPEN_WORK_THRESH: [PMC] If the number of requests to open pages is greater than or equal to this value, a per-bank refresh is favored to be issued in lieu of an activate on the refresh bank as long as the activate is not for a high-priority expired request.
14:8	0x10	REFPB_THRESH_DISABLE_HP: [PMC] Per-bank refreshes become low-priority when the number of pending REFpb requests are less than or equal to this value.
6:0	0x20	REFPB_THRESH_ENABLE_HP: [PMC] Per-bank refreshes become high-priority when the number of pending REFpb requests are greater than or equal to this value.

18.11.1.112 MC_EMEM_ARB_REFPB_BANK_CTRL_0

External Memory Arbitration Configuration: REFPB - Bank control

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.
- This register is shadowed: see usage note at the top of *Section 18.11.1: MC Registers*.

Offset: 0x6f4 | Read/Write: R/W | Reset: 0x00002636 (0b0xxxxxxxxxxxxxxxx0100110x0110110)

Bit	Reset	Description
31	0x0	REFPB_EXPLICIT_BANK_MODE: [PMC] When set, REFpb cannot be issued simultaneously to more than one rank (i.e., device) of DRAM unless the next bank to be refreshed for both ranks are coincidentally the same (i.e., this is required for LPDDR4 support).
14:8	0x26	REFPB_THRESH_DISABLE_FORCE_CLOSE: [PMC] Per-bank refreshes will force bank closure when the number of pending REFpb requests are less than or equal to this value.
6:0	0x36	REFPB_THRESH_ENABLE_FORCE_CLOSE: [PMC] Per-bank refreshes will force bank closure when the number of pending REFpb requests are greater than or equal to this value.

18.11.1.113 MC_EMEM_ARB_OVERRIDE_1_0

Boot requirements:

- Some fields of register should be saved in the scratch registers and restored by the Boot ROM during warm boot.
- This security configuration register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0x968 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000xxxxx000000)

18.11.1.114 MC_CLIENT_HOTRESET_CTRL_1_0

Memory Client Hot Reset Control Register

Writing FLUSH_ENABLE to a bit in this register causes a flush to be performed on all clients for the selected swname. The status of the flush (done/in progress) can be monitored in the CLIENT_HOTRESET_STATUS register.

A proper client reset sequence is as follows:

- Set the appropriate FLUSH_ENABLE bit in the CLIENT_HOTRESET_CTRL register to block further access by the client, and start the flush process.
- Poll the CLIENT_HOTRESET_STATUS register until the appropriate bit returns FLUSH_DONE.
- Clear module bit in the CLK_RST_CONTROLLER_RST_DEVICES_* register to reset the module.
- Set module bit in the CLK_RST_CONTROLLER_RST_DEVICES_* register to release the module reset.
- Clear the appropriate FLUSH_ENABLE bit in the CLIENT_HOTRESET_CTRL register to allow transactions to flow.

Offset: 0x970 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxx000xx0000xx000)

Bit	Reset	Description
13	DISABLE	TSECB_FLUSH_ENABLE: 0 = DISABLE 1 = ENABLE 0 = DISABLED 1 = ENABLED

31	DISABLE	SDMMC1A_SMMU_ENABLE: If set, translation is enabled for this client. 0 = DISABLE 1 = ENABLE
30:24	0x0	SDMMC1A_ASID_3: If translation enabled, ASID to use when va[33:32] = 0x3
22:16	0x0	SDMMC1A_ASID_2: If translation enabled, ASID to use when va[33:32] = 0x2
14:8	0x0	SDMMC1A_ASID_1: If translation enabled, ASID to use when va[33:32] = 0x1
6:0	0x0	SDMMC1A_ASID: If translation enabled, ASID to use when va[33:32] = 0x0.

18.11.1.131 MC_SMMU_SDMMC2A_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

SMMU SDMMC2A ASID Assignment Register

Offset: 0xa98 | Read/Write: R/W | Reset: 0x00000000 (0b00000000x0000000x0000000x0000000)

Bit	Reset	Description

18.11.1.150 MC_EMEM_ARB_NISO_THROTTLE_MASK_1_0

External Memory Arbitration Configuration: Highest Ring Input NISO Throttle Mask

This register is used to group partition clients in the highest level snap-arbiter ring into a "NISO meta-client" group for the purpose of throttling. This is to allow soft-ISO clients in this ring to meet their bandwidth needs.

To prevent non-ISO (NISO) clients from filling the MC row-sorter (which could prevent soft-ISO clients from getting bandwidth), NVIDIA has implemented selective throttling at the input of ring2. To do this, the EMEM_ARB_NISO_THROTTLE_MASK register is used to specify which partition clients get included into a "NISO meta-client" group. To implement throttling, a total number of outstanding transactions counter (e.g., only one counter exists in the whole "NV_MC_cif" to track this, and is shared by all throttling circuits) gets compared to a programmable maximum limit for this NISO meta-client group. If the number is greater than the maximum limit, then all clients included in the "NISO meta-client" group get throttled based on the EMEM_ARB_NISO_THROTTLE priv register. This NISO_THROTTLE priv register is used to specify some number of stall cycles that get inserted at the input to the ring after every request from any of the clients included in the NISO group.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xb80 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000x)

Bit	Reset	Description

18.11.1.152 MC_EMEM_ARB_ISOCHRONOUS_4_0

Per-client isochronous settings

Controls whether a client is considered to be an isochronous client for EMEM arbitration. If a client is configured to be isochronous, the arbiter will favor expired isochronous requests over requests of any other type. This applies to arbitration for: best-bank arbiter (BA), activation arbiter (AA), direction arbiter (DA), and transaction arbiter (TA).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xb94 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000000000)

Bit	Reset	Description
9	DISABLE	ISO_GPUSWR2: client gpuswr2 is treated as an isochronous client 0 = DISABLE 1 = ENABLE
8	DISABLE	ISO_GPUSRD2: client gpusrd2 is treated as an isochronous client 0 = DISABLE 1 = ENABLE
7	DISABLE	ISO_TSECSWRB: client tsecswrb is treated as an isochronous client 0 = DISABLE 1 = ENABLE
6	DISABLE	ISO_TSECSRDB: client tsecsrdb is treated as an isochronous client 0 = DISABLE 1 = ENABLE
5	DISABLE	ISO_ETRW: client etrw is treated as an isochronous client 0 = DISABLE 1 = ENABLE
4	DISABLE	ISO_ETRR: client etrr is treated as an isochronous client 0 = DISABLE 1 = ENABLE
3	DISABLE	ISO_AXIAPW: client axiapw is treated as an isochronous client 0 = DISABLE 1 = ENABLE
2	DISABLE	ISO_AXIAPR: client axiapr is treated as an isochronous client 0 = DISABLE 1 = ENABLE
1	DISABLE	ISO_SESWR: client seswr is treated as an isochronous client 0 = DISABLE 1 = ENABLE
0	DISABLE	ISO_SESRD: client sesrd is treated as an isochronous client 0 = DISABLE 1 = ENABLE

18.11.1.153 MC_SMMU_TRANSLATION_ENABLE_4_0

Per-client SMMU translation enables. Used in addition to the global (MC_SMMU_CONFIG.SMMU_ENABLE) and per-module (MC_SMMU_*_ASID.*_SMMU_ENABLE) enables.

Access to this register is restricted to TrustZone-secured requestors.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xb98 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000Xff (0bxxxxxxxxxxxxxxxxxxxxxxxxxx11111111)

Bit	R/W	Reset	Description
9	RO	X	SMMU_GPUSWR2_ENABLE: GPU translation is handled by swid, so this is required to be enabled 0 = DISABLE 1 = ENABLE
8	RO	X	SMMU_GPUSRD2_ENABLE: GPU translation is handled by swid, so this is required to be enabled 0 = DISABLE 1 = ENABLE

18.11.1.154 MC_EMEM_ARB_DHYSTERESIS_0_0

Per-client dynamic hysteresis settings

Controls whether a client is considered to be a dynamic hysteresis client for EMEM arbitration.

If a client is NOT marked dynamic hysteresis, it will immediately cause the arbiter to turn off ts2aa_holdoff (see the comments for EMEM_ARB_OVERRIDE for further description of ts2aa_holdoff functionality).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbb0 | Read/Write: R/W | Reset: 0x10000000 (0b0001xxxx000xxx0000xxxxxxx0000000)

18.11.1.159 MC_EMEM_ARB_DHYST_CTRL_0

Control register for dynamic hysteresis logic (power saving feature)

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbcc | Read/Write: R/W | Reset: 0x00000002 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxx10)

Bit	Reset	Description
31	DISABLE	DHYST_ENABLE: The dynamic hysteresis logic will not be enabled unless this bit is set. When disabled, the dynamic hysteresis logic is forced quiescent (to save power) 0 = DISABLE 1 = ENABLE
1:0	0x2	DHYST_BW_MON_INTERVAL: Specifies the bandwidth monitor interval to be used for dynamic hysteresis. 0 = 8 mclk interval 1 = 16 mclk interval 2 = 32 mclk interval (default) 3 = 64 mclk interval In general, larger values of this interval should save more power, but at the potential cost of memory latency due to longer ts2aa_holdoff exit response time.

18.11.1.160 MC_EMEM_ARB_DHYST_TIMEOUT_UTIL_0_0

Controls the timeout delay (in mcclk's) for dynamic hysteresis holdoff when DRAM utilization is between 0% and 12.5%.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbd0 | Read/Write: R/W | Reset: 0x00000100 (0bxxxxxxxxxxxxxxxxxxxxxx000100000000)

Bit	Reset	Description
11:0	0x100	DHYST_DELAY_BIN_0

18.11.1.161 MC_EMEM_ARB_DHYST_TIMEOUT_UTIL_1_0

Controls the timeout delay (in mcclk's) for dynamic hysteresis holdoff when DRAM utilization is between 12.5% and 25%.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbd4 | Read/Write: R/W | Reset: 0x000000a0 (0bxxxxxxxxxxxxxxxxxxxxxx000010100000)

Bit	Reset	Description
11:0	0xa0	DHYST_DELAY_BIN_1

18.11.1.162 MC_EMEM_ARB_DHYST_TIMEOUT_UTIL_2_0

Controls the timeout delay (in mcclk's) for dynamic hysteresis holdoff when DRAM utilization is between 25% and 37.5%.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbd8 | Read/Write: R/W | Reset: 0x00000060 (0bxxxxxxxxxxxxxxxxxxxxxx000001100000)

Bit	Reset	Description
11:0	0x60	DHYST_DELAY_BIN_2

18.11.1.163 MC_EMEM_ARB_DHYST_TIMEOUT_UTIL_3_0

Controls the timeout delay (in mcclk's) for dynamic hysteresis holdoff when DRAM utilization is between 37.5% and 50%.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbdc | Read/Write: R/W | Reset: 0x00000034 (0bxxxxxxxxxxxxxxxxxxxxxx000000110100)

Bit	Reset	Description
11:0	0x34	DHYST_DELAY_BIN_3

18.11.1.164 MC_EMEM_ARB_DHYST_TIMEOUT_UTIL_4_0

Controls the timeout delay (in mcclk's) for dynamic hysteresis holdoff when DRAM utilization is between 50% and 62.5%.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbe0 | Read/Write: R/W | Reset: 0x00000018 (0bxxxxxxxxxxxxxxxxxxxxxx000000011000)

Bit	Reset	Description
11:0	0x18	DHYST_DELAY_BIN_4

18.11.1.165 MC_EMEM_ARB_DHYST_TIMEOUT_UTIL_5_0

Controls the timeout delay (in mcclk's) for dynamic hysteresis holdoff when DRAM utilization is between 62.5% and 75%.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbe4 | Read/Write: R/W | Reset: 0x0000000c (0bxxxxxxxxxxxxxxxxxxxxxx000000001100)

Bit	Reset	Description
11:0	0xc	DHYST_DELAY_BIN_5

18.11.1.166 MC_EMEM_ARB_DHYST_TIMEOUT_UTIL_6_0

Controls the timeout delay (in mcclk's) for dynamic hysteresis holdoff when DRAM utilization is between 75% and 87.5%.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbe8 | Read/Write: R/W | Reset: 0x00000004 (0bxxxxxxxxxxxxxxxxxxxxxx000000000100)

Bit	Reset	Description
11:0	0x4	DHYST_DELAY_BIN_6

18.11.1.167 MC_EMEM_ARB_DHYST_TIMEOUT_UTIL_7_0

Controls the timeout delay (in mcclk's) for dynamic hysteresis holdoff when DRAM utilization is between 87.5% and 100%.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xbec | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	DHYST_DELAY_BIN_7

18.11.1.168 MC_DA_CONFIG0_0

This register is used to select which scheme of arbitration the DA uses.

5:0	0x3f	PTSA_MIN_SDM

18.11.1.238 MC_APB_PTSA_RATE_0

DDA rate for APB PTSA

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x4e8 I Read/Write: R/W I Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	PTSA_RATE_APB

18.11.1.239 MC_MSE_PTSA_MIN_0

DDA minimum value for direct client mse PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x4c8 I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MIN_MSE

18.11.1.240 MC_HOST_PTSA_RATE_0

DDA rate for host PTSA

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x518 I Read/Write: R/W I Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	PTSA_RATE_HOST

18.11.1.241 MC_VE_PTSA_RATE_0

DDA rate for ve PTSA

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x434 I Read/Write: R/W I Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	PTSA_RATE_VE

18.11.1.242 MC_AHB_PTSA_MAX_0

DDA maximum value for direct client ahb PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x4e4 I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MAX_AHB

18.11.1.243 MC_SAX_PTSA_MIN_0

DDA minimum value for direct client sax PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x4bc I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MIN_SAX

18.11.1.244 MC_SMMU_SMMU_PTSA_MIN_0

DDA minimum value for direct client ptc PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x45c I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MIN_SMMU_SMMU

18.11.1.245 MC_ISP_PTSA_MIN_0

DDA minimum value for direct client isp PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x4a4 I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MIN_ISP

18.11.1.246 MC_HOST_PTSA_MAX_0

DDA maximum value for direct client host PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x520 I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MAX_HOST

18.11.1.247 MC_SAX_PTSA_MAX_0

DDA maximum value for direct client sax PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x4c0 I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MAX_SAX

18.11.1.248 MC_VE_PTSA_MIN_0

DDA minimum value for direct client ve PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x438 I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MIN_VE

18.11.1.249 MC_GK_PTSA_MIN_0

DDA minimum value for direct client gk PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x540 I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MIN_GK

18.11.1.250 MC_MSE_PTSA_MAX_0

DDA maximum value for direct client mse PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x4cc I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MAX_MSE

18.11.1.251 MC_DISB_PTSA_MAX_0

DDA maximum value for direct client disb PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x430 I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MAX_DISB

18.11.1.252 MC_DISB_PTSA_MIN_0

DDA minimum value for direct client disb PTSA.

Indicate negative values by their 2's complement.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x42c I Read/Write: R/W I Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	PTSA_MIN_DISB

18.11.1.253 MC_SMMU_SMMU_PTSA_RATE_0

DDA rate for ptc PTSA

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x458 I Read/Write: R/W I Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	PTSA_RATE_SMMU_SMMU

18.11.1.254 MC_VE2_PTSA_RATE_0

DDA rate for ve2 PTSA

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x494 I Read/Write: R/W I Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	PTSA_RATE_VE2

18.11.1.255 MC_GK_PTSA_RATE_0

DDA rate for gk PTSA

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x53c I Read/Write: R/W I Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	PTSA_RATE_GK

18.11.1.256 MC_PTSA_GRANT_DECREMENT_0

The amount that the PTSA DDAs will be decremented each cycle that there is a grant should be programmed to the fraction of total memory BW / maximum total memory BW

PTSA Grand Decrement

Boot requirements: This register should be saved in the SDRAM and restored by the OS during warmboot.

This register is shadowed: see usage note at top of *Section 18.11.1: MC Registers*.

Offset: 0x960 I Read/Write: R/W I Reset: 0x00001000 (0bxxxxxxxxxxxxxxxxxxxx1000000000000)

Bit	Reset	Description
12	0x1	PTSA_GRANT_DECREMENT_INT: integer portion (0 or 1)
11:0	0x0	PTSA_GRANT_DECREMENT_FRAC: fractional portion

18.11.1.257 MC_LATENCY_ALLOWANCE_AVPC_0_0

Latency allowance settings for AVPC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x2e4 I Read/Write: R/W I Reset: 0x00800004 (0bxxxxxxxx10000000xxxxxxxx00000100)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_AVPCARM7W
7:0	0x4	ALLOWANCE_AVPCARM7R

18.11.1.258 MC_LATENCY_ALLOWANCE_AXIAP_0_0

Latency allowance settings for AXIAP clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3a0 I Read/Write: R/W I Reset: 0x008000ff (0bxxxxxxxx10000000xxxxxxxx11111111)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_AXIAPW
7:0	0xff	ALLOWANCE_AXIAPR

18.11.1.259 MC_LATENCY_ALLOWANCE_XUSB_1_0

Latency allowance settings for XUSB_DEV clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x380 I Read/Write: R/W I Reset: 0x00800039 (0bxxxxxxxx10000000xxxxxxxx00111001)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_XUSB_DEVW
7:0	0x39	ALLOWANCE_XUSB_DEVR

18.11.1.260 MC_LATENCY_ALLOWANCE_ISP2B_0_0

Latency allowance settings for ISP2B clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x384 I Read/Write: R/W I Reset: 0x00000018 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00011000)

Bit	Reset	Description
7:0	0x18	ALLOWANCE_ISPRAB

18.11.1.261 MC_LATENCY_ALLOWANCE_SDMMCAA_0_0

Latency allowance settings for SDMMC2A clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3bc I Read/Write: R/W I Reset: 0x0080005a (0bxxxxxxxx10000000xxxxxxxx01011010)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_SDMMCWAA
7:0	0x5a	ALLOWANCE_SDMMCRAA

18.11.1.262 MC_LATENCY_ALLOWANCE_SDMMCA_0_0

Latency allowance settings for SDMMC1A clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3b8 I Read/Write: R/W I Reset: 0x00800049 (0bxxxxxxxx10000000xxxxxxxx01001001)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_SDMMCWA
7:0	0x49	ALLOWANCE_SDMMCRA

18.11.1.263 MC_LATENCY_ALLOWANCE_ISP2_0_0

Latency allowance settings for ISP2 clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x370 I Read/Write: R/W I Reset: 0x00000018 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00011000)

Bit	Reset	Description
7:0	0x18	ALLOWANCE_ISPRA

18.11.1.264 MC_LATENCY_ALLOWANCE_SE_0_0

Latency allowance settings for SE clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3e0 I Read/Write: R/W I Reset: 0x0080002e (0bxxxxxxxx10000000xxxxxxxx00101110)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_SESWR
7:0	0x2e	ALLOWANCE_SESRD

18.11.1.265 MC_LATENCY_ALLOWANCE_ISP2_1_0

Latency allowance settings for ISP2 clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x374 I Read/Write: R/W I Reset: 0x00800080 (0bxxxxxxxx10000000xxxxxxxx10000000)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_ISPWB
7:0	0x80	ALLOWANCE_ISPWA

18.11.1.266 MC_LATENCY_ALLOWANCE_DC_0_0

Latency allowance settings for DC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x2e8 I Read/Write: R/W I Reset: 0x001e001e (0bxxxxxxxx00011110xxxxxxxx00011110)

Bit	Reset	Description
23:16	0x1e	ALLOWANCE_DISPLAY0B
7:0	0x1e	ALLOWANCE_DISPLAY0A

18.11.1.267 MC_LATENCY_ALLOWANCE_VIC_0_0

Latency allowance settings for VIC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x394 I Read/Write: R/W I Reset: 0x0080001a (0bxxxxxxxx10000000xxxxxxxx00011010)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_VICSWR
7:0	0x1a	ALLOWANCE_VICSRD

18.11.1.268 MC_LATENCY_ALLOWANCE_DCB_1_0

Latency allowance settings for DCB clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x2f8 I Read/Write: R/W I Reset: 0x0000001e (0bxxxxxxxxxxxxxxxxxxxxxxxxxx00011110)

Bit	Reset	Description
7:0	0x1e	ALLOWANCE_DISPLAY0CB

18.11.1.269 MC_LATENCY_ALLOWANCE_NVDEC_0_0

Latency allowance settings for NVDEC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3d8 I Read/Write: R/W I Reset: 0x00800023 (0bxxxxxxxx10000000xxxxxxxx00100011)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_NVDECSWR
7:0	0x23	ALLOWANCE_NVDECSRD

18.11.1.270 MC_LATENCY_ALLOWANCE_DCB_2_0

Latency allowance settings for DCB clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'.

This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x2fc I Read/Write: R/W I Reset: 0x0000001e (0bxxxxxxxxxxxxxxxxxxxxxxxxxx00011110)

Bit	Reset	Description
7:0	0x1e	ALLOWANCE_DISPLAYHCB

18.11.1.271 MC_LATENCY_ALLOWANCE_TSEC_0_0

Latency allowance settings for TSEC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x390 I Read/Write: R/W I Reset: 0x0080009b (0bxxxxxxxx10000000xxxxxxxx10011011)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_TSECSWR
7:0	0x9b	ALLOWANCE_TSECSRD

18.11.1.272 MC_LATENCY_ALLOWANCE_DC_2_0

Latency allowance settings for DC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x2f0 I Read/Write: R/W I Reset: 0x001e001e (0bxxxxxxxx00011110xxxxxxxx00011110)

Bit	Reset	Description
23:16	0x1e	ALLOWANCE_DISPLAYT
7:0	0x1e	ALLOWANCE_DISPLAYHC

18.11.1.273 MC_SCALED_LATENCY_ALLOWANCE_DISPLAY0AB_0

Scaled Latency Allowance settings for DISPLAY0AB

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x694 I Read/Write: R/W I Reset: 0x001e001e (0bxxxxxxxx00011110xxxxxxxx00011110)

Bit	Reset	Description
23:16	0x1e	SCALED_2_ALLOWANCE_HI_DISPLAY0AB
7:0	0x1e	SCALED_2_ALLOWANCE_LO_DISPLAY0AB

18.11.1.274 MC_LATENCY_ALLOWANCE_PPCS_1_0

Latency allowance settings for PPCS clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x348 I Read/Write: R/W I Reset: 0x00800080 (0bxxxxxxxx10000000xxxxxxxx10000000)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_PPCSAHBSLVW

Scaled Latency Allowance settings for DISPLAY0C

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x6a0 I Read/Write: R/W I Reset: 0x001e001e (0bxxxxxxxx00011110xxxxxxxx00011110)

Bit	Reset	Description
23:16	0x1e	SCALED_2_ALLOWANCE_HI_DISPLAY0C
7:0	0x1e	SCALED_2_ALLOWANCE_LO_DISPLAY0C

18.11.1.283 MC_LATENCY_ALLOWANCE_A9AVP_0_0

Latency allowance settings for A9AVP clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3a4 I Read/Write: R/W I Reset: 0x00800004 (0bxxxxxxxx10000000xxxxxxxx00000100)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_A9AVPSCW
7:0	0x4	ALLOWANCE_A9AVPSCR

18.11.1.284 MC_LATENCY_ALLOWANCE_GPU2_0_0

Latency allowance settings for GPU clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'.This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3e8 I Read/Write: R/W I Reset: 0x0080001a (0bxxxxxxxx10000000xxxxxxxx00011010)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_GPUSWR2
7:0	0x1a	ALLOWANCE_GPUSRD2

18.11.1.285 MC_LATENCY_ALLOWANCE_DCB_0_0

Latency allowance settings for DCB clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x2f4 I Read/Write: R/W I Reset: 0x001e001e (0bxxxxxxxx00011110xxxxxxxx00011110)

Bit	Reset	Description
23:16	0x1e	ALLOWANCE_DISPLAY0BB
7:0	0x1e	ALLOWANCE_DISPLAY0AB

18.11.1.286 MC_LATENCY_ALLOWANCE_HC_1_0

Latency allowance settings for HC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x314 I Read/Write: R/W I Reset: 0x00000080 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx10000000)

Bit	Reset	Description
7:0	0x80	ALLOWANCE_HOST1XW

18.11.1.287 MC_LATENCY_ALLOWANCE_SDMMC_0_0

Latency allowance settings for SDMMC3A clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3c0 I Read/Write: R/W I Reset: 0x00800049 (0bxxxxxxxx10000000xxxxxxxx01001001)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_SDMMCW
7:0	0x49	ALLOWANCE_SDMMCR

18.11.1.288 MC_LATENCY_ALLOWANCE_NVJPG_0_0

Latency allowance settings for NVJPG clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3e4 I Read/Write: R/W I Reset: 0x00800023 (0bxxxxxxxx10000000xxxxxxxx00100011)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_NVJPGSWR
7:0	0x23	ALLOWANCE_NVJPGSRD

18.11.1.289 MC_LATENCY_ALLOWANCE_PTC_0_0

Latency allowance settings for PTC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

18.11.1.295 MC_LATENCY_ALLOWANCE_SATA_0_0

Latency allowance settings for SATA clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x350 I Read/Write: R/W I Reset: 0x00800065 (0bxxxxxxxx10000000xxxxxxxx01100101)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_SATAW
7:0	0x65	ALLOWANCE_SATAR

18.11.1.296 MC_SCALED_LATENCY_ALLOWANCE_DISPLAY0A_0

Scaled Latency Allowance settings for DISPLAY0A

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x690 I Read/Write: R/W I Reset: 0x001e001e (0bxxxxxxxxx00011110xxxxxxxx00011110)

Bit	Reset	Description
23:16	0x1e	SCALED_2_ALLOWANCE_HI_DISPLAY0A
7:0	0x1e	SCALED_2_ALLOWANCE_LO_DISPLAY0A

18.11.1.297 MC_LATENCY_ALLOWANCE_HC_0_0

Latency allowance settings for HC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x310 I Read/Write: R/W I Reset: 0x0050001e (0bxxxxxxxx01010000xxxxxxxx00011110)

Bit	Reset	Description
23:16	0x50	ALLOWANCE_HOST1XR
7:0	0x1e	ALLOWANCE_HOST1XDMAR

18.11.1.298 MC_LATENCY_ALLOWANCE_DC_3_0

Latency allowance settings for DC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3c8 I Read/Write: R/W I Reset: 0x0000001e (0bxxxxxxxxxxxxxxxxxxxxxxxxxx00011110)

Bit	Reset	Description
7:0	0x1e	ALLOWANCE_DISPLAYD

18.11.1.299 MC_LATENCY_ALLOWANCE_GPU_0_0

Latency allowance settings for GPU clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3ac I Read/Write: R/W I Reset: 0x0080001a (0bxxxxxxxx10000000xxxxxxxx00011010)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_GPUSWR
7:0	0x1a	ALLOWANCE_GPUSRD

18.11.1.300 MC_LATENCY_ALLOWANCE_SDMMCAB_0_0

Latency allowance settings for SDMMC4A clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'. This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x3c4 I Read/Write: R/W I Reset: 0x0080005a (0bxxxxxxxx10000000xxxxxxxx01011010)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_SDMMCWAB

Bit	Reset	Description
23:16	0x80	ALLOWANCE_ISPWBB
7:0	0x80	ALLOWANCE_ISPWAB

18.11.1.302 MC_LATENCY_ALLOWANCE_NVENC_0_0

Latency allowance settings for NVENC clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'.This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x328 I Read/Write: R/W I Reset: 0x00800023 (0bxxxxxxxx10000000xxxxxxxx00100011)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_NVENCSWR
7:0	0x23	ALLOWANCE_NVENCSRD

18.11.1.303 MC_LATENCY_ALLOWANCE_HDA_0_0

Latency allowance settings for HDA clients

The number of ticks a request from a particular client may wait in the EMEM arbiter before it becomes a high-priority request. See EMEM_ARB_CFG for definition of the units 'ticks'.This value should be set with consideration for the module's latency tolerance and internal buffering capabilities.

Boot requirements: This register should be saved to SDRAM and restored by the OS during warmboot.

Offset: 0x318 I Read/Write: R/W I Reset: 0x00800024 (0bxxxxxxxx10000000xxxxxxxx00100100)

Bit	Reset	Description
23:16	0x80	ALLOWANCE_HDAW
7:0	0x24	ALLOWANCE_HDAR

18.11.2 EMC Registers

USAGE NOTE: Many EMC register fields are shadowed:

- Writes to shadowed register fields update the shadow copy (this is default, assumes DBG.WRITE_MUX==ASSEMBLY).
- Reads to shadowed register fields return the active copy (this is default, assumes DBG.READ_MUX==ACTIVE).

This allows a new set of frequency-dependent timing parameters to be written to the shadow registers while memory traffic is ongoing, then when the parameters are completely written, the EMC hardware can perform a timing-safe switch.

Such switches can be triggered via two methods: TIMING_CONTROL.TIMING_UPDATE (generally used during initialization), or the automatic CAR/EMC handshake on a clock-frequency or divider change (assuming CFG_2.CLKCHANGE_REQ_ENABLE==ENABLED).

Registers that are shadowed are marked by a comment:

> ***Note:*** *This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.*

Occasionally, only certain fields in the register will be shadowed; if so they are noted after the above comment.

USAGE NOTE: Many EMC registers play crucial roles in warm boot (also known as "wake from LP0") and cold boot (also known as "power up") sequences. Suggested actions for the Boot ROM/Boot Loader are noted after "Boot requirements:".

USAGE NOTE: The EMC register fields to be stored in the PMC must have "[PMC]", "[PMC2]", or "[PMC3]".in their comments. ([PMC2] registers are packed/unpacked after [PMC] register group in software code. [PMC3] is even later.) The fields that need to be stored in PMC Secure Scratch registers must have [PMC_SECURE] in their comments.

USAGE NOTE: When writing to a register, any bits that are not intended to be modified should be rewritten with their existing values.

USAGE NOTE: Unspecified bits may not appear in tables and should be written with their Reset values.

18.11.2.1 EMC_INTSTATUS_0

Interrupt Status Register

Clear on 1-write. Init value is clear. This register is “sticky”.

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000000xxx)

Bit	Reset	Description
9	CLEAR	DLL_LOCK_TIMEOUT_INT: Indicates a DLL lock timeout has occurred. In dual channel COMBINED_INTERRUPT_MODE, this is the OR of the two channels interrupt. 0 = CLEAR 1 = SET
8	CLEAR	CCFIFO_OVERFLOW_INT: Clock change FIFO overflow. In dual channel COMBINED_INTERRUPT_MODE, this is the OR of the two channels interrupt. 0 = CLEAR 1 = SET
7	CLEAR	DLL_ALARM_INT: Indicates a DLL alarm has been set. In dual channel COMBINED_INTERRUPT_MODE, this is the OR of the two channels interrupt. 0 = CLEAR 1 = SET
6	CLEAR	ACCESS_TO_SR_DPD_DEV_INT: Indicates a system attempt to access a self-refresh/deep-powered-down device. In dual channel COMBINED_INTERRUPT_MODE, this is the OR of the two channels interrupt. 0 = CLEAR 1 = SET
5	CLEAR	MRR_DIVLD_INT: MRR data is available to be read. In dual channel COMBINED_INTERRUPT_MODE, this is the OR of the two channels interrupt. 0 = CLEAR 1 = SET

Bit	Reset	Description
4	CLEAR	CLKCHANGE_COMPLETE_INT: CAR/EMC clock-change handshake complete. In dual channel COMBINED_INTERRUPT_MODE, this is the AND of the two channels interrupt. 0 = CLEAR 1 = SET
3	CLEAR	REFRESH_OVERFLOW_INT: Refresh request overflow timeout. In dual channel COMBINED_INTERRUPT_MODE, this is the OR of the two channels interrupt. 0 = CLEAR 1 = SET

18.11.2.2 EMC_INTMASK_0

Interrupt Mask Register

Init value is masked.

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000000xxx)

Bit	Reset	Description
9	MASKED	DLL_LOCK_TIMEOUT_INTMASK: Mask for DLL lock timeout interrupt. 0 = MASKED 1 = UNMASKED
8	MASKED	CCFIFO_OVERFLOW_INTMASK: Mask for clock change FIFO overflow. 0 = MASKED 1 = UNMASKED
7	MASKED	DLL_ALARM_INTMASK: Mask for DLL alarm and DLL alarm minimum. 0 = MASKED 1 = UNMASKED
6	MASKED	ACCESS_TO_SR_DPD_DEV_INTMASK: Mask for access a self-refresh/deep-powered-down device interrupt. 0 = MASKED 1 = UNMASKED
5	MASKED	MRR_DIVLD_INTMASK: Mask for MRR data available. 0 = MASKED 1 = UNMASKED
4	MASKED	CLKCHANGE_COMPLETE_INTMASK: Mask for CAR/EMC clock-change handshake complete. 0 = MASKED 1 = UNMASKED
3	MASKED	REFRESH_OVERFLOW_INTMASK: Mask for refresh request overflow timeout. 0 = MASKED 1 = UNMASKED

18.11.2.3 EMC_DBG_0

Debug Register

The DBG register is used to reconfigure the EMC during debug or chip testing.

Boot requirements: This register should be parameterized in the BCT and written by the Boot ROM during coldboot.

Boot requirements: This register should be saved in the scratch registers and restored by the Boot ROM during warmboot.

Offset: 0x8 I Read/Write: R/W I Reset: 0x01000c00 (0b00000001xxxxxxxxxx00110xxxx00000)

Bit	Reset	Description
31	DISABLED	AUTOCAL_IGNORE_SWAP: When set to ENABLED, autocal registers controlled by the autocal FSM do not obey the CFG_SWAP setting, and forces them to operate in the ACTIVE_ONLY mode. Setting to DISABLED will allow the autocal registers to obey the CFG_SWAP setting 0 = DISABLED 1 = ENABLED

Bit	Reset	Description
30	DISABLED	WRITE_ACTIVE_ONLY: By default, when WRITE_MUX=ACTIVE, it writes both the shadowed and active version of the register. When WRITE_ACTIVE_ONLY is set, it only writes the ACTIVE copy. This overrides the programming of WRITE_MUX 0 = DISABLED 1 = ENABLED
29	DISABLED	ALLOW_HOSTIF_DURING_CCFIFO: Normally hostif requests are blocked when the CCFIFO is processing. Setting this to ENABLED unblocks them for debugging training/DVFS hangs 0 = DISABLED 1 = ENABLED
28	DISABLED	ALLOW_EMC1_PMACRO_CFG_ACCESS: When enabled, allows config access to EMC1 to be sent to the pad macro. By default, the pad macro configuration space is only visible through EMC0 0 = DISABLED 1 = ENABLED
27:26	ACTIVE_ONLY	CFG_SWAP: Enable the configuration swap feature. It is only intended to be used for the training sequence ACTIVE_ONLY means that the ASSEMBLY copy is copied into the ACTIVE copy SWAP means that the ASSEMBLY and ACTIVE copies swap values ASSEMBLY_ONLY means that the ACTIVE copy is copied into the ASSEMBLY copy (opposite of DISABLED) 0 = ACTIVE_ONLY 1 = SWAP 2 = ASSEMBLY_ONLY
25	DISABLED	AUTOCAL_ALLOW_WRITE_MUX: When DISABLED, autocal registers controlled by autocal FSM do not obey WRITE_MUX/WRITE_ACTIVE_ONLY settings, and operate in WRITE_MUX=ASSEMBLY/WRITE_ACTIVE_ONLY=DISABLED mode. Setting to ENABLED will allow autocal registers to obey WRITE_MUX/WRITE_ACTIVE_ONLY settings 0 = DISABLED 1 = ENABLED
24	ENABLED	CFG_PRIORITY: determines the priority of cfg accesses to the DRAM. Setting this register to ENABLED gives DRAM config cycles (refresh, mrs, emrs, etc.) higher priority over real time requestors. The DISABLED setting gives the real time requestors higher priority than DRAM config cycles. Do not program to DISABLED unless for debugging. 0 = DISABLED 1 = ENABLED
13	DISABLED	SUPPRESS_WRITE_CMD: suppress write command sent to DRAM 0 = DISABLED 1 = ENABLED
12	DISABLED	SUPPRESS_READ_CMD: suppress read command sent to DRAM 0 = DISABLED 1 = ENABLED
11	ENABLED	STRETCH_MRW_RESET:stretch MRW RESET command to three clocks; affects only LPDDR3 0 = DISABLED 1 = ENABLED
10	ENABLED	AP_REQ_BUSY_CTRL: determines whether the busy signal from the auto-precharge cancellation (APC) fifo is allowed to stall requests to the EMC. This field should usually be set to ENABLED. 0 = DISABLED 1 = ENABLED
9	MANAGED	READ_DQM_CTRL: controls whether the dqm signals during reads are managed for power (not relevant for DDR). If set to MANAGED, EMC only turns them on when necessary. If set to ALWAYS_ON, the dqm signals are enabled during non-write operation. This field should usually be set to MANAGED. 0 = MANAGED 1 = ALWAYS_ON
2	DISABLED	FORCE_UPDATE: causes the active state to get updated with the assembly state immediately upon setting this register to 1. 0 = DISABLED 1 = ENABLED
1	ASSEMBLY	WRITE_MUX: controls whether writes to the configuration registers are done from the assembly or active state. 0 = ASSEMBLY 1 = ACTIVE
0	ACTIVE	READ_MUX: controls whether reads to the configuration registers are done from the assembly or active state. 0 = ACTIVE 1 = ASSEMBLY

18.11.2.4 EMC_CFG_0

Configuration Register

The CFG register is used to configure the external memory interface.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0xc | Read/Write: R/W | Reset: 0x03c00000 (0b0000x011110xx000xxxxxx000000000x)

Bit	Reset	Description
31	DISABLED	DRAM_CLKSTOP_PD: [PMC] clock stop is only allowed to happen if the DRAM is in active/precharge powerdown (for all CKE bits associated with clock) 0 = DISABLED 1 = ENABLED
30	DISABLED	DRAM_CLKSTOP_SR: [PMC] clockstop is only allowed to happen if the DRAM is in self-refresh (for all CKE bits associated with clock) 0 = DISABLED 1 = ENABLED
29	NO_POWERDOWN	DRAM_ACPD: [PMC] Allows the DRAM controller to perform opportunistic active powerdown control using the CKE pin on the DRAM. The behavior of the powerdown control logic is controlled by the PDEX2* and *2PDEN registers. The value of DRAM_ACPD should only be changed when CKE is low, e.g., during software-controlled self-refresh or before DRAM initialization. 0 = NO_POWERDOWN 1 = ACTIVE_POWERDOWN
28	DISABLED	DYN_SELF_REF: [PMC] 0 = DISABLED 1 = ENABLED
26	DISABLED	REQACT_ASYNC: [PMC] Allows independent transfers of activates and transactions from the MC to the EMC. Disabled to preserve the order of requests selected by mc_arb logic. 0 = DISABLED 1 = ENABLED
25	ENABLED	AUTO_PRE_WR: [PMC] enable using MC auto-precharge indication for writes. This bits, when set to DISABLE, will override the settings in the MC register (EMC ignore the auto-precharge indication from MC). Otherwise, they permit clients to make either auto or explicit precharge requests depend on the state of MAN_PRE_WR. 0 = DISABLED 1 = ENABLED
24	ENABLED	AUTO_PRE_RD: [PMC] enable using MC auto-precharge indication for reads. This bits, when set to DISABLE, will override the settings in the MC register (EMC ignores the auto-precharge indication from MC). Otherwise, they permit clients to make either auto or explicit precharge requests depend on the state of MAN_PRE_RD. 0 = DISABLED 1 = ENABLED
23	ENABLED	MAN_PRE_WR: [PMC] enable explicit-precharge in the EMC for writes. When this bit is enabled (and AUTO_PRE_WR=enable), EMC will issue an explicit precharge command after the memory write command. If this bit is disabled (and AUTO_PRE_WR=enable), the EMC will issue an auto-precharge with the memory write command. 0 = DISABLED 1 = ENABLED
22	ENABLED	MAN_PRE_RD: [PMC] enable explicit-precharge in the EMC for reads. When this bit is enabled (and AUTO_PRE_RD=enable), EMC will issue an explicit precharge command after the memory read command. If this bit is disabled (and AUTO_PRE_RD=enable), the EMC will issue an auto-precharge with the memory read command. 0 = DISABLED 1 = ENABLED
21	DISABLED	PERIODIC_QRST: [PMC] 0 = DISABLED 1 = ENABLED

Bit	Reset	Description
18	DISABLED	DSR_VTTGEN_DRV_EN: [PMC] enable VTTGEN controls (via DSR_VTTGEN_DRV/ TXDSRVTTGEN registers) during DSR. 0 = DISABLED 1 = ENABLED
17:16	TWOX	EMC2MC_CLK_RATIO: [PMC] EMC to MC clock ratio. 0 = TWOX 1 = ONEX 2 = FOURX 3 = RESERVED
9	0x0	WAIT_FOR_ISP2B_READY_B4_CC: [PMC] 1 = wait for isp2b ready event to be asserted before acknowledge clock change.
8	0x0	WAIT_FOR_VI2_READY_B4_CC: [PMC] 1 = wait for vi2 ready event to be asserted before acknowledge clock change.
7	0x0	WAIT_FOR_ISP2_READY_B4_CC: [PMC] 1 = wait for isp2 ready event to be asserted before acknowledge clock change.
6	0x0	INVERT_DQM: [PMC] 1 = invert DQM polarity.
5	0x0	WAIT_FOR_DISPLAYB_READY_B4_CC: [PMC] 1 = wait for displayb ready event to be asserted before acknowledging clock change.
4	0x0	WAIT_FOR_DISPLAY_READY_B4_CC: [PMC] 1 = wait for display ready event to be asserted before acknowledging clock change.
3	0x0	EMC2PMACRO_CFG_BYPASS_DATAPIPE2: Reserved
2	0x0	EMC2PMACRO_CFG_BYPASS_DATAPIPE1: Reserved
1	0x0	EMC2PMACRO_CFG_BYPASS_ADDRPIPE: Reserved

18.11.2.5 EMC_ADR_CFG_0

External Memory Address Configuration System

The ADR_CFG register is used to specify the number of DRAM devices. DRAM density and geometry parameters are specified by the EMEM_ADR_CFG* registers in MC.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x10 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	N2	EMEM_NUMDEV: [PMC SECURE] Number of populated DRAM devices. 0 = N1 1 = N2

18.11.2.6 EMC_REFCTRL_0

Refresh Control Register

The REFCTRL register allows software to enable or disable the refresh controller.

REF_VALID should be enabled after the initialization sequence is completed.

Boot requirements:

- If per-device DPD is used, the DEVICE_REFRESH_DISABLE field should be parameterized in the BCT and written by the Boot ROM during cold boot.
- If per-device DPD is used, the DEVICE_REFRESH_DISABLE field should be parameterized the scratch registers and restored by the Boot ROM during warm boot.
- REF_VALID field should always be set to ENABLED for normal use, no need to parameterize in BCT/scratch.

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
31	DISABLED	REF_VALID: Enable refresh controller. 0 = DISABLED 1 = ENABLED
1:0	0x0	DEVICE_REFRESH_DISABLE: Disables refresh to individual attached device (1 bit per DRAM chip select).

18.11.2.7 EMC_PIN_0

Controls State of Selected DRAM Pins

The PIN register allows software to control the state of the selected external DRAM pins.

Boot requirements:

- Both fields in this register should be set to NORMAL during cold boot.
- Both fields in this register should be set to NORMAL during warm boot.

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxx00xx00xxx0xxx0x000)

Bit	Reset	Description
17:16	DISABLED	PIN_GPIO_EN: General-purpose DRAM I/O enable 0 = DISABLED 1 = ENABLED
13:12	INACTIVE	PIN_GPIO: General-purpose DRAM I/O, to use corresponding EN must be set routing controlled via CMD_MAPPING_CMD* registers 0 = INACTIVE 1 = ACTIVE
8	ACTIVE	PIN_RESET: Selects the level of the RESET# pin (if applicable). 0 = ACTIVE 1 = INACTIVE
4	NORMAL	PIN_DQM: Is used to always mask DRAM writes. This pin should only be used for initialization. Certain DRAM vendors require the DQM to be high during initialization. The register value should be set to NORMAL after the initialization sequence. 0 = NORMAL 1 = INACTIVE
2	DISABLED	PIN_CKE_PER_DEV: per device CKE enable. When disabled, PIN_CKE is used for all CKE pins; when enabled PIN_CKEB is used for CKEB pins 0 = DISABLED 1 = ENABLED
1	POWERDOWN	PIN_CKEB: selects the level of the CKEB pin. This can be used to place the DRAM in power down state. PIN_CKEB value is applied to the CKEB pins when PIN_CKE_PER_DEV is 1. 0 = POWERDOWN 1 = NORMAL
0	POWERDOWN	PIN_CKE: Selects the level of the CKE pin. This can be used to place the DRAM in power down state. PIN_CKE value is applied to all CKE pins when PIN_CKE_PER_DEV is 0. 0 = POWERDOWN 1 = NORMAL

18.11.2.8 EMC_TIMING_CONTROL_0

Triggers an Update of the Timing-Related Registers

The TIMING_CONTROL register is used by software to trigger parameter updates for timing parameter registers, RDQS/QUSE delay controls, and some DLL controls. Writing the TIMING_UPDATE field updates the active state of these registers with the programmed assembly state. The active state is updated during a safe interval determined by the EMC. If CLKCHANGE_REQ_ENABLE is enabled, the active value will automatically be updated on completion of the clock change.

Note: *Programming of this register does not trigger the shadow register update event immediately. To prevent shadow register programming issued after programming this register from being*

latched accidentally, always poll for TIMING_UPDATE_STALLED==0 after programming this register.

Boot requirements:

- Writing this register with 0x1 will trigger a timing update event, which should be used in both warm boot and cold boot sequences.

Offset: 0x28 | Read/Write: R/W | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	TIMING_UPDATE

18.11.2.9 EMC_RC_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2c | Read/Write: R/W | Reset: 0x000000ff (0bxxxxxxxxxxxxxxxxxxxxxxxx11111111)

Bit	Reset	Description
6:0	0xff	RC: [PMC] Specifies the row cycle time. This is the minimum number of cycles between activate commands to the same bank.

18.11.2.10 EMC_RFC_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x30 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxx0000111111)

Bit	Reset	Description
9:0	0x3f	RFC: [PMC] specifies the auto refresh cycle time. This is the minimum number of cycles between an auto refresh command and a subsequent auto refresh or activate command.

18.11.2.11 EMC_RAS_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x34 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
5:0	0x7f	RAS: [PMC] specifies the row active time. This is the minimum number of cycles between an activate command and a precharge command to the same bank.

18.11.2.12 EMC_RP_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x38 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	RP: [PMC] specifies the row precharge time. This is the minimum number of cycles between a precharge command and an activate command to the same bank.

18.11.2.13 EMC_R2W_0

R2something and W2something registers are independent of burst length, and are relative to the last virtual CAS_ of a command. Counting starts from the last data transfer as related to where CAS_ would be if BL = 4.

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x3c | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	R2W: [PMC] specifies the minimum number of cycles from any read command to any write command, irrespective of bank. This parameter guarantees the read->write turnaround time on the bus.

18.11.2.14 EMC_W2R_0

R2something and W2something registers are independent of burst length, and are relative to the last virtual CAS_ of a command. Counting starts from the last data transfer as related to where CAS_ would be if BL = 4.

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x40 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	W2R: [PMC] specifies the minimum number of cycles from a write command to a read command, irrespective of bank.

18.11.2.15 EMC_R2P_0

R2something and W2something registers are independent of burst length, and are relative to the last virtual CAS_ of a command. Counting starts from the last data transfer as related to where CAS_ would be if BL = 4.

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x44 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	R2P: [PMC] specifies the minimum number of cycles from a read command to a precharge command for the same bank.

18.11.2.16 EMC_W2P_0

R2something and W2something registers are independent of burst length, and are relative to the last virtual CAS_ of a command. Counting starts from the last data transfer as related to where CAS_ would be if BL = 4.

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x48 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	W2P: [PMC] Specifies the minimum number of cycles from a write command to a precharge command for the same bank.

18.11.2.17 EMC_RD_RCD_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x4c | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx011111)

Bit	Reset	Description
5:0	0x1f	RD_RCD: [PMC] Specifies the RAS to CAS delay. RD_RCD is the minimum number of cycles between an activate command and a read command to the same bank.

18.11.2.18 EMC_WR_RCD_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x50 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx011111)

Bit	Reset	Description
5:0	0x1f	WR_RCD: [PMC] Minimum number of cycles between an activate command and a write command to the same bank.

18.11.2.19 EMC_RRD_0

DRAM timing parameter

This register is shadowed: see usage note in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x54 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	RRD: [PMC] specifies the Bank X Act to Bank Y Act command delay.

18.11.2.20 EMC_REXT_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x58 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx00001)

Bit	Reset	Description
4:0	0x1	REXT: [PMC] specifies the read to read delay for reads when multiple physical devices are present.

18.11.2.21 EMC_WDV_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x5c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:0	0x0	WDV: [PMC] The number of cycles to post (delay) write data from being asserted to the RAMs. 40 = MAX

18.11.2.22 EMC_QUSE_0

DRAM timing parameter

Because SDRAM uses a tristating clock (the DQS), a method is needed to deal with the ambiguity of when DQS is tristated. Only one such method is supported: QUSE.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x60 | Read/Write: R/W | Reset: 0x00000002 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000010)

Bit	Reset	Description
5:0	0x2	QUSE: [PMC] Tells the chip when to look for read return data.

18.11.2.23 EMC_QRST_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x64 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxx00000xxxxxxxxx0000001)

Bit	Reset	Description
20:16	0x0	QRST_DURATION: [PMC] QRST remains asserted for QRST_DURATION + 1 cycles
6:0	0x1	QRST: [PMC] time from expiration of QSAFE until reset is issued.

18.11.2.24 EMC_QSAFE_0

DRAM timing parameter

When PERIODIC_QRST is enabled, the QSAFE parameter is intended to guarantee that the QRSTs will not interfere with pending reads (for example, the queue is empty). This field must be set to at least (RDV - QRST).

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x68 | Read/Write: R/W | Reset: 0x00000007 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0000111)

Bit	Reset	Description
6:0	0x7	QSAFE: [PMC] Time from a read command to when it is safe to issue a QRST (delayed by the QRST parameter).

18.11.2.25 EMC_RDV_0

DRAM timing parameter

RDV is the read latency register. This register value is not negotiable; it will work with the right value and will not with the wrong value. It uses sequential timing, not combinational timing.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x6c | Read/Write: R/W | Reset: 0x00000008 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0001000)

Bit	Reset	Description
6:0	0x8	RDV: [PMC] Time from read command to latching the read data from the pad macros. 60 = MAX_1TO1 120 = MAX_2TO1

18.11.2.26 EMC_REFRESH_0

DRAM timing parameter

The value of REFRESH is calculated using the following formula:

```
{REFRESH, REFRESH_LO} = max[(tREF/#_of_rows) / (emc_clk_period) - 64,
                            (tREF/#_of_rows) / (emc_clk_period) * 97%]
```

For example, if the clock frequency is 133 MHz, and the refresh requirement is 64 ms per 4096 rows. The programming value is 0x7e3.

This should always be programmed using the all-bank refresh timings, and does not need to change for per-bank refresh operation.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x70 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxx0000000000011111)

Bit	Reset	Description
15:6	0x0	REFRESH: [PMC] Specifies the interval between refresh requests.
5:0	0x1f	REFRESH_LO: [PMC]

18.11.2.27 EMC_BURST_REFRESH_NUM_0

DRAM timing parameter

BURST_REFRESH_NUM is used to specify the refresh burst count. The refresh controller will wait until BURST_REFRESH_NUM refreshes have been scheduled, then issue them all at once. This can result in a performance improvement in many cases.

Notes:

- *If tRAS(max) is less than the refresh interval (tREF/#_of_rows), tRAS(max) must be used instead of the refresh interval in the formula above. This is because refresh is used to satisfy tRAS(max) timing. Accordingly, BURST_REFRESH_NUM must be programmed in such a way that queuing up multiple refreshes does not violate tRAS(max) timing. Burst length = 2^BURST_REFRESH_NUM. Refreshes will be throttled to meet TREFBW limitation (8/window) if TREFBW > 0.*
- *Do not program this register to value non-zero unless for testing.*

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x74 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	BR1	BURST_REFRESH_NUM: [PMC] Specify the refresh burst count. 0 = BR1 1 = BR2 2 = BR4 3 = BR8 4 = BR16 5 = BR32 6 = BR64 7 = BR128 8 = BR256 9 = BR512 9 = MAX

18.11.2.28 EMC_PDEX2WR_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x78 | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	PDEX2WR: Specify the timing delay from exit of powerdown mode to a write command.

18.11.2.29 EMC_PDEX2RD_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x7c | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	PDEX2RD: Specify the timing delay from exit of powerdown mode to a read command.

18.11.2.30 EMC_PCHG2PDEN_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x80 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx011111)

Bit	Reset	Description
5:0	0x1f	PCHG2PDEN: [PMC] Specify the timing delay from a precharge command to powerdown entry.

18.11.2.31 EMC_ACT2PDEN_0

[PMC] DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x84 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx011111)

Bit	Reset	Description
5:0	0x1f	ACT2PDEN: Specify the timing delay from an activate, MRS or EMRS command to power-down entry.

18.11.2.32 EMC_AR2PDEN_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x88 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxx000011111)

Bit	Reset	Description
8:0	0x1f	AR2PDEN: [PMC] Specify the timing delay from an autorefresh command to powerdown entry.

18.11.2.33 EMC_RW2PDEN_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x8c | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxx0011111)

Bit	Reset	Description
6:0	0x1f	RW2PDEN: [PMC] Specify the timing delay from a read/write command to powerdown entry. Auto-precharge timing must be taken into account when programming this field

18.11.2.34 EMC_TXSR_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x90 | Read/Write: R/W | Reset: 0x000003fe (0bxxxxxxxxxxxxxxxxxxxxxxxx1111111110)

Bit	Reset	Description
9:0	0x3fe	TXSR: [PMC] Cycles between self-refresh exit & first DRAM command that does not require a locked DLL. Largest allowed value is 0x3fe.

18.11.2.35 EMC_TCKE_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x94 | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	TCKE: Specify the minimum CKE high pulse width.

18.11.2.36 EMC_TFAW_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x98 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
6:0	0x0	TFAW: [PMC] specify the width of the FAW (four-activate window) for 8-bank devices. Set to 0 to disable this timing check. Only 4 activates may occur within the rolling window.

18.11.2.37 EMC_TRPAB_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x9c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:0	0x0	TRPAB: [PMC] Specify precharge-all tRP allowance for 8-bank devices. Setting this field to 0 will cause EMC to use TRP.TRP for precharge-all.

18.11.2.38 EMC_TCLKSTABLE_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xa0 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0001111)

Bit	Reset	Description
6:0	0xf	TCLKSTABLE: [PMC] Specify minimum number of cycles of a stable clock period prior to exiting powerdown or self-refresh modes.

18.11.2.39 EMC_TCLKSTOP_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xa4 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx01111)

Bit	Reset	Description
4:0	0xf	TCLKSTOP: [PMC] Delay from last command to stopping the external clock to DRAM devices.

18.11.2.40 EMC_TREFBW_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xa8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxx00000000000000)

Bit	Reset	Description
13:0	0x0	TREFBW: [PMC] specify the width of the burst-refresh window. If set to a non-zero value, only 8 refreshes will occur in this rolling window. Set to 0 to disable this timing check.

18.11.2.41 EMC_TPPD_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xac | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	TPPD: [PMC] precharge-precharge delay

18.11.2.42 EMC_ODT_WRITE_0

ODT may be enabled during writes via control of ODT pin.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xb0 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxx0000xx000000)

Bit	Reset	Description
31	0x0	ENABLE_ODT_DURING_WRITE: enables ODT to be turned on prior to issuing write to DRAM. [PMC] If ENABLE_ODT_DURING_WRITE = 1 and DISABLE_ODT_DURING_READ = 0, ODT will always be enabled after the first write.
11:8	0x0	ODT_WR_DURATION: [PMC] for LPDDR3, indicate how long to assert ODT by.
5	0x0	SHARE_ONE_ODT: [PMC] For LPDDR3 only. When enabled, ODT[1] is not used. The ODT for both ranks will be sharing the same ODT[0]. When disabled, ODT[0] is controlling rank0, ODT[1] is controlling rank1.
4	0x0	DRIVE_BOTH_ODT: [PMC] If this field = 0, only the ODT for the requested device will be asserted during write. If this field = 1, ODTs for both devices will be asserted during write.
3:0	0x0	ODT_WR_DELAY: [PMC] Set this field = ABS (WL - ceiling(tAOND) - 2).

18.11.2.43 EMC_PDEX2MRR_0

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xb4 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	PDEX2MRR: [PMC] precharge-precharge delay

18.11.2.44 EMC_WEXT_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the
- Boot ROM during warm boot.

Offset: 0xb8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4:0	0x0	WEXT: [PMC] specifies the write to write delay for writes when multiple physical devices are present.

18.11.2.45 EMC_RFC_SLR_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xc0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx000000000)

Bit	Reset	Description
8:0	0x0	RFC_SLR: [PMC] Specifies the stagger refresh cycle time between ranks. This is the minimum number of cycles between an auto refresh command to one rank and a subsequent auto refresh to another rank. A zero value indicates stagger refresh is disabled.

18.11.2.46 EMC_MRS_WAIT_CNT2_0

This register allows the delay between an MRS/EMRS/MRW/MRR command and the following DRAM command

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xc4 | Read/Write: R/W | Reset: 0x0208000f (0bxxxxx01000001000xxxxxx0000001111)

Bit	Reset	Description
25:16	0x208	MRS_EXT2_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing any commands after sending an MRS ext2 command.
9:0	0xf	MRS_EXT1_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing any commands after sending an MRS ext1 command.

18.11.2.47 EMC_MRS_WAIT_CNT_0

This register allows the delay between an MRS/EMRS/MRW/MRR command and the following DRAM command.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xc8 | Read/Write: R/W | Reset: 0x0208000f (0bxxxxx01000001000xxxxxx0000001111)

Bit	Reset	Software Default	Description
26:16	0x208	0x3ff	MRS_LONG_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing any commands after sending an MRS long command.
9:0	0xf	0x3ff	MRS_SHORT_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing any commands after sending an MRS short command.

18.11.2.48 EMC_MRS_0

Command Trigger: MRS

The MRS register allows software to issue an MRS command.

BA0, BA1 are used to address MRS or EMRS registers in DRAM. Although this register can also program EMRS, use the EMRS register so that the hardware registers can shadow what is in the DRAM.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xcc | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xxxx00xxxxxx00000000000000)

Bit	Reset	Description
31:30	0x0	MRS_DEV_SELECTN: [PMC] Active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
27	0x0	USE_MRS_EXT_CNT: [PMC] {USE_MRS_EXT_CNT, USE_MRS_LONG_CNT}: 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_MRS_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
21:20	0x0	MRS_BA: [PMC] Set to 0x0 for MRS.
13:0	0x0	MRS_ADR: [PMC] Mode-register data to be written.

18.11.2.49 EMC_EMRS_0

Command trigger: EMRS

The EMRS register allows software to issue an EMRS command.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xd0 | Read/Write: R/W | Reset: 0x00000000 (0b00xxx0xxxx00xxxxxx00000000000000)

Bit	Reset	Description
31:30	0x0	EMRS_DEV_SELECTN: [PMC] Active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
27	0x0	USE_EMRS_EXT_CNT: [PMC] {USE_MRS_EXT_CNT, USE_MRS_LONG_CNT}: 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_EMRS_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
21:20	0x0	EMRS_BA: [PMC] Set to 0x1 for EMRS (and where applicable, 0x2 for EMRS2, and 0x3 for EMRS3).
13:0	0x0	EMRS_ADR: [PMC] Mode-register data to be written.

18.11.2.50 EMC_REF_0

Command Trigger: Refresh

> ***Note:*** *The REF register allows software to issue refresh commands. This is done to ensure proper DRAM initialization.*

Boot requirements:

- This register triggers a refresh command. REF_CMD should be written with 0x1 during cold boot to trigger refresh commands during DRAM initialization.

Offset: 0xd4 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxx00000000000xxxxxx00)

Bit	Reset	Description
31:30	0x0	REF_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
18:8	0x0	REF_NUM: perform (REF_NUM + 1) refresh cycles.
1	0x0	REF_NORMAL: 0 = execute first refresh immediately (this is use during DRAM initialization). 1 = execute refresh through normal refresh mechanism (this should be used in normal operation).
0	0x0	REF_CMD: causes the hardware to perform a REFRESH to all DRAM banks.

18.11.2.51 EMC_PRE_0

Command Trigger: Precharge-All

The PRE register allows software to issue a precharge all command. This command may be used to ensure proper DRAM initialization.

Boot requirements:

- This register triggers a precharge-all command. PRE_CMD should be written with 0x1 during cold boot to trigger refresh commands during DRAM initialization.
- If per-device DPD is used, the PRE_DEV_SELECTN field should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xd8 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
31:30	0x0	PRE_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
0	0x0	PRE_CMD: causes the hardware to perform a PRECHARGE to all DRAM banks.

18.11.2.52 EMC_NOP_0

Command Trigger: NOP

The NOP register allows software to issue an explicit NOP command. This command may be used to ensure proper DRAM initialization.

Boot requirements:

- This register triggers a no-operation command. NOP_CMD should be written with 0x1 during cold boot to trigger no-op commands during DRAM initialization.

Offset: 0xdc | Read/Write: R/W | Reset: 0b00xxxxxxxxxxxxxxxxxxxxxxxxxxxxx0

Bit	Reset	Description
31:30	0x0	NOP_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
0	0x0	NOP_CMD: causes the hardware to perform a NOP to all DRAM banks.

18.11.2.53 EMC_SELF_REF_0

Command Trigger: SELF REFRESH

The SELF_REF register allows software to issue self-refresh commands.

LP4: CKE follows SELF_REF_CMD

Do not program this register when a clock change sequence is on-going. Check the CLKCHANGE_COMPLETE_INT value if not sure.

Offset: 0xe0 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxxxxxxxxxx0xxxxxxx0)

Bit	Reset	Description
31:30	0x0	SREF_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1, 0x3 for neither device.
8	DISABLED	ACTIVE_SELF_REF: Determines the state of the CKE pin while SELF_REF_CMD=ENABLE. If ENABLED, CKE is held true. This bit should only be ENABLED for DRAM types that support active self-refresh, e.g. LPDDR4. 0 = DISABLED 1 = ENABLED
0	DISABLED	SELF_REF_CMD: causes the hardware to issue a SELF_REFRESH command. REF_NUM refreshes will be issued to both ranks regardless of SREF_DEV_SELECTN. While SELF_REF_CMD=ENABLED, the state of the CKE pin is determined by ACTIVE_SELF_REF. The SELF_REF_CMD=ENABLED state will override the PIN:CKE setting. The DRAM will ignore all accesses until CMD:DISABLED. 0 = DISABLED 1 = ENABLED

18.11.2.54 EMC_DPD_0

Command Trigger: Deep Power Down

The DPD register allows software to issue a deep power down command.

Offset: 0xe4 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
31:30	0x0	DPD_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
0	DISABLED	DPD_CMD: causes the hardware to issue the deep power down command (Burst Terminate with CKE low). While in DPD mode, the DRAM will not maintain data integrity. While CMD:ENABLED, the CKE pin is held deasserted. The CMD:ENABLED state will override the PIN:CKE setting. The DRAM will ignore all accesses until CMD:DISABLED. 0 = DISABLED 1 = ENABLED

18.11.2.55 EMC_MRW_0

Command Trigger: MRW

Mode Register Write: LPDDRx-only version of MRS/EMRS

Boot requirements:

- This register triggers a mode register write command. Multiple mode-register writes may be required by the cold boot sequence. Such commands should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xe8 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xx00000000xxxxxxxx00000000

Bit	Reset	Description
31:30	0x0	MRW_DEV_SELECTN: [PMC] Active-low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for dev1.
27	0x0	USE_MRW_EXT_CNT: [PMC] {USE_MRS_EXT_CNT, USE_MRS_LONG_CNT}: 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_MRW_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
23:16	0x0	MRW_MA: [PMC] Register address
7:0	0x0	MRW_OP: [PMC] Data to be written

18.11.2.56 EMC_MRR_0

Command Trigger: MRR

Mode Register Read: For DRAM types supporting MRR (LPDDRx)

Sequence

1. 1. Read MRR until EMC_STATUS.MRR_DIVLD=0 (ok to skip if it is sure there are no pending MRR reads)
2. Write this register with the desired addr (MA) and device (DEV_SELECTN), device needs to be either DEV0 or DEV1: writing to both is illegal
3. Poll EMC_STATUS.MRR_DIVLD=1, or if using interrupt, wait for MRR_DIVLD_INT
4. Read back MRR. The value is in MRR_DATA field.

> ***Note:*** *It is okay to issue new MRR requests while there are on-going requests. For example, to issue 3 MRR requests, follow these steps: 1,2,2,2,3,4,3,4,3,4. Data read back in step 4 is in the same order requested in step 2.*

To make sure the EMC is available for new MRR requests, poll for EMC_STATUS.MRR_FIFO_SPACE > 0 before step 2.

If using 2 x16 DRAM, MRR_DATA[15:8] can be used to store MRR from the second DRAM on the same CS (configured via CFG_3.MRR_BYTESEL_X16)

Offset: 0xec | Read/Write: R/W | Reset: 0x0000XXXX (0b00xx00xx00000000xxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31:30	RW	0x0	MRR_DEV_SELECTN: active-low chip-select, choose which device to send the command to. (enum for safety). 0 = ILLEGAL 1 = DEV1 2 = DEV0 3 = RESERVED
27	RW	0x0	USE_MRR_EXT_CNT: 0 = USE_MRS_LONG_CNT will select between SHORT(0)/LONG(1), 1 = USE_MRS_LONG_CNT will select between EXT1(0)/EXT2(1).
26	RW	SHORT	USE_MRR_LONG_CNT: Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
23:16	RW	0x0	MRR_MA: register address
15:0	RO	X	MRR_DATA: data returned

18.11.2.57 EMC_CMDQ_0

Command Queue Depth Register

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This arbitration configuration register should be parameterized in the BCT and written by the OS during cold boot and warm boot.

Offset: 0xf0 | Read/Write: R/W | Reset: 0x10004408 (0bxxx10000xxxxxxxxx100x100xxx01000)

Bit	Reset	Description
28:24	0x10	RW_WD_DEPTH
14:12	0x4	PRE_DEPTH
10:8	0x4	ACT_DEPTH
4:0	0x8	RW_DEPTH

18.11.2.58 EMC_MC2EMCQ_0

Command Queue Depth Register

Boot requirements:

- This arbitration configuration register should be parameterized in the BCT and written by the OS during cold boot and warm boot.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0xf4 | Read/Write: R/W | Reset: 0x06000404 (0bxxxx0110xxxxxxxxxxxxx100xxxxx100)

Bit	Reset	Description
27:24	0x6	MCWD_DEPTH
10:8	0x4	MCACT_DEPTH
2:0	0x4	MCREQ_DEPTH

18.11.2.59 EMC_FBIO_SPARE_0

FBIO Spare Register

Note: *CFG_FBIO_SPARE_0[1] = FBIO_SPARE[1] = lock further change to ADDR_SWIZZLE_STACK* and ADR_CFG. registers.*

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- CFG_FBIO_SPARE_3 should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x100 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:24	0x0	CFG_FBIO_SPARE_3
23:16	0x0	CFG_FBIO_SPARE_2
15:8	0x0	CFG_FBIO_SPARE_1
7:2	0x0	CFG_FBIO_SPARE_0
1	0x0	CFG_ADR_EN: [PMC_SECURE] write once after powering up EMC.
0	0x0	CFG_SWAP_DLL: [PMC]

18.11.2.60 EMC_FBIO_CFG5_0

FBIO Configuration Register

The trimmer value may be overridden by setting using MULT==0 and OFFS = value << 4.

The FBIO_CFG5 register controls the FBIO I/O cells.

The following fields are shadowed: DIFFERENTIAL_DQS, CTT_TERMINATION, DQS_PULLD, CMD_2T_TIMING.

Writes to these fields will not take effect until the active value is updated via TIMING_UPDATE or (if enabled) CLKCHANGE_REQ.

Boot requirements:

- This register (except for field DISABLE_CONCURRENT_AUTOPRE) should be parameterized in the BCT and written by the Boot ROM during cold boot.

- This register (except for field DISABLE_CONCURRENT_AUTOPRE) should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x104 | Read/Write: R/W | Reset: 0x10400015 (0b00x100000100xxxx0000x0x0xxx10101) | Default: 0x00400010

Bit	Reset	Software Default	Description
31	DISABLED	NONE	DATA_BUS_RETURN_TO_ZERO: [PMC] this will drive the data bus back to a zero as resting stage, which can save power in LP4. Shadowed 0 = DISABLED 1 = ENABLED
30	DISABLED	NONE	DATA_BUS_RETURN_TO_ONE: [PMC] this will drive the data bus back to a one as resting stage, which can save power in LP3. Shadowed 0 = DISABLED 1 = ENABLED
28	ENABLED	NONE	MASK_PUTERM_N_DQS_PULLD_DURING_ZQCAL: [PMC] When this bit is enabled; it deasserts DQ/DQS puterm and DQS pulld during ZQ calibration in hardware. 0 = DISABLED 1 = ENABLED
27	DISABLED	_NONE_	CMD_BUS_RETURN_TO_ZERO: [PMC] this will drive the cmd bus back to a zero as resting stage, which is needed as deselect during CKE transistions in LP4. Shadowed 0 = DISABLED 1 = ENABLED
26	DISABLED	NONE	CMD_BUS_RETURN_TO_ONE: [PMC] this bit drives the cmd bus back to a one as a resting stage (legacy Tegra device behavior). Power is saved if this is not done (Tegra X1 behavior). Shadowed 0 = DISABLED 1 = ENABLED
25	DISABLED	NONE	LPDDR3_DRAM: [PMC] Enables differentiation between lpddr3 DRAM protocol. 0 = DISABLED 1 = ENABLED
24	DISABLED	NONE	LPDDR3_WR_PREAMBLE_TOGGLE: [PMC] enable LPDDR3 write preamble toggle. 0 = DISABLED 1 = ENABLED
23:20	0x4	0x4	ERR_RD_BUBBLE: [PMC] Number of bubbles to be inserted in CMDQ after every error-Read. A dummy read is placed in CMDQ for each error read. This field controls the number of emcclk bubbles inserted for each dummy read. It is expected that this should be set to BL/2. Without this, ret_stat_fifo will build up and block non-error reads. This could cause ret_data_fifo to overflow as it is only 8 deep (area savings) whereas ret_stat_fifo is 20 deep. Shadowed. Not applicable if REQ_CTRL.KILL_DECERR_READS=0.
15:13	NORMAL	NONE	EMC2PMACRO_CFG_QUSE_MODE: [PMC] Select QUSE mode. Shadowed. (NORMAL = off-chip) (ALWAYS_ON = requires DQS PULL) (INTERNAL_LPBK selects on-chip loopback) (DIRECT_QUSE = directly controlled QUSE). 0 = NORMAL 1 = ALWAYS_ON 2 = INTERNAL_LPBK 3 = PULSE_INT 4 = RESERVED 5 = DIRECT_QUSE 6 = RESERVED1
12	DISABLED	NONE	CMD_2T_TIMING: [PMC] Enable 2T command timing (RAS/CAS/WE/ROW/A/BA). Shadowed. 0 = DISABLED 1 = ENABLED

Bit	Reset	Software Default	Description
10	DISABLED	NONE	DISABLE_CONCURRENT_AUTOPRE: [PMC] Disables reads/writes to a device until the precharge command has been issued by the DRAM internally. 0 = DISABLED 1 = ENABLED
8	ENABLED	ENABLED	CMD_TX_EN: [PMC] controls tx_en on the cmd bricks, active low 0 = ENABLED 1 = DISABLED
4	X64	X64	DRAM_WIDTH: [PMC] Specifies DRAM width. Platform specific. 0 = X32 1 = X64
3:2	BURST8	NONE	DRAM_BURST: [PMC] Specifies the burst length to use for the attached device(s). Shadowed. 0 = BURST4 1 = BURST8 2 = Reserved 3 = BURST16
1:0	LPDDR4	NONE	DRAM_TYPE: [PMC] Specifies which DRAM protocol to use for the attached device(s). Should be set to LPDDR2 for LPDDR3. 0 = DDR3 1 = LPDDR4 2 = LPDDR2 3 = DDR2

18.11.2.61 EMC_FBIO_CFG6_0

FBIO Configuration Register

QUSE_LATE determines how much added delay FBIO should add to the QUSE path. QUSE needs to align (approximately) with the incoming DQS in order to qualify it, since the incoming DQS/feedback clock is not always valid.

DRAMC can position QUSE with m2clk granularity (2 bit times). QUSE_LATE provides finer granularity of 1/2 an M2CLK cycle (1/2 bit time). The amount of delay added is primarily a function of the round trip wire delay to/from the DRAM. Other portions of the delay (driver and receiver delay) are compensated for by delay through a non-bonded QUSE pad cell.

Additional delay can be added to QUSE vi XFORM_QUSEx_MULT and XFORM_QUSEx_OFFS (applied to DLL offset).

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x114 | Read/Write: R/W | Reset: 0x00000002 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx010)

Bit	Reset	Description
2:0	0x2	CFG_QUSE_LATE: [PMC]

18.11.2.62 EMC_PDEX2CKE_0

DRAM timing parameter

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x118 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:0	0x0	PDEX2CKE: [PMC] specifies the timing delay from exit of powerdown mode to turning on CKE

18.11.2.63 EMC_CKE2PDEN_0

DRAM timing parameter

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x11c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:0	0x0	CKE2PDEN: [PMC] specifies the timing delay from turning off CKE to powerdown entry.

18.11.2.64 EMC_CFG_RSV_0

EMC Configuration Reserved

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x120 | Read/Write: R/W | Reset: 0xff00ff00 (0b11111111000000001111111100000000)

Threshold for ACPD

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x124 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	ACPD_THRESHOLD: [PMC] number of idle cycles to wait before allowing power-down entry

18.11.2.66 EMC_MPC_0

MPC cmd is only supported for LP4.

Offset: 0x128 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xxxxxxxxxxxxxxxx0000000000)

Bit	Reset	Description
31:30	0x0	MPC_DEV_SELECTN
27:26	0x0	MPC_SUBP_SELECTN: Active-low subchannel select 0x0 applies command to both sub-channels 0x1 for subp1 0x2 to for only subp0
9	0x0	MPC_WR: Send CAS2 (required for FIFO WR)
8	0x0	MPC_RD: Send CAS2 (required for FIFO RD and DQ_CAL RD)

Bit	Reset	Description
7	0x0	MPC_CAS2: Send CAS2 (required for FIFO RD/WR and DQ_CAL RD)
6:0	0x0	MPC_OP: MPC OP code

18.11.2.67 EMC_EMRS2_0

Command Trigger: EMRS2

The EMRS2 register allows software to issue an EMRS2 command.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x12c | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xxxx00xxxxxx00000000000000)

Bit	Reset	Description
31:30	0x0	EMRS2_DEV_SELECTN: [PMC] active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
27	0x0	USE_EMRS2_EXT_CNT: [PMC]{USE_MRS_EXT_CNT, USE_MRS_LONG_CNT}: 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_EMRS2_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
21:20	0x0	EMRS2_BA: [PMC] Set to 0x1 for EMRS (and where applicable, 0x2 for EMRS2, and 0x3 for EMRS3).
13:0	0x0	EMRS2_ADR: [PMC] mode-register data to be written.

18.11.2.68 EMC_EMRS3_0

Command Trigger: EMRS2

The EMRS3 register allows software to issue an EMRS3 command.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x130 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xxxx00xxxxxx00000000000000)

Bit	Reset	Description
31:30	0x0	EMRS3_DEV_SELECTN: [PMC] active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
27	0x0	USE_EMRS3_EXT_CNT: [PMC]: 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_EMRS3_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
21:20	0x0	EMRS3_BA: [PMC] Set to 0x1 for EMRS (and where applicable, 0x2 for EMRS2, and 0x3 for EMRS3).
13:0	0x0	EMRS3_ADR: [PMC] mode-register data to be written.

18.11.2.69 EMC_MRW2_0

Command Trigger: MRW2

Mode Register Write: LPDDRx -only version of MRS/EMRS

Boot requirements:

This register triggers a mode register write command. Multiple mode-register writes may be required by the cold boot sequence. Such commands should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x134 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xx00000000xxxxxxxx00000000)

Bit	Reset	Description
31:30	0x0	MRW2_DEV_SELECTN: [PMC] active-low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for dev1.
27	0x0	USE_MRW2_EXT_CNT: [PMC] 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_MRW2_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
23:16	0x0	MRW2_MA: [PMC] register address
7:0	0x0	MRW2_OP: [PMC] data to be written

18.11.2.70 EMC_MRW3_0

Command Trigger: MRW3

Mode Register Write: LPDDRx -only version of MRS/EMRS

Boot requirements:

This register triggers a mode register write command. Multiple mode-register writes may be required by the cold boot sequence. Such commands should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x138 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xx00000000xxxxxxxx00000000)

Bit	Reset	Description
31:30	0x0	MRW3_DEV_SELECTN: [PMC] active-low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for dev1.
27	0x0	USE_MRW3_EXT_CNT: [PMC] 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_MRW3_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
23:16	0x0	MRW3_MA: [PMC] register address
7:0	0x0	MRW3_OP: [PMC] data to be written

18.11.2.71 EMC_MRW4_0

Command Trigger: MRW4

Mode Register Write: LPDDRx -only version of MRS/EMRS

Boot requirements:

This register triggers a mode register write command. Multiple mode-register writes may be required by the cold boot sequence. Such commands should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x13c | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xx00000000xxxxxxxx00000000)

Bit	Reset	Description
31:30	0x0	MRW4_DEV_SELECTN: [PMC] active-low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for dev1.
27	0x0	USE_MRW4_EXT_CNT: [PMC] 00 = SHORT, 01 = LONG, 10 = EXT1, 11=EXT2
26	SHORT	USE_MRW4_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
23:16	0x0	MRW4_MA: [PMC] register address
7:0	0x0	MRW4_OP: [PMC] data to be written

18.11.2.72 EMC_CLKEN_OVERRIDE_0

Second-Level Clock Enable Override Register

Offset: 0x140 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxx000xx000x)

Bit	Reset	Description
31	DISABLED	OBS_BUS_CLKEN: 0 = DISABLED 1 = ENABLED
8	CLK_GATED	PAD_CONFIG_OVR: [PMC] 0 = CLK_GATED 1 = CLK_ALWAYS_ON 0 = DISABLE 1 = ENABLE 0 = DISABLED 1 = ENABLED
7	CLK_GATED	TR_CLKEN_OVR: [PMC] 0 = CLK_GATED 1 = CLK_ALWAYS_ON 0 = DISABLE 1 = ENABLE 0 = DISABLED 1 = ENABLED
6	CLK_GATED	STATS_CLKEN_OVR: 0 = CLK_GATED 1 = CLK_ALWAYS_ON 0 = DISABLE 1 = ENABLE 0 = DISABLED 1 = ENABLED
3	CLK_GATED	RR_CLKEN_OVR: 0 = CLK_GATED 1 = CLK_ALWAYS_ON 0 = DISABLE 1 = ENABLE 0 = DISABLED 1 = ENABLED
2	CLK_GATED	DRAMC_CLKEN_OVR: 0 = CLK_GATED 1 = CLK_ALWAYS_ON 0 = DISABLE 1 = ENABLE 0 = DISABLED 1 = ENABLED

18.11.2.73 EMC_R2R_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x144 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	R2R:

18.11.2.74 EMC_W2W_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x148 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	W2W:

18.11.2.75 EMC_EINPUT_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x14c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:0	0x0	EINPUT: [PMC] specifies when to assert EINPUT for a read, should normally be the same as QUSE.

18.11.2.76 EMC_EINPUT_DURATION_0

DRAM Timing Parameter

The minimum for EINPUT_DURATION is 4.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x150 | Read/Write: R/W | Reset: 0x00000004 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000100)

Bit	Reset	Description
5:0	0x4	EINPUT_DURATION: [PMC] Specifies how long the EINPUT should be asserted.

18.11.2.77 EMC_PUTERM_EXTRA_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x154 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000001)

Bit	Reset	Description
5:0	0x1	RXTERM: [PMC] tells the chip when to assert dynamic TERM for read return data.

18.11.2.78 EMC_TCKESR_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x158 | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	TCKESR: [PMC] Specify minimum low CKE pulse width for self-refresh mode.

18.11.2.79 EMC_TPD_0

DRAM Timing Parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x15c | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	TPD: [PMC] specify minimum low CKE pulse width for power-down mode.

18.11.2.80 EMC_AUTO_CAL_CONFIG_0

Auto-Calibration Settings for EMC Pads

Boot requirements:

- This register (except for AUTOCAL_SLW_OVERRIDE and AUTO_CAL_START(trigger)) should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register (except for AUTOCAL_SLW_OVERRIDE and AUTO_CAL_START(trigger)) should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2a4 | Read/Write: R/W | Reset: 0x0a195048 (0b00001010000110010101000001001000)

Bit	R/W	Reset	Description
31	RO	0x0	AUTO_CAL_START: [PMC] Writing a one to this bit triggers a complete Autocal cycle starting with measure FSM 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
30	RW	DISABLE	AUTO_CAL_COMP_PAD_FLIP: [PMC] When enabled, flip the COMP pad slices used for pull-up and pull-down calibration. Meant to address any full-chip connectivity/board routing issues related to off-chip calibration resistors 0 = DISABLE 1 = ENABLE
29	RW	DISABLED	AUTO_CAL_ENABLE: [PMC] ENABLED (normal operation): Use EMC Autocal-generated pullup/dn cal codes for drive/termination strength. DISABLED: Use emc padmacro register settings for pullup/dn drive/termination strength. When changed from ENABLED -> DISABLED, measure/compute/transfer FSMs immediately go to idle state. Old cal codes are still retained in padmacro registers and continue to be used till they are overwritten 0 = DISABLED 1 = ENABLED
28:25	RW	0x5	AUTO_CAL_NUM_SAMPLES: [PMC] If AUTO_CAL_CHECK_LOCK is enabled, number of samples to take for the majority test
24	RW	DISABLE	AUTO_CAL_CHECK_LOCK: [PMC] If enabled, whenever COMP pad indicates a "lock" take multiple samples and latch cal code only if majority of samples indicate "lock". Step to the next higher test value if majority of samples indicate "no lock" 0 = DISABLE 1 = ENABLE
23:19	RW	0x3	AUTO_CAL_WAIT_AFTER_EN: [PMC] Wait time between enabling COMP pad (i.e. changing TX_EN, BG_E_PWRD, IVREF_CAL_MODE, IVREF_LVL, E_IVREF or E_INPUT) and changing TX_DRVUP/TX_DRVDN test cal codes (in microseconds)
18:16	RW	0x1	AUTO_CAL_STEP: [PMC] Autocal measure step interval (in microseconds)
15:11	RW	0xa	AUTO_CAL_UPDATE_DELAY: [PMC] Number of EMC clocks to wait before Autocal transfer FSM triggers an update FSM cycle. This delay accounts for worst case priv write latency from EMC core to farthest pad macros. Static - Do not change or randomize
10	RW	DISABLE	AUTO_CAL_UPDATE_STALL: [PMC] When enabled, Autocal update FSM exits any ongoing update cycle and goes to idle state. Cal codes from previously completed update cycle are still available and continue to be used 0 = DISABLE 1 = ENABLE
9	RW	DISABLE	AUTO_CAL_MEASURE_STALL: [PMC] When enabled, Autocal measure FSM exits any ongoing vref cycle and goes to idle state. Locked cal codes from previously completed vref cycles are still available and continue to be used 0 = DISABLE 1 = ENABLE
8	RW	DISABLE	AUTO_CAL_PD_VREF2_EN: [PMC] Enable vref2 pull-down calibration measure cycle 0 = DISABLE 1 = ENABLE
7	RW	DISABLE	AUTO_CAL_PD_VREF1_EN: [PMC] Enable vref1 pull-down calibration measure cycle 0 = DISABLE 1 = ENABLE
6	RW	ENABLE	AUTO_CAL_PD_VREF0_EN: [PMC] Enable vref0 pull-down calibration measure cycle 0 = DISABLE 1 = ENABLE
5	RW	DISABLE	AUTO_CAL_PU_VREF2_EN: [PMC] Enable vref2 pull-up calibration measure cycle 0 = DISABLE 1 = ENABLE
4	RW	DISABLE	AUTO_CAL_PU_VREF1_EN: [PMC] Enable vref1 pull-up calibration measure cycle 0 = DISABLE 1 = ENABLE
3	RW	ENABLE	AUTO_CAL_PU_VREF0_EN: [PMC] Enable vref0 pull-up calibration measure cycle 0 = DISABLE 1 = ENABLE
2	RO	0x0	AUTO_CAL_UPDATE_START: [PMC] Writing a one to this bit triggers an Autocal update FSM cycle 0 = DISABLE 1 = ENABLE
1	RO	0x0	AUTO_CAL_TRANSFER_START: [PMC] Writing a one to this bit triggers an Autocal transfer FSM cycle 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
0	RO	0x0	AUTO_CAL_COMPUTE_START: [PMC] Writing a one to this bit triggers an Autocal compute FSM cycle 0 = DISABLE 1 = ENABLE

18.11.2.81 EMC_AUTO_CAL_INTERVAL_0

EMC Pad Calibration Interval

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2a8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000000000000000000)

Bit	Reset	Description
20:0	0x0	AUTO_CAL_INTERVAL: [PMC] Auto-calibration occurs at intervals equivalent to the programmed number of microseconds.

18.11.2.82 EMC_AUTO_CAL_STATUS_0

Autocal master status register

Offset: 0x2ac | Read/Write: RO | Reset: 0xXXXX0XXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
29:24	X	AUTO_CAL_VREF0_DRVDN: Pull-down code from VREF0 measure cycle
21:16	X	AUTO_CAL_VREF0_DRVUP: Pull-up code from VREF0 measure cycle
9	X	AUTO_CAL_PD_CAL_ZI: RX_D pin of COMP pad slice used for pull-down calibration
8	X	AUTO_CAL_PU_CAL_ZI: RX_D pin of COMP pad slice used for pull-up calibration
4	X	AUTO_CAL_ACTIVE: One when Autocal is active. Superset of measure + compute + transfer + update FSM cycles
3	X	AUTO_CAL_UPDATE_ACTIVE: One when Autocal update FSM cycle is active
2	X	AUTO_CAL_TRANSFER_ACTIVE: One when Autocal transfer FSM cycle is active
1	X	AUTO_CAL_COMPUTE_ACTIVE: One when Autocal compute FSM cycle is active
0	X	AUTO_CAL_MEASURE_ACTIVE: One when Autocal measure FSM cycle is active

18.11.2.83 EMC_REQ_CTRL_0

Request Status/Control

When either STALL_ALL_READS and/or STALL_ALL_WRITES is asserted, the stalling of read and/or write requests will not take effect until the status bit from EMC_STATUS register's NO_OUTSTANDING_TRANSACTIONS field is asserted.

Offset: 0x2b0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxx00)

Bit	Reset	Description
1	0x0	STALL_ALL_WRITES: Stall incoming write transactions
0	0x0	STALL_ALL_READS: Stall incoming read transactions

18.11.2.84 EMC_EMC_STATUS_0

EMC State-Machine Status

DRAM_IN_POWERDOWN, DRAM_IN_SELF_REFRESH, DRAM_IN_DPD: active high signal indicating current DRAM status for each of these modes, with 1 status bit per device, bit[0] = dev0 status, bit[1] = dev1 status.

Example: DRAM_IN_SELF_REFRESH = 0x3, both devices are in self-refresh, DRAM_IN_DPD= 0x2 would indicate only dev1 is in deep-power-down mode.

> ***Note:*** *If EMC is reset or powered down, the actual DRAM state could be different than indicated by these status bits. These bits do not reflect manually entered/exited powerdown or self-refresh (via use of PIN_CKE).*

Offset: 0x2b4 | Read/Write: RO | Reset: 0x0XXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
27:26	X	ACPD_FSM_IDLE: Indicate dev[n] power-down FSM is idle.
25:24	X	DSR_FSM_IDLE: Indicate dev[n] dynamic self refresh FSM is idle.
23	X	TIMING_UPDATE_STALLED: Indicates timing update triggered by TIMING_CONTROL.TIMING_UPDATE is not yet completed.
22	X	ZQ_FSM_IDLE: Indicates auto ZQ state machine is idle.
21	X	CFG_ZQ_ACTIVE: Indicates ZQ configuration access is active.
20	X	MRR_DIVLD: MRR data available for reading
19:16	X	MRR_FIFO_SPACE: MRR FIFO space available
13:12	X	DRAM_IN_DPD: dev[n] has been put into deep powerdown state
11:10	X	DRAM_IN_ACTIVE_SELF_REFRESH: dev[n] has been put into ACTIVE self-refresh (will remain until SR exit command).
9:8	X	DRAM_IN_SELF_REFRESH: dev[n] has been put into self-refresh (will remain until SR exit command). Indicates ACTIVE/POWERDOWN self-refresh
5:4	X	DRAM_IN_POWERDOWN: dev[n] has entered powerdown state (incoming req's will awaken if not stalled)
2	X	NO_OUTSTANDING_TRANSACTIONS: All non-stalled requests have completed
0	X	EMC_REQ_FIFO_EMPTY: Request FIFO is empty

18.11.2.85 EMC_CFG_2_0

EMC Configuration

Clock change sequencing: Once the divider is reprogrammed, CAR signals to EMC that a clock change is pending. If enabled, EMC stalls incoming requests, drains outstanding requests, and, if CLKCHANGE_(PD|SR)_ENABLE is enabled, puts DRAM into power-down (or self-refresh) before signalling to CAR that it is idle and ready for the change to happen. CAR will then change the divider/pll reprogramming. Once complete, EMC updates its shadow registers (assuming they may have been reprogrammed for new clock setting), unstalls requests, and resumes operation with new clock settings.

Some fields of this register are shadowed: see usage note in Section 18.11.2: EMC Registers.

Boot requirements:

- This register (except for fields DRAMC_PRE_B4_ACT, MRR_BYTESEL_X16, MRR_BYTESEL) should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x2b8 | Read/Write: R/W | Reset: 0x00108017 (0b0000000000x1xxx010xx000000010111)

Bit	Reset	Description
31	DISABLED	DRAMC_PRE_B4_ACT: [PMC] Diagnostic bit, gives priority to activates over precharges, determining which (precharge/activate) is processed first if both are pending and unblocked. 0 = DISABLED 1 = ENABLED
30	DISABLED	IGNORE_MC_A_BUS: [PMC] Tell whether to ignore the MC *_A_* bus. 0 = DISABLED 1 = ENABLED
29	DISABLED	CLR_ACT_BANK_INUSE_WHEN_BANK_CLOSE: [PMC] Tell whether to close/unlock actfifo bank inuse bit when the bank is close. 0 = DISABLED 1 = ENABLED

Bit	Reset	Description
28	DISABLED	DONT_CLR_TIMING_COUNTER_WHEN_CLKCHANGE: [PMC] Don't clear timing counters when clock change happen. 0 = DISABLED 1 = ENABLED
27:26	0x0	DRAMC_WD_CHK_POLICY: [PMC] 00 = no need to check if WDV (adj) >= WDV_CHK_BASE - Shadowed 01 = no need to check if WDV (adj) >= WDV_CHK_BASE+1 10 = no need to check if WDV (adj) >= WDV_CHK_BASE+2 11 = always check RWAQ_WD fifo quantity where WDV (adj) is in terms of EMC clocks
25	DISABLED	ALLOW_REF_DURING_CC_PRE_EXE: [PMC] Allow refresh to happen during clock change pre-execute phase. 0 = DISABLED 1 = ENABLED
24	DISABLED	DSR_STUTTER_ENABLE: [PMC] 1 = enable DSR stutter mode/protocol between MC and EMC. 0 = DISABLED 1 = ENABLED
23	0x0	CHK_PDEX2RD_TO_START_WR: [PMC] 1 = check PDEX2RD when starting write. 0 = check PDEX2WR when starting write. Shadowed
22	0x0	ISSUE_PCHGALL_AFTER_REF: [PMC] 1 = always generate precharge all bank after refresh. Shadowed
20	ENABLED	COMBINED_INTERRUPT_MODE: [PMC] 1 = combined interrupt mode. 0 = independent interrupt mode. Shadowed 0 = DISABLED 1 = ENABLED
16	DISABLED	CLKCHANGE_ACTIVE_SR: [PMC] execute frequency change when DRAM is in active SELF-REF state 0 = DISABLED 1 = ENABLED
11	0x0	DIS_CNTR_WITH_CFG_TIMING_UPDATE: [PMC] Diagnostic bit. 1 = Disable reset of timing parameter counters with TIMING_CONTROL.TIMING_UPDATE.
7	0x0	EARLY_TRFC_8_CLK: [PMC] Diagnostic bit. Shadowed. 1 = 8 clocks early 0 = 16 clocks early.
5:3	0x2	ZQ_EXTRA_DELAY: [PMC] Additional delay to push out ZQCMD based on tODToff (maximum) & frequency.
2	0x1	REF_AFTER_SREF: [PMC] 1 = Enables trigger of refresh after exiting self-refresh.
1	ENABLED	CLKCHANGE_PD_ENABLE: [PMC] Forces DRAM into power-down during CLKCHANGE. 0 = DISABLED 1 = ENABLED
0	ENABLED	CLKCHANGE_REQ_ENABLE: [PMC] Allows the EMC and CAR to handshake on PLL divider/source changes. 0 = DISABLED 1 = ENABLED

18.11.2.86 EMC_CFG_DIG_DLL_0

Configure Digital DLL

Controls for digital DLL's, which used to measure and maintain 1/4 cycle phase adjustment for RDQS strobes.

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register (except for field CFG_DLL_ALARM_DISABLE and DLL_RESET (trigger) and CFG_DLL_USE_OVERRIDE_UNTIL_LOCK(trigger)) should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register (except for field CFG_DLL_ALARM_DISABLE and DLL_RESET (trigger) and CFG_DLL_USE_OVERRIDE_UNTIL_LOCK(trigger)) should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2bc | Read/Write: R/W | Reset: 0xXX0000XX (0bx0xx0x00000000000000x000011x11x0)

Bit	R/W	Reset	Description
31	RO	X	CFG_DLL_USE_OVERRIDE_UNTIL_LOCK: [PMC] Writing 1 to this register causes override_val to be used in place of DLL output until DLL_LOCK/DLL_LOCK_TIMEOUT is obtained. Takes effect on next shadow update.
30	RO	0x0	DLL_RESET: [PMC] Writing 1 to this register will send reset pulse to DLL's on next shadow update. Must reset DLLs when changing clock frequency by factor >= 2. Reset occurs at next shadow update.
27	RW	0x0	CFG_DLL_ALARM_DISABLE: [PMC] Diagnostic bit. Shadowed. Disable override of DLL logic when DLL_ALM is set (otherwise overrides DLI to 0x3FF).
26	RO	X	CFG_DLL_UPDATE_AT_NXT_REFRESH: Writing 1 to this register causes the DLCELL update to occur at the next REFRESH interval. Ordinarily, updates are only performed if the DLL value is updated. This mechanism allows updates to the XFORM_MULT/OFF to be taken at the next REFRESH.
25:16	RW	0x0	CFG_DLL_OVERRIDE_VAL: [PMC] Value to use in place of DLI output if CFG_DLL_OVERRIDE_EN is set or prior to lock in RUN_TIL_LOCK mode. Shadowed.
15	RW	0x0	CFG_DLL_TESTEN: [PMC] Enable DLL test mode
14	RW	0x0	CFG_DLL_QUSE_TESTOUT: [PMC] Enable DLL TESTOUT on QUSE pads
13:12	RW	0x0	CFG_DLL_TESTSEL: [PMC] Select DLL test output
10:8	RW	0x0	CFG_DLL_UDSET: [PMC] In case DLL has problems locking. Shadowed. DLL will be treated as locked after LIMIT uSec. Counter is reset with DLL_RESET (from above) or with each periodic update (if using RUN_PERIODIC). Settings are: 000: LIMIT = 16 µs 001: LIMIT = 64 µs 010: LIMIT = 12 µs 011: LIMIT = 512 µs 011: LIMIT = 1
7:6	RW	RUN_TIL_LOCK	CFG_DLL_MODE: [PMC] Controls how frequently DLL runs. Shadowed. 0 = RUN_CONTINUOUS: DLL will run continuously. This option will consume the most power. Once LOCK/TIMEOUT occurs, trimmers will be updated at REFRESH or shadow update. 1 = RUN_TIL_LOCK: after DLL_RESET is set, DLL will run until it has locked/timed out, then be disabled. Trimmers updated at following REFRESH/shadow update. 2 = RUN_PERIODIC: after DLL_LOCK/TIMEOUT, DLL will be disabled and re-enabled after CFG_DLL_RUN_PERIOD µs to track delay changes (temperature/voltage). 3 = RUN_PRELOCK
5	RW	0x1	CFG_DLL_LOWSPEED: [PMC] Enable DLL for use with low-speed EMCCLK operation (< 200 MHz). Shadowed. The DLL does power optimization by itself. This control should stay at 1.
4	RO	X	CFG_DLL_STALL_RW_UNTIL_LOCK: [PMC] Writing 1 to this register will cause the EMC to stall all RW traffic until the DLL locks. Takes effect on the next shadow update.
3	RW	0x1	CFG_DLL_STALL_ALL_TRAFFIC: [PMC] Enables stalling of all DRAM traffic while undergoing dll_stall condition;otherwise only block reads/writes are stalled during dll_stall. Shadowed.
2	RW	ENABLED	CFG_DLL_OVERRIDE_EN: [PMC] Override DLL's DLI output with OVERRIDE_VAL (still uses mult/offset). Shadowed. 0 = DISABLED 1 = ENABLED
1	RO	X	CFG_DLL_STALL_ALL_UNTIL_LOCK: [PMC] Writing 1 to this register will cause emc to stall all traffic until DLL locks. Takes effect on next shadow update.
0	RW	DISABLED	CFG_DLL_EN: [PMC] Enables digital DLL. Shadowed. 0 = DISABLED 1 = ENABLED

18.11.2.87 EMC_CFG_DIG_DLL_PERIOD_0

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x2c0 | Read/Write: R/W | Reset: 0x00008000 (0bxxxxxxxxxxxxxxxx1000000000000000)

Bit	Reset	Description
15:0	0x8000	CFG_DLL_RUN_PERIOD: [PMC] If CFG_DLL_MODE == RUN_PERIODIC, this specifies the interval between runs in microseconds.

18.11.2.88 EMC_DIG_DLL_STATUS_0

Digital DLL Status

Digital DLL Status bits directly from DLL

Offset: 0x2c4 | Read/Write: RO | Reset: 0x000XXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
18	X	DLL_ALARM_MIN
17	X	DLL_PRIV_UPDATED
16	X	DLLCAL_IN_PROGRESS
15	X	DLL_LOCK
14	X	DLL_ALARM
13	X	DLL_LOCK_TIMEOUT
10:0	X	DLL_OUT

18.11.2.89 EMC_CFG_DIG_DLL_1_0

Digital DLL Status

Additional DLL configuration bits used by DRAMc update logic

Offset: 0x2c8 | Read/Write: R/W | Reset: 0x00003801 (0bxxxxxxxxxxxxxxxx0011100000000001)

Bit	Reset	Description
15:12	0x3	CFG_DLL_WAIT_BEFORE_UPDATE: [PMC] Number of clocks to stall before DLL update sent to pad macros. Minimum valid value is 0x3. Shadowed
11:6	0x20	DLL_NUM_STALL_CYCLES: [PMC] Number of clocks to stall after DLL update sent to pad macros. Shadowed
5:1	0x0	CFG_DLL_UPDATE_TIMEOUT: [PMC] Timeout if waiting for idle/refresh- 0 means no timeout. Shadowed
0	0x1	CFG_DLL_UPDATE_IDLE: [PMC] Update Dig Dll during idle (outside refresh). Shadowed

18.11.2.90 EMC_RDV_MASK_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2cc | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxx0111111)

Bit	Reset	Description
6:0	0x3f	RDV_MASK: [PMC] This should be programmed to RDV.

18.11.2.91 EMC_WDV_MASK_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2d0 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx001111)

Bit	Reset	Description
5:0	0xf	WDV_MASK: [PMC] This should be programmed to WDV.

18.11.2.92 EMC_RDV_EARLY_MASK_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2d4 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxx0111111)

Bit	Reset	Description
6:0	0x3f	RDV_EARLY_MASK: [PMC] This should be programmed to RDV_EARLY.

18.11.2.93 EMC_RDV_EARLY_0

DRAM timing parameter

Offset: 0x2d8 | Read/Write: R/W | Reset: 0x00000008 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx0001000)

Bit	Reset	Description
6:0	0x8	RDV_EARLY: [PMC] time from read command to latching the read data from the pad macros. 60 = MAX_1TO1 120 = MAX_2TO1

18.11.2.94 EMC_AUTO_CAL_CONFIG8_0

Autocal master compute control register

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2dc | Read/Write: R/W | Reset: 0x00770000 (0bxxxxxxxxxx111x111xx000000xx000000)

Bit	Reset	Description
22:20	0x7	AUTO_CAL_DQS_TERM_SLOPE: [PMC] slope for DQS term value - range is 0.125 to 1.000 in steps of 0.125
18:16	0x7	AUTO_CAL_DQ_TERM_SLOPE: [PMC] slope for DQ term value - range is 0.125 to 1.000 in steps of 0.125
13:8	0x0	AUTO_CAL_DQS_TERM_OFFSET: [PMC] 2's complement offset for DQS term value
5:0	0x0	AUTO_CAL_DQ_TERM_OFFSET: [PMC] 2's complement offset for DQ term value

ZQ Calibration Registers

1. Periodic mode

   Allows a ZQ calibration command to be sent periodically to DRAM. After ZCAL_INTERVAL, ZCAL_MRW_CMD will be sent to each DRAM, 1 at a time, followed by ZCAL_WAIT_CNT interval in which no other commands will be allowed to be sent to either DRAM. So if ZQ_MRW_DEV_SELECTN == 2'b00, it would send the MRW command to dev0, wait ZCAL_WAIT_CNT, send the command to dev1, wait ZCAL_WAIT_CNT, resume normal operation. It will then wait

ZCAL_INTERVAL microseconds before repeating the procedure. The ZQ calibration command will not be sent to devices that are 1) unpopulated and 2) either in or about to enter self-refresh or DPD.

To enable periodic ZQ calibration, program ZCAL_INTERVAL and ZCAL_WAIT_CNT to be non-zero, as well as ZCAL_MRW_CMD to contain the command and device selection, followed by TIMING_CONTROL to latch those three registers.

Note that ZCAL_WAIT_CNT will be used instead of MRS_WAIT_CNT for delaying the subsequent DRAM commands after the ZQ calibration commands, even if a ZQ calibration command is also an MRW command.

Disable this feature by setting ZCAL_INTERVAL.ZCAL_REF_INTERVAL = 0, followed by TIMING_CONTROL to latch it.

2. One-shot mode

   Allows ZQ calibration command to be sent to DRAM.

   To send a one-shot command, keep ZCAL_INTERVAL and ZCAL_WAIT_CNT equal to zero, program ZCAL_MRW_CMD with only one device selected, then program TIMING_CONTROL to latch in those registers, and finally program ZQ_CAL_CMD to 1 to trigger the one-shot command. If more than one device needs to be calibrated, wait the ZQ calibration time and repeat the steps above with the other device selection bit enabled in ZCAL_MRW_CMD.

   Do not send a one-shot ZQ calibration command when periodic mode is enabled.

ZQ Calibration Registers – LPDDR4

1. Periodic mode

   Allows a ZQ calibration start command to be sent periodically to DRAM. LPDDR4 requires a separate MPC command to latch the ZQ calibration results. So, the LPDDR4 sequence looks like this for each DRAM:

   - after ZCAL_INTERVAL, an MPC ZQCal Start command will be sent
   - after ZCAL_WAIT_CNT interval, an MPC ZQCal Latch command will be sent
   - after ZCAL_LATCH_CNT interval, subsequent ZQ calibration of additional DRAM occurs or other commands can be issued

   So if ZQ_MRW_DEV_SELECTN == 2'b00, it would send the Start command to dev0, wait ZCAL_WAIT_CNT, send Latch command to dev0, wait ZCAL_LATCH_CNT, send Start command to dev1, wait ZCAL_WAIT_CNT, send Latch command to dev1, wait ZCAL_LATCH_CNT, resume normal operation. It will then wait ZCAL_INTERVAL microseconds before repeating the procedure. The ZQ calibration command will not be sent to devices that are 1) unpopulated and 2) either in or about to enter self-refresh or DPD.

   To enable periodic ZQ calibration:

   - enable FBIO_CFG7.ZQCAL_MPC_ENABLE and FBIO_CFG7.ZQCAL_LATCH_ENABLE
   - program ZCAL_INTERVAL, ZCAL_WAIT_CNT, and ZCAL_LATCH_CNT to be non-zero
   - program ZCAL_MRW_CMD.ZQ_MRW_OP=ZQCal_Start and ZCAL_MRW_CMD.ZQ_MRW_MA=ZQCal_Latch
   - program ZQ_MRW_DEV_SELECTN to contain the device selection
   - write to TIMING_CONTROL to latch the three registers

   To disable periodic ZQ calibration, program ZCAL_INTERVAL.ZCAL_REF_INTERVAL = 0, followed by TIMING_CONTROL to latch it.

2. One-shot mode

   Allows ZQ calibration command to be sent to DRAM.

   To send a one-shot command, keep ZCAL_INTERVAL and ZCAL_WAIT_CNT equal to zero, program ZCAL_MRW_CMD with only one device selected, then program TIMING_CONTROL to latch in those registers, and finally program ZQ_CAL_CMD to 1 to trigger the one-shot command. Wait the ZQ calibration time and program ZQ_LATCH_CMD to 1. If more than one device needs to be calibrated, wait the ZQ calibration time and repeat the steps above with the other device selection bit enabled in ZCAL_MRW_CMD. Only one of ZQ_CAL_CMD and ZQ_LATCH_CMD should be 1 for any ZQ_CAL write.

Do not send a one-shot ZQ calibration command when periodic mode is enabled.

18.11.2.95 EMC_ZCAL_INTERVAL_0

Configure ZQ Calibration

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2e0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000000000000000000000)

Bit	Reset	Description
23:10	0x0	ZCAL_INTERVAL_HI: [PMC] Combined with ZCAL_INTERVAL_LO specifies the number of microseconds to wait between issuance of ZCAL_MRW_CMD. If 0, ZCAL is disabled and internal counter will be reset.
9:0	0x0	ZCAL_INTERVAL_LO [PMC]

18.11.2.96 EMC_ZCAL_WAIT_CNT_0

Configure ZQ Calibration

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the
- Boot ROM during warm boot.

Offset: 0x2e4 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxx000000xxxxx00000000000)

Bit	Reset	Description
31	DISABLED	ZCAL_RESISTOR_SHARED: [PMC] ENABLED is ZQ resistor is shared across ranks 0 = DISABLED 1 = ENABLED
21:16	0x0	ZCAL_LATCH_CNT: [PMC] LPDDR4 - Number of EMC clocks to wait before issuing any commands after sending MPC ZQCAL_LATCH command.
10:0	0x0	ZCAL_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing any commands after sending ZCAL_MRW_CMD. LPDDR4 - Number of EMC clocks to wait before issuing any commands after sending MPC ZQCAL_START command.

18.11.2.97 EMC_ZCAL_MRW_CMD_0

Configure ZQ Calibration

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2e8 | Read/Write: R/W | Reset: 0xc0000000 (0b11xxxxxx00000000xxxxxxxx00000000)

Bit	Reset	Description
31:30	0x3	ZQ_MRW_DEV_SELECTN: [PMC] Active-low chip-select, 0x0 applies command to both devices (will happen 1 at a time), 0x2 to for only dev0, 0x1 for dev1.

Bit	Reset	Description
23:16	0x0	ZQ_MRW_MA: [PMC] MRW MA field to be sent after ZCAL_INTERVAL. LPDDR4 - program to ZQCal_Latch
7:0	0x0	ZQ_MRW_OP: [PMC] MRW OP field to be sent after ZCAL_INTERVAL. LPDDR4 - program to ZQCal_Start

18.11.2.98 EMC_ZQ_CAL_0

Trigger a Single ZQ Calibration

This register issues a ZQ calibration MRS command.

Offset: 0x2ec | Read/Write: R/W | Reset: 0x00000010 (0b00xxxxxxxxxxxxxxxxxxxxxxxxxx1xx00)

Bit	Reset	Description
31:30	0x0	ZQ_CAL_DEV_SELECTN: Active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1, 0x3 for neither device (0x0, for both devices, is not allowed if the ZQ resister is shared between devices).
4	LONG	ZQ_CAL_LENGTH: Indicate short or long ZQ calibration. 0 = SHORT 1 = LONG
1	0x0	ZQ_LATCH_CMD: Issues a ZQ latch command (LPDDR4 only).
0	0x0	ZQ_CAL_CMD: Issues a ZQ calibration command (DDR3 only).

18.11.2.99 EMC_XM2COMPPADCTRL3_0

Autocal COMP pad control register

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2f4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxx00000000000000000)

18.11.2.107 EMC_SCRATCH0_0

This is a scratch register for general use.

Offset: 0x324 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SCRATCH:

18.11.2.108 EMC_PMACRO_BRICK_CTRL_RFU1_0

Controls the lower 16 RFU pin of the IOBRICK (CMD and DATA)

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x330 | Read/Write: R/W | Reset: 0x1fff1fff (0b00011111111111111000111111111111)

Bit	Reset	Description
31:16	0x1fff	DATA_BRICK_CTRL_RFU1: [PMC]
15:0	0x1fff	CMD_BRICK_CTRL_RFU1: [PMC]

18.11.2.109 EMC_PMACRO_BRICK_CTRL_RFU2_0

Controls the upper 16 RFU pin of the IOBRICK (CMD and DATA)

Offset: 0x334 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:16	0x0	DATA_BRICK_CTRL_RFU2: [PMC]
15:0	0x0	CMD_BRICK_CTRL_RFU2: [PMC]

18.11.2.110 EMC_CMD_MAPPING_CMD0_0_0

Configures the command mapping

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x380 | Read/Write: R/W | Reset: 0x01010101 (0bx0000001x0000001x0000001x0000001)

Bit	Reset	Description
6:0	0xf	TR_RDV: 60 = MAX_1TO1 120 = MAX_2TO1

18.11.2.128 EMC_STALL_THEN_EXE_BEFORE_CLKCHANGE_0

Scheme to change controller timing parameters + SDRAM mode timing atomically.

1. Program the EMC controller timing registers (shadowed).
2. Pre-program the SDRAM mode registers.
   a. Write 1 to the STALL_THEN_EXE_BEFORE_CLKCHANGE field, which will prevent further cfg execution until a clock change request has been detected.

Note: *After this step, no register read should happen on the EMC before the clock change (C) happens, otherwise the system will hang. Disable the EMC interrupt before this step if the interrupt handler reads EMC registers.*

---

   b. Write to whatever EMC registers you want to be execute after clock change request has been detected but before the actual clock change happens. For example, if you want to disable DLL in DDR3 mode, you can,
      - Issue a write to SDRAM's MR1 register via EMC MRS register to disable DLL.
      - Issue a Self-refresh entry via EMC SELF_REF register.

Note: *If there is no need to execute any register access before clock change, skip step (b); step (a) is still required.*

c. Write 1 to STALL_THEN_EXE_AFTER_CLKCHANGE field which will prevent further config execution until after the actual clock change has happened.

d. Write to whatever EMC registers you want to be executed after the clock change. Using the same example as (b), you will,

- Issue a Self-refresh exit via EMC SELF_REF register.
- Issue writes to SDRAM's MRx register(s) to change read/write latencies and/or enable DLL
- Issue burst refreshes via EMC REF register.

Note: *If there is no need to execute any register access after clock change, skip step (d); step (c) is still required.*

3. Program the CAR to change either clock source and/or clock divider.

Notes:

- *In both sequences above, DYN_SELF_REF must be disabled off before the first step, then it can be restored after the last step.*
- *The interval between two clock change sequences are recommended to be at least 20 µs apart.*

Writes to this register will stall the register read/write path until a clock change request is detected. Once detected, whatever register access follows this register write will be executed until a STALL_THEN_EXE_AFTER_CKLCHANGE is encountered. At that point, EMC timing registers will be updated and the clock change request will be acknowledged.

Offset: 0x3c8 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	STALL_THEN_EXE_BEFORE_CLKCHANGE: Writing a one to this bit will stall subsequent register accesses.

18.11.2.129 EMC_STALL_THEN_EXE_AFTER_CLKCHANGE_0

Writes to this register will stall the register read/write path until after EMC timing registers are updated and that clock change has been completed. Once that happens, whatever register access follows this register write will be executed until UNSTALL_RW_AFTER_CLKCHANGE is encountered. At that point, normal memory read/write will be allowed to resume.

Offset: 0x3cc | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	STALL_THEN_EXE_AFTER_CLKCHANGE: Writing a one to this bit will stall subsequent register accesses.

18.11.2.130 EMC_UNSTALL_RW_AFTER_CLKCHANGE_0

Writing to this register will unstall memory reads/writes after a clock change. Use in conjunction with STALL_THEN_EXE_AFTER_CLKCHANGE.

Offset: 0x3d0 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	UNSTALL_RW_AFTER_CLKCHANGE: Writing a one to this bit will unstall memory reads/writes after a clock change.

18.11.2.131 EMC_AUTO_CAL_ STATUS2_0

Autocal master status register

Offset: 0x3d4 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
29:24	X	AUTO_CAL_VREF2_DRVDN: Pull-down code from VREF2 measure cycle.
21:16	X	AUTO_CAL_VREF2_DRVUP: Pull-up code from VREF2 measure cycle.
13:8	X	AUTO_CAL_VREF1_DRVDN: Pull-down code from VREF1 measure cycle.
5:0	X	AUTO_CAL_VREF1_DRVUP: Pull-up code from VREF1 measure cycle.

18.11.2.132 EMC_SEL_DPD_CTRL_0

Configures Functional SEL_DPD Modes

Offset: 0x3d8 | Read/Write: R/W | Reset: 0x00040000 (0bxxxxxxxxxxxxxx100xxxxxxx0xx0000xx)

Bit	Reset	Description
18:16	0x4	SEL_DPD_DLY: [PMC] number of cycles to wait before asserting SEL_DPD
8	DISABLED	DATA_SEL_DPD_EN: [PMC] allow SEL_DPD assertion for data pads 0 = DISABLED 1 = ENABLED
5	DISABLED	ODT_SEL_DPD_EN: [PMC] tie SEL_DPD for ODT pads to ENABLE_ODT_DURING_WRITE 0 = DISABLED 1 = ENABLED
4	DISABLED	RESET_SEL_DPD_EN: [PMC] assert SEL_DPD for reset pad 0 = DISABLED 1 = ENABLED
3	DISABLED	CA_SEL_DPD_EN: [PMC] allow SEL_DPD assertion for discrete command/address pads 0 = DISABLED 1 = ENABLED
2	DISABLED	CLK_SEL_DPD_EN: [PMC] allow SEL_DPD assertion for discrete clock pad 0 = DISABLED 1 = ENABLED

18.11.2.133 EMC_PRE_REFRESH_REQ_CNT_0

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x3dc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	PRE_REF_REQ_CNT: [PMC] When the refresh counter reach this pre-refresh request count before a burst refresh will be issued when it reach the {REFRESH,REFRESH_LO}, a pre-refresh request will be asserted to MC to close the banks/pages and flush its pipeline. A 0 value will disable this feature.

18.11.2.134 EMC_DYN_SELF_REF_CONTROL_0

Threshold for Dynamic Self-Refresh Entry

This register controls how dynamic self-refresh entry/exit is handled.

If ODT is enabled, the DSR_PER_DEVICE field must be set to DISABLED.

It is recommended to change the values of ODT_WRITE and DSR_PER_DEVICE with a clock change

To do it outside of a clock change sequence, one has to be aware that DSR enable/disable takes time to take effect. This is the sequence for disabling DSR_PER_DEVICE and enabling ODT outside of clock change:

1. DYN_SELF_REF <= DISABLED (DSR exit)

2. TIMING_UPDATE <= 1 (latch in the shadow value)
3. Read back and discard any EMC register such as INTSTATUS (ensure 1 and 2 have gone through)
4. Wait 2 µs for the last possible self-refresh entry
5. Poll for SDRAM_IN_SELF_REFRESH == 0 (ensure that self-refresh exits)
6. ODT_WRITE <= new value to turn on ODT

   DSR_PER_DEVICE <= DISABLED (turn off per-device DSR)

   DYN_SELF_REF <= ENABLED (re-enable DSR)
7. TIMING_UPDATE <= 1 (latch in the shadow values)

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Offset: 0x3e0 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
31	DISABLED	DSR_PER_DEVICE: [PMC] controls whether dynamic self-refresh is done on a per-device basis. PER_DEVICE_DSR must be enabled in single-rank system also. 0 = DISABLED 1 = ENABLED
15:0	0x0	DSR_THRESHOLD: [PMC] number of idle cycles to wait before allowing dynamic self-refresh entry

18.11.2.135 EMC_TXSRDLL_0

DRAM timing parameter

This register is shadowed: see usage notes in Section 18.11.2: EMC Registers.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the
- Boot ROM during warm boot.

Note: If operating in non-DLL mode, this register needs to be updated with the non-DLL timing requirement.

Offset: 0x3e4 | Read/Write: R/W | Reset: 0x000007ff (0bxxxxxxxxxxxxxxxxxxxx011111111111)

Bit	Reset	Description
11:0	0x7ff	TXSRDLL: [PMC] Cycles between self-refresh exit and first DRAM command requiring a locked DLL. For DDR3 only: READ (and RAP) and synchronous ODT commands. \ Largest allowed value is 0xffe

18.11.2.136 EMC_CCFIFO_ADDR_0

CCFIFO_ADDR: This register contains the address offset of the EMC register that is intended to be executed during the clock change sequence.

> ***Note:*** *Before triggering a clock change sequence from the CAR, you must configure the pre-/post-clock change sequence by writing, multiple times, to the CCFIFO_DATA/CCFIFO_ADDR register pair. After the CCFIFO_ADDR register is written, Hardware will write the register offset and corresponding data into the 32-deep clock change FIFO (CCFIFO).*

Offset: 0x3e8 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	CCFIFO_STALL_CNT_BY_1:if set, count by 1 instead of 256 clk increments

Bit	Reset	Description
30:16	0x0	CCFIFO_STALL_CNT: non-zero value will stall CCFIFO processing counter uses a hardcoded 8-bit pre-scalar; e.g. CNT=1 results in a 256 clock delay or 1 if CCFIFO_STALL_CNT_BY_1 is set
15:0	0x0	CCFIFO_ADDR: clock change FIFO address register.

18.11.2.137 EMC_CCFIFO_DATA_0

CCFIFO_DATA: This register contains the 32-bit data of the EMC register that is intended to be written to or pointed at by CCFIFO_ADDR.

Offset: 0x3ec | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	CCFIFO_DATA: clock change FIFO data register.

18.11.2.138 EMC_CCFIFO_STATUS_0

Offset: 0x3f0 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
6:0	X	CCFIFO_COUNT

18.11.2.139 EMC_TR_QPOP_0

DRAM timing parameter

Offset: 0x3f4 | Read/Write: R/W | Reset: 0x00000006 (0bxxxxxxxxx0000000xxxxxxxx0000110)

Bit	Reset	Description
22:16	0x0	TR_QPOP_PREAMBLE:time from read command to pop preamble from the pad macro FIFO. EMC ignores this field if FBIO_CFG7.QPOP_RD_PREAMBLE_TOGGLE=0. 60 = MAX_1TO1 120 = MAX_2TO1
6:0	0x6	TR_QPOP: Time from training read command to pop data from the pad macro FIFO. 60 = MAX_1TO1 120 = MAX_2TO1

18.11.2.140 EMC_TR_RDV_MASK_0

DRAM timing parameter

Offset: 0x3f8 | Read/Write: R/W | Reset: 0x00000006 (0bxxxxxxxxxxxxxxxxxxxxxxxxx0000110)

Bit	Reset	Description
6:0	0x6	TR_RDV_MASK: Serves the same purpose as RDV_MASK serves for RDV. Training needs separate RDV so a separate RDV_MASK. 60 = MAX_1TO1 120 = MAX_2TO1

18.11.2.141 EMC_TR_QSAFE_0

DRAM timing parameter

Offset: 0x3fc | Read/Write: R/W | Reset: 0x00000006 (0bxxxxxxxxxxxxxxxxxxxxxxxxx0000110)

Bit	Reset	Description
6:0	0x6	TR_QSAFE: Training time from a read command to when it is safe to issue a QRST (delayed by the QRST parameter). 60 = MAX_1TO1 120 = MAX_2TO1

18.11.2.142 EMC_TR_QRST_0

DRAM timing parameter

Offset: 0x400 | Read/Write: R/W | Reset: 0x00000006 (0bxxxxxxxxxxxx00000xxxxxxxxx0000110)

Bit	Reset	Description
20:16	0x0	TR_QRST_DURATION: QRST remains asserted for QRST_DURATION + 1 cycles
6:0	0x6	TR_QRST: Training time from a read command to when it is safe to issue a QRST (delayed by the QRST parameter). 60 = MAX_1TO1 120 = MAX_2TO1

18.11.2.143 EMC_SWIZZLE_RANK0_BYTE0_0

The SWZ_RANK*_BYTE*_BIT*_SEL fields indicate which SDRAM data bit (0-7) within each byte is mapped/connected to the corresponding bit of the chip.

Offset: 0x404 | Read/Write: R/W | Reset: 0x76543210 (0bx111x110x101x100x011x010x001x000)

Bit	Reset	Description
30:28	0x7	SWZ_RANK0_BYTE0_BIT7_SEL: (encoded)
26:24	0x6	SWZ_RANK0_BYTE0_BIT6_SEL: (encoded)
22:20	0x5	SWZ_RANK0_BYTE0_BIT5_SEL: [PMC]
18:16	0x4	SWZ_RANK0_BYTE0_BIT4_SEL: [PMC]
14:12	0x3	SWZ_RANK0_BYTE0_BIT3_SEL: [PMC]
10:8	0x2	SWZ_RANK0_BYTE0_BIT2_SEL: [PMC]
6:4	0x1	SWZ_RANK0_BYTE0_BIT1_SEL: [PMC]
2:0	0x0	SWZ_RANK0_BYTE0_BIT0_SEL: [PMC]

18.11.2.144 EMC_SWIZZLE_RANK0_BYTE1_0

Offset: 0x408 | Read/Write: R/W | Reset: 0x76543210 (0bx111x110x101x100x011x010x001x000)

Bit	Reset	Description
30:28	0x7	SWZ_RANK0_BYTE1_BIT7_SEL: (encoded)
26:24	0x6	SWZ_RANK0_BYTE1_BIT6_SEL: (encoded)
22:20	0x5	SWZ_RANK0_BYTE1_BIT5_SEL: [PMC]
18:16	0x4	SWZ_RANK0_BYTE1_BIT4_SEL: [PMC]
14:12	0x3	SWZ_RANK0_BYTE1_BIT3_SEL: [PMC]
10:8	0x2	SWZ_RANK0_BYTE1_BIT2_SEL: [PMC]
6:4	0x1	SWZ_RANK0_BYTE1_BIT1_SEL: [PMC]
2:0	0x0	SWZ_RANK0_BYTE1_BIT0_SEL: [PMC]

18.11.2.145 EMC_SWIZZLE_RANK0_BYTE2_0

Offset: 0x40c | Read/Write: R/W | Reset: 0x76543210 (0bx111x110x101x100x011x010x001x000)

Bit	Reset	Description
30:28	0x7	SWZ_RANK0_BYTE2_BIT7_SEL: (encoded)
26:24	0x6	SWZ_RANK0_BYTE2_BIT6_SEL: (encoded)
22:20	0x5	SWZ_RANK0_BYTE2_BIT5_SEL: [PMC]
18:16	0x4	SWZ_RANK0_BYTE2_BIT4_SEL: [PMC]
14:12	0x3	SWZ_RANK0_BYTE2_BIT3_SEL: [PMC]
10:8	0x2	SWZ_RANK0_BYTE2_BIT2_SEL: [PMC]
6:4	0x1	SWZ_RANK0_BYTE2_BIT1_SEL: [PMC]

Bit	Reset	Description
2:0	0x0	SWZ_RANK0_BYTE2_BIT0_SEL: [PMC]

18.11.2.146 EMC_SWIZZLE_RANK0_BYTE3_0

Offset: 0x410 | Read/Write: R/W | Reset: 0x76543210 (0bx111x110x101x100x011x010x001x000)

Bit	Reset	Description
30:28	0x7	SWZ_RANK0_BYTE3_BIT7_SEL: (encoded)
26:24	0x6	SWZ_RANK0_BYTE3_BIT6_SEL: (encoded)
22:20	0x5	SWZ_RANK0_BYTE3_BIT5_SEL: [PMC]
